Ground State Configuration [Σ] ΔH<sub>f</sub><sup>o</sup> = [169.4] kcal. mole<sup>-1</sup>  
S<sub>298.15</sub><sup>o</sup> = [55.76] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
ΔH<sub>f</sub><sup>o</sup> 298.15 = [170.5] kcal. mole<sup>-1</sup>

Electronic Levels and Multiplicities

$$\frac{\epsilon_{el}}{cm^{-1}} = \frac{\epsilon_{el}}{0} [2]$$

$\omega_e = [840] cm^{-1}$   
 $B_e = [0.4146] cm^{-1}$   
 $\omega_e x_e = [5] cm^{-1}$   
 $\epsilon_{el} = [0.0025] cm^{-1}$   
 $r_e = [1.83] \text{ \AA}$

Heat of Formation.

ΔH<sub>f</sub><sup>o</sup> 0 was estimated as 170.7 kcal. mole<sup>-1</sup> by J. S. Gordon, AstroSystems International, Livingston, New Jersey, private communication, January 10, 1963. ΔH<sub>f</sub><sup>o</sup> 298.15 was then calculated.

Heat Capacity and Entropy.

Molecular constants were estimated by J. S. Gordon, loc. cit. r<sub>e</sub> was calculated from the relationship r<sub>e</sub> = (16.858778/μ<sup>1/2</sup>B<sub>e</sub>)<sup>1/2</sup> Å.

Dec. 31, 1960; Mar. 31, 1961; Sept. 30, 1965

NITROGEN, DIATOMIC (N<sub>2</sub>) (IDEAL GAS - REFERENCE STATE)

MOL. WT. = 28.0134

Ground State Configuration  $1 \sum_g^+$   
 $S_{298.15} = 45.77 \pm 0.01$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $\Delta H_f^0 = 0$   
 $\Delta H_f^0_{298.15} = 0$

$\omega_e = 2357.55$  cm.<sup>-1</sup>  
 $\omega_e x_e = 14.059$  cm.<sup>-1</sup>  
 $B_e = 1.9825$  cm.<sup>-1</sup>  
 $\alpha_e = 0.01791 \pm 0.0001$  cm.<sup>-1</sup>  
 $r_e = 1.08758 \pm 0.0001$  Å  
 $\sigma^- = 2$

Heat of Formation. The heat of formation ( $\Delta H_f^0$ ) for N<sub>2(g)</sub> is zero at all temperatures by definition.

Heat Capacity and Entropy.

The functions adopted here are based on the direct summation calculations of L. Glatz, J. Belzer and H. L. Johnston, Ohio State Univ. Res. Found. Proj. 316, Report No. 9, 1953. They calculated the functions for N<sub>2</sub> by a direct summation using spectroscopic data given by O. Herzberg, "Diatomic Molecules", D. Van Nostrand Co., New York, 1950. The entropies were changed by -Rln9 to remove the effects of nuclear spin included by Glatz, Belzer, and Johnston, and by 0.012 for the difference in spectroscopic constants. J. A. Goff and S. Orbach, Trans. Am. Soc. Mech. Engrs., 72, 741 (1950), calculated a set of functions by a direct summation over the ground state levels only. Agreement with the functions of Glatz, Belzer, and Johnston is within 0.1%.

B. P. Stoicheff, Can. J. Phys. 32, 630 (1954), determined the spectroscopic constants of N<sub>2</sub> by combining his measured rotational spectra with the results of band spectra given in the literature. The constants listed above have been corrected to apply to the naturally occurring isotopic composition listed by D. Strominger, J. M. Hollander and O. T. Seaborg, Rev. Mod. Phys., 30, 565 (1956).

Heat of Formation.

An analysis of the heat of reaction data is summarized below. Carlton-Sutton, et al., studied the direct decomposition at pressures of 40 to 50 atmospheres and made P-V-T measurements in order to reduce the data. They obtained a similar but less certain heat of formation by combustion of N<sub>2</sub>O in CO. Flame calorimetric measurements of the combustion by Aberly and Griffiths are in good agreement, but the bomb calorimetry of Penning and Cotton gives a heat of formation about 0.2 kcal. larger. The selected heat of formation is a weighted average of these values.

| Source | Method            | Reaction  | $\Delta H_f^\circ$ (kcal. mole <sup>-1</sup> ) |
|--------|-------------------|---|--|
| 1      | Bomb Calorimetry  | N <sub>2</sub> O(g) → N <sub>2</sub> (g) + 0.5 O <sub>2</sub> (g)                   | -19.52 ± 0.10                                  |
| 1      | Bomb Calorimetry  | N <sub>2</sub> O(g) + CO(g) → CO <sub>2</sub> (g) + N <sub>2</sub> (g)              | -87.10 ± 0.30                                  |
| 2      | Flame Calorimetry | N <sub>2</sub> O(g) + CO(g) → CO <sub>2</sub> (g) + N <sub>2</sub> (g)              | -87.09 ± 0.22                                  |
| 3      | Bomb Calorimetry  | N <sub>2</sub> O(g) + CO(g) → CO <sub>2</sub> (g) + N <sub>2</sub> (g)              | -87.37 ± 0.12                                  |
| 3      | Bomb Calorimetry  | N <sub>2</sub> O(g) + H <sub>2</sub> (g) → H <sub>2</sub> O(l) + N <sub>2</sub> (g) | -88.03 ± 0.12                                  |

\*Based on  $\Delta H_f^\circ 298.15 = -68.32$  (H<sub>2</sub>O, l), -94.054 (CO<sub>2</sub>, g), -26.417 (CO, g)

Heat Capacity and Entropy.

The functions are based on the rotational constants of Fliva, J. Mol. Spectr. **12**, 360 (1964), and the frequencies determined by Tidwell, Plyler and Benedict, J. Opt. Soc. Am. **50**, 1243 (1960). The bond distances reported by Fliva were obtained from measurements of isotopic shifts in the infrared. They include higher-order corrections for vibration-rotation interaction and are in satisfactory agreement with the infrared and microwave studies of Douglas and Moller, J. Chem. Phys. **22**, 275 (1954) and the electron diffraction data of Schomaker and Spurr, J. Am. Chem. Soc. **64**, 1184 (1942).

Heat of Formation.  
Equilibria for the reaction N<sub>2</sub>O<sub>3</sub>(g) → NO(g) + NO<sub>2</sub>(g) have been studied by Beattie and Bell, J. Chem. Soc. 1957, 1681 (1957), Verhoek and Daniels, J. Am. Chem. Soc. 53, 1250 (1931) and Abel and Profel, Z. Elektrochem. 35, 712 (1929). The results of Beattie and Bell are the most extensive, but they depend on the early analysis of Olauque and Kemp, J. Chem. Phys. 5, 40 (1938), for the simultaneous equilibrium N<sub>2</sub>O<sub>4</sub>(g) → 2NO<sub>2</sub>(g). The JANAF analysis of the tetroxide dissociation has been used to recalculate the data of Beattie and Bell. Non-ideality of N<sub>2</sub>O<sub>4</sub> and NO<sub>2</sub> was allowed for by use of the equations of state of Olauque and Kemp, while non-ideality of NO and N<sub>2</sub>O<sub>3</sub> was removed by extrapolation of the equilibrium constants to zero pressure in a manner similar to that of Beattie and Bell. The data of Verhoek and Daniels and of Abel and Profel have not been recalculated. Second and third law analyses of the results are summarized below. The heat of formation was obtained from ΔH<sub>f</sub>°<sub>298</sub> = 9.70 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.  
e) Given by authors b) From author's K<sub>p</sub> values c) From recalculated K<sub>p</sub> values  
The functions are similar to those calculated by I. G. Hisatsune, J. Phys. Chem. 65, 2249 (1961), based on the analysis of Devlin and Hisatsune, Spectrochim. Acta 17, 218 (1961), of the Raman and infrared spectra in terms of Urey - Bradley force constants. Devlin and Hisatsune used observed isotopic shifts in the spectra along with force constants transferred from nitrogen oxides and oxyhalides in order to select the N-N bond distance and the O-N-N bond angle.  
The unobserved mode was assumed to be free internal rotation around the N-N bond, leading to S<sub>298</sub> = 73.91 cal. deg.<sup>-1</sup> mole<sup>-1</sup> which is in good agreement with 74.12 ± 0.52 cal. deg.<sup>-1</sup> mole<sup>-1</sup> obtained from the recalculated second law of Beattie and Bell. The principal moments of inertia are I<sub>A</sub> = 22.694 X 10<sup>-39</sup>, I<sub>B</sub> = 29.577 X 10<sup>-39</sup>, and I<sub>C</sub> = 6.883 X 10<sup>-39</sup> g. cm.<sup>2</sup>, while the reduced moment for internal rotation was calculated as I<sub>r</sub> = 0.990 X 10<sup>-39</sup> g. cm.<sup>2</sup>

 ΔH<sub>f</sub>° 298.15 = -8.375 ± 0.4 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub>° = 3.502 ± 0.005 kcal. mole<sup>-1</sup>

S° 298.15 = 35.92 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 261.95 ± 0.05°K.

Heat of Formation.

The heat of formation was back calculated from that of the liquid using the measured heat of melting and the enthalpy of the crystal and liquid.

Heat Capacity and Entropy.

W. F. Otaque and J. D. Kemp, J. Chem. Phys. 5, 40 (1939) measured the low temperature heat capacity from 15-295°K. The entropy was obtained by integration of this data using S<sub>15</sub> = 0.34 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.

The temperature and heat of melting were also measured by Otaque and Kemp, loc. cit.

Dinitrogen Tetroxide (N<sub>2</sub>O<sub>4</sub>)

 $T_b = [301.4^\circ\text{K.}] \text{ (to N}_2\text{O}_4)$

Heat of Formation.

The heat of formation was back calculated from that of the gas using the calorimetrically measured heat of vaporization to the equilibrium mixture, in conjunction with a dissociation constant  $\alpha_c = 0.161$ .

Heat Capacity and Entropy.

W. F. Giauque and J. D. Kemp, J. Chem. Phys. 5, 40 (1938) measured the low temperature heat capacity from 15°-295°K., above 295°K. the heat capacity was smoothly extrapolated.

Melting and Vaporization Data.

Giauque and Kemp, loc. cit. measured the temperature and heat of melting and also the boiling point and the calorimetric value of the heat of vaporization to the equilibrium mixture. The heat of vaporization to a hypothetical pure N<sub>2</sub>O<sub>4</sub> gas at 294.25°K. was calculated to be 6.91 kcal. mole<sup>-1</sup>.

 $\sigma = 4$

Heat of Formation.

W. P. Olsague and J. D. Kemp, J. Chem. Phys. 5, 40 (1936) calculated idealized equilibrium constants for the reaction N<sub>2</sub>O<sub>4</sub>(g) = 2NO<sub>2</sub>(g) from the work of Bodenstein and Bekas (1), Zeits. fur physik. Chem. 100, 75 (1922), Verhoek and Daniels (2), J. Am. Chem. Soc. 53, 1250 (1931) and Wurtzel (3), Compt. Rend. 163, 1397 (1919). The second and third law analysis of these equilibrium constants has been repeated using more recent functions. The results are shown below.

| Ref. | Third Law $\Delta H^{\circ}_{298}$ | Second Law $\Delta H^{\circ}_{298}$ |
|------|------------------------------------|-------------------------------------|
| 1.   | 13.644                             | 13.634 ± 0.015*                     |
| 2.   | 13.672                             | 14.429 ± 0.126                      |
| 3.   | 13.657                             | 13.599 ± 0.019**                    |

\* Ten points rejected because of statistically significant scatter.  
 \*\* One point rejected.

The second law value of Verhoek and Daniels was not considered significant due to the extremely small temperature range and the use of only three temperatures. The adopted value was 13.65 ± 0.03 kcal. which leads to 2.17 kcal. mole<sup>-1</sup> for the heat of formation of N<sub>2</sub>O<sub>4</sub>(g).

Heat Capacity and Entropy.

The structural parameters were taken from the electron diffraction measurements of D. W. Smith and K. Hedberg, J. Chem. Phys. 25, 1282 (1956). The vibrational frequencies are those chosen by I. C. Hiraataune, J. P. Devlin and Y. Wada, J. Chem. Phys. 33, 714 (1960). The torsional frequency of 50 cm.<sup>-1</sup> was estimated in order to bring the entropy of the gas into agreement with that determined by Glaueque and Kemp loc. cit. From low temperature heat capacities and heats of fusion and vaporization. The individual moments of inertia were I<sub>A</sub> = 12.508 X 10<sup>-39</sup> g. cm.<sup>2</sup>, I<sub>B</sub> = 22.609 X 10<sup>-39</sup> g. cm.<sup>2</sup>, and I<sub>C</sub> = 35.117 X 10<sup>-39</sup> g. cm.<sup>2</sup>

Point Group C<sub>2v</sub>  
 $\Delta H_f^\circ = 82.8 \pm 1.0$  cal. deg. mole<sup>-1</sup>  
 $\Delta H_f^\circ = 298.15 = 2.7 \pm 0.3$  kcal. mole<sup>-1</sup>

Bond Distance: O-N = 1.21 Å  
 Bond Angle: O-N-O = 134°  
 N-O'-N = 95°  
 O-N-O planes perpendicular to N-O'-N plane

Product of the Moments of Inertia:  $I_A I_B I_C = 2.066 \times 10^{-113} \text{ g}^3 \text{ cm}^6$

$\sigma = 2$

Heat of Formation.  
 The heat of formation was obtained by recalculation of the calorimetric data of Ray and Ogg for the reaction of N<sub>2</sub>O<sub>5</sub>(g) with NO. The stoichiometry of the reaction products, originally based on the results for N<sub>2</sub>O<sub>4</sub> → 2 NO<sub>2</sub> from Oiaque and Kemp, J. Chem. Phys. 5, 40 (1938), was based on the JANAF analysis of this simultaneous equilibrium. A correction of 0.29 kcal. was made in the heat of reaction because of the additional formation of N<sub>2</sub>O<sub>3</sub> from NO and NO<sub>2</sub>. Confirmation of the heat of formation was obtained by combination of the heats of hydrolysis and sublimation of N<sub>2</sub>O<sub>5</sub>(c). The results are summarized below. Second law values are given for the heats of sublimation, but third law analyses suggest that the value from Rusa and Pokorny is more reliable. Most of the uncertainty in this path, however, arises from the heat of hydrolysis.

| Source | Method         | Reaction  | $\Delta H_f^\circ$ 298.15 (kcal. mole <sup>-1</sup> ) | $\Delta H_f^\circ$ 298.15 (kcal. mole <sup>-1</sup> ) |
|--------|----------------|---|---|---|
| 1      | Calorimetric   | N <sub>2</sub> O <sub>5</sub> (g) + NO(g) → O.724 NO <sub>2</sub> (g) + 1.138 N <sub>2</sub> O <sub>4</sub> (g) | -16.05 ± 0.20   | 2.67  |
| 2      | Calorimetric   | N <sub>2</sub> O <sub>5</sub> (c) + H <sub>2</sub> O(l) → 2 HNO <sub>3</sub> (aq)                               | -20.2 ± 0.5   | —   |
| 3      | Vapor Pressure | N <sub>2</sub> O <sub>5</sub> (c) → N <sub>2</sub> O <sub>5</sub> (g)   | 13.37 ± 0.06  | 2.79*   |
| 4      | Vapor Pressure | N <sub>2</sub> O <sub>5</sub> (c) → N <sub>2</sub> O <sub>5</sub> (g)   | 13.25 ± 0.12  | 2.67*   |

\*Using reaction 2 and  $\Delta H_f^\circ$  298.15 = -68.352(H<sub>2</sub>O, l), -49.55(HNO<sub>3</sub>, aq)

Heat Capacity and Entropy.  
 Ray and Ogg, J. Chem. Phys. 26, 984 (1957) reported  $S_{298.15}^\circ = 85 \pm 0.5$  cal. deg. mole<sup>-1</sup> from combination of kinetic and thermochemical values. This entropy was recalculated as follows. The rate data of Ray and Ogg, loc. cit., and of Daniels and Johnston, J. Am. Chem. Soc. 43, 53 (1921) give for the reaction N<sub>2</sub>O<sub>5</sub>(g) → NO(g) + NO<sub>2</sub>(g) + O<sub>2</sub>(g) at 25°C the equilibrium constant  $K = 5.15 \times 10^{-7}$  mole<sup>2</sup> liter<sup>-2</sup> =  $3.08 \times 10^{-4}$  atm<sup>2</sup>. The resulting value of  $\Delta F_{298.15}^\circ = 4.79$  kcal. mole<sup>-1</sup> leads to  $S_{298.15}^\circ = 82.8$  cal. deg. mole<sup>-1</sup> for N<sub>2</sub>O<sub>5</sub>(g) when combined with the JANAF entropies and heats of formation of the components of the reaction.

The molecular structure is the nonplanar configuration derived from the electron diffraction study of Akiehin, Vilkov and Resolovskii, Zhur. Struk. Khim. 1, 1 (1960). A planar model (also point group C<sub>2v</sub>) was assumed by Hatake, Devlin and Wada, Spectrochim. Acta 18, 1641 (1962) in their approximate normal coordinate analysis of the infrared and Raman spectra. The frequency assignments of these authors are listed above in the order for the planar model, although the vibrations for the nonplanar form will separate differently into the species 5A<sub>1</sub>, 3B<sub>2</sub>, 3B<sub>1</sub> and 4B<sub>2</sub>. Hatake, et al., estimated the N-O'-N deformation frequency (85 cm<sup>-1</sup>) from combination bands in the solid and gas phase spectra. The JANAF thermodynamic functions were obtained using these frequencies and assuming the two NO<sub>2</sub> groups to be hindered internal rotators. Barriers to internal rotation of 4.4 kcal. (corresponding to torsional vibrations of about 65 cm<sup>-1</sup>) were selected in order to give the observed entropy at room temperature. The principal moments of inertia for the nonplanar model were taken as  $I_A = 30.60 \times 10^{-39}$ ,  $I_B = 40.15 \times 10^{-39}$  and  $I_C = 16.82 \times 10^{-39}$  g. cm<sup>2</sup>, while  $I_p = 4.695 \times 10^{-39}$  g. cm<sup>2</sup> was used for the reduced moment of inertia of the O<sub>2</sub> tops.

ΔHf° = Unknown

ΔHf°<sub>298.15</sub> = -178 ± 7 kcal/mol

S°<sub>298.15</sub> = [27 ± 4] gibbs/mol

T<sub>0</sub> = [2151]°K

Heat of Formation.

The equilibria (A) Si<sub>3</sub>N<sub>4</sub>(c) = 3 Si(l) + 2 N<sub>2</sub>(g) and (B) Si<sub>3</sub>N<sub>4</sub>(c) = 3 Si(c) + 2 N<sub>2</sub>(g) have been investigated by three groups. R. D. Pehlke and J. P. Elliott, Trans. Met. Soc. AIME 215, 781 (1959), made four series of measurements which mainly concerned reaction (A). W. B. Hinke and L. R. Brantley, J. Amer. Chem. Soc. 52, 48 (1930), made a single series of measurements which covered reactions (A) and (B). C. Matignon, Bull. Soc. Chim. France 13, 791 (1913), also gave a single equilibrium point for reaction (C) 3 SiO<sub>2</sub>(c) + 6 C + 2 N<sub>2</sub> = Si<sub>3</sub>N<sub>4</sub>(c) + 6 CO(g). Below are shown 2nd and 3rd law analyses of the data. It should be noted that these analyses are based on the estimated heat capacities above 900°K, and on an estimated entropy. The uncertainty due to these estimates is estimated as ± 7 kcal in ΔHf°<sub>298</sub>.

\*Calculated from the third law ΔHf°<sub>298</sub> values.

\*\*Four points rejected due to failure of a statistical test; this set is a combination of the first four sets.

The adopted ΔHf°<sub>298</sub>( $\alpha$ -Si<sub>3</sub>N<sub>4</sub>) = -178±7 kcal/mol.

L. A. McClaine and C. F. Coppel, A. D. Little, Inc., "Equilibrium Studies of Refractory Nitrides," Tech. Rept. AFML-TR-65-99, Part 11, Dec. 1966, have investigated the decomposition reaction (B). They conclude that at 1618°K the equilibrium pressure is roughly 0.15 mm. This corresponds to ΔHf°<sub>298</sub> = -182.3 kcal, and was not given any weight in the adopted value.

Heat Capacity and Entropy.

The enthalpy of  $\alpha$ -Si<sub>3</sub>N<sub>4</sub> has been measured at three temperatures, in the range 373° - 658°K, by S. Sato, Bull. Chem. Soc. Japan 13, 41 (1938). The heat capacity is calculated from the data assuming that a limit of 45 gibbs/mol is attained by 3000°K. The entropy is obtained from the equilibrium data of Pehlke and Elliott, loc. cit.

Decomposition Data.

The temperature of decomposition is calculated as the point at which the decomposition pressure of nitrogen reaches 1 atm.

ΔH<sup>f</sup><sub>0</sub> = Unknown

ΔH<sup>f</sup><sub>298.15</sub> = -64 ± 5 kcal/mol

S<sup>o</sup><sub>298.15</sub> = [44 ± 6] gibbs/mol

T<sub>0</sub> = [730]°K

Heat of Formation.

The heat of formation is based on the work of A. Stock and F. Wrede, Chem. Ber. 40, 2923 (1907), who burned P<sub>3</sub>N<sub>5</sub> in oxygen. They report a ΔH<sup>f</sup><sub>298</sub> = -949.4 kcal for the reaction 2 P<sub>3</sub>N<sub>5</sub>(c) + 7.5O<sub>2</sub>(g) = 1.5 P<sub>4</sub>O<sub>10</sub>(amorph) + 5N<sub>2</sub>(g). In NBS Technical Note 270-1, "Selected Values of Chemical Thermodynamic Properties," Washington, D.C. (1965), a value of -947.7 kcal is used for the above reaction and we adopt this value. Using the JANAF value for P<sub>4</sub>O<sub>10</sub>(c) and correcting this to P<sub>4</sub>O<sub>10</sub>(amorph) by adding -13.8 kcal/mol, from Technical Note 270-1, we obtain ΔH<sup>f</sup><sub>298</sub> P<sub>3</sub>N<sub>5</sub>(c) = -716.5 kcal/mol. Thus, we derive ΔH<sup>f</sup><sub>298</sub> P<sub>3</sub>N<sub>5</sub>(c) = -63.525 kcal/mol; however, because of the uncertainties in the heat of reaction and correction for amorphous P<sub>4</sub>O<sub>10</sub> we round the value to -64 ± 5 kcal/mol.

Heat Capacity and Entropy.

S. Sato, Sci. Papers Inst. Phys. Chem. Res. (Tokyo) 34, 584 (1958), gave an equation for the heat capacity in the range 273° - 578°K. Judging from his results for Be<sub>3</sub>N<sub>2</sub>(c) in the same paper, we believe his values will be slightly high at the upper end of the range. Thus, taking 8.2 gibbs/g-atom as the limiting value, a curve was drawn through Sato's values at the low end and approaching the limit asymptotically. The entropy was estimated from that of Si<sub>3</sub>N<sub>4</sub>(c) by assuming that the ratio Cp<sub>298</sub>/S<sub>298</sub> on a gram atom basis would be the same for P<sub>3</sub>N<sub>5</sub>(c).

Temperature of Decomposition.

T<sub>d</sub> is calculated as the point at which the total pressure reaches 1 atm. This corresponds to log Kp = -0.76 for the reaction P<sub>3</sub>N<sub>5</sub>(c) = 0.75P<sub>4</sub>(g) + 2.5N<sub>2</sub>(g). The temperature of decomposition has been reported by V. P. Postnikov and L. L. Kuzmin, J. Appl. Chem. (USSR) 2, 429 (1955) as 1075°K. This has been confirmed by H. Moreau and P. Rocquet, Compt. Rend. 199, 1691 (1934) and Bull. Soc. Chim. France, 3, 1801 (1936); and E. O. Huffman, G. Tarbutton, G. V. Elmore, A. J. Smith and M. G. Rountree, J. Am. Chem. Soc. 79, 1765 (1957). However, it was also noted that P<sub>3</sub>N<sub>5</sub>(c) is not reformed on cooling the decomposition products; thus the decomposition is non-equilibrium. It is known that the decomposition of AlN, BN and Be<sub>3</sub>N<sub>2</sub> is kinetically limited and the equilibrium pressure is not attained until the average energy is greater than the activation energy. It appears that this is also the case for P<sub>3</sub>N<sub>5</sub> and a high activation energy is expected.

## SODIUM (Na)

(CRYSTAL)

AT. WT. = 22.991

$$\Delta H_f^{\circ} 298.15 = 0$$

$$\Delta H_g^{\circ} 298.15 = 25.755 \text{ kcal. mole}^{-1} \text{ (Monatomic gas)}$$

$$\Delta H_g^{\circ} 298.15 = 32.87 \text{ kcal. mole}^{-1} \text{ (Diatomic gas)}$$

$$S^{\circ} 298.15 = 12.296 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$T_m = 370.98 \pm 0.02^{\circ}\text{K.}$$

$$\Delta H_m = 0.622 \text{ kcal. mole}^{-1}$$

## Heat of Formation.

Zero by definition.

## Heat Capacity and Entropy.

D. L. Martin, Proc. Roy. Soc. **A254**, 433 (1960) reports that the low temperature heat capacity of sodium depends on the thermal history of the sample and ascribes this to a martensitic transformation. The effect is most pronounced in the range 40-80°K., where the graph of C<sub>p</sub> against T increases continuously for some samples and rises to a peak at 55°K. for others. Martin lists heat capacities obtained in several runs on "high purity" sodium at 21° to 300°K. and the higher values, those defining the peak at 55°K., have been selected here. The heat capacities reported by T. M. Dauphinee, D. L. Martin, and H. Preston-Thomas, Proc. Roy. Soc. **A233**, 214 (1955), have not been used, since one of the authors in a later publication (Martin, loc. cit.) questions the accuracy of the measurements above 100°K. and at lower temperatures there is no rise to a peak at 55°K. In the range 1.5° to 20°K., L. M. Roberts, Proc. Phys. Soc. **B70**, 744 (1957) and D. H. Parkinson and J. E. Quarrington Proc. Phys. Soc. **A68**, 762 (1955) have measured the heat capacity of very high purity sodium. The values of Parkinson and Quarrington are somewhat higher than those of Roberts and have been given greater weight, since they show better continuity with Martin's results. The results of O. L. Piclard and F. E. Simon, Proc. Phys. Soc. **61**, 1 (1948) have been rejected below 10°K., since they show a peak between 5° and 8°, a feature not verified by other workers; between 10° and 25°K they agree exactly with the results of Parkinson and Quarrington. J. Rayne, Phys. Rev. **95**, 1428 (1954) states that the graph of C<sub>p</sub> against T has a small peak at about 0.9°K. This peak has not been observed in the work of W. H. Liden and N. E. Phillips, Phys. Rev. **119**, 959 (1960) from 0.15° to 1°K. R. E. Osamer and C. V. Heer, Phys. Rev. **119**, 955 (1960) from 0.4° to 2°K and D. L. Martin, Phys. Rev. **124**, 438 (1961) from 0.4 to 1.5°K.

T. B. Douglas, A. P. Ball, D. C. Olinings, and W. D. Davis, J. Am. Chem. Soc. **74**, 2472 (1952) report heat capacities in the range 273° to 1173°K on a sample of not less than 99.9% purity. These values agree to within 1% with those of Martin in the range 272° to 300°K, and the two sets of data have been smoothly joined.

## Melting.

Douglas et al. (loc. cit.) have determined the triple point to be 97.82 ± 0.02°C., from which the melting point is calculated to be 97.83 ± 0.02°C., and have measured the heat of fusion.

## Heat of Sublimation.

At the boiling point and higher temperatures sodium vapor contains an appreciable proportion of diatomic molecules. O. W. Thompson and E. Oerelia "Sodium - Its Manufacture, Properties and Uses," Ed. M. Sittig, Chapter 5, Reinhold Publishing Corporation, Inc., New York (1956), have made a careful analysis of the available vapor pressure data. Their results are consistent with the free energy functions calculated in the present work and have been adopted.

SODIUM (Na)

(LIQUID)

At. Wt. = 22.991

$$\Delta H_f^{\circ} 298.15 = 0.575 \text{ kcal. mole}^{-1}$$

$$T_m = 370.99 \pm 0.02^{\circ}\text{K}$$

$$T_b = 1156^{\circ}\text{K (Equilibrium mixture)}$$

$$\Delta H_v 1176.9 = 23.285 \text{ kcal. mole}^{-1}$$

$$S_{298.15}^{\circ} = 13.827 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$\Delta H_m^{\circ} = 0.622 \text{ kcal. mole}^{-1}$$

$$T_b \text{ (Monatomic Gas)} = 1176.9^{\circ}\text{K}$$

Heat of Formation.

Obtained from the heat of fusion by adding  $H_{370.99}^{\circ} - H_{298.15}^{\circ}$  for the solid and subtracting  $H_{370.99}^{\circ} - H_{298.15}^{\circ}$  for the liquid.

Heat Capacity.

The heat capacity data of T. B. Douglas, A. F. Ball, D. C. Ginnings and W. D. Davis, J. Am. Chem. Soc. 74, 2472 (1952) were used and were extrapolated below  $T_m$  and above  $1173^{\circ}\text{K}$  in a reasonable manner.

Entropy.

Back calculated from the entropy of the liquid at the melting point and the extrapolated heat capacity from the melting point to  $298^{\circ}\text{K}$ .

Vaporization.

Sodium vaporizes to a mixture of monatomic and diatomic gas. The total vapor pressure reaches 1 atm. at  $1156^{\circ}\text{K}$ . The vapor pressure of the monatomic gas reaches 1 atm. at  $1176.9^{\circ}\text{K}$  and the heat of vaporization to monatomic gas is  $23.285 \text{ kcal. mole}^{-1}$  [See Na(cryatal)].

Heat of Formation.

The heat of formation at 0°K. was obtained from that of the ideal monatomic sodium gas by adding the enthalpy of ionization, calculated from the ionization limit given by C. E. Moore "Atomic Energy Levels" Natl. Bur. Standards Circ. 467 (1949). This was converted to 298°K. by using the formation equation Na(ref. state) - e<sup>-</sup>(ref. state) = Na<sup>+</sup> (monatomic gas), thus Na<sup>+</sup> involves the difference in enthalpies of the two reference states as well as its own enthalpy.

Heat Capacity and Entropy.

These were calculated using the electronic energy levels tabulated above, taken from C. E. Moore loc. cit.

Na<sup>+</sup>

Sodium Monoxide (NaO)

σ = 1  
r<sub>e</sub> = [2.0] Å

Heat of Formation

Bawn and Evans (1) have studied the reaction rate of sodium vapor with nitrous oxide, nitrogen peroxide, nitromethane, ethyl nitrate and amyl nitrate, using the diffusion flame method. On the avoidance of reaction rate measurements they estimated the value, ΔH<sub>f,298</sub><sup>0</sup> < 0, for the reaction Na(g) + NO<sub>2</sub>(g) = NaO(g) + NO(g). Based on this result, we calculate ΔH<sub>f,298</sub><sup>0</sup>(NaO, g) > 12 kcal/mol, using ΔH<sub>f,298</sub><sup>0</sup> = 25.8, 7.9 and 21.6 kcal/mol for Na(g), NO<sub>2</sub>(g) and NO(g), respectively.

Assuming that D<sub>0</sub>(NaO) = 1/2(D<sub>0</sub>(Na<sub>2</sub>) + D<sub>0</sub>(O<sub>2</sub>)), or ΔH<sub>f,0</sub><sup>0</sup> = 68.1 kcal/mol for the reaction NaO(g) = Na(g) + O(g), we derive ΔH<sub>f,0</sub><sup>0</sup> = 16.7 and ΔH<sub>f,298</sub><sup>0</sup> = 16.4 kcal/mol, using ΔH<sub>f,0</sub><sup>0</sup> = 25.8 and 59.0 kcal/mol for Na(g) and O(g), respectively. Somayajulu (2) found that in a sequence of similar diatomic molecules the force constant (k<sub>e</sub>), dissociation energy (D<sub>0</sub>) and equilibrium bond distance (r<sub>e</sub>) are related by the expression k<sub>e</sub>r<sub>e</sub><sup>3</sup>/D<sub>0</sub> = constant. Using r<sub>e</sub> = 1.62 Å, D<sub>0</sub> = 77.9 kcal/mol for LiO(g), r<sub>e</sub> = 2.0 Å for NaO(g) and k<sub>e</sub>(NaO)/k<sub>e</sub>(LiO) = 0.4827, we evaluate D<sub>0</sub> = 65.4 kcal/mol for NaO(g), yielding ΔH<sub>f,298</sub><sup>0</sup>(NaO, g) = 19.4 kcal/mol. The value k<sub>e</sub> is calculated from the relation k<sub>e</sub> = 4π<sup>2</sup>ν<sup>2</sup>μ where ν is the vibrational frequency of the diatomic molecule and μ is the reduced mass.

The value of ΔH<sub>f,298</sub><sup>0</sup>(NaO, g) is tentatively adopted as 20 ± 10 kcal/mol. The corresponding D<sub>0</sub><sup>0</sup>(NaO) is 65 ± 10 kcal/mol.

Heat Capacity and Entropy

The ground state configuration is assumed to be the same as that for OH(g) which has the same number of valence electrons as NaO(g). The values of ω<sub>e</sub> and ω<sub>e</sub>X<sub>e</sub> are estimated by comparison with those for LiO(g), LiF(g) and NaF(g). The value of r<sub>e</sub> is estimated from those for OH(g), HF(g) and NaF(g). ω<sub>e</sub> and α<sub>e</sub> are derived from r<sub>e</sub>, ω<sub>e</sub> and ω<sub>e</sub>X<sub>e</sub> by the method suggested by Herzberg (3).

Dec. 31, 1950; Dec. 31, 1957

NaO

Sodium Monoxide Uninegative Ion (NaO<sup>-</sup>)

(Ideal Gas) GFW = 38.98975

NaO<sup>-</sup>

(IDEAL GAS) GFW = 38.98975

Ground State Configuration [1<sup>2</sup>]

$\Delta H_f^\circ = [-29 \pm 20] \text{ kcal/mol}$   
 $\Delta H_f^\circ_{298.15} = [-29 \pm 20] \text{ kcal/mol}$

$S^\circ_{298.15} = [52.0 \pm 0.5] \text{ gibbs/mol}$

Electronic Levels and Quantum Weights

| $\frac{E_i, \text{cm}^{-1}}{0}$        | $\frac{g_i}{(1)}$         |
|--|---------------------------|
| $\omega_e X_e = [3.2] \text{ cm}^{-1}$ | $\sigma = 1$              |
| $\omega_e = [0.00493] \text{ cm}^{-1}$ | $r_e = [2.0] \text{ \AA}$ |

Heat of Formation

The electron affinity (E. A.) of NaO<sup>-</sup>(g) is unavailable, therefore the value of  $\Delta H_f^\circ(\text{NaO}^-, g)$  is estimated. We first assume that the enthalpy change ( $\Delta H_f^\circ$ ) of the reaction (1)  $\text{NaO}^-(g) = \text{Na}(g) + \text{O}^-(g)$  is close to the average of the  $\Delta H_f^\circ$  values for the reactions (2)  $\text{NaO}(g) = \text{Na}(g) + \text{O}(g)$  and (3)  $\text{NaF}(g) = \text{Na}(g) + \text{F}(g)$ . The atom F(g) is isoelectronic with O<sup>-</sup>(g). In other words, the  $\Delta H_f^\circ$  for reaction (1) is approximately  $1/2(64.8 + 113.9) = 89.3 \text{ kcal/mol}$ . Then we compare the  $\Delta H_f^\circ$  values for the reactions (4)  $\text{HO}(g) = \text{H}(g) + \text{O}(g)$ , (5)  $\text{HO}^-(g) = \text{H}(g) + \text{O}^-(g)$ , and (6)  $\text{HF}(g) = \text{H}(g) + \text{F}(g)$ , and find that  $\Delta H_f^\circ$  for reaction (5) is experimentally determined as  $109.7 \text{ kcal/mol}$  which is about  $8 \text{ kcal/mol}$  more negative than the average of  $\Delta H_f^\circ$  values for reactions (4) and (6). Based on this fact we estimate  $\Delta H_f^\circ = 80 \text{ kcal/mol}$  for reaction (1), yielding  $\Delta H_f^\circ_{298}(\text{NaO}^-, g) = -29 \text{ kcal/mol}$  which is tentatively adopted. The uncertainty of this value may be  $\pm 20 \text{ kcal/mol}$ . Based on this  $\Delta H_f^\circ_{298}$  value we calculate E. A. =  $2.1 \pm 0.9 \text{ eV}$  for NaO(g). The corresponding value for HO(g) is  $1.8 \pm 0.1 \text{ eV}$ .

Heat Capacity and Entropy

The ground state configuration is assumed to be the same as that of NaF(g) which is isoelectronic with NaO<sup>-</sup>(g). The values of  $\omega_e$ ,  $\omega_e X_e$  and  $r_e$  are estimated by comparison with the observed data for NaF(g). The values of  $B_e$  and  $\omega_e$  are calculated from  $r_e$ ,  $\omega_e$  and  $\omega_e X_e$  using the method recommended by G. Herzberg, "Spectra of Diatomic Molecules." D. Van Nostrand Co., Inc., New York, 1950. The enthalpy at 0°K is  $-2.248 \text{ kcal/mol}$ .

| T, °K | $C_p^\circ$ | $S^\circ$ | $-(G^\circ - H^\circ_{298})/T$ | $H^\circ - H^\circ_{298}$ | $\Delta H_f^\circ$ | $\Delta G_f^\circ$ | Log Kp |
|-------|-------------|-----------|--------------------------------|---------------------------|--------------------|--------------------|--------|

$\Delta H_f^o = -63.1 \pm 0.7$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^{298.15} = 27.7 \pm 0.3$  cal. deg<sup>-1</sup> mole<sup>-1</sup>  
 $\Delta H_f^{298.15} = -62.3 \pm 0.7$  kcal. mole<sup>-1</sup>  
 $\Delta H_{t1}^o = 350$  cal. mole<sup>-1</sup>  
 $T_{t1} = 196.5^\circ\text{K.}$   
 $\Delta H_{t2}^o = 370$  cal. mole<sup>-1</sup>  
 $T_{t2} = 223.3^\circ\text{K.}$   
 $T_m = 825^\circ \pm 10^\circ\text{K.}$   
 $\Delta H_m^o = \text{Unknown}$

Heat of Formation.

$\Delta H_f^{298.15}$  was obtained from National Bureau of Standards Report 7437, "Preliminary Report on the Thermodynamic Properties of Selected Light-Element and Some Related Compounds," January 1, 1962. P. W. Olliea and J. L. Margrave, J. Phys. Chem. 66, 1333 (1962) measured the heat of decomposition of Na<sub>2</sub>O(c) in H<sub>2</sub>O, yielding  $\Delta H_f^{298.15} = -62.1 \pm 0.7$  kcal. mole<sup>-1</sup>. From the original experimental data by R. de Forcrand, Compt. rend., 127, 514 (1898) 158, 843, 931 (1914), the value of  $\Delta H_f^{298.15}$  was recalculated to be  $-65.0$  kcal. mole<sup>-1</sup> by P. W. Olliea and J. L. Margrave, loc. cit.

Heat Capacity and Entropy.

The low temperature heat capacities,  $52.13^\circ \sim 296.46^\circ\text{K.}$ , were measured by S. S. Todd, J. Am. Chem. Soc., 75, 1229 (1953). The heat capacities above  $298.15^\circ\text{K.}$  were estimated by comparison with those for Na<sub>2</sub>O(c).  $S_{298.15}$  was given by S. S. Todd, loc. cit., using  $S_{51}^o(\text{extrap.}) = 2.23$  cal. deg<sup>-1</sup> mole<sup>-1</sup>.

Transition Data.

$T_{t1}$ ,  $T_{t2}$ ,  $\Delta H_{t1}^o$ , and  $\Delta H_{t2}^o$  were calculated from the data reported by S. S. Todd, loc. cit.

Temperature of Melting.

The melting temperature was obtained from J. L. Margrave, private communication, May 21, 1963.

$\Delta H_f^\circ = -98.74 \pm 1.0$  kcal/mol  
 $\Delta H_f^\circ S_{298.15} = -99.90 \pm 1.0$  kcal/mol  
 $\Delta H_f^\circ(\gamma + \beta) = 0.42$  kcal/mol  
 $\Delta H_f^\circ(\beta + \alpha) = 2.85$  kcal/mol  
 $\Delta H_m^\circ = 11.4$  kcal/mol

$S_{298.15}^\circ = 17.935$  gibbs/mol  
 $T_f(\gamma + \beta) = 1023.2^\circ K$   
 $T_f(\beta + \alpha) = 1243.2^\circ K$   
 $T_m = 1405.2^\circ K$

Heat of Formation

The enthalpy change of the reaction  $Na_2O(c) + H_2O(l) = 2NaOH(aq)$  has been determined by Matsui (1, 2), Roth (3, 4) and Rengade (5). Based on their reported  $\Delta H_f^\circ$  values, the corresponding  $\Delta H_f^\circ S_{298}$  for  $Na_2O(c)$  are calculated, using  $\Delta H_f^\circ S_{298}(H_2O, l) = -68.315$  kcal/mol obtained from U. S. Natl. Bur. Std. Tech. Note 270-1, 1955, and  $\Delta H_f^\circ S_{298}(NaOH, aq)$  derived from JANAF  $\Delta H_f^\circ S_{298}(NaOH, c)$  and  $\Delta H_{soln}$  reported by V. B. Parker, U. S. Natl. Bur. Std. NSRDS-NBS 2, 1965. The sample employed by Matsui was prepared by the method of Rengade (1) and contains  $Na_2O_2(c)$  and  $Na(c)$  as impurities. The sample used by Roth also contains 3.95 per cent (by weight)  $Na_2O_2(c)$ . Corrections in the reported results for such impurities have been made by the authors. However, in order to obtain better results, more measurements using purer samples are necessary. The enthalpy change of the reaction  $2Na(c) + H_2O(l) = Na_2O(c) + H_2(g)$  was calculated by Rengade (5) from his measurements (5) incorporating with  $\Delta H_f^\circ = -85.2$  kcal/mol for the reaction  $2Na(c) + 2H_2O(l) = 2NaOH(aq) + H_2(g)$  determined by Joannis (6). The value  $\Delta H_f^\circ S_{298} = -94.9$  kcal/mol is derived from the data of Forcand (6) using  $\Delta H_f^\circ S_{298}(Na_2O_2, c) = -122.66$  kcal/mol. The results are presented in the table below.

Brewer (10) determined the equilibrium constants, 918-1467°K, for the vaporization of  $Na_2O(c)$ , using an effusion method. The  $Na_2O$  vapor consists predominately of  $Na(g)$  and  $O_2(g)$  molecules with any oxide molecules being not important. The  $Na/O$  ratio was not measured and assumed to be 2/1 in all calculations on  $Na_2O$ . Based on the reported data, we derive the equilibrium constants for the reaction  $Na_2O(c) = 2Na(g) + 1/2O_2(g)$  and evaluate the third law  $\Delta H_f^\circ S_{298}$  as  $117.1 \pm 10$  kcal/mol. From this  $\Delta H_f^\circ S_{298}$  value, we obtain  $\Delta H_f^\circ S_{298}(Na_2O, c) = -65.6 \pm 10$  kcal/mol, employing  $\Delta H_f^\circ S_{298} = 25.76$  kcal/mol for  $Na(g)$ . The value  $-65.6$  kcal/mol is not consistent with the other values described above. This may be caused by an invalid assumption used in the calculation.

The heat of formation at 298°K for  $Na_2O(c)$  is tentatively selected as  $-99.90 \pm 1.0$  kcal/mol.

Heat Capacity and Entropy

The low temperature heat capacities, 15-380°K, were obtained from Furukawa (9). We make the corrections in the reported Cp values for impurity  $Na_2CO_3(c)$  2.33 per cent (by weight), analyzed by Grimley (10). The effect on heat capacity due to the presence of  $Na_2O_2(0.91$  per cent) impurity is insignificant. Using the smoothed low temperature Cp data the  $S_{298.15}^\circ$  is calculated, based on  $S_{15}^\circ = 0.0122$  eu.

Grimley (10) measured the high temperature enthalpies, 380.1-1174.6°K, with a copper block drop-type calorimeter. The enthalpies for the  $\gamma$  phase, 380.1-980.4°K, are joined smoothly with the low temperature data and extrapolated to 1023.2°K (the  $\gamma + \beta$  transition temperature). The enthalpies above 1023.2°K are obtained by extrapolation. The enthalpies measured at 1078.3 and 1174.6°K by Grimley are unreasonably large, and are not adopted.

Transition Data

The transition temperature and heats of transition were determined calorimetrically by Bouaziz (12) who used a very pure sample. The adopted  $\Delta H^\circ = 0.42$  and 2.85 kcal/mol, are averages of the derived values, 0.36 - 0.48 and 2.7 - 3.0 kcal/mol, respectively.

Melting Data

$T_m$  and  $\Delta H_m^\circ$  were obtained from Bouaziz (12). The adopted  $\Delta H_m^\circ$  is an average of the reported 10.8-12.0 kcal/mol.  $T_m$  has been reported as 1193 and 1190 ± 10°K by Bunzel (13) and Brewer (11), respectively, which are not adopted.

DISODIUM MONOXIDE (Na<sub>2</sub>O)

(LIQUID)

GFW = 61.979

S°<sub>298.15</sub> = [21.895] gibbs/mol

ΔHf°<sub>298.15</sub> = [-89.112] kcal/mol

Tm = 1405.2°K

ΔHm° = 11.4 kcal/mol

Td = 2223°K

Heat of Formation

The heat of formation is obtained from ΔHf°<sub>298.15</sub>(c) by adding ΔHm° and the difference between H°<sub>1405.2</sub> - H°<sub>298</sub> for Na<sub>2</sub>O(c) and Na<sub>2</sub>O(l).

Heat Capacity and Entropy

The heat capacity is estimated by comparison with those for Na<sub>2</sub>SiO<sub>3</sub>(l) and SiO<sub>2</sub>(l). The entropy is obtained in a manner analogous to that of the heat of formation.

Melting Data

See the Na<sub>2</sub>O(c) table.

Decomposition Temperature

Td is the temperature at which the Gibbs energy change of the decomposition reaction Na<sub>2</sub>O(l) = 2Na(g) + 1/2O<sub>2</sub>(g) approaches zero.

Disodium Dioxide (Na<sub>2</sub>O<sub>2</sub>)

DISODIUM DIOXIDE (Na<sub>2</sub>O<sub>2</sub>)

(CRYSTAL)

GFW = 77.9784

ΔHf°<sub>0</sub> = -121.26 ± 1.2 kcal/mol  
 ΔHf°<sub>298.15</sub> = -122.66 ± 1.2 kcal/mol  
 ΔHf° = 1.37 kcal/mol  
 ΔHm° = Unknown

S°<sub>298.15</sub> = 22.66 ± 0.3 gibbs/mol

Tt = 785 ± 1°K

Tm = 948°K

Heat of Formation

The enthalpy change of the reaction Na<sub>2</sub>O<sub>2</sub>(c) + H<sub>2</sub>O(l) = 2NaOH(1200 H<sub>2</sub>O) + 1/2O<sub>2</sub>(g) was measured at 18.5°C by Roth (1). He employed a sample with composition 96.81 per cent Na<sub>2</sub>O<sub>2</sub> and 3.43 per cent Na<sub>2</sub>O by weight. Using ΔH°<sub>298</sub>(Na<sub>2</sub>O, c) = -56.02 kcal/mol, Roth derived the value ΔH°<sub>298</sub>(Na<sub>2</sub>O<sub>2</sub>, c) = -34.65 kcal/mol. This value was later corrected to be -35.75 kcal/mol (2). From this data we calculate the heat of formation (298°K) of Na<sub>2</sub>O<sub>2</sub>(c) as -121.0 kcal/mol. Poncrand obtained ΔH°<sub>298</sub>(H<sub>2</sub>O, l) = -68.315 kcal/mol. The auxiliary data ΔH°<sub>298</sub>(H<sub>2</sub>O, g) = -68.315 kcal/mol is taken from U. S. Natl. Bur. Std. Tech. Note 270-1.1, 1965; and ΔH°<sub>298</sub>(NaOH·1200 H<sub>2</sub>O) = -112.468 kcal/mol is derived based on ΔH°<sub>298</sub>(NaOH, c) = -101.90 kcal/mol from JANAF Table and ΔH°<sub>298</sub> = -10.637 kcal/mol and ΔH°<sub>298</sub>(1200 H<sub>2</sub>O + ωH<sub>2</sub>O) = -0.079 kcal/mol from V. B. Parker, U. S. Natl. Bur. Std. NBS-21, 1965.

Gilles (3) determined the enthalpy change of the reaction Na<sub>2</sub>O<sub>2</sub>(c) + H<sub>2</sub>O(l) = 2NaOH(3800 H<sub>2</sub>O) + 1/2O<sub>2</sub>(g), using a purer sample (Na<sub>2</sub>O<sub>2</sub> 99.2 per cent, Na<sub>2</sub>O 0.8 per cent). Based on the reported value ΔH°<sub>298</sub> = -34.0 ± 0.3 kcal/mol and derived ΔH°<sub>298</sub>(NaOH·3000 H<sub>2</sub>O) = -112.467 kcal/mol, we calculate ΔH°<sub>298</sub> = -122.66 ± 1.2 kcal/mol for Na<sub>2</sub>O<sub>2</sub>(c).

Leffler (4) studied the oxygen pressure-melt composition for the liquid sodium-oxygen system between 760 and 900°C. These results, together with the thermodynamic data for Na<sub>2</sub>O<sub>2</sub>, were used to calculate the heats and free energies of formation of melt compositions between Na<sub>2</sub>O and Na<sub>2</sub>O<sub>2</sub>. However, there are no numerical results reported. Therefore this data is not used for evaluation.

The heat of formation at 298°K is adopted as -122.66 ± 1.2 kcal/mol.

Heat Capacity and Entropy

The low temperature heat capacities, 53.31-296.22°K, were measured by Todd (5). His sample contains (per cent) 94 Na<sub>2</sub>O<sub>2</sub>(c), 3.6 Na<sub>2</sub>O(c) and 2.4 Na<sub>2</sub>CO<sub>3</sub>. Corrections in the reported results have been made for Na<sub>2</sub>CO<sub>3</sub> content, but not for Na<sub>2</sub>O content which was estimated to be small. The Cp values below 52.31°K are calculated using the equation Cp = D( $\frac{298}{T}$ ) + 3E( $\frac{298}{T}$ ), reported by Todd. S°<sub>298</sub> is derived from the adopted Cp, based on S°<sub>0</sub> = 1.012 eu.

The high temperature enthalpies, 375.4-869.2°K, were determined by Chandrasekhariah (6), using drop calorimetry. Corrections were made for the contributions from impurities (Na<sub>2</sub>CO<sub>3</sub> 1.5 and Na<sub>2</sub>O 0.2 per cent). A discontinuity was observed in the enthalpies between 773 and 793°K, indicating some kind of transition (see Transition Data). The Cp for Na<sub>2</sub>O<sub>2</sub>(c) at temperatures 298-769.5°K are derived from the enthalpy measurements, 375.4-769.5°K, and joined smoothly with the low temperature data at 298°K, and extrapolated to 785°K(Tt). The Cp for Na<sub>2</sub>O<sub>2</sub>(p) is derived from the enthalpy data, 794-869.2°K, as constant, 27.15 gibbs/mol, and extrapolated to 2500°K.

Vedenev (7) measured the high temperature specific heat of Na<sub>2</sub>O<sub>2</sub>(c) in the temperature interval 292-373°K using adiabatic calorimetry. The reported average value, 21.46 gibbs/mol, is in fair agreement with the adopted ones.

Transition Data

It was reported by Tallman (8), who measured the X-ray powder diffraction pattern by a Geiger-counter diffractometer and found that at about 510°C the pattern changes entirely and a new set of peaks indicates a new phase. Separate thermal analysis measurements (9) confirm the transition temperature (α + β) is 512 ± 1°C or 785 ± 1°K, which is adopted here. Poppl (9) found a thermal anomaly at 485°C in both heating and cooling curves. ΔHt° is derived from the adopted enthalpy and Cp data on Na<sub>2</sub>O<sub>2</sub>(c) and Na<sub>2</sub>O<sub>2</sub>(p).

Melting Data

Tm is obtained from Benzel (10). Tm = 733 and 783°K were reported by Blumenthal (11) and Rode (12), respectively, which are not adopted.

ΔH<sup>°</sup> = -370.75 ± 1.0 kcal/mol  
 ΔH<sup>°</sup><sub>298.15</sub> = -373.19 ± 1.0 kcal/mol  
 ΔH<sup>°</sup><sub>298.15</sub> = 27.21 ± 0.3 gibbe/mol  
 T<sub>m</sub> = 1362 ± 0.5°K

Heat of Formation

The heats of solution of NaCl(c), Na<sub>2</sub>SO<sub>4</sub>(c), SiO<sub>2</sub>(quartz), Na<sub>2</sub>SiO<sub>3</sub>(c), HCl(aq) and H<sub>2</sub>SO<sub>4</sub>(aq) in 20 percent hydrofluoric acid at 74.7° were measured by F. C. Kracek, Ann. Rept. Director of the Geophysical Laboratory, No. 1215, 69 (1933). The author derived two values of ΔH<sub>soln</sub> of Na<sub>2</sub>O(c) from those of NaCl(c), Na<sub>2</sub>SO<sub>4</sub>(c), HCl(aq) and H<sub>2</sub>SO<sub>4</sub>(aq) presumably employing auxiliary data from U. S. Natl. Bur. Std. Circ. 500, 1952. We recalculate ΔH<sub>soln</sub> of Na<sub>2</sub>O(c) in the calorimetric solution as -87.50 (chloride scheme, originally -87.66) and -86.74 kcal/mol (sulfate scheme, originally -89.19), using recent ΔH<sup>°</sup><sub>298</sub> values for NaCl(c), Na<sub>2</sub>SO<sub>4</sub>(c), HCl(aq), H<sub>2</sub>SO<sub>4</sub>(aq), and Na<sub>2</sub>O(c). The corresponding enthalpy changes, ΔH<sup>°</sup><sub>298</sub>, for the reaction Na<sub>2</sub>O(c) + SiO<sub>2</sub>(quartz) = Na<sub>2</sub>SiO<sub>3</sub>(c) are derived as -55.20 and -56.38 kcal/mol. Adopting the weighted average ΔH<sup>°</sup><sub>298</sub> = -55.59 kcal/mol with ΔH<sup>°</sup><sub>298</sub>(Na<sub>2</sub>O, c) = -99.9 kcal/mol and ΔH<sup>°</sup><sub>298</sub>(SiO<sub>2</sub>, quartz) = -217.7 kcal/mol, we obtain ΔH<sup>°</sup><sub>298</sub> = -373.19 kcal/mol for Na<sub>2</sub>SiO<sub>3</sub>(c). This ΔH<sup>°</sup><sub>298</sub>(Na<sub>2</sub>SiO<sub>3</sub>, c) value is independent of future change in ΔH<sup>°</sup><sub>298</sub> of Na<sub>2</sub>O(c) but the value of ΔH<sub>soln</sub> and ΔH<sup>°</sup> are not independent. The adopted value of ΔH<sup>°</sup><sub>298</sub>(Na<sub>2</sub>SiO<sub>3</sub>, c) is the average of -100.1 and -99.7 kcal/mol reported by W. A. Roth and H. L. Kaule, Z. Anorg. Chem. 253, 352 (1947); *ibid.*, 255, 324 (1948), and M. Matsui and S. Oka, J. Soc. Chem. Ind. (Japan) 32, 79 (1929), respectively.

W. A. Roth and H. Troitzsch, Z. Anorg. Chem. 260, 337 (1949), have measured the heats of solution of SiO<sub>2</sub>(quartz), Na<sub>2</sub>SiO<sub>3</sub>(c) and Na<sub>2</sub>O(c) in 10.3 percent HF at 22°C to be -32.85, -67.96 and -86.9 kcal/mol, respectively. Using these results, we calculate the enthalpy change of the reaction Na<sub>2</sub>O(c) + SiO<sub>2</sub>(quartz) = Na<sub>2</sub>SiO<sub>3</sub>(c) as -53.79 kcal/mol and ΔH<sup>°</sup><sub>298</sub>(Na<sub>2</sub>SiO<sub>3</sub>, c) = -371.39 kcal/mol.

By use of high temperature reaction calorimetry D. C. Kroger and W. Janetzko, Z. Anorg. Allgem. Chem. 284, 83 (1956), have determined the enthalpy change of the reaction Na<sub>2</sub>CO<sub>3</sub>(c) + Na<sub>2</sub>SiO<sub>3</sub>(c) = 2Na<sub>2</sub>SiO<sub>3</sub>(c) + CO<sub>2</sub>(g) as 17.99 kcal/mol. Based on ΔH<sup>°</sup><sub>298</sub> = -270.26, -582.92 and -94.05 kcal/mol for Na<sub>2</sub>CO<sub>3</sub>(c), Na<sub>2</sub>SiO<sub>3</sub>(c) and CO<sub>2</sub>(g), respectively, we evaluate ΔH<sup>°</sup><sub>298</sub> = 370.57 kcal/mol for Na<sub>2</sub>SiO<sub>3</sub>(c).

The heats of solution of Na<sub>2</sub>CO<sub>3</sub>(c), SiO<sub>2</sub>(quartz) and Na<sub>2</sub>SiO<sub>3</sub>(c) in 39 percent HF at 26.5°C were measured to be -244.1, -584.5 and -673.6 cal/g, by C. Hummel and H. E. Schwiate, Glastech. Ber. 32, 327 (1959). From these results we calculate the enthalpy change to be 22.43 kcal/mol for the reaction Na<sub>2</sub>CO<sub>3</sub>(c) + SiO<sub>2</sub>(quartz) = Na<sub>2</sub>SiO<sub>3</sub>(c) + CO<sub>2</sub>(g), yielding ΔH<sup>°</sup><sub>298</sub>(Na<sub>2</sub>SiO<sub>3</sub>, c) = -371.48 kcal/mol.

Many other older calorimetric measurements have been made in order to derive the heat of formation for Na<sub>2</sub>SiO<sub>3</sub>(c), but most of these are of questionable accuracy and in some cases the products of the reaction are uncertain. For further details the review by N. W. McCready, J. Phys. Colloid. Chem. 52, 1277 (1948).

Heat Capacity and Entropy

The low temperature heat capacities, 53.6 - 294.5°K, were measured by K. K. Kelley, J. Am. Chem. Soc. 61, 471 (1939), and high temperature enthalpies, 360.5 - 1747°K, were determined by B. F. Maylor, J. Am. Chem. Soc. 67, 466 (1945). The high temperature heat capacities are derived from the measured enthalpy data and joined smoothly with the low temperature Cp values. The entropy at 298°K is calculated using the adopted low temperature heat capacities, based on S<sub>298</sub> = 1.195 eu.

Melting Data

See Na<sub>2</sub>SiO<sub>3</sub>(l) table for details.

Dec. 31, 1960; June 30, 1965; Sept. 30, 1967

Heat of Formation

ΔH<sub>f298</sub>° (Δ) is obtained from ΔH<sub>f298</sub>°(c) by adding ΔH<sub>m</sub>° and the difference between H<sub>1362</sub>° and H<sub>298</sub>° for crystal and liquid.

Heat Capacity and Entropy

The heat capacity above 900°K is derived as constant from the high temperature enthalpy data, 1414 - 1747°K, measured by B. F. Naylor, J. Am. Chem. Soc. 67, 466 (1945). A glass transition temperature is assumed at 900°K; i.e. the heat capacities below 900°K are taken to be the same as those for Na<sub>2</sub>SiO<sub>3</sub>(c).

The entropy is obtained in a manner analogous to that of the heat of formation. The low temperature heat capacities, 63.74 - 162.88°K, have been measured by V. V. Tarasov and Y. S. Savitskaya, Dokl. Akad. Nauk SSSR, 68, 1019 (1953); however, these are not adequate to be used to evaluate S<sub>298</sub>°.

Melting Data

The adopted T<sub>m</sub> = 1362°K, determined by F. C. Kracek, J. Phys. Chem. 24, 1583 (1930), is in good agreement with the value 1281°K reported by F. M. Jaeger, J. Wash. Acad. Sci., 1, 49 (1911), and later confirmed by G. W. Norey and N. L. Bowen, J. Phys. Chem. 28, 1167 (1924).

Other reported T<sub>m</sub> values are 1280, 1291 and 1320°K by N. V. Kultascheff, Z. Anorg. Chem. 35, 186 (1903); R. C. Wallace, ibid., 53, 1 (1909); and H. S. van Klooster, ibid., 53, 135 (1910), respectively. These values are all lower than the adopted T<sub>m</sub> value, probably because the sample compositions were not the exact composition of metasilicate.

The value of ΔH<sub>m</sub>° is evaluated from the adopted heat capacities for Na<sub>2</sub>SiO<sub>3</sub>(c) and Na<sub>2</sub>SiO<sub>3</sub>(l), and the enthalpy data reported by B. F. Naylor, loc. cit., assuming the final state of the calorimetric sample to be Na<sub>2</sub>SiO<sub>3</sub>(c). From the phase diagrams of Na<sub>2</sub>SiO<sub>3</sub> with other compounds, K. K. Kelley, U. S. Bur. Mines Bull. 393, 1936, derived the values of ΔH<sub>m</sub>° of 9.8 - 10.5 kcal/mol.

SODIUM SULFATE, V (Na<sub>2</sub>SO<sub>4</sub>)

(CRYSTAL)

OPW = 142.0412

ΔH<sup>f</sup>° = -328.82 ± 0.2 kcal/mol  
 ΔH<sup>f</sup>°<sub>298.15</sub> = -331.55 ± 0.2 kcal/mol  
 ΔH<sup>f</sup>°(V-I) = 2.584 kcal/mol

S<sup>o</sup><sub>298.15</sub> = 35.76 ± 0.1 gibbs/mol  
 π(V-I) = 521.7°K

Heat of Formation.

P. L. E. Shibata, S. Oda and S. Furukawa, J. Sci. Hiroshima Univ. (Japan) Ser. A, 3, 227 (1953), measured the ent of the cell: Na-amalg. (0.207%) | Na<sub>2</sub>SO<sub>4</sub> (sat. soln.) | Hg<sub>2</sub>SO<sub>4</sub> | Hg at 33-37°C. Extrapolating their results to 25°C, we obtain the ΔH<sup>f</sup>°<sub>298.15</sub> = -153.77 kcal/mol for the reaction 2Na(c) + Hg<sub>2</sub>SO<sub>4</sub>(c) = 2Hg(l) + Na<sub>2</sub>SO<sub>4</sub>(c), which yields ΔG<sup>f</sup>°<sub>298.15</sub> = -303.36 and ΔH<sup>f</sup>°<sub>298.15</sub> = -331.53 kcal/mol for Na<sub>2</sub>SO<sub>4</sub>(c). The auxiliary value, ΔG<sup>f</sup>°<sub>298.15</sub> = -149.59 kcal/mol, for Hg<sub>2</sub>SO<sub>4</sub>(c) is obtained from D. D. Wagman, W. H. Evans, I. Hallow, V. B. Parker, S. M. Bailey and R. H. Schumm, "Selected Values of Chemical Thermodynamic Properties," Tech. Note 270-1, Natl. Bur. Std., Washington, D.C., 1965.

The heat of formation for Na<sub>2</sub>SO<sub>4</sub>(∞ H<sub>2</sub>O) is evaluated as -332.10 kcal/mol, using ΔH<sup>f</sup>°<sub>298.15</sub> = -57.39 and -21.732 kcal/mol for Na<sup>+</sup>(∞ H<sub>2</sub>O) and SO<sub>4</sub><sup>2-</sup>(∞ H<sub>2</sub>O), respectively, from Tech. Note 270-1, loc. cit. J. P. Coughlin, J. Am. Chem. Soc. 77, 868 (1955), determined the enthalpy change, ΔH<sup>f</sup>°<sub>298.15</sub> = -0.301 ± 0.035 kcal/mol for the reaction Na<sub>2</sub>SO<sub>4</sub>(c,V) = Na<sub>2</sub>SO<sub>4</sub>(1050 H<sub>2</sub>O). Adopting ΔH<sup>f</sup>°<sub>298.15</sub> = 0.244 kcal/mol for the reaction Na<sub>2</sub>SO<sub>4</sub>(∞ H<sub>2</sub>O) = Na<sub>2</sub>SO<sub>4</sub>(1050 H<sub>2</sub>O) from Natl. Bur. Std. Circ. 500, Washington, D.C., 1952, we derive the value, ΔH<sup>f</sup>°<sub>298.15</sub> = 0.545 kcal/mol for the reaction Na<sub>2</sub>SO<sub>4</sub>(∞ H<sub>2</sub>O) = Na<sub>2</sub>SO<sub>4</sub>(c,V), yielding ΔH<sup>f</sup>°<sub>298.15</sub> = -331.56 kcal/mol for Na<sub>2</sub>SO<sub>4</sub>(c,V).  
 The heat of formation for Na<sub>2</sub>SO<sub>4</sub>(c,V) is adopted as -331.55 ± 0.2 kcal/mol.

Heat Capacity and Entropy.

The low temperature heat capacities, 13.74 - 313.44°K, have been measured by K. S. Pitzer and L. V. Coulter, J. Am. Chem. Soc. 60, 1310 (1938). The heat capacities in the temperature range 324.61 - 503.05°K were determined by N. E. Shmidt and V. A. Sokolov, Russ. J. Inorg. Chem. 5, 1321 (1961), using an adiabatic calorimeter. These two sets of data are joined smoothly and extrapolated graphically to 1500°K. The enthalpy values derived from the adopted Cp data are in fair agreement with those determined by J. P. Coughlin, J. Am. Chem. Soc. 77, 868 (1955). The corresponding Cp values, reported by M. M. Popov and O. L. Galchenko, J. Gen. Chem. USSR, 21, 2489 (1951), seem too high at the high temperature end. S<sub>298.15</sub> is derived using the low temperature Cp data reported by K. S. Pitzer and L. V. Coulter, loc. cit., based on S<sub>14</sub><sup>o</sup> = 0.057 eu.

Transition Data.

Polymorphism studies by F. C. Kracek, J. Phys. Chem. 33, 1281 (1929), and F. C. Kracek and R. E. Gibson, J. Phys. Chem. 33, 1304 (1929); ibid., 34, 188 (1930), indicate five distinct modifications, I-e, V, IV, III, II, I, of which only V and I are stable forms. Calorimetric studies of Shmidt and Sokolov, loc. cit., suggest another form, stable at high temperatures, which is labeled as δ.

The transition temperature and heat of transition are from the calorimetric data for thenardite reported by Shmidt and Sokolov, loc. cit.

$\Delta H_f^\circ(III) = -331.005$  kcal/mol  
 $\Delta H_f^\circ(III \rightarrow I) = -1.630$  kcal/mol

$S_{298}^\circ = 36.653$  gibbs/mol  
 $T_f(III \rightarrow I) = 521.7^\circ K$

Heat of Formation.

The  $\Delta H_f^\circ$  (Na<sub>2</sub>SO<sub>4</sub>, III) value is obtained from  $\Delta H_f^\circ$  (Na<sub>2</sub>SO<sub>4</sub>, I) by subtracting  $\Delta H_t^\circ(III \rightarrow I)$  and the difference between  $H_{521.7}^\circ$  for Na<sub>2</sub>SO<sub>4</sub>(III) and Na<sub>2</sub>SO<sub>4</sub>(I).

J. P. Coughlin, J. Am. Chem. Soc. 77, 868 (1955), determined the heat of reaction of Na<sub>2</sub>SO<sub>4</sub>(V)  $\rightarrow$  Na<sub>2</sub>SO<sub>4</sub>(III) as 0.735  $\pm$  0.015 kcal/mol at 303.16°K by solution calorimetry. This value is in reasonable agreement with 0.55 kcal/mol obtained from the selected heat of formation.

Heat Capacity and Entropy.

The heat capacities in the temperature range 319.02 - 521.65°K were measured with an adiabatic calorimeter by N. E. Schmidt and V. A. Sokolov, Russ. J. Inorg. Chem. 6, 1321 (1961). The Cp values below 319°K and above 521°K are obtained by graphical extrapolation. The entropy is calculated in a manner analogous to that of the heat of formation.

Transition Data.

Na<sub>2</sub>SO<sub>4</sub>(III) is the melttable form obtained by cooling Na<sub>2</sub>SO<sub>4</sub>(I) in the absence of moisture. The temperature and heat of transition are taken from the calorimetric data of Schmidt and Sokolov, loc. cit. The value  $\Delta H_t^\circ(III \rightarrow I) = -1.630 + 0.005$  kcal/mol is the average of three determinations.

J. P. Coughlin, loc. cit., reported the heat of transition (III  $\rightarrow$  I) at 514°K to be 1.680 kcal/mol, obtained by drop calorimetry, which is in good agreement with the value adopted.

ΔH<sup>o</sup><sub>298.15</sub>(v → I) = -330.096 kcal/mol  
 ΔH<sup>o</sup>(v → I) = 2.584 kcal/mol  
 ΔH<sup>o</sup>(I → δ) = 0.06 kcal/mol  
 ΔH<sup>o</sup> = 5.67 kcal/mol

S<sup>o</sup><sub>298.15</sub> = 37.733 gibbs/mol  
 Tt(v → I) = 521.7°K  
 Tt(I → δ) = 980°K  
 Tm = 1157°K

Heat of Formation.

The ΔH<sup>o</sup><sub>298.15</sub>(Na<sub>2</sub>SO<sub>4</sub>, I) is obtained from ΔH<sup>o</sup><sub>298.15</sub>(Na<sub>2</sub>SO<sub>4</sub>, v) by adding ΔH<sup>o</sup>(v → I) and the difference between H<sup>o</sup><sub>521.7</sub> - H<sup>o</sup><sub>298.15</sub> for Na<sub>2</sub>SO<sub>4</sub>(v) and Na<sub>2</sub>SO<sub>4</sub>(I).

Heat Capacity and Entropy.

The heat capacities in the temperature range 538.65 - 917.65°K were measured with an adiabatic calorimeter by N. E. Schmidt and V. A. Sokolov, Russ. J. Inorg. Chem. 5, 1321 (1961). The Cp values below 538.65°K and above 917.65°K are obtained by graphical extrapolation. The entropy is calculated in a manner analogous to that of the heat of formation.

Transition Data.

The value ΔH<sup>o</sup>(v → I) = 2.584 ± 0.015 kcal/mol is the average of two determinations from the calorimetric studies of Schmidt and Sokolov, loc. cit. The transition temperature was derived from the heating curve obtained in measuring the heat of transition. It was taken to be the temperature at which the specimen began to show its lowest heating rate. The heat of transition was the difference between the quantity of heat actually dissipated and the sum of the heats calculated from the heat capacity curve of the apparatus and from the specific heat curves of (v) and (I) linearly extrapolated to the transition temperature.

The values of Tt and ΔH<sup>o</sup> for Na<sub>2</sub>SO<sub>4</sub>(I) → Na<sub>2</sub>SO<sub>4</sub>(δ) transition were reported by Schmidt and Sokolov, loc. cit. See Na<sub>2</sub>SO<sub>4</sub>(δ) table for details.

Melting Data.

See Na<sub>2</sub>SO<sub>4</sub>(I) table for details.

Dec. 31, 1966

SODIUM SULFATE,  $\delta$  (Na<sub>2</sub>SO<sub>4</sub>)

(CRYSTAL)

OPW = 142.0412

$\Delta H^{\circ}_{298,15} = 37.741 \text{ gibbs/mol}$

$\Delta H^{\circ} (I \rightarrow \delta) = 0.08 \text{ kcal/mol}$

$\Delta H^{\circ}_{\text{m}} = 5.50 \text{ kcal/mol}$

$S^{\circ}_{298,15} = 37.741 \text{ gibbs/mol}$

$T_f (I \rightarrow \delta) = 880^{\circ}\text{K}$

$T_m = 1157^{\circ}\text{K}$

Heat of Formation

The heat of formation ( $\Delta H^{\circ}_{298,15}$ ) is obtained from  $\Delta H^{\circ}_{298,15}$  for Na<sub>2</sub>SO<sub>4</sub> (I) by adding  $\Delta H^{\circ} (I \rightarrow \delta)$  and the difference between  $H_{890} - H^{\circ}_{298,15}$  for Na<sub>2</sub>SO<sub>4</sub>(I) and Na<sub>2</sub>SO<sub>4</sub> ( $\delta$ ).

Heat Capacity and Entropy

The heat capacities in the temperature range 530 - 1010°K were measured by N. E. Shmidt and V. A. Sokolov, Russ. J. Inorg. Chem. 5, 1321 (1961). The Cp values below 900°K are assumed to be the same as those for Na<sub>2</sub>SO<sub>4</sub> (I). The heat capacities above 1010°K are obtained by graphical extrapolation. The entropy is calculated in a manner analogous to that of the heat of formation.

Transition Data

A small anomalous region between 690 - 720°C (963.15 - 993.15°K) on the Cp curve for Na<sub>2</sub>SO<sub>4</sub>(c) was reported by N. E. Shmidt and V. A. Sokolov, loc. cit. By use of graphical integration of the area between the measured Cp curve and an arbitrary base line over the region 900 - 1100°K, a value of  $\Delta H^{\circ} (I \rightarrow \delta) = 0.08 \text{ kcal/mol}$  was obtained. It is assumed to be 880°K. This anomalous region was first observed by G. W. Wyrouboff, Z. Krist. 21, 284 (1893), and later confirmed by Y. P. Simanov and D. F. Kirikina, Zh. Neorg. Khim. 2, 699 (1957), as a transition from a hexagonal to an orthorhombic structure. This transition was not observed by the earlier investigators because their measurements did not extend to that temperature range.

Melting Data

The temperature end heat of melting of Na<sub>2</sub>SO<sub>4</sub> (I)  $\rightarrow$  Na<sub>2</sub>SO<sub>4</sub> (l) were reported to be 1157°K and 5.67 kcal/mol, respectively, by Coughlin, loc. cit. No mention was made of the  $\delta$  phase and the enthalpy measurements were probably not sensitive enough to detect this phase. Based on our selected Cp values for  $\delta$  and liquid Na<sub>2</sub>SO<sub>4</sub>, we derive  $H_m^{\circ}(\delta \rightarrow l) = 5.50 \text{ kcal/mol}$ , using Coughlin's enthalpy data on Na<sub>2</sub>SO<sub>4</sub> (l). The melting temperature is assumed to be the same as that reported by Coughlin.

Tm was reported to be 880°C (1153°K), 897°C (1170°K) and 888°C (1161°K) by Ruff and Plato, Ber. Deutsch. Chem. Ges. 35, 2357 (1903); K. Hiltner and O. Temmeln, Z. Anorg. Chem. 43, 215 (1905); and H. E. Boeke, Z. Anorg. Chem. 50, 355 (1906), respectively.

S<sub>298.15</sub> = 42.777 g/bba/mol

Tm(δ → 1) = 1157°K

ΔHf<sup>o</sup><sub>298.15</sub> = -324.241 kcal/mol

ΔHm<sup>o</sup>(δ → 1) = 5.50 kcal/mol

Heat of Formation.

The value of ΔHf<sup>o</sup><sub>298.15</sub>(1) is obtained from ΔHf<sup>o</sup><sub>298.15</sub>(I) by adding ΔHm<sup>o</sup> and the difference between H<sup>o</sup><sub>1157</sub> - H<sup>o</sup><sub>298.15</sub> for Na<sub>2</sub>SO<sub>4</sub>(δ) and Na<sub>2</sub>SO<sub>4</sub>(1).

Heat Capacity and Entropy.

The enthalpies for Na<sub>2</sub>SO<sub>4</sub>(1) were measured by drop calorimetry in the temperature range 1157 - 1828°K by J. P. Coughlin, J. Am. Chem. Soc. **77**, 868 (1955) and in the temperature range 1173 - 1250°K by M. M. Popov and D. M. Ginzburg, J. Gen. Chem. USSR **25**, 1107 (1956). The constant heat capacity adopted here is derived from the enthalpy measurements reported by J. P. Coughlin, loc. cit. Below 800°K, the heat capacities are assumed to be the same as those of the δ phase. The entropy is calculated in a manner analogous to that of the heat of formation.

Melting Data.

The temperature and heat of melting of Na<sub>2</sub>SO<sub>4</sub>(I) → Na<sub>2</sub>SO<sub>4</sub>(1) were reported to be 1157°K and 5.67 kcal/mol, respectively, by Coughlin, loc. cit. No mention was made of the δ phase, and the enthalpy measurements were probably not sensitive enough to detect this phase. Based on our selected Cp values for δ liquid Na<sub>2</sub>SO<sub>4</sub>, we derive ΔHm<sup>o</sup>(δ → 1) = 5.50 kcal/mol, using Coughlin's enthalpy data on Na<sub>2</sub>SO<sub>4</sub>(1). The melting temperature is assumed to be the same as that reported by Coughlin.

Tm was reported to be 860°C(1153°K), 897°C(1170°K) and 888°C(1161°K) by Ruff and Plato, Ber. Deutsch. Chem. Ges. **36**, 2357 (1903); K. Hüttner and G. Tammann, Z. Anorg. Chem. **43**, 215 (1905); and H. E. Boeke, Z. Anorg. Chem. **50**, 355 (1906), respectively.

S<sup>298.15</sup> = 38.32 ± 0.5 gibbs/mol  
 T<sub>1</sub> = 862.0°K  
 T<sub>2</sub> = 860.8°K  
 T<sub>m</sub> = 968.7°K

ΔHf° = -366.8 ± 2 kcal/mol  
 ΔHf<sub>298.15</sub>° = -369.2 ± 2 kcal/mol  
 ΔH<sub>1</sub>° = 0.983 kcal/mol  
 ΔH<sub>2</sub>° = 7.373 kcal/mol  
 ΔH<sub>m</sub>° = 5.688 kcal/mol

Heat of Formation

The adopted heat of formation, ΔH<sub>f,298</sub>° (Na<sub>2</sub>WO<sub>4</sub>, c) = -369.2 kcal/mol, is calculated from ΔH<sub>f,303.15</sub>° = 19.44 ± 0.08 kcal/mol for the reaction H<sub>2</sub>WO<sub>4</sub>(c) + 2HCl(12.731 H<sub>2</sub>O), using the JANAF value of ΔH<sub>f,298</sub>° (H<sub>2</sub>WO<sub>4</sub>, c) = -270.5 kcal/mol and ΔH<sub>f,298</sub>° (NaCl, c) = -98.26 kcal/mol, and auxiliary data for HCl(aq) (11). The value of ΔH<sub>f,303.15</sub>° was determined by solution calorimetry by M. F. Koehler, L. B. Pankratz and R. Barany (1).

J. M. Sherfey and A. Bremner (2) measured by electrochemical calorimetry the heat of reaction ΔH<sub>r,298</sub>° = -7 ± 1.5 kcal/mol for W(c) + 2NaOH(55.55H<sub>2</sub>O) + 2H<sub>2</sub>O(l) = Na<sub>2</sub>WO<sub>4</sub>(c) + 3H<sub>2</sub>(g). This value, combined with the heat of solution (3,3,3), ΔH<sub>sol</sub>° = -1.7 ± 0.1 kcal/mol for Na<sub>2</sub>WO<sub>4</sub>(c) = Na<sub>2</sub>WO<sub>4</sub>(aq), gives ΔH<sub>f,298</sub>° (Na<sub>2</sub>WO<sub>4</sub>, c) = -369.4 kcal/mol, which is in good agreement with the value adopted.

The previously accepted value (1,3), ΔH<sub>f,298</sub>° (Na<sub>2</sub>WO<sub>4</sub>, c) = -379 ± 0.5 kcal/mol, was based on the unreliable ΔH<sub>f,298</sub>° (H<sub>2</sub>WO<sub>4</sub>, c) = -280.2 ± 0.4 kcal/mol. (See JANAF H<sub>2</sub>WO<sub>4</sub>(c) table of March 31, 1967.) The other quoted value (4), ΔH<sub>f,298</sub>° (Na<sub>2</sub>WO<sub>4</sub>, c) = -385 kcal/mol, was obtained from W. G. Mixter's (5) measurement of the heat of reaction of tungsten powder with excess Na<sub>2</sub>O. This value was probably in error because the complex tungstate and peroxytungstates were formed in the reaction.

Heat Capacity and Entropy

Low temperature heat capacities (52-299.87°K) were measured calorimetrically by E. G. King and W. W. Weller (6). The heat capacities above 300°K are estimated by extrapolation of the low temperature heat capacity curve to Cp,600 = 49.0 gibbs/mol. The latter is obtained from an estimate of Cp equal to 7 gibbs/g-atom at the first transition temperature.

The entropy, S<sub>298</sub>° = 38.32 ± 0.5 eu, is calculated from low temperature heat capacity data of King and Weller (6), based on an extrapolation of S<sub>298</sub>° = 2.77 ± 0.5 eu.

Transition Data

Transition temperatures and heats were obtained from differential heating and cooling curves both at atmospheric and higher pressures by R. W. Goranson and F. C. Kracek (7). Existence of three phases is confirmed by the earlier birefringence studies of H. E. Boeke (8).

R. Riccardi and C. Sinistri (10) found only one transition at 864°K with ΔH<sub>t</sub>° = 8.23 kcal/mol by differential thermal analysis. This heat is apparently the sum of the two adopted heats of transition.

Melting Data

The adopted melting data were measured by the differential heating and cooling curve method by Goranson and Kracek (7). R. Riccardi and C. Sinistri (10) found the melting point at 871°K with ΔH<sub>m</sub>° = 7.52 kcal/mol by differential thermal analysis.

 T<sub>m</sub>(B → Aβ) = 951°K  
 T<sub>m</sub>(Aβ → Aα) = 980°K  
 T<sub>m</sub> = 1147°K

Heat of Formation

The heats of solution of NaCl(c), Na<sub>2</sub>SO<sub>4</sub>(c), SiO<sub>2</sub>(quartz), Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c), HCl(aq) and H<sub>2</sub>SO<sub>4</sub>(aq), in 20 percent hydrofluoric acid at 74.7°C were measured by Kracek (1). The author derived two values of ΔH<sub>soln</sub> of Na<sub>2</sub>O(c) from those of NaCl(c), Na<sub>2</sub>SO<sub>4</sub>(c), HCl(aq) and H<sub>2</sub>SO<sub>4</sub>(aq), presumably employing auxiliary data from (2). We recalculate ΔH<sub>soln</sub> of Na<sub>2</sub>O(c) in the calorimetric solution as -87.50 (chlorine scheme, originally -87.66) and -88.74 kcal/mol (sulfate scheme, originally -89.19), using recent ΔH<sup>o</sup><sub>298</sub> values (16, 17, 18) for NaCl(c), HCl(aq), H<sub>2</sub>SO<sub>4</sub>(aq), Na<sub>2</sub>SO<sub>4</sub>(c), and Na<sub>2</sub>O(c). The corresponding enthalpy changes, ΔH<sup>o</sup><sub>298</sub> for the reaction Na<sub>2</sub>O(c) + 2SiO<sub>2</sub>(quartz) = Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) are derived as -94.65 and -55.89 kcal/mol. Adopting the weighted average ΔH<sup>o</sup><sub>298</sub> = -55.06 kcal/mol with ΔH<sup>o</sup><sub>298</sub>(Na<sub>2</sub>O, c) = -99.9 kcal/mol and ΔH<sup>o</sup><sub>298</sub>(SiO<sub>2</sub>, quartz) = -217.7 kcal/mol, we obtain ΔH<sup>o</sup><sub>298</sub> = -590.36 kcal/mol for Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c). This ΔH<sup>o</sup><sub>298</sub>(Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>, c) value is independent of future changes in ΔH<sup>o</sup><sub>298</sub> of Na<sub>2</sub>O(c), but the values of ΔH<sub>soln</sub> and ΔH<sup>o</sup> are not independent.

Stevens et al. (3) measured the heats of solution of Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c), Na<sub>2</sub>O(c) and SiO<sub>2</sub>(quartz) in HF(aq) at 25°C. Based on the reported results, the enthalpy change for the reaction Na<sub>2</sub>O(c) + 2SiO<sub>2</sub>(quartz) = Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) is calculated as -53.25 ± 0.32 kcal/mol, yielding ΔH<sup>o</sup><sub>298</sub>(Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>, c) = -588.55 kcal/mol.

Hummel (4) determined the heats of solution of Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c), SiO<sub>2</sub>(quartz) and Na<sub>2</sub>CO<sub>3</sub>(c) in 39 percent HF at 26.5°C. From the data reported we derive the enthalpy change to be 20.88 kcal/mol for the reaction Na<sub>2</sub>CO<sub>3</sub>(c) + 2SiO<sub>2</sub>(quartz) = Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) + CO<sub>2</sub>(g). Employing ΔH<sup>o</sup><sub>298</sub> = -270.26, -217.7 and -94.05 kcal/mol for Na<sub>2</sub>CO<sub>3</sub>(c), SiO<sub>2</sub>(quartz) and CO<sub>2</sub>(g), respectively, we obtain ΔH<sup>o</sup><sub>298</sub> = -590.73 kcal/mol for Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(c) which is in good agreement with the adopted one.

Heat Capacity and Entropy

The low temperature heat capacities, 54.3 - 294.7°K, have been measured by Kelley (5) and the high temperature enthalpies, 376.8 - 1100.2°K, by Naylor (6). The derived high temperature heat capacities are joined smoothly with the low temperature ones at 298°K. An approximate Cp of 70 gibbs/mol is derived from the enthalpies above 980°K; this value is extrapolated to 2000°K. The value of S<sup>o</sup><sub>298</sub> is calculated from the adopted low temperature heat capacities based on S<sup>o</sup><sub>50</sub> = 2.945 eu. The entropy extrapolation derives from the Debye-Einstein extrapolation of Kelley (5) which yields a Cp curve with an extra inflection in the region from 15 to 50°K. A more normal extrapolation would lead to a value of S<sup>o</sup><sub>50</sub> which is lower by 0.5 eu.

Transition Data

There are six slowly inverting polymorphous phases (1, 7-9), namely A, B, C, D, E and F, of which only the first two phases are stable. Two rapid transitions have been reported at 951 and 980°K (1, 10). Phase A, which has two subphases, Aα and Aβ, is stable above 951°K. The stable phase below 951°K is known as phase B, previously called β-Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>. The two values of ΔH<sup>o</sup> are derived from the enthalpy data of Naylor (6) using the adopted Cp values. Three more rapid transitions have been reported at 822, 846 and 868°K (1, 10) in E, previously called γ-Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>. A recent examination of these transitions was reported by Willgallis and Range (10).

Heating Data

T<sub>m</sub> is obtained from Morey (11). The selected value of ΔH<sup>o</sup><sub>m</sub> is based on the following ΔH<sup>o</sup><sub>m</sub> values derived from four different kinds of measurements.

| Investigator            | ΔH <sup>o</sup> <sub>m</sub> , kcal/mol* | Method** | Reference |
|-------------------------|--|----------|-----------|
| Kelley (1936)           | at 298°K<br>(7.51)                       | I        | 1, 2      |
| Kracek (1953)           | at 1147°K<br>8.46                        | I        | 12        |
| Kröger-Janetzko (1956)  | 5.25                                     | II       | 1         |
| Kröger-Kreitlow (1956)  | 8.81                                     | III      | 13        |
| Kröger-Ziegler (1956)   | 8.83                                     | II       | 14        |

GFW = 182.1586

ΔH<sup>o</sup><sub>298,15</sub> = -586.87 ± 1.0 kcal/mol  
 ΔH<sup>o</sup><sub>298,15</sub> = -590.36 ± 1.0 kcal/mol  
 ΔH<sup>o</sup> = 0.1 kcal/mol  
 ΔH<sup>o</sup> = 0.15 kcal/mol  
 ΔH<sup>o</sup><sub>m</sub> = 8.5 kcal/mol

(Crystal)

Sodium Disilicate (Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>)

(Liquid) GFW = 182.1586

Na<sub>2</sub>O<sub>5</sub>Si<sub>2</sub>

GFW = 182.1586

(LIQUID)

SODIUM DISILICATE (Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>)

S<sup>o</sup><sub>298.15</sub> = 45.101 cal/mole

ΔH<sup>f</sup><sub>298.15</sub> = -582.811 kcal/mol

ΔH<sup>m</sup> = 8.5 kcal/mol

T<sub>m</sub> = 1147°K

Heat of Formation

The ΔH<sup>f</sup><sub>298</sub>(*l*) is obtained from ΔH<sup>f</sup><sub>298</sub>(*c*) by adding ΔH<sup>m</sup> and the difference between H<sup>o</sup><sub>1147</sub> - H<sup>o</sup><sub>298</sub> for crystal and liquid. The heats of solution of NaCl(*c*), Na<sub>2</sub>SO<sub>4</sub>(*c*), HCl(aq), H<sub>2</sub>SO<sub>4</sub>(aq), SiO<sub>2</sub>(quartz) and Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*gl*) in 20 percent hydrofluoric acid at 74.7°C were measured by Kracek (1). Following the same procedure as described in the Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*c*) table, we derive the enthalpy changes, ΔH<sup>f</sup><sub>298</sub>, for the reaction Na<sub>2</sub>O(*c*) + 2SiO<sub>2</sub>(quartz) = Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*gl*) as -49.40 and -50.64 kcal/mol using the heats of solution of Na<sub>2</sub>O(*c*) as -87.50 (chloride scheme) and -88.74 kcal/mol (sulfate scheme), respectively. Adopting the weighted average ΔH<sup>f</sup><sub>298</sub> = -89.81 kcal/mol with ΔH<sup>f</sup><sub>298</sub>(Na<sub>2</sub>O, *c*) = -99.9 kcal/mol and ΔH<sup>f</sup><sub>298</sub>(SiO<sub>2</sub>, quartz) = -217.7 kcal/mol, we obtain ΔH<sup>f</sup><sub>298</sub> = -585.113 kcal/mol for Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*gl*).

Using high temperature reaction calorimetry, Krögar (2) determined the enthalpy changes as 25.28 ± 0.22 and -18.58 ± 0.36 kcal/mol for the reactions Na<sub>2</sub>CO<sub>3</sub>(*c*) + 2SiO<sub>2</sub>(quartz) = Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*gl*) + CO<sub>2</sub>(*g*) and 2NaOH(*l*) + 2SiO<sub>2</sub>(quartz) = Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*gl*) + H<sub>2</sub>O(*l*), respectively. From the given results, we calculate the corresponding values of ΔH<sup>f</sup><sub>298</sub>(Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>, *gl*) to be -586.32 and -589.46 kcal/mol, using ΔH<sup>f</sup><sub>298</sub> = -270.26, -217.70, -94.05, -101.90 and -68.32 kcal/mol for Na<sub>2</sub>CO<sub>3</sub>(*c*), SiO<sub>2</sub>(quartz), CO<sub>2</sub>(*g*), NaOH(*l*) and H<sub>2</sub>O(*l*), respectively. These two ΔH<sup>f</sup><sub>298</sub>(Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>, (*l*)) values, as well as the value -585.113 kcal/mol based on Kracek's data, are not adopted, because incorporating these ΔH<sup>f</sup><sub>298</sub>(*gl*) values with the value of ΔH<sup>f</sup><sub>298</sub>(*c*), gives values of the heat of melting at 298°K which are too low in comparison with the other values (see the Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*c*) table).

Hummel (3) measured the heats of solution of Na<sub>2</sub>CO<sub>3</sub>(*c*), SiO<sub>2</sub>(quartz) and Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*gl*) in 39 percent hydrofluoric acid at 26.5°C, as -244.1, -584.5 and -673.7 cal/g, respectively. Based on these results, we derive the enthalpy change for the reaction Na<sub>2</sub>CO<sub>3</sub>(*c*) + 2SiO<sub>2</sub>(quartz) = Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*gl*) + CO<sub>2</sub>(*g*) to be 29.01 kcal/mol, yielding ΔH<sup>f</sup><sub>298</sub>(Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>, *gl*) = -582.6 kcal/mol which is in good agreement with the adopted value.

Heat Capacity and Entropy

Using drop calorimetry, Naylor (4) has measured the enthalpies of Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*gl*), 445.5 - 1120.7°K, and Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*l*), 1173.2 - 1744°K. Based on the liquid enthalpy data, we evaluate the heat capacity of Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*l*) to be 62.43 gibbs/mol. The Cp values below 1147°K are derived from the enthalpies measured at 445.5 - 1120.7°K by Naylor (4). Below 600°K, Cp is identical with that of the crystal. The adopted curve rises rapidly to a maximum in the glass transition region, 650-950°K, then smoothly approaches the value of the real liquid near T<sub>m</sub>. The heat capacity of Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*l*) is assumed to be constant in the temperature range 1147 to 2500°K.

S<sup>o</sup><sub>298</sub> is obtained in a manner analogous to that of the heat of formation.

Melting Data

See Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>(*c*) table for details.

Heat of Formation.

P. Brix and G. Herzberg, Can. J. Phys. 32, 110 (1954), observed 21 bands in the transition  $X^3\Sigma_g^- \rightarrow B^3\Sigma_u^-$ . The Birge-Sponer extrapolation to the dissociation products  $^3P_2 + ^1D_2$  was corrected to the zero levels,  $^3P_2 + ^3P_2$ , to give the dissociation energy 41260 ± 15 cm.<sup>-1</sup>. This is in agreement with the extrapolation of the band heads of the  $X^3\Sigma_g^- \rightarrow A^3\Sigma_u^-$  transition which goes to the normal products. The extrapolation of the B level is very small, the lowest ΔE<sub>1/2</sub> is 34 cm.<sup>-1</sup>

Heat Capacity and Entropy.

The electronic levels from C. E. Moore, Nat. Bur. Standards, Circ. 467, (1949), were averaged above 80,000 cm.<sup>-1</sup>

OXYGEN UNINEGATIVE ION (O<sup>-</sup>) (IDEAL GAS) MOL. WT. = 15.99995

Round State Configuration  $2s^2 2p^4$   
 $S_{298.15} = 37.712 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^0 = 25.2 \pm .5 \text{ kcal/mole}$   
 $\Delta H_f^0 298.15 = 24.3 \pm .5 \text{ kcal/mole}$

Electronic Levels and Quantum Weight  
 $\frac{E_i, \text{ cm.}^{-1}}{[160.0]} \frac{g_i}{4}$

Heat of Formation.  
 The heat of formation was calculated from the equation:  $O(g) + e^- \rightarrow O^-(g)$  with the JANAF auxiliary value for  $O(g)$ ; using the measured electron affinity = 1.465 e.v. (33.783 kcal/mole) obtained from L. M. Branacomb, D. S. Burch, S. J. Smith and S. Oulman, Phys. Rev. **111**, 504 (1956). Other calculated values for the electron affinity are: 1.22 e.v. E. Clementi and A. D. McLean, Phys. Rev. **133**, A419 (1964); 1.16 e.v. E. Clementi, A. D. McLean, D. L. Rainmond, and M. Yoshimine, Phys. Rev. **133**, A1274 (1964); and 1.47 e.v. B. Edlén, J. Chem. Phys. **33**, 98 (1960).

Heat Capacity and Entropy.  
 The electronic levels and quantum weights were estimated by assuming that the extra electron would produce an electronic structure similar to the next higher atomic numbered element, in this case F(I). An analogy was then made between O<sup>-</sup> and F(II), and O(II) and F(III) in order to estimate the height of the first level above the ground state. The data for F(I), O(I), F(II), O(II) and F(III) were obtained from C. E. Moore, "Atomic Energy Levels", Vol. I, Circular of the National Bureau of Standards 467, June 15, 1949. It is possible that the entropy below 3000°K. could be in error by 0.5 e.v. due to the estimation of the low lying electronic level. The electronic levels above  $1 \times 10^5 \text{ cm.}^{-1}$  were omitted because their contribution is negligible below 6000°K. The  $H^0_{298}$  value at 0°K. is -1.567 kcal/mole.

| T, °K. | C <sub>p</sub> | S°     | $-(F^0 - H^0_{298})/T$ | $H^0 - H^0_{298}$ | $\Delta H_f^0$ | $\Delta F_f^0$ | Log K <sub>p</sub> |

 $B_e = 0.734 \text{ cm.}^{-1}$   $\alpha_e = 0.0055 \text{ cm.}^{-1}$   
 $\sigma_e = 1$   $r_e = 1.473 \text{ \AA}$

Heat of formation based upon a dissociation energy of 49,000 cm.<sup>-1</sup>, which is the value of two predissociations observed by K. Dressler, Helv. Phys. Acta 29, 563 (1955).

Heat Capacities and Entropies, Molecular and spectroscopic constants based upon measurements of K. Dressler, loc. cit., K. S. Rao, Can. J. Phys. 36, 1526 (1958), and those of M. L. Singh, Can. J. Phys. 37, 136 (1959).

Lead Monoxide, Red (PbO) (Crystal)

Mol. Wt. = 223.21

$\Delta H_f^\circ 298.15 = -52.41 \pm 0.16 \text{ kcal. mole}^{-1}$

$\Delta S_f^\circ 298.15 = 15.6 \pm 0.2 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

$\Delta H_f^\circ 298.15 = 63.88 \pm 0.22 \text{ kcal. mole}^{-1}$

$T_f = 762^\circ\text{K}$

$\Delta H_f^\circ = 0.18 \pm 0.23 \text{ kcal. mole}^{-1}$

Heat of Formation. Calculated from the cell reaction

reported by D. P. Smith and H. K. Woods, *J. Am. Chem. Soc.*, **45**, 2632 (1923), using  $\Delta H_f^\circ 298.15$  for  $\text{H}_2\text{O}(\text{l})$ ,  $-68.317 \text{ kcal. mole}^{-1}$ , given by Natl. Bur. Standards Circular 500 (1952).  $\Delta H_f^\circ$  values reported by other investigators were discussed by R. W. Miller, *J. Am. Chem. Soc.*, **51**, 207 (1929).

Heat Capacity and Entropy. Heat capacity values (51° to 298.15°K) were obtained from E. O. King, *J. Am. Chem. Soc.*, **80**, 2400 (1958). For the higher temperature range, heat capacity given by K. K. Kelley, U. S. Bur. Mines Bull. 504 (1960) was used and joined smoothly to data of King at 298.15°K by graphical extrapolation.

King obtained entropies below 51°K by empirical extrapolation of the heat capacity curve which fits the measured heat capacities within 1.3%.

Transition Data. Heat of transition recalculated from the data given by E. O. King, loc. cit.

Heat of Sublimation. Calculated from free-energy functions and vapor pressure reported by A. N. Neumeysanov, L. P. Firsova and E. P. Lunkova, *Zhur. Fiz. Khim.* **34**, 1699 (1960) and R. Hörbe and O. Knaack, *Z. Erzbergbau u. Metallhüttenw.* **12**, 321 (1959).

Lead Monoxide, Yellow (PbO) (Crystal)

Mol. Wt. = 223.21  
 $\Delta H_f^o$  298.15 = -52.07 ± 0.28 kcal. mole<sup>-1</sup>  
 $S_{298.15}^o$  = 16.1 ± 0.2 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $\Delta H_s^o$  298.15 = 63.54 ± 0.32 kcal. mole<sup>-1</sup>  
 $T_m$  = 1170 ± 4°K.  
 $\Delta H_m^o$  = 6.1 ± 0.1 kcal. mole<sup>-1</sup>

Heat of Formation. Calculated from  $\Delta H_f^o$  298.15 for PbO (c, red) and  $\Delta H_c^o$  298.15 between PbO (c, red) and PbO (c, yellow).

Heat Capacity, Entropy, and Melting Data.  $C_p$  values (51° to 298.15°K.) obtained from E. G. King, J. Am. Chem. Soc., 80, 2400 (1958). For the higher temperature range, the heat capacity reported by E. N. Rodigina, K. Z. Gornal'skii and V. F. Luginina, Zhur. Fiz. Khim., 35, 1799 (1961) was used and joined smoothly to data of King at 298.15°K. by graphical extrapolation.  $T_m$  and  $\Delta H_m^o$  given by E. N. Rodigina, K. Z. Gornal'skii and V. F. Luginina, loc. cit.

Heat of Sublimation. Calculated from  $\Delta H_c^o$  298.15 and  $\Delta H_s^o$  298.15 for PbO (c, red).

Lead Monoxide (PbO) (Liquid)

Mol. Wt. = 223.21  
 $\Delta H_f^{298.15} = [-46.712] \text{ kcal. mole}^{-1}$   
 $S^{298.15} = [20.546] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_m = 1170 \pm 4^\circ\text{K.}$   
 $\Delta H_m^o = 6.1 \pm 0.1 \text{ kcal. mole}^{-1}$   
 $T_b = 1769^\circ\text{K.}$   
 $\Delta H_v^o = 49.53 \pm 0.22 \text{ kcal. mole}^{-1}$

Heat of Formation. Calculated from that of the crystal.

Heat Capacity, Entropy, and Melting Data, C<sub>p</sub>, T<sub>m</sub>, and ΔH<sub>m</sub><sup>o</sup> are obtained from E. N. Rodzina, K. Z. Gmel'skii and V. P. Luganina, Zhur. Fiz. Khim., 35, 1799 (1961). The reported heat capacity is extrapolated to an assumed glass transition temperature of 780°K., below which the heat capacity is taken to be equal to that of the crystal, PbO (c, red).

Vaporization Phenomena. T<sub>b</sub> and ΔH<sub>v</sub><sup>o</sup> calculated from ΔH<sub>f</sub><sup>o</sup> 298.15 for PbO (c, red) and functions for condensed and gaseous states.

| T. °K. | C <sub>p</sub>                            | S°       | (F-H <sub>298</sub> )/T | H°-H <sub>298</sub>     | ΔH <sub>f</sub> <sup>0</sup> | ΔF <sub>f</sub> <sup>0</sup> | Log K <sub>p</sub> |

## SULFUR MONOXIDE (SO)

(IDEAL GAS)

MOL. WT. = 48.0634

Ground State Configuration  $3 \sum^-$  $\Delta H_f^0 = 1.64 \pm 0.3$  kcal. mole<sup>-1</sup> $\Delta H_f^0$  298.15 =  $1.64 \pm 0.3$  kcal. mole<sup>-1</sup> $S_{298.15} = 53.0$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Electronic Levels and Quantum Weight

$$\frac{E_i, \text{cm.}^{-1}}{0} \frac{g_i}{3}$$

$$\omega_e x_e = 6.116 \text{ cm.}^{-1}$$

$$\sigma = 1$$

$$r_e = 1.461 \text{ \AA}$$

$$\omega_e = 1148.19 \text{ cm.}^{-1}$$

$$\alpha_e = 0.00562 \text{ cm.}^{-1}$$

## Heat of Formation.

The dissociation energy of sulfur monoxide has been reported by following investigators:

| D <sub>0</sub> (SO) e.v. (kcal. mole <sup>-1</sup> ) | Investigator |
|--|--------------|
| 5.035  | (116.5)      |
| 5.184  | (119.5)      |
| 4.001  | (92.3)       |
| 5.357  | (123.5)      |
| 5.510  | (127.1)      |

E. V. Martin, Phys. Rev. **41**, 167 (1932).  
A. O. Gaydon, "Dissociation Energies", Chapman & Hall Ltd. London, 1955.  
O. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Company, Inc. 2nd Ed., 1950.  
R. G. W. Norrish and G. A. Oldershaw, Proc. Roy. Soc. **A249**, 498 (1959).  
J. J. McOravey, W. D. McOravey, Proc. Roy. Soc. **A278**, 490 (1964).

E. V. Martin, loc. cit., has measured the spectrum of SO(g) in the region 2400-4000 Å, and both Herzberg's and Gaydon's data were based on Martin's spectroscopic measurement. Because of the ambiguity of defining the state of excitation of the atomic products resulting from predissociation, the dissociation energy of SO was in question. Herzberg favored  $D_0$  (SO) = 92.3 kcal. mole<sup>-1</sup> but Gaydon  $D_0$  (SO) = 119.5 kcal. mole<sup>-1</sup>.

Norrish and Oldershaw, loc. cit., redetermined the absorption spectrum of SO by flash photolysis, and also corrected Martin's original vibrational numbering, and then obtained the dissociation energy,  $D_0$ (SO) = 123.5 kcal. mole<sup>-1</sup>, based on the assumption of predissociation into S(-b) and O(<sup>3</sup>P). This value,  $D_0 = 123.5$  kcal. mole<sup>-1</sup>, has been selected as the dissociation energy for SO(g) and combination with JANAF values of  $\Delta H_f^0$ (S; g) and  $\Delta H_f^0$ (O; g) gives the heat of formation of sulfur monoxide,  $\Delta H_f^0$  298 =  $1.64 \pm 0.3$  kcal. mole<sup>-1</sup>, which is adopted in this tabulation.

R. Colin, P. Goldfinger and M. Jeunehomme, Trans. Faraday Soc. **60**, 306 (1964), have confirmed the selected  $D_0$  (SO) = 123.5 kcal. mole<sup>-1</sup> in their mass spectrometric studies on the vaporization of CaS, SrS and BaS. J. J. McOravey and W. D. McOravey, loc. cit., reported the dissociation energy to be 127.1 kcal. mole<sup>-1</sup> based on their ultraviolet spectroscopic studies. This value appears to be the  $D_e$  from the minimum of the potential curve which corresponds to  $D_0$  (SO) =  $125 \pm 1.5$  kcal. mole<sup>-1</sup>.

Besides the spectroscopic information, G. St. Pierre and J. Chipman, J. Am. Chem. Soc. **76**, 4787 (1954), have reported  $\Delta H_f^0$  298 = -19 kcal. mole<sup>-1</sup> for the reaction  $0.5 S_2(g) + 0.5 O_2(g) \rightarrow SO(g)$  in the equilibrium study of lime-iron oxide slags with SO<sub>2</sub> or SO<sub>2</sub>-CO mixtures. Using  $\Delta H_f^0$  298 (S<sub>2</sub>(g)) = 30.8 kcal. mole<sup>-1</sup>, the derived heat of formation,  $\Delta H_f^0$  298 (SO; g) = -3.6 kcal. mole<sup>-1</sup> was obtained. However, this value is doubtful because the reported  $\Delta H_f^0$  298 = -19 kcal. mole<sup>-1</sup> was dependent upon many assumptions and subsidiary data. E. W. Dewing and P. D. Richardson, Trans. Faraday Soc. **54**, 679(1958) have measured the equilibrium constants for the reaction  $S_2(g) + 2SO(g) \rightarrow 4SO(g)$  at 1250°C. and  $SO_2(g) \rightarrow SO(g) + 1/2 O_2(g)$  at 1500°C. Using the JANAF auxiliary data, the former yields  $\Delta H_f^0$  298 (SO; g) = +0.13 kcal. mole<sup>-1</sup> and the latter -0.17 kcal. mole<sup>-1</sup>, respectively. The average of these two values is  $\Delta H_f^0$  298 = 0 kcal. mole<sup>-1</sup>. Although D. Meschi and R. Myers, J. Mol. Spectry. **3**, 405 (1959) and U. Blukis and R. Myers, J. Phys. Chem. **69**, 1154 (1965), have certainly concluded in their microwave spectroscopic studies that the SO species was one of the important products in the Sulfur - SO<sub>2</sub> equilibrium which was considered as unimportant by Dewing and Richardson, the value,  $\Delta H_f^0$  298 (SO; g) = 0 kcal. mole<sup>-1</sup>, derived from Dewing and Richardson is still very close to the selected value,  $\Delta H_f^0$  298 (SO; g) = 1.64 kcal. mole<sup>-1</sup>.

## Heat Capacity and Entropy.

The molecular constants  $\omega_e$ ,  $\omega_e x_e$  and  $\alpha_e$  were obtained from R. Norrish and G. Oldershaw, loc. cit., and the values of  $r_e$  and  $B_e$  were recently measured in the microwave spectrum by F. X. Powell and D. R. Lide, Jr., J. Chem. Phys. **41**, 1413 (1964).

Point Group C<sub>2v</sub>  
 S<sub>298.15</sub> = 63.8 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 S<sub>298.15</sub> = [-13.5 ± 8] kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> = [-13 ± 8] kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = [-13.5 ± 8] kcal. mole<sup>-1</sup>

Vibrational Frequencies and Degeneracies  
 (μ, cm.<sup>-1</sup>)  
 679 (1)  
 388 (1)  
 1165 (1)

Bond Distance: S-S = 1.884 Å S-O = 1.465 Å  
 Bond Angle: S-S-O = 118°  
 Product of the Moment of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 6.27441 X 10<sup>-115</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.  
 There is no direct measurement of the standard enthalpy of formation for S<sub>2</sub>O(g). U. Blukis and R. Myers, J. Phys. Chem., 69, 1154 (1965), have discussed the discrepancy of the value of ΔH<sub>f</sub><sup>o</sup> which vary from -1 to -35 kcal. mole<sup>-1</sup>. R. Hsgmann, Compt. Rend., 225, 1102 (1962), reported ΔH<sub>f</sub><sup>o</sup> = -17 kcal. mole<sup>-1</sup> from his ionization and appearance potential measurements by mass spectrometry. R. Steudel and P. W. Schenk, Z. Physik Chem., 43, 33 (1964), estimated the enthalpy of formation as -22.7 kcal. mole<sup>-1</sup>. If the bond dissociation energies D<sub>0</sub>(S-O) = 123.5 kcal. mole<sup>-1</sup> and D<sub>0</sub>(S-S) = 103 kcal. mole<sup>-1</sup> were used to estimate the dissociation energy of S<sub>2</sub>O (i.e. D<sub>0</sub>(S<sub>2</sub>O) = 224.5 kcal. mole<sup>-1</sup>), one will obtain ΔH<sub>f</sub><sup>o</sup> = -35.3 kcal. mole<sup>-1</sup>. A. V. Jones, J. Chem. Phys., 16, 1263 (1950), reported the predissociation energy, 91 kcal. mole<sup>-1</sup>, for sulfur monoxide from the infrared and ultraviolet spectra. [D. Meschi and R. Myers, J. Mol. Spectro., 3, 405 (1959), have concluded from their experiment that the so called sulfur monoxide is S<sub>2</sub>O.] Therefore, if 30(g) + S(g), were the dissociation products, the ΔH<sub>f</sub><sup>o</sup> would be -25.4 kcal. mole<sup>-1</sup>; and if S<sub>2</sub>(g) + O(g) were the products, the ΔH<sub>f</sub><sup>o</sup> would be -1.2 kcal. mole<sup>-1</sup>. (All JANAF auxiliary data used in calculation.)

E. Dewing and P. Richardson, Trans. Faraday Soc., 54, 679 (1958), have investigated the gas phase equilibria in the sulfur-oxygen vapor at 1250° and 1500°C respectively. U. Blukis and R. Myers (loc. cit.) recalculated their data based on the assumption that the S<sub>2</sub>O (instead of SO) was the major product in the equilibrium, and obtained ΔH<sub>f</sub><sup>o</sup> = -13 kcal. mole<sup>-1</sup> for S<sub>2</sub>O(g) which is adopted in this table.

Heat Capacity and Entropy.  
 The bond distance, angle, and vibrational frequencies were obtained from the microwave and infrared spectra measurements by D. Meschi and R. Myers, loc. cit., and U. Blukis and R. Myers, loc. cit. The three principal moments of inertia are I<sub>A</sub> = 2.0219 X 10<sup>-39</sup>, I<sub>B</sub> = 16.6342 X 10<sup>-39</sup> and I<sub>C</sub> = 18.6560 X 10<sup>-39</sup> g. cm.<sup>2</sup>

Dec. 31, 1960; Sept. 30, 1963; Sept. 30, 1967

Heat of Formation

The adopted value is based on equilibrium data summarized below. The more reliable results from three different reactions lie in the range from about -73 to -26 kcal/mol. Extreme values, including -70 and -32 kcal/mol, can be discounted on experimental grounds. Margrave (1) recently reported ΔH<sub>f</sub><sup>298</sup> = 82.8 ± 1.5 kcal/mol for 0.5SiO<sub>2</sub>(s) + 0.5Si(s) = SiO(g), but details are not yet available. Assuming that this corresponds to reaction A below, we calculate ΔH<sub>f</sub><sup>298</sup> = -25.4 kcal/mol. Reaction A involves the nominal composition SiO(s) which is treated as an intimate mixture of 0.5Si(c) + 0.5SiO<sub>2</sub>(high cristobalite). X-ray studies (13, 14) suggest that the condensed "SiO" used in (4, 5) is probably a mixture of Si and amorphous or vitreous SiO<sub>2</sub>. The adopted ΔH<sub>f</sub><sup>298</sup> corresponds to D<sub>0</sub><sup>0</sup> = 190 ± 3 kcal/mol. This may be compared with D<sub>0</sub><sup>0</sup> = 179 kcal/mol obtained by linear Birge-Sponer extrapolation of the ground state vibrational constants and with D<sub>0</sub><sup>0</sup> = 185 ± 7 kcal/mol obtained by Barrow (15) from D<sub>0</sub><sup>0</sup>(LiX) = 77.5 kcal/mol for the excited state at 5280 cm<sup>-1</sup>. Barrow assumed D<sub>0</sub><sup>0</sup>(LiX) = 0.456 based on related molecules.

\*Starting material was "SiO"  
\*\*Starting material was SiO<sub>2</sub>(g) + Hg(g) = HgO(c) + SiO(g)  
\*\*\*Starting material was tridymite  
C. SiO<sub>2</sub>(high cristobalite) = 0.5O<sub>2</sub>(g) + SiO(g)  
D. SiO<sub>2</sub>(g) + Hg(g) = HgO(c) + SiO(g)

Heat Capacity and Entropy

All constants for the ground state and the A<sup>1</sup>Π state at 42640 cm<sup>-1</sup> are taken from the analysis of the A-X system reported by Lagyarvitz (16). An intercombination transition has been observed and assigned as 1<sup>1</sup>Σ<sup>+</sup> ← 1<sup>1</sup>Π, by Verma (17). The value of the a-X excitation energy is unknown but is estimated here as 30000 ± 5000 cm<sup>-1</sup> by comparison with the a and A states of CO and ACl. Several additional excited states are known (15, 16) to lie near or above the A state, but they are omitted because their contribution to the thermal functions is negligible.

$\Delta H_f^\circ = -123.48 \pm 1$  kcal/mol  
 $\Delta H_f^\circ_{298.15} = -124.19 \pm 1$  kcal/mol  
 $\Delta H^\circ = 0.83$  kcal/mol  
 $\Delta H^\circ_{298.15} = 128 \pm 10$  kcal/mol

$S^\circ_{298.15} = [12.2]$  gbbv/mol  
 $T_b = 1264^\circ K$

Heat of Formation.

O. L. Humphrey, *J. Am. Chem. Soc.* **73**, 1587 (1951), determined the heat of combustion  $\Delta H_{f,298}^\circ = -101.61 \pm 0.12$  kcal/mol for the reaction  $TiO(\alpha) + 1/2O_2(g) = TiO_2(\text{rutile})$ . Based on this result and on  $\Delta H_{f,298}^\circ(\text{rutile}) = -225.8 \pm 1$  kcal/mol, the adopted  $\Delta H_{f,298}^\circ$  for  $TiO(\alpha)$  is calculated to be  $-124.19 \pm 1$  kcal/mol. A value of  $-125.4 \pm 0.4$  kcal/mol was reported by S. M. Ariya, M. P. Morozova and E. Vol'f, *Russ. J. Inorg. Chem. (English Transl.)* **2**, 16 (1957), who measured the heats of combustion of various compositions in the Ti-O system. Ariya et al. used an estimated correction for the formation of  $TiO_2 \cdot x$ , while Humphrey obtained values of 0.2 - 0.4 kcal/mol by grinding the product and reburning it with white oil. Most of the assigned uncertainty arises from this problem of non-stoichiometry [see  $TiO_2(\text{rutile})$  for further details].

Heat Capacity and Entropy.

The high temperature heat capacities, 52.6 - 296.3°K, were measured by C. H. Shomate, *J. Am. Chem. Soc.* **68**, 310 (1946). The high temperature enthalpies, 357.0 - 1771°K, were determined by B. F. Naylor, *J. Am. Chem. Soc.* **69**, 1077 (1946), by use of drop calorimetry. The high temperature Cp, 357 - 1200.5°K, derived from the enthalpy data, are joined smoothly with the low temperature heat capacities at 298°K. The Cp values above 1200°K are obtained by extrapolation. The entropy is obtained from Cp using  $S^\circ_0 = 4.13$  eu; this extrapolation includes 0.23, 1.7 and 2.2 eu for contributions of the lattice, of vacancies and of spin magnetic effects, respectively.

P. W. Odiles, *J. Chem. Phys.* (in press), discussed the inconsistencies in the thermodynamic properties of TiO as derived from widely different measurements. These inconsistencies include (1) a difference of 10 kcal/mol in  $H^\circ$  values for  $TiO(g)$  obtained from vaporization of  $TiO$  and  $Ti_2O_3(2)$  a difference of about 10 kcal/mol between the calorimetric data for  $TiO(\beta)$  and a recent re-assessment of the partial free energy of dissociation for the TiO system, and (3) enthalpy data which suggest that the entropy of  $TiO(\beta)$  should be increased relative to those of  $Ti$  and  $Ti_2O_3$ . In order to minimize these discrepancies, we tentatively increase the experimental value of  $S^\circ_{298}$  by addition of estimated contributions due to vacancies in the crystal lattice and to spin-magnetic effects of  $Ti^{2+}$  ion.

P. Ehrlich, *Z. Elektrochem.* **45**, 362 (1959) and Z. Anorg. Chem. **247**, 53 (1941), concluded from the difference in pycnometric and x-ray densities of  $TiO(\beta)$  that about 45 percent of the Ti and O lattice sites are vacant. This was confirmed later by S. Anderson, B. Colleen, U. Kuylenstierna and A. Magnali, *Acta. Chem. Scand.* **11**, 1641 (1957), A. D. Pearson, *J. Phys. Chem. Solids* **5**, 316 (1958), and M. E. Straumanis and H. W. Li, *Z. Anorg. Allgem. Chem.* **305**, 143 (1960). Anderson et al. noted that there may be a "close structural kinship" between the  $\alpha$  and  $\beta$  forms, based on the similarity of their densities and the pronounced relationship between their powder diffraction patterns. The authors suggested that the (presumably) random vacancies in  $TiO(\beta)$  may occur in an ordered way in  $TiO(\alpha)$ . Recent electron diffraction studies by J. M. Cowley, *Acta Cryst.* (to be published), may provide an answer to this problem. Assuming the vacancies to be randomly arranged, we estimate the residual entropy of  $TiO(\alpha)$  due to vacancies as  $-2R(0.85 \ln 0.85 + 0.15 \ln 0.15) = 1.7$  eu, based on the method proposed by M. Hoch, A. S. Iyer and J. Neiken, *J. Phys. Chem. Solids* **23**, 1463 (1962). An alternative possibility for increasing the entropy of  $TiO(\beta)$  is discussed in the Transition Data section of the table for  $TiO(\beta)$ .

Metallic-type conductivity of  $TiO(\alpha)$  at temperatures 80 - 1000°K was reported by A. D. Pearson, loc. cit., and P. J. Morin, *Phys. Rev. Letters* **3**, 34 (1959). This led J. B. Goodenough, *Phys. Rev.* **117**, 1442 (1960), to suggest the existence of strong cation-cation interactions and the possibility of a low temperature transformation of the martensitic or antiferromagnetic type. Goodenough noted that the isolectric compound Vn becomes superconducting below 8.2°K. We approximate the entropy contribution of these various possibilities at 50°K by a spin-magnetic term of  $R \ln 3 = 2.2$  eu.

Transition Data.

See  $TiO(\beta)$  table.

Heat of Sublimation.

The difference between  $\Delta H_{f,298}^\circ$  for  $TiO(g)$  and  $TiO(\alpha)$  is  $\Delta H_{f,298}^\circ$ .

TITANIUM MONOXIDE, BETA ( $\beta$ -TiO) (CRYSTAL)  
 $S_{298}^{\circ} = 12.372$  e.t.u./mole  
 $T_f = 1264^{\circ}K$   
 $T_m = 2023^{\circ}K$   
 $\Delta H_f^{\circ} = 123.872$  kcal/mol  
 $\Delta H^{\circ} = 0.85$  kcal/mol  
 $\Delta S_m^{\circ} = 13$  kcal/mol

Heat of Formation.  
 The  $\Delta H_f^{\circ}(\beta)$  is obtained from  $\Delta H_f^{\circ}(\alpha)$  by adding  $\Delta H^{\circ}$  and the difference between  $H_{1264}^{\circ}$  -  $H_{298}^{\circ}$  for TiO( $\alpha$ ) and TiO( $\beta$ ).

Heat Capacity and Entropy.

High temperature enthalpies, 1273 - 1771°K, have been measured with a drop calorimeter by B. F. Naylor, J. Am. Chem. Soc. 68, 1077 (1946). The adopted heat capacities are derived from these data, assuming the final state to be TiO( $\alpha$ ). This problem is discussed in the Transition Data section. Cp values below 900°K are assumed to be the same as those for TiO( $\alpha$ ). The heat capacities at temperatures 900 - 1273°K and above 1771°K are obtained by extrapolation.

The  $S_{298}^{\circ}$  is derived in a manner analogous to that of the heat of formation.

Transition Data.

Tt and  $\Delta H^{\circ}$  are derived from the enthalpy data of Naylor, loc. cit., assuming that TiO( $\alpha$ ) is the final state of the drop experiment. The X-ray studies of C. C. Wang and N. J. Grant, J. Metals 5, 184 (1956), and A. D. Pearson, J. Phys. Chem. Solids 5, 316 (1956), appear to contradict this assumption. These authors found that the  $\alpha$  form of stoichiometric TiO was obtained at room temperature only by annealing the  $\beta$  phase for long periods below 1223°K. Samples quenched from temperatures of 1223°K or higher retained the NaCl structure of the  $\beta$  form. Since the drop calorimetric experiment is similar to quenching, it is possible that the final state was mostly the  $\beta$  form. If this is the case, then the derived values of  $\Delta H^{\circ}$  and  $\Delta S^{\circ}$  are probably much too small. This would be an alternative means for increasing the entropy of TiO( $\beta$ ). It is possible, however, that differences in particle size allowed Naylor's sample to drop to the  $\alpha$  form, or that the  $\beta$  form was stabilized by impurities in the X-ray studies. Further experiments are desirable in order to resolve this question. Also related to the question is the fact that the structure of TiO( $\alpha$ ) has not been reported, probably because the X-ray diffraction pattern is quite complex.

P. G. Wehbeck and P. W. Gilles, J. Am. Ceram. Soc. 49, 180 (1966), reviewed the phase data and presented the most current phase diagram for the Ti-O system. This diagram suggests that stoichiometric TiO( $\alpha$ ) starts to transform near 1210°K with formation of the two phases TiO<sub>1+x</sub>( $\beta$ ) and Ti<sub>2</sub>O. Transformation to stoichiometric TiO( $\beta$ ) is complete near 1270°K, which is essentially the Tt chosen by Naylor. This behavior is consistent with Naylor's observation of "pre-transition effects" in the enthalpy between 1224 and 1264°K.

Melting Data.

See TiO(1) table for details.

(LIQUID)

GFW = 63.8994

ΔHf°298.15 = [-112.801] kcal/mol  
 ΔHm° = [13] kcal/mol  
 ΔHv° = [91.6] kcal/mol

S°298.15 = [14.235] gibbs/mol  
 Tm = 2023°K  
 T0 = [3934] °K

Heat of Formation.

The value of ΔHf°298 for TiO(l) is obtained from that of TiO(β) by adding ΔHm° and the difference between H°2023 - H°298 for TiO(β) and TiO(l).

Heat Capacity and Entropy.

The heat capacity for TiO(l) is estimated on the basis of 8 cal/g-atom. S°298 is obtained in a manner analogous to that of the heat of formation.

Melting Data.

Tm is taken from W. Dawhl and K. Schröter, Z. Anorg. Allgem. Chem. 233, 178 (1937). The heat of melting is estimated by comparison with that of VO(c) reported by C. E. Wicks and P. E. Block, U. S. Bur. Mines Bull. 605, 1963.

Tm has also been reported as 2023 and 2103°K by H. Nishimura and H. Kimura, J. Japan Inst. Metals (Sendai) 20, 569 (1954), and R. DeVries, R. Roy, and E. Osborne, Trans. Brit. Ceram. Soc. 53, 525 (1954), respectively. According to the Ti-O phase diagram reported by P. G. Wahlbeck and P. W. Gilles, J. Am. Ceram. Soc. 49, 180 (1966), TiO melts incongruently.

Vaporization Data.

Tb is calculated as the temperature at which the Gibbs energy change of the reaction TiO(l) = TiO(g) approaches zero. The difference between ΔHf° for TiO(g) and TiO(l) at Tb is ΔHv°.

| T, °K | Cp <sup>o</sup> | $\frac{g\text{ cal}}{\text{mole} \cdot \text{mole}} \cdot \text{mole}^{-1}$ | $-(C^o - H^o_{298})/T$ | $H^o - H^o_{298}$ | $\frac{\text{kcal}}{\text{mole}}$ | $\Delta H^o$ | $\Delta G^o$ | Log Kp   |

## Heat of Formation.

P. W. Ollies, *J. Chem. Phys.* (to be published), has discussed the difference of about 10 kcal/mol in the dissociation energies of TiO(g) obtained from vaporization of Ti<sub>2</sub>O<sub>3</sub>(s) and TiO(s). By mass spectrometric and Knudsen effusion techniques, P. O. Wahlbeck and P. W. Ollies, *J. Chem. Phys.* 45, 2465 (1967), studied congruently vaporizing Ti<sub>2</sub>O<sub>3</sub>(s) and derived D<sup>o</sup>(TiO, g) = 7.26 ± 0.10 eV. Values of 6.89, 6.93 and 6.8 eV were derived from incongruently vaporizing TiO(s) in earlier studies reported by Q. D. Wheatley, Ph. D. Thesis, University of Kansas, 1954; W. O. Oroves, M. Hoch, and H. L. Johnson, *J. Phys. Chem.* 59, 127 (1955); and J. Berkowitz, W. A. Chupke, and M. O. Inghram, *J. Phys. Chem.* 61, 1569 (1957). A spectroscopic value of 6.8 eV is obtained by Birge-Sponer extrapolation of the vibrational constants given on this table. Related discrepancies are listed in the Heat Capacity and Entropy section of the table for TiO(g). O. Herzberg, "Spectra of Diatomic Molecules," D. Van Nostrand Co., Inc., New York, 1950, reported D<sup>o</sup> = 6.9 eV.

In order to minimize these discrepancies, we tentatively increase the entropy of TiO(g) [see TiO(g) table for details] and re-evaluate the vapor pressure data by the second and third law methods. The results are given in the table below. Values derived from TiO(s) are uncertain due to excess oxygen in the condensed phase; e.g., the sample of Oroves et al. contained an excess of about 3%. Our analysis assumes that the activity of TiO is unity in the actual condensed phase. The value of ΔHf<sup>o</sup>(TiO, g) adopted is 3.75 ± 5 kcal/mol.

| Investigator     | Reaction | Temperature, °K | No. of Points | ΔHf <sup>o</sup> <sub>298</sub> , kcal/mol | Drift, kcal/mol    |
|------------------|----------|-----------------|---------------|--|--------------------|

| Berkowitz et al. | (B)      | 2071, 2072      | 2             | 139.4**                                    | 129.4              |

\*Calculation based on the third law ΔHf<sup>o</sup><sub>298</sub> value. The corresponding D<sup>o</sup>(TiO, g) values are 167.83, 166.75

and 166.05 kcal/mol.

\*\*Average end law value from ion intensities.

## Heat Capacity and Entropy.

The electronic spectrum of TiO(g) consists of both singlet and triplet systems with near-degenerate low-lying states. The lowest-lying triplet was originally thought to be <sup>3</sup>T<sub>1</sub> by Herzberg, loc. cit., B. Rosen, "Selected Constants," Hermann & Co., Paris, 1951, and J. O. Phillips, *J. Astrophys. J.* 115, 567 (1952); *ibid.*, 119, 274 (1954), but has been reidentified as <sup>3</sup>A<sub>1</sub> by U. Uhler, Dissertation, University of Stockholm, Sweden, 1954, and W. Walther, Jr. and D. McLeod, Jr., *J. Phys. Chem.* 65, 3468 (1965). The values of the three lowest electronic levels and quantum weights are obtained from Herzberg. A <sup>8</sup>A<sub>1</sub> state lying about 581 cm<sup>-1</sup> above the ground state was reported by Phillips, loc. cit. A. V. Pettersson and B. Lindgren, *Arkiv Fysik* 22, 491 (1962); A. V. Pettersson, *ibid.*, 16, 185 (1959), reported two electronic states, d<sup>1</sup><sup>1</sup><sub>Σ</sub> and b<sup>1</sup><sup>1</sup><sub>Π</sub>, at 1708.0 and 10814.4 cm<sup>-1</sup> above <sup>3</sup>A<sub>1</sub> thus, the values of 2289 and 11395.4 are derived. The next two electronic levels, <sup>3</sup>E<sub>g</sub> and <sup>3</sup>H<sub>g</sub>, are obtained from Weitzner et al., and the value <sup>1</sup>E<sub>g</sub> = 18502 cm<sup>-1</sup> is obtained from Rosen. The last three levels and the values of w<sub>0</sub>, α<sub>e</sub>, B<sub>e</sub>, r<sub>e</sub> and r<sub>e</sub> are taken from Herzberg, loc. cit. The moment of inertia is 5.226 × 10<sup>-39</sup> g cm<sup>2</sup>.

The rather thorough studies of the emission spectra of TiO(g) have been summarized by R. W. B. Pearse and A. O. Gaydon, "The Identification of Molecular Spectra," 3rd Ed., John Wiley & Sons, Inc., New York, 1963, and A. Gatterer, J. Junkes, E. W. Salpeter, and B. Rosen, "Molecular Spectra of Metallic Oxides," Vatican Press, Vatican City, 1957.

Heat of Formation

The heat of formation,  $\Delta H_f^\circ(298, \text{WO}(g)) = 101.6$  kcal/mol, was derived from the heat of reaction,  $\Delta H_r^\circ(298) = -42.0$  kcal/mol for  $\text{WO}(g) \rightarrow \text{W}(c) + \text{O}(g)$  with all JANAF auxiliary data. The value of  $\Delta H_f^\circ(298)$  was calculated by the third law method from the partial pressure data, which were determined mass-spectrometrically in the temperature range 2188° to 2475°K, by G. DeWarris, R. P. Burns, J. Drowart and M. G. Inghram, J. Chem. Phys. 32, 1373 (1960). The drift in the third law analysis was  $\pm 20 \pm 7$  eu.

Heat Capacity and Entropy

The fundamental vibrational frequency, the ground state configuration, and the probable electronic levels for tungsten monoxide (g) were obtained from the infrared and ultraviolet spectroscopic investigations by matrix isolation by W. Weitzer, Jr., and D. McLeod, J. Mol. Spectry, 11, 275 (1965). The rotational constant  $B_e$  was calculated from an estimated bond distance,  $r_e = 1.81 \text{ \AA}$ . The value of  $x_e$  was calculated from the relation  $x_e = 0.014$  which was given by R. F. Barrow and A. D. Caunt, Proc. Roy. Soc. (London) 219A, 120 (1953). The constant, 0.014, was estimated, based on those for  $\text{ZrO}(g)$  and  $\text{VO}(g)$ . The value of  $a_e$  was calculated from the Morse potential function.

## Heat of Formation.

The  $\Delta H_f^o$  298.15 = 14.0 ± 12 kcal. mole<sup>-1</sup> was calculated from the  $\Delta H_f^o$  298.15 = 290.342 ± 12.8 kcal. mole<sup>-1</sup> for the reaction Zr(c) + ZrO<sub>2</sub>(c) = ZrO(g). The value of  $\Delta H_f^o$  298.15 was obtained by the third law analysis from the mass spectrometric studies of M. A. Chupka, J. Berkowitz and M. G. Inghram, J. Chem. Phys. 28, 1207 (1957). They observed the variation of the ZrO<sup>+</sup> ion intensity over the system Zr + ZrO<sub>2</sub> and reported equilibrium constants for the reaction Zr + ZrO<sub>2</sub> → ZrO in the range 2124-2322°K. The third law drift is -58 ± 26 e.u.

## Heat Capacity and Entropy.

The ground state of ZrO(g) was assumed to be  $1\Sigma^+$  as determined from the matrix isolation spectra of W. Weltner, Jr., and D. McLeod, Jr., J. Phys. Chem. 69, 3488 (1965). Previously this had been described as the lower state in the A band system reported by V. Uhler and L. Akerlind, Arkiv Fysik 10, 431 (1955).

All molecular constants were obtained from Uhler and Akerlind, loc. cit., except  $\omega_e = 978 \text{ cm.}^{-1}$  and  $\omega_e x_e = 4 \text{ cm.}^{-1}$  which were calculated from  $\omega$  and  $\omega_e = 0.0023 \text{ cm.}^{-1}$  using the equations

$$\omega_e x_e = \frac{6 \sqrt{\omega_e x_e} \cdot B^3}{\omega_e} - \frac{6 B^2}{\omega_e} \quad \text{and} \quad \omega = \omega_e - 2 \omega_e x_e = 969.76 \text{ cm.}^{-1}$$

The higher electronic levels were obtained or estimated from the correlation diagram given by Weltner and McLeod, loc. cit.

ω<sub>e</sub> = 0.0158 cm.<sup>-1</sup> r<sub>e</sub> = 1.2074 Å

Heat of Formation.

The heat of formation (ΔH<sub>f</sub><sup>0</sup>) for O<sub>2</sub>(g) is zero at all temperatures, by definition.

Heat Capacity and Entropy.

The functions adopted here are based on those of H. W. Woolley, J. Research, Nat. Bur. Standards 40, 163 (1948), who used a direct summation to 5000°K. The spectroscopic constants used were the same as those listed by O. Herzberg, Spectra of Diatomic Molecules, D. Van Nostrand Co., 1950. Raman measurements of rotation-vibration levels by A. Haber and E. A. McGinnis, J. Molec. Spect., 4, 195 (1960), support the constants selected by Herzberg which were changed on this table to apply to the naturally occurring isotopic composition given by D. Stromlinger, J. M. Hollander, and T. Seaborg, Rev. Mod. Phys. 30, 585 (1958).

The entropies listed by Woolley were reduced by 0.0065 cal. deg.<sup>-1</sup> mole<sup>-1</sup> which was added by Woolley to account for the contribution due to the presence of both odd and even rotational levels in O<sub>2</sub><sup>16</sup> and O<sub>2</sub><sup>16</sup> molecules. This correction is not necessary when isotope mixing entropy is neglected, cf. W. F. Clauque and R. Overstreet, J. Am. Chem. Soc. 54, 1731 (1932).

| T, °K | Cp°   | h <sub>h</sub> (kcal/mol) | S°     | -(h <sub>h</sub> ° - H° <sub>300</sub> )/T | H° - H° <sub>300</sub> | ΔHf°   | ΔGf°   | Log Kp |

Heat of Formation.

The electron affinity of O<sub>2</sub>(g) has been measured in the electron detachment experiments of J. L. Pack and A. V. Phelps, J. Chem. Phys. 44, 1870 (1966). The value reported is 0.43 ± 0.02 eV (9.92 ± 0.46 kcal/mol) which is in good agreement with the value 0.46 ± 0.10 eV selected by C. W. Beckett and E. C. Casady, Natl. Bur. Std. Report 8628, Jan. 1, 1965.

Heat Capacity and Entropy.

J. Holfo, J. Chem. Phys. 40, 1664 (1964), has deduced from fluorescence emission spectra of O<sub>2</sub><sup>-</sup> in alkali halides, the vibrational constants and an excited electronic level. The <sup>2</sup>Π<sub>g</sub> ground state is that predicted by molecular orbital theory and the first excited state should also be <sup>2</sup>Π<sub>g</sub>. By analogy with Cl<sub>2</sub><sup>-</sup>, which is isoelectronic, the first excited level is estimated to lie in the 20000 - 30000 cm<sup>-1</sup> region. Thus, the level observed by Rolfe is assumed to be the first excited <sup>2</sup>Π<sub>u</sub> state. The bond length is taken from F. R. Ollmore, The Rand Corporation, Memorandum RM-4034-1-PR, AD 630997.  $E_0$  was calculated from the bond length and  $\alpha_e$  was estimated from the above quantities using the Morse potential function relation.

The enthalpy at 0°K is -2.086 kcal/mol.

Phosphorus Dioxide (PO<sub>2</sub>)

(Ideal Gas) Mol. Wt. = 62.975

Angle O-P-O = 134° 4'

P-O distance = 1.485 Å

I<sub>A</sub> = [10.81 X 10<sup>-39</sup>] g. cm.<sup>2</sup>

I<sub>B</sub> = [9.933 X 10<sup>-39</sup>] g. cm.<sup>2</sup>

I<sub>C</sub> = [0.977 X 10<sup>-39</sup>] g. cm.<sup>2</sup>

Heat of Formation. ΔH<sub>f</sub><sup>o</sup> 298.15 was calculated from an estimated heat of dissociation (270 ± 25 kcal. mole<sup>-1</sup>) reported by L. Brewer and G. M. Rosenblatt, Chem. Reviews, 61, 257 (1961).

Heat Capacity and Entropy. The molecular constants selected for this table were estimated by J. S. Gordon. The molecular constants for PO<sub>2</sub>(g) have been estimated by (1) J. S. Gordon, "Thermodynamic Data for Combustion Products," January 1960, Thiokol Chemical Corp., Reaction Motor Division, Denville, N. J. (2) R. L. Potter, V. N. DiStefano and S. N. Fox, "The Thermodynamic Functions of Some Combustion Products Containing Phosphorus-I," American Cyanamid Company and (3) C. B. Henderson and R. S. Scheffer, "Survey of Thermochemical Data," January 1960, Atlantic Research Corp., Alexandria, Virginia. The entropies at 3000° calculated from these three estimates differ by less than 0.8 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Lead Dioxide (PbO<sub>2</sub>) (crystal)

Mol. Wt. = 239.21

ΔH<sub>f</sub><sup>o</sup> 298.15 = -64.55 ± 0.16 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = 18.3 ± 0.5 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Heat of Formation. Recalculated from ΔH<sub>f</sub><sup>o</sup> 298.15 = 12.14 kcal. mole<sup>-1</sup> for the reaction: PbO(c) + 1/2O<sub>2</sub>(g) = PbO<sub>2</sub>(c) reported by M. Tschelizow, Compt. rend., 100, 1458 (1885).

Heat Capacity and Entropy. C<sub>p</sub> (69.9° to 297.2°K.) reported by R. W. Miller, J. Am. Chem. Soc. 51, 207 (1929). Above 298.15°K., the heat capacity value estimated by K. K. Kelley, U. S. Bur. Mines Bull. 594 (1960) was used. The two heat capacity curves were joined smoothly at 298.15°K. by graphical extrapolation.

Heat of Formation

J. R. Eckman and P. D. Rossini, J. Research Nat. Bur. Standards **5**, 587 (1929), measured the heat of combustion of rhombic sulfur to SO<sub>2</sub>. Changes due to different atomic weights and electrical constants though negligible have been made.

Heat Capacities and Entropies

The functions were calculated by J. Gordon, private communication, Feb. 2, 1961, using the method of R. E. Pennington and K. A. Kobe, J. Chem. Phys. **22**, 1442 (1954). Structural parameters are given by M. H. Sirvatk, J. Chem. Phys. **19**, 938 (1951), obtained from microwave measurements. Frequencies were measured by R. D. Shelton, A. H. Meisen, W. H. Fletcher, J. Chem. Phys. **21**, 2178 (1953) and *ibid.*, **22**, 1791 (1954). A third law value of S<sub>298.15</sub> = 59.24 cal. deg.<sup>-1</sup> mole<sup>-1</sup> was obtained by W. F. Olanqua and C. C. Stevenson, J. Am. Chem. Soc. **50**, 1389 (1928).

$S_{298.15}^\circ = 9.91 \pm 0.03$  gibbs/mol  
 $Tf_1 = 847 \pm 1.5^\circ K$  (low quartz  $\rightarrow$  high quartz)  
 $Tf_2 = 1079 \pm 250^\circ K$  (high quartz  $\rightarrow$  high cristobalite)  
 $Tm = 1696 \pm 50^\circ K$  (high quartz + liquid)

## Heat of Formation

The heat of formation is based on data of Wise (1) for combustion of SiO<sub>2</sub> (low quartz) and Si(c) in F<sub>2</sub> to form SiF<sub>4</sub>(g). Good (2) burned a mixture of Si(c) and vinylidene fluoride polymer in oxygen in the presence of HF(aq) to form H<sub>2</sub>SiF<sub>6</sub>(aq HF). Combining this result with a previous heat of solution of quartz (3), the authors derived  $\Delta Hf_{298}^\circ = -217.5 \pm 0.5$  kcal/mol. Agreement with the adopted value is excellent, considering the complexity of the latter scheme. Both schemes are independent of  $\Delta Hf^\circ$  (HF), although the polymer-Si scheme depends on the heat of dilution of HF(aq). Wise (1) has reviewed other data which confirm the adopted value rather than the oxygen combustion value (4) of  $-209.9$  kcal/mol. Pertinent equilibrium data are analyzed on the table for SiO<sub>2</sub> (low cristobalite), while the calorimetric results are summarized below.

## Heat Capacity and Entropy

Heat capacities below 300°K are based on data of Jones (5) and Westrum (6). Earlier data of Anderson (7) are in good agreement. The entropy is obtained from Cp\* using  $S_2^\circ = 0.00001$  eu. Cp\* from 300° to 847°K is derived from adiabatic calorimetric data of Moser (8) and SineI'nikov (9). The adopted Cp\* is discontinuous at 847°K and  $\Delta Cp^\circ = -2.17$  gibbs/mol. Values above the transition temperature are based on data of Moser and on data up to 1473°K obtained with a thermal analysis method by Leonidov (10). Cp\* is extrapolated linearly to higher temperatures.

From a review of data available before 1953, Kelley (11) selected almost identical enthalpies below 847°K but a value higher by 96 cal/mol at 900°K. The higher value, due to use of a larger  $\Delta Hf_1^\circ$ , was presumably based on Roth (12), Wietzel (13) and White (14) whose enthalpy data were given the most weight by Kelley. Near 900°K these three sets of data deviate from the adopted function by  $-150$  to  $30$ ,  $+130$  to  $40$  and  $+15$  to  $35$  cal/mol, respectively; however, a recent enthalpy datum (15) obtained by transposed temperature drop calorimetry deviates by  $+75$  cal/mol at  $968^\circ K$ .

## Transition Data

Tf<sub>1</sub> is taken as  $847 \pm 1.5^\circ K$  based on thermal analysis of many specimens by Kieth and Tuttle (16). Wide variations in Tf<sub>1</sub> for some specimens were attributed by the authors to small amounts of impurities. The discontinuity in the volume curve (17) during inversion from trigonal low quartz to hexagonal high quartz suggests that the transition should be treated as first order. Thus, the heat of transition is derived as  $(1011-854)/17 = 174$  cal/mol, where 1011  $\pm$  6 is (H<sub>2</sub>g<sub>73.15</sub> - H<sub>2</sub>g<sub>73.15</sub>) measured by Moser (8), 854 is the corresponding increment calculated from the JANAF Cp\*, and 17 is an endpoint correction for the difference between the observed and adopted curves below 823.15°K. Some of the more recent data which confirm the adopted  $\Delta Hf_1^\circ$  are summarized below.

| Source                | Method                                       | $\Delta Hf_1^\circ$ , kcal/mol  |

Additional polymorphism of SiO<sub>2</sub> is discussed on the table for high cristobalite. Quartz has been superheated through the cristobalite region to some 300° above its metastable melting point. This melting point is calculated from the adopted tables as  $1895 \pm 50^\circ K$ , which agrees well with the range  $1673 - 1723^\circ K$  indicated by the data of Mackenzie (13). The adopted tables predict the inversion of high quartz to high cristobalite at  $1079 \pm 250^\circ K$ . Holmquist (20) tentatively placed this inversion at  $1298 \pm 25^\circ K$ .  $\Delta Hf_2^\circ$  and  $\Delta Hm^\circ$  are calculated from the differences in heats of formation of the appropriate phases at Tf<sub>2</sub> and Tm.

Cristobalite, Low (SiO<sub>2</sub>)  
(CRYSTAL)

GFW = 60.0848

ΔH° = -215.9 ± 0.5 kcal/mol

S°<sub>298.15</sub> = 10.372 ± 0.03 gibbs/mol

Tt = 543 ± 3°K (Low cristobalite + high cristobalite)

ΔHt° = 0.321 ± 0.06 kcal/mol

Heat of Formation

The heat of formation is calculated from that of quartz using ΔHr°<sub>970</sub> = 0.45 ± 0.15 kcal/mol for high quartz + high cristobalite, as determined by Holm(1) from ΔHsoln in an oxide melt. This value reduces to ΔHr°<sub>298</sub> = 0.60 kcal/mol for low quartz + low cristobalite. Kracek(2) obtained essentially the same value, ΔHr°<sub>298</sub> = 0.63 kcal/mol, from ΔHsoln in HF(aq, 74.7°C), while Hummel(3) found ΔHr°<sub>298</sub> = 1.80 kcal/mol from ΔHsoln in HF(aq, 26.5°C). The larger ΔHr° corresponds to a less negative ΔH° (i.e., less stable) and suggests that the sample of Hummel has disorder approaching that of vitreous silica. Presumably, this disagreement arises from different methods of preparation of cristobalite from quartz. Holm heated for 24 hours at 1743°K, while Hummel heated for 4 hours at 1973°K. Hummel's sample was then ground and treated with dilute HF to remove amorphous surface layers created by grinding; particles smaller than 2.5 microns were used in order to obtain adequate rates of dissolution. Neither author gave X-ray or DTA evidence to confirm that the samples were the more stable, ordered form of cristobalite(1).

The calorimetric data are summarized below along with equilibrium data which confirm the adopted values of ΔH° for cristobalite and quartz. Data from Matoba(5) and Rein(6) were reduced to the standard state of Si(ℓ) using activity coefficients from the curves of (10).

\*Values at Tt are from second law analysis while those at 298.15°K are from third law.

- A. SiO<sub>2</sub> (quartz, low or high) = SiO<sub>2</sub> (cristobalite, low or high)
- B. SiO<sub>2</sub> (high cristobalite) + 2H<sub>2</sub>(g) = Si(ℓ) + 2H<sub>2</sub>O(g)
- C. SiO<sub>2</sub> (high cristobalite) + 2C(graph) = Si(ℓ) + 2CO(g)
- D. SiO<sub>2</sub> (high cristobalite) + 2SiC(β) = 3Si(ℓ) + 2CO(g)
- E. SiO<sub>2</sub> (high cristobalite) + 3C(graph) = SiC(β) + 2CO(g)

Heat Capacity and Entropy

Cp\* below 300°K is based on data of Westrum(11). Earlier data of Anderson(12) are in satisfactory agreement. The entropy is obtained from Cp\* using S°<sub>298</sub> = 0.0007 eu. Cp\* above 300°K is derived from enthalpy data of Moesman(13) and White(14). The former deviate from the adopted functions by -0.7 to 0.5 and the latter by +0.44. Although the functions above 300°K appear to be reliable, it would be desirable to have new data for a well-characterized sample (see Transition Data).

Transition Data

Low cristobalite is metastable with respect to quartz but persists up to Tt. Tt is taken as the temperature at the peak in the heating curve for well-ordered cristobalite; however, see (15, 16) for detailed discussions of temperatures about 25° lower which were found from cooling curves. ΔHt° is derived from enthalpy data(13, 14) for high cristobalite using the adopted enthalpy for the low form. The enthalpy data of Moesman(13) gave a lower Tt which suggests that the sample was less well-ordered than desirable. ΔHt° is confirmed, however, by other data which are summarized below. Additional polymorphism is discussed on the table for high cristobalite.

CRISTOBALITE, HIGH (SiO<sub>2</sub>)

S<sup>298.15</sup> = 11.963 gibbs/mol  
 Tt = 543 ± 3°K (low cristobalite + high cristobalite)  
 Tt = 1079 ± 250°K (high quartz + high cristobalite)  
 Tm = 1995 ± 5°K (high cristobalite + liquid)

Heat of Formation  
 The heat of formation is calculated from that of low cristobalite by addition of ΔH<sup>o</sup> = 0.321 kcal/mol and the difference between <sup>1</sup>S<sub>43</sub> - H<sub>298</sub> for low and high forms.

Heat Capacity and Entropy  
 Cp<sup>o</sup>s are derived from enthalpies of Mossman (1) and White (2), whose data deviate from the adopted functions by -0.6 to +0.51 and +0.9 to 0.01, respectively. White's deviations for cristobalite have a magnitude and trend similar to his deviations for quartz and vitreous silica. Data of Wietzel (3) for his sample prepared at 1600°C deviate by +3% at 673°K and -1.6% at 1973°K. Cp<sup>o</sup> below 543°K is smoothly extrapolated to give the proper trend in the Gibbs energy, but the heat capacity at 298°K is not realistic. The entropy is calculated in a manner analogous to that of the heat of formation.

Transition Data

Literature on the polymorphism of SiO<sub>2</sub> is voluminous but is summarized in detail in recent books by Sosman (4) and Eitel (5). The known phases of SiO<sub>2</sub> include quartz, tridymite(?), cristobalite, vitreous silica and the more recently discovered high pressure phases. Muan (6) concisely reviewed the still controversial question of whether tridymite is stabilized only by the presence of foreign ions or whether it is a stable phase of SiO<sub>2</sub> intermediate between quartz and cristobalite. Transitions among the different phases are generally sluggish because of large energy barriers to the structural change and small differences in Gibbs free energies. As a result, the phases often persist far into metastable regions. In contrast, transitions within a particular phase are rapid and reversible (i.e., the low + high inversions of quartz or cristobalite).

High cristobalite is the stable phase near Tm. It becomes metastable with respect to quartz at lower temperatures but persists down to the high + low inversion at 543°K (see table for low cristobalite). The high form is cubic and the low form tetragonal (12, 13).

The adopted tables give 1079±250°K as the temperature at which ΔGr<sup>o</sup> = 0 for high quartz + high cristobalite; which, in turn, is taken from ΔH<sup>o</sup>970 = 0.45±0.15 kcal/mol obtained by Holm (7) from ΔHsoln measurements in an oxide melt. It is apparent that Tt is extremely sensitive to small changes in G or H. Holmquist (8) tentatively placed this inversion at 1298±25°K but did observe cristobalite formation at temperatures as low as 1171°K.

Melting Data

Melting point data were reviewed by Schneider (9) and adjusted to the 1948 International Temperature Scale. The adopted melting point for cristobalite is based on Greig (10). ΔHm<sup>o</sup> is calculated as the difference in ΔHf<sup>o</sup> for liquid and crystal at Tm. Mackenzie et al. (11) showed that cristobalite may be superheated by as much as 40° above Tm due to its slow rate of fusion.

Silicon Dioxide (SiO<sub>2</sub>)

(Liquid) GFW = 60.0848

SILICON DIOXIDE (SiO<sub>2</sub>)

(LIQUID)

GFW = 60.0848

$\Delta H_f^{\circ} = 11.485 \pm 0.3$  gibbs/mol

$\Delta H_m^{\circ} = 2.29 \pm 0.5$  kcal/mol

Heat of Formation

The heat of formation is calculated from that of quartz using  $\Delta H_f^{\circ} = 1.45 \pm 0.15$  kcal/mol for high quartz + SiO<sub>2</sub>(l), as determined by Holm (1) from within in an oxide melt. This value reduces to  $\Delta H_f^{\circ} = 1.96$  kcal/mol for low quartz + SiO<sub>2</sub>(l) and is consistent within  $\pm 0.3$  kcal/mol with other calorimetric data summarized below. Earlier results were reviewed by Hummel (4).

Heat Capacity and Entropy

Cp° below 300°K is based on data of Flubacher (5) and Westrum (6) for samples annealed at 1100 and 1070°C, respectively. Data of Turdakin (7) are higher by about 1 percent in the range 60-160°K and at 300°K but are in agreement elsewhere. The entropy is calculated from Cp° using  $S_2^{\circ} = 34.34 - S_0^{\circ} = 0.0001$  eu and  $S_0^{\circ} = 1.038$  eu. Cp° data (E) for a different sample annealed at 1300°C yield an entropy larger by <0.04 eu. Earlier data were reviewed by Kelley (8). The residual entropy is calculated from  $S_0^{\circ} = S_{298}^{\circ} - (S_0^{\circ} - S_{298}^{\circ}) = 41.258 - 40.160 = 1.098$  eu, where 40.160 is obtained from the adopted functions, while 41.258 is the sum of  $\Delta S_m^{\circ} = 1.147$  eu and  $S_0^{\circ} = 40.111$  eu for high cristobalite. We estimate the uncertainty as 40.3 eu, primarily from the uncertainty in  $\Delta H_m^{\circ}$ .

Cp° above 300°K is based on adiabatic calorimetric data of Moser (9) up to 900°K. Enthalpy data of White (10) and Fischer (11) are in excellent agreement. Cp° from 900 to 1500°K is derived from enthalpy data of Southard (12) and White (10). Maximum deviation of the data from the adopted values in this range is 0.5 percent. Enthalpy data of Egan (13) and Kelley (14) deviate from the adopted values by less than 1 percent in the range 1000-1500°K, although large positive deviations appear at lower temperatures.

In the region 1500-1700°K, the adopted Cp° shows a rapid, sigmoidal rise which is suggested by the enthalpy data of Wietzel (15). This is presumed to be the glass transition region in which Cp° rises to that of the stable liquid. Cp° above 1700°K is estimated as 20.5 gibbs/mol or 6.83 gibbs/g-atom. This value is consistent with the enthalpy data (15) and with liquid heat capacities of Al<sub>2</sub>O<sub>3</sub>, Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub> and Na<sub>2</sub>SiO<sub>3</sub>.

Melting Data

The melting point of high cristobalite is 1996 ± 5°K, while the metastable melting point of high quartz is 1696 ± 50°K.  $\Delta H_m^{\circ}$  is the difference between  $\Delta H_f^{\circ}$  for liquid and high cristobalite at Tm. Values ranging from 1.6 to 3.6 kcal/mol have been derived from various interpretations of phase diagrams (1).

SILICON DIOXIDE (SiO<sub>2</sub>)

(IDEAL GAS)

Point Group [D<sub>2h</sub>]S°<sub>298.15</sub> = [54.7] gibbs/mol

Ground State Quantum Weight = [1]

ΔHf°<sub>0</sub> = -72.7 ± 8 kcal/molΔHf°<sub>298.15</sub> = -73 ± 8 kcal/mol

## Vibrational Frequencies and Degeneracies

 $\frac{\omega_e}{\text{cm}^{-1}}$   
 [980] (1)  
 [370] (2)  
 [1430] (1)

Bond Distance: Si-O = [1.55] Å

Bond Angles: O-Si-O = [180°]

Rotational Constant: B<sub>0</sub> = [0.2193] cm<sup>-1</sup>

## Heat of Formation

The adopted value is based on the data summarized below. Margrave (1) has reported a value of ΔHf°<sub>298</sub> = 140.9 ± 1 kcal/mol but details are not yet available. Assuming that this corresponds to reaction A below, we calculate ΔHf°<sub>298</sub> = -75.5 kcal/mol. Firsova (2) reported two values of the sublimation pressure which were derived from Knudsen effusion data using auxiliary data for SiO(g). Porter (4) derived two pressures from a mass spectrometric study and also obtained a 2nd Law value for ΔHf° from ion intensities. The resulting range for ΔHf°<sub>298</sub>, 136 to 141 kcal/mol, is consistent with the lower limit of 130 kcal/mol obtained by Bergman (3) from a method involving explosion in a spherical bomb. An alternative analysis of the mass spectrometric data (4) using the gas phase reaction B suggests an even higher ΔHf° of 148 kcal/mol. The adopted ΔHf° corresponds to ΔHf°<sub>298</sub> = 143.4 ± 8 kcal/mol and to ΔHatom°<sub>0</sub> = 297.3 ± 8 kcal/mol.

## Heat Capacity and Entropy

Point group, ground state quantum weight and the linear symmetrical configuration are estimated by analogy with the properties of CO<sub>2</sub>. From the bond lengths in SiO, CO<sub>2</sub> and CO, the length in SiO<sub>2</sub> is estimated as 1.509 × 1.160/1.128. Bond lengths and atomization energies for these molecules are reasonably consistent with the existence of six-electron bonds in the monoxides and four-electron bonds in the dioxides (5). Vibrational frequencies are estimated from a valence bond calculation using force constants, k = 9 × 10<sup>5</sup> and k<sub>6/6</sub> = 0.3 × 10<sup>5</sup> dyne/cm, which are obtained from those of SiO, CO<sub>2</sub> and CO. The moment of inertia is 12.76 × 10<sup>-39</sup> g cm<sup>2</sup>.

TITANIUM DIOXIDE, ANATASE (TiO<sub>2</sub>) (CRYSTAL) OPW = 79.8988

ΔHf° = -221.8 ± 1 kcal/mol  
 ΔHf°<sub>298.15</sub> = -223.0 ± 1 kcal/mol  
 ΔHf° = [0.0] kcal/mol  
 ΔHm° = Unknown  
 ΔHf°<sub>298.15</sub> = 161 kcal/mol

S°<sub>298.15</sub> = 11.93 gibbs/mol  
 Tm = 918 °K  
 Tm = Unknown

Heat of Formation.

The value of ΔHf°<sub>298</sub> (anatase) is obtained from J. L. Margrave and B. D. Kybett, "Thermodynamic and Kinetic Studies of Borides and Other Refractory Materials at High Temperatures," Tech. Rept. AFML-TR-65-123, August 1965, Rice University, Houston, Texas. The authors measured the heat of fluorination of anatase, according to the reaction TiO<sub>2</sub> (anatase) + 2F<sub>2</sub>(g) = TiF<sub>4</sub>(c) + O<sub>2</sub>(g), but no experimental data were given.

P. W. Vahldek, J. Less-Common Metals 11, 99 (1966), studied the irreversible anatase-rutile phase transition at pressures of 3.8 to 24 kbars and temperatures 20 to 1000°C. Isothermal phase-transition studies were also carried out at 1 bar pressure and 850-950°C. From the slope, dT/dP, the enthalpy differences between rutile and anatase were calculated to be -2.79 and -2.89 kcal/mol at 1183 and 1223°K, respectively. Using these data and ΔHf°<sub>298</sub>(rutile) = -225.8 kcal/mol, the value of ΔHf°<sub>298</sub>(anatase) is derived as -223.23 kcal/mol, which is in excellent agreement with the adopted value.

Heat Capacity and Entropy.

Low temperature heat capacities, 52-296°K, were measured by C. H. Shomate, J. Am. Chem. Soc. 69, 218 (1947). Enthalpy data were determined in the range 416-1305°K by B. P. Naylor, J. Am. Chem. Soc. 68, 1077 (1946), and in the range 580 - 1000°K by J. Lietz, Hamburger Beitr. Angew. Mineral. Kristallphysik 1, 229 (1956). High temperature heat capacities are derived from the enthalpy data, subject to the constraint that there be a smooth joint at 298°K. The resulting enthalpies are higher by 1 to 3% than those measured by Lietz and lower by 1 to 4% than those measured by Naylor. Values above 1300°K are smoothly extrapolated. S°<sub>298</sub> is calculated from the low temperature Cp° using S°<sub>50</sub> = 0.45 eu.

In view of the discrepancies in the enthalpy data, a review of the anatase samples is pertinent. Those of Shomate and Lietz were prepared by precipitation of the hydrated oxide and conversion to the oxide at 550 - 565°C. Shomate's starting material was high purity Ti and the product analyzed as 99.3% TiO<sub>2</sub>. Lietz' starting material was high purity TiCl<sub>4</sub>. Naylor's sample, obtained from J. T. Baker Co., was dried at 1050°C; spectrographic analysis indicated 0.3% SiO<sub>2</sub> and 0.15% CaO. All three samples gave only the X-ray lines of anatase.

Transition Data.

Tm = 918°K and ΔHt° = 0.040 kcal/mol have been reported by J. Lietz, loc. cit. A. Schröder, Z. Kryst. 65, 483 (1928), suggested a transition temperature at 915°K on the basis of a peak in the thermal expansion curve. Lietz reported ΔHt° = 0.04 kcal/mol, but this value is not adopted since its magnitude is much less than the uncertainty in the selected enthalpies. Further study is desirable to confirm this transition.

Heat of Sublimation.

ΔHs°<sub>298</sub> is calculated as the difference between ΔHf°<sub>298</sub> for TiO<sub>2</sub>(g) and TiO<sub>2</sub>(anatase).

ΔH<sub>f</sub><sup>o</sup> = -224.6 ± 1 kcal/mol  
 ΔH<sub>f</sub><sup>o</sup><sub>298.15</sub> = -225.8 ± 1 kcal/mol  
 ΔH<sub>m</sub><sup>o</sup> = [16] kcal/mol  
 ΔH<sub>s</sub><sup>o</sup><sub>298.15</sub> = 163.8 kcal/mol

S<sub>298.15</sub> = 12.03 e.u./mole  
 T<sub>m</sub> = 2143°K

Heat of Formation.

The heat of formation for rutile has been determined from combustion calorimetry by many investigators. Several of the more consistent ΔH<sub>f</sub><sup>o</sup><sub>298</sub> values are listed in the table below. Ariys et al.<sup>3</sup> reported that the composition of the rutile obtained from combustion of Ti(c) was between TiO<sub>1.94</sub> and TiO<sub>1.95</sub>. Emf studies by R. N. Blumenthal and D. H. Whitmore, *J. Electrochem. Soc.* **110**, 92 (1963), indicate that at 1200°K there is a two-phase region beginning at about TiO<sub>1.99</sub>. If this region extends to 298°K, then the non-stoichiometric combustion products probably involve a mixture of the phases. Meh et al.<sup>4</sup> applied an approximate energy correction for incomplete combustion which corresponds to 0.7 - 1.5 kcal/mol. In ΔH<sub>f</sub><sup>o</sup><sub>298</sub>. Analogous corrections were applied by Ariys et al.<sup>3</sup> but were not mentioned by Neumann et al.<sup>1</sup> and Humphrey.<sup>5</sup>

The ΔH<sub>f</sub><sup>o</sup><sub>298</sub> value reported by Margrave and Kybett<sup>5</sup> was obtained by fluorine bomb calorimetry, according to the reaction TiO<sub>2</sub>(rutile) + 2F<sub>2</sub>(g) = TiF<sub>4</sub>(c) + O<sub>2</sub>(g). No experimental data were given.

Comparison of the fluorine result with the oxygen results indicates that the magnitude of the corrections for the oxygen data is reasonable, probably within ± 1 kcal/mol, provided that the fluorine data refer to stoichiometric TiO<sub>2</sub>. Corresponding ΔH<sub>f</sub><sup>o</sup> corrections for TiO<sub>2-x</sub> are of the same order of magnitude when estimated from the partial molar free energy values given by P. Kofstad, *J. Phys. Chem. Solids* **23**, 1579 (1962), and J. B. Meier, R. N. Blumenthal and D. H. Whitmore, *J. Am. Ceram. Soc.* **48**, 384 (1965).

The ΔH<sub>f</sub><sup>o</sup><sub>298</sub> value determined by Meh et al.<sup>4</sup> is adopted.

Heat Capacity and Entropy.

The low temperature heat capacities, 10 - 297.7°K, have been measured by the following investigators: P. H. Keenan and N. Pearlman, *Phys. Rev.* **112**, 800 (1958), 10 - 20°K; J. S. Dugdale, J. A. Morrison and D. Patterson, *Proc. Roy. Soc. (London)* **A224**, 228(1954), 20 - 50°K; H. Shomate, *J. Am. Chem. Soc.* **69**, 218 (1947), 52.5 - 297.7°K; and H. J. McDonald and H. Seltz, *J. Am. Chem. Soc.* **61**, 2405 (1939), 68.78 - 295.0°K. The first three sets of Cp data are joined smoothly and extrapolated to 298°K, yielding S<sub>298</sub> = 12.03 e.u., based on S<sub>0</sub> = 0.0014 e.u. The Cp values reported by McDonald and Seltz seem too high and are not used.

The high temperature enthalpies have been determined by B. F. Naylor, *J. Am. Chem. Soc.* **69**, 1077 (1946), 393.5 - 1746°K; J. S. Arthur, *J. Appl. Phys.* **21**, 732 (1950), 293.2 - 1073.2°K; and J. Lietz, *Hamburger Beiträge Angew. Mineral u. Kristall Phys.* **1**, 229 (1956), 577.7 - 1265.0°K. The Cp values are derived from the data of Lietz and join smoothly at 298°K with the low temperature data. Deviations from the selected values are -1.6 to 1.0% for Lietz, -6.1 to +4.0% for Arthur, and +6.6 to +0.8% for Naylor. The data point of Lietz at 947.95°K is omitted as a probable typographical error. The largest deviations in the case of Naylor and Arthur are near 400 and 500°K, respectively.

The mean specific enthalpies have also been measured by L. F. Nilson and O. Patterson, *Z. Physik, Chem.* **1**, 27 (1987), 373.2 - 717.2°K.

The samples used by Keenan and Pearlman, Dugdale et al., Shomate, Arthur and Lietz were of high purity, according to chemical and spectroscopic analysis. However, the sample employed by Naylor was black-colored and chemical analysis gave 97.9% TiO<sub>2</sub>. The main impurities were: 0.55% ZrO<sub>2</sub>, 0.50% SiO<sub>2</sub>, 0.27% V<sub>2</sub>O<sub>5</sub>, 0.15% CaO, 0.15% Fe<sub>2</sub>O<sub>3</sub> and 0.12% Al<sub>2</sub>O<sub>3</sub>. The sample of McDonald and Seltz was obtained commercially. Therefore the results reported by Naylor and McDonald et al. are given the least weight.

Melting Data.

See TiO<sub>2</sub>(1) table for details.

Heat of Sublimation.

The difference between ΔH<sub>f</sub><sup>o</sup><sub>298</sub> for TiO<sub>2</sub>(g) and TiO<sub>2</sub>(rutile) is ΔH<sub>s</sub><sup>o</sup><sub>298</sub>.

O<sub>2</sub>Ti

Titanium Dioxide (TiO<sub>2</sub>)  
(Liquid)      GFW = 79.8988

O<sub>2</sub>Ti

TITANIUM DIOXIDE (TiO<sub>2</sub>)      (LIQUID)      OFW = 79.8988

$$\Delta H_f^{\circ} S_{298.15} = [-210.726] \text{ kcal/mol}$$

$$\Delta H_m^{\circ} = [16] \text{ kcal/mol}$$

$$S_{298.15}^{\circ} = [18.934] \text{ gibbs/mol}$$

$$T_m = 2143^{\circ} \text{K}$$

Heat of Formation.

The  $\Delta H_f^{\circ} S_{298.15}$  is calculated from  $\Delta H_f^{\circ} S_{298.15}$  (rutile, c) by adding  $\Delta H_m^{\circ}$  and the difference between  $H_m^{\circ} S_{2143}^{\circ}$  -  $H_m^{\circ} S_{298.15}$  for TiO<sub>2</sub>(rutile, c) and TiO<sub>2</sub>(l).

Heat Capacity and Entropy.

The heat capacity of TiO<sub>2</sub>(l) is estimated on the basis of 7.0 gibbs/g-atom. The value of  $S_{298}^{\circ}$  is obtained in a manner analogous to that of the heat of formation.

Melting Data.

The melting point of TiO<sub>2</sub>(rutile) has been measured by many investigators. Eleven pertinent  $T_m$  values were reviewed and corrected, according to the International Temperature Scale of 1948, by S. J. Schneider, Natl. Bur. Std. Monograph 68, October 10, 1963. The adopted melting point is obtained from G. Brauer and W. Litke, J. Inorg. Nucl. Chem. 16, 67 (1960). These authors found that TiO<sub>2</sub> loses oxygen on heating and the solid residue consists of a non-stoichiometric compound of the composition TiO<sub>2-x</sub>. The value of the coefficient x depends on the temperature and on the oxygen pressure of the gaseous phase. Under oxygen pressures greater than or equal to 300 torr, the solid residue was TiO<sub>2.000</sub> within the sensitivity of chemical analysis; however, color of the residue was a more sensitive indicator of composition. At pressures of 600 torr or greater, the residue was bright yellow rather than blue-gray and the melting point was constant at the maximum value of 2143 ± 15°K. This value is adopted.

The heat of melting is calculated using an estimated entropy of melting,  $\Delta S_m^{\circ} = 2.5 \text{ eu/g-atom}$ .

Heat of Formation.

P. W. Gilles, K. D. Carlson, H. F. Frenzen, and P. O. Wählbeck, *J. Chem. Phys.* **45**, 2461 (1967), studied the vaporization behavior of the titanium-oxygen system and found that Ti<sub>3</sub>O<sub>5</sub> is the final residue of both higher and lower titanium oxides; hence Ti<sub>3</sub>O<sub>5</sub> is the congruently vaporizing phase. This conclusion was obtained by measurement of the change in composition of the solid residue accompanying vaporization as determined by x-ray diffraction, chemical analysis, and color of sample.

From mass spectrometric studies over Ti<sub>3</sub>O<sub>5</sub>(g) near 2000°K, P. O. Wählbeck and P. W. Gilles, *J. Chem. Phys.* **45**, 2465 (1967), concluded that the partial pressure of TiO<sub>2</sub> is probably less than 1% of the pressure of TiO produced by the main vaporization, Ti<sub>3</sub>O<sub>5</sub>(g) = 3 TiO(g) + 2 O(g). This yields ΔH°<sub>298</sub> ≥ 228 kcal for the reaction Ti<sub>3</sub>O<sub>5</sub>(g) = 2 TiO<sub>2</sub>(g) + TiO(g) and ΔHf°<sub>298</sub>(TiO<sub>2</sub>, g) ≥ -62 kcal/mol, which is the value adopted. The corresponding atomization energy is D<sub>0</sub> ≤ 292 kcal/mol.

Earlier vaporization studies over TiO<sub>2</sub>-x gave apparent heats of formation which are more negative by 20-35 kcal; however, the results appear to be uncertain due to lack of sufficient auxiliary data for the oxygen-deficient condensed phase. Knudsen effusion-mass spectrometric studies of J. Berkowitz, W. A. Chupka and M. O. Inghram, *J. Phys. Chem.* **61**, 1569 (1957), revealed the initial evolution of large amounts of MoO<sub>3</sub>(g), suggesting that the reduction of TiO<sub>2</sub> is enhanced by the Mo cell. In order to reduce the effect of the initial high rate of evaporation, W. O. Groves, M. Hoch and H. L. Johnston, *J. Phys. Chem.* **59**, 127 (1955), conducted their Knudsen effusion-weight loss studies on TiO<sub>1.94</sub>. Preferential loss of oxygen during the experiment, as indicated by a residue of TiO<sub>1.85</sub>, was apparently ignored. Groves et al. estimated the activity of TiO<sub>2</sub>(rutile) as 0.53; Berkowitz et al. assumed unit activity but did not indicate the composition of their condensed phase. These activities may be in serious error due to the presence of a series of distinct phases between TiO<sub>1.8</sub> and TiO<sub>1.9</sub> [cf. S. Andersson, *Acta Chem. Scand.* **14**, 1161 (1960)] and to the possible existence of a two phase region near TiO<sub>1.99</sub> [cf. R. N. Blumenthal and D. H. Whitmore, *J. Electrochem. Soc.* **110**, 82 (1963)]. Second and third law analyses of the data, using the authors' original assumptions, are summarized below. No weight is given to these results.

| Investigator     | Temperature, °K | No. of Points | ΔHf° <sub>298</sub> kcal/mol | 2nd Law | 3rd Law   | Drift eu |
|------------------|-----------------|---------------|------------------------------|---------|-----------|----------|
| Groves et al.    | 1849 - 2010     | 14            | 128.7 ± 7.5                  | 130.1   | 1.1 ± 4.0 | -85.7    |
| Berkowitz et al. | 1891            | 5             | 142.7 ± 5**                  | 142.8   | -         | -83.0    |

\*Calculation based on the third law ΔHf°<sub>298</sub>.  
 \*\*Obtained from the temperature variation experiments, reported in the original paper.

Heat Capacity and Entropy.

The molecular structure is assumed to be linear. The Ti-O bond distance is estimated as the same as that in TiO(g). The vibrational frequency 940 cm<sup>-1</sup> was observed in matrix isolation by W. Weltner, Jr., and D. McLeod, Jr., *J. Phys. Chem.* **69**, 3488 (1965). The other two frequencies are calculated, based on the valence bond method as suggested by Berkowitz, Chupka and Inghram, loc. cit. The moment of inertia is 1.3944 x 10<sup>-38</sup> g cm<sup>2</sup>.

Heat of Formation.

The adopted heat of formation, -140.94 ± 0.21 kcal/mol, was determined by combustion calorimetry by A. D. Mah, J. Am. Chem. Soc. 81, 1582 (1959). R. C. Griffiths, J. Electrochem. Soc. 105, 398 (1958), has measured the heat of combustion to WO<sub>3</sub>(c) which yields ΔHf°<sub>298</sub>(WO<sub>3</sub>, c) = -139.8 ± 1.5 kcal/mol when recalculated with ΔHf°<sub>298</sub>(WO<sub>3</sub>, c) = -201.46 kcal/mol. This result is less certain because of the incomplete characterization of the final products.

Recent equilibrium data yield essentially the same average of the heat of formation by the third law method. The results are presented as follows.

| Author                      | Reaction* | Temp. (°K)  | No. of Points | ΔHf° <sub>298</sub> (kcal/mol) | Drift (eu) | ΔHf° <sub>298</sub> (kcal/mol) |

Heat Capacity and Entropy.

E. G. King, W. W. Weller, and A. U. Christensen, U. S. Bur. Mines RI 5664, (1960), have measured the low temperature heat capacities from 53° to 297°K and high temperature enthalpy changes from 396° to 1800°K by drop calorimetry. The low temperature and high temperature heat capacities were joined smoothly at 298.15°K. The entropy was obtained from the heat capacities based on S°<sub>298</sub> = 0.52 eu. It is possible that at temperatures below 50°K the entropy due to the uncoupling of the d<sup>2</sup> electrons will appear, contributing an additional 2.2 eu.

Temperature of Decomposition.

Tungsten dioxide (c) has no melting point, since disproportionation occurs to yield W(c) and WO<sub>3</sub>(l) before melting starts. The Td is calculated as the temperature at which ΔG equals zero for 3 WO<sub>2</sub>(c) = 2 WO<sub>3</sub>(l) + W(c).

Heat of Sublimation.

The heat of sublimation was calculated from the difference between the heats of formation of WO<sub>2</sub>(g) and WO<sub>2</sub>(c).

Tungsten Dioxide (WO<sub>2</sub>)

(Ideal Gas) GFW = 215.8488

TUNGSTEN DIOXIDE (WO<sub>2</sub>)

(IDEAL GAS)

OPM = 215.8488

 $\sigma = [2]$

Heat of Formation.

G. DeMaris, R. P. Burns, J. Drowart and M. O. Inghram, J. Chem. Phys. **32**, 1375 (1960), have reported the partial pressures of WO(g), WO<sub>2</sub>(g) and O(g) in a mass spectrometric study of aluminum oxide vaporized from a tungsten cell from 2188° to 2475°K. The adopted value,  $\Delta H_f^{\circ}(\text{WO}_2\text{g}) = 18.3 \pm 7$  kcal/mol, was calculated from  $\Delta H_f^{\circ}(\text{WO}_2\text{g}) = -100.9$  kcal/mol for W(c) + 2 O(g) → WO<sub>2</sub>(g), which was obtained from third law treatment of their partial pressure data, using all JANAF functions. The third law drift is 15.0 ± 5.2 eu. Partial pressures of WO<sub>2</sub>(g), WO(g) and O(g) at 2242°K have also been reported by W. A. Chupka, J. Berkowitz and C. F. Giese, J. Chem. Phys. **30**, 827 (1959), in a mass spectrometric study of beryllium oxide in a tungsten cell. Similar calculation gives  $\Delta H_f^{\circ}(\text{WO}_2\text{g}) = -105.9$  kcal/mol which yields  $\Delta H_f^{\circ}(\text{WO}_2\text{g}) = 13.2$  kcal/mol.

Heat Capacity and Entropy.

The WO<sub>2</sub>(g) was assumed to have a C<sub>2v</sub> symmetry with a bond angle O-W-O = 110°. The bond distance W-O was estimated to be the same as that in WO(g). The symmetric and asymmetric stretching frequencies were obtained from the infrared spectrum of WO<sub>2</sub> in an neon matrix by W. Weltner, Jr., and D. McLeod, Jr., J. Mol. Spectry. **11**, 276 (1965). The bending vibrational frequency (300 cm<sup>-1</sup>) was estimated by comparison with other dioxides. The electronic levels and quantum weights were estimated from W<sup>4+</sup> ion by analogy with Mo<sup>4+</sup> ion. The three principal moments of inertia are: I<sub>A</sub> = 4.8776 x 10<sup>-39</sup>, I<sub>B</sub> = 1.1680 x 10<sup>-38</sup> and I<sub>C</sub> = 1.6559 x 10<sup>-38</sup> g cm<sup>2</sup>.

$\Delta H_f^0 = -261.0 \pm 0.4 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^0 \text{ at } 298.15 = -262.3 \pm 0.4 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^0 \text{ at } 1.42 \pm 0.1 \text{ kcal. mole}^{-1}$   
 $\Delta H_m^0 = [20.8] \text{ kcal. mole}^{-1}$

Heat of Formation.

The  $\Delta H_f^0$  298.15 = -263.1 ± 0.5 kcal. mole<sup>-1</sup> measured (by combustion calorimetry) by O. L. Humphrey, J. Am. Chem. Soc. 75, 978 (1954) and E. J. Huber, Jr., E. L. Head and C. E. Holley, Jr., J. Phys. Chem. 68, 3040 (1964) respectively. Also the heat of formation was measured calorimetrically by B. Neumann, C. Kröger and H. Kunz, Z. anorg. Chem. 218, 379 (1934), by W. A. Roth, E. Böhrer, and H. Stenmons, ibid., 239, 321 (1938) and by A. Sieverts, A. Gotta and S. Halberstadt, ibid., 187, 155 (1890) and was found -259.2, -258.8 and -256.1 kcal. mole<sup>-1</sup> respectively. However more weight was given to the Humphrey and Huber values.

Heat Capacity and Entropy.

The low temperature heat capacities, 54.3-295°K., were measured by K. K. Kelley, Ind. Eng. Chem. 35, 377 (1944). The heat capacities in the temperature range 298-1478°K. were calculated by using the J. P. Coughlin and E. O. King equation  $C_p = 16.64 + 1.80 \times 10^{-5} T - 3.36 \times 10^{-8} T^2$  obtained from their measured enthalpy data in the range 396.8-1841°K., J. Am. Chem. Soc. 72, 2252 (1950). The values from the two sources join smoothly at 298°K. Above the transition 1478°K. the heat capacity was taken as constant at 17.80 cal. mole<sup>-1</sup> deg<sup>-1</sup>, Coughlin and King, loc. cit. The entropy was calculated at 54.30 using the Debye and Einstein function  $D(\frac{54.3}{T}) + E(\frac{54.3}{T})$  given by Kelley, loc. cit. The value of  $S_{54.3}^0 = 0.5507 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$ .

Transition Data.

$T_t$  and  $\Delta H_t^0$  were taken from Coughlin and King loc. cit.

Melting Data.

The  $T_m$  and  $\Delta H_m^0$  were taken from Natl. Bur. Standards Circ. 500 Washington (1952).

June 30, 1961 Dec. 31, 1965

ΔH<sub>f</sub>° 298.15 = [-244.55] kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub>° = [20.8] kcal. mole<sup>-1</sup>  
 ΔH<sub>v</sub>° = [149.2] kcal. mole<sup>-1</sup>

Heat of Formation.

The ΔH<sub>f</sub>° 298.15 (1) was obtained from ΔH<sub>f</sub>° 298.15 (c) by adding ΔH<sub>m</sub>° and the difference between H<sub>m</sub>° and H<sub>l</sub>° 298.15 for crystal and liquid.

Heat Capacity and Entropy.

A glass transition was assumed at 2000°K. The heat capacity below 2000°K. was obtained from the heat capacity of the crystal. Above 2000°K. the heat capacity was assumed constant and estimated to be 21.0 cal. deg<sup>-1</sup> mole<sup>-1</sup> or 7 cal. deg<sup>-1</sup> per g-atom as suggested by O. Kubachewski and E. L. Evans, "Metallurgical Thermochemistry," Pergamon Press, New York (1958). The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See ZrO<sub>2</sub>(c) table.

Vaporization Data.

T<sub>b</sub> was calculated as the temperature at which the free energy change of the reaction ZrO<sub>2</sub>(l) → ZrO<sub>2</sub>(g) approaches zero. The difference between ΔH<sub>f</sub>° 4548 for ZrO<sub>2</sub>(g) and ZrO<sub>2</sub>(l) is ΔH<sub>v</sub>°.

Bond Distance: O-Zr = 1.711 Å  
 Bond Angle: O-Zr-O = 109°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 5.679856 × 10<sup>-115</sup> g.<sup>3</sup> cm.<sup>6</sup>  
 σ = 2

Heat of Formation.  
 The ΔH<sub>f</sub> 298.15 = -68.4 ± 11 kcal. mole<sup>-1</sup> was calculated from the ΔH<sub>f</sub> 298.15 = 193.667 ± 11.25 kcal. mole<sup>-1</sup> for the reaction ZrO<sub>2</sub>(c) → ZrO<sub>2</sub>(g). The value of ΔH<sub>f</sub> 298.15 was obtained by the third law method using the determined vapor pressures (at the range 2331-2480°K) by W. A. Chupka, J. Berkowitz and M. G. Inghram, J. Chem. Phys. 25, 1207 (1957). They observed the variation of the ZrO<sub>2</sub><sup>+</sup> ion intensity over ZrO<sub>2</sub> and reported equilibrium constants for the reaction ZrO<sub>2</sub>(c) → ZrO<sub>2</sub>(g) in the range 2331-2480°K. The third law drift is 80 ± 23 e.u.  
 Heat Capacity and Entropy.  
 The vibrational frequencies ν<sub>1</sub> = 884, ν<sub>2</sub> = 1377, ν<sub>3</sub> = 818 and angle O-Zr-O = 109° were obtained from M. J. Linevsky, Spectroscopic Studies of the Vaporization of Refractory Materials, Technical Report Nr. AFML TR-64-420 Air Force Materials Lab. Research and Technology Division, Wright Patterson Air Force Base, Ohio (1965). The bond distances (r<sub>e</sub>) O-Zr = 1.711 Å was obtained from U. Uhler and L. Akerlind, Arkiv Fysik 10, 431 (1955). The three principal moments of inertia are: I<sub>A</sub> = 1.03083 × 10<sup>-38</sup>, I<sub>B</sub> = 3.8828 × 10<sup>-38</sup>, I<sub>C</sub> = 1.41909 × 10<sup>-38</sup> g. cm.<sup>2</sup>

ΔH<sup>c</sup><sub>298.15</sub> = Unknown  
ΔH<sup>c</sup><sub>298.15</sub> = -186.70 ± 0.5 kcal/mol

S<sup>b</sup><sub>298.15</sub> = [16.35] gibbs/mol

Heat of Formation.

The adopted heat of formation, -186.7 ± 0.5 kcal/mol, is derived from recent equilibrium data which are in excellent agreement; the results are summarized below. In addition R. C. Oriffis, *J. Electrochem. Soc.* **105**, 388 (1958), has measured the heat of combustion to WO<sub>3</sub>(c) which yields ΔH<sup>c</sup><sub>298</sub>(WO<sub>2.72</sub>, c) = -185.4 ± 1 kcal/mol when recalculated with ΔH<sup>c</sup><sub>298</sub>(WO<sub>3</sub>, c) = -201.48 kcal/mol. This result is less certain because of the incomplete characterization of the final products. The EMF data reported by Ye. I. Gerasimov, I. A. Vasil'eva, T. P. Chusova, V. A. Gaidelikh, and M. A. Timofeeva, *Zh. Fiz. Khim.* **36**, 358 (1962), give the value of -186.89 kcal/mol for the heat of formation at 298° K. R. J. Ackermann and E. O. Rauh, *J. Phys. Chem.* **67**, 2596 (1963), have investigated the tungsten-oxygen system by mass effusion, mass spectroscopy, and X-ray diffraction. In the temperature range from 1300° to 1600° K, they have derived indirectly from their measurements the heat of formation, -182.2 kcal/mol (corresponding to -187.2 kcal/mol at 298° K, using the JANAF functions).

Heat Capacity and Entropy.

The monoclinic unit cell of WO<sub>2.72</sub> corresponds to W<sub>10</sub>O<sub>49</sub>, as shown by the x-ray diffraction studies of A. Magneli, O. Anderson, B. Blomberg and L. Kihlberg, *Anal. Chem.* **24**, 1998 (1952). The tabulated heat capacities of WO<sub>2.72</sub>(c) were estimated from those of WO<sub>2</sub>(c) and WO<sub>3</sub>(c), because all three have similar monoclinic structures as identified by Magneli et al.

The entropy (S<sup>c</sup><sub>298</sub> = 16.35 eu) was calculated from ΔS<sup>c</sup><sub>298</sub> = 7.96 ± 0.09 eu for reaction A, using all JANAF values. The value of ΔS<sup>c</sup><sub>298</sub> was derived from the second law analysis of Oriffis' data, loc. cit.

Heat of Formation:

$S_{298.15}^{\circ} = [17.54] \text{ gibbs/mol}$   
 $\Delta H_f^{\circ} = \text{Unknown}$   
 $\Delta H_f^{\circ}{}_{298.15} = -196.0 \pm 3 \text{ kcal/mol}$

Heat of Formation:

The adopted heat of formation, -196.0 ± 3 kcal/mol, is a weighted average of those derived from equilibrium data, in addition the following results have been reported.

R. C. Oriffia, J. Electrochem. Soc. 105, 398 (1958), has measured the heat of combustion to W<sub>2</sub>O<sub>3</sub>(c), which yields -195.6 kcal/mol when recalculated with  $\Delta H_f^{\circ}{}_{298}(\text{W}_2\text{O}_3, c) = -201.46 \text{ kcal/mol}$ . This result is less certain because of the incomplete characterization of the final products. R. J. Ackermann and E. O. Raub, J. Phys. Chem. 57, 2598 (1953), have investigated the tungsten-oxygen system by mass effusion, mass spectroscopy, and X-ray diffraction. In the temperature range from 1300° to 1600°K, they have derived indirectly two values of  $\Delta H_f^{\circ}(\text{W}_2\text{O}_9, c)$  -190.9 and -188.0 kcal/mol (corresponding to -196.1 and -193.3 kcal/mol, respectively, at 298.15°K, using all JANAF functions).

$\Delta H_f^{\circ}{}_{298}(\text{W}_2\text{O}_9, c) = -195.4$

ΔH<sub>f</sub><sup>o</sup> = Unknown  
ΔH<sub>f</sub><sup>o</sup>298.15 = -199.56 ± 3 kcal/mol

S<sup>o</sup>298.15 = [17.90] ebbu/mol

Heat of Formation.

The adopted value, ΔH<sub>f</sub><sup>o</sup>298 (WO<sub>2.96</sub>, c) = -199.56 kcal/mol, was obtained by third law treatment of ΔH<sub>f</sub><sup>o</sup> = 191,600 + 54.0 T (cal/mol) in the temperature range from 1300 - 1550°K, using all JANAF functions. The equation for ΔH<sub>f</sub><sup>o</sup> was reported by R. J. Ackermann and E. G. Rauh, J. Phys. Chem. **67**, 2536 (1963), based on studies by mass spectroscopy and x-ray diffraction. In this study ΔH<sub>f</sub><sup>o</sup> was obtained by comparison of the Gibbs energies of sublimation (to gaseous W<sub>2</sub>O<sub>6</sub>, W<sub>2</sub>O<sub>5</sub>, W<sub>2</sub>O<sub>3</sub>, and W<sub>2</sub>O<sub>2</sub>) over the two systems W-WO<sub>2</sub>(c) and WO<sub>2.96</sub>(c); thus WO<sub>2.96</sub>(c) was related to WO<sub>2</sub>(c) through the gaseous species.

J. E. Battles, Ph. D. Thesis, "A Mass Spectrometric Investigation of Tungsten Dioxide and Tungsten Trioxide," The Ohio State University, (1964), has reported partial pressures of W<sub>2</sub>O<sub>3</sub>(g) and W<sub>2</sub>O<sub>2</sub>(g) in equilibrium with WO<sub>3</sub> - WO<sub>2.90</sub>(c). In light of Ackermann and Rauh's observation, the condensed phase was presumed to have the composition of WO<sub>2.96</sub>(c). The pressure data are in reasonable agreement with the studies of Ackermann and Rauh as summarized below. Values of ΔH<sub>f</sub><sup>o</sup>298 for WO<sub>2.96</sub>(c) derived from the data of Battles are based on the same author's data for W<sub>2</sub>O<sub>3</sub>(g), and W<sub>2</sub>O<sub>2</sub>(g) in order to relate WO<sub>2.96</sub> to WO<sub>2</sub> directly.

| 4. Ackermann & Rauh | C        | 1300-1550        | 35.81                                       | 33.58       | -199.60   |
| 5. Battles          | C        | 1333-1418        | 35.37                                       | 38.74       | -199.95   |

Reaction: A: WO<sub>2.96</sub>(c) = 0.44 W<sub>2</sub>O<sub>3</sub>(g) + 0.04 W<sub>2</sub>O<sub>2</sub>(g)

B: WO<sub>2.96</sub>(c) = 0.29333 W<sub>2</sub>O<sub>3</sub>(g) + 0.04 W<sub>2</sub>O<sub>2</sub>(g)

C: WO<sub>2.96</sub>(c) = 0.22 W<sub>2</sub>O<sub>3</sub>(g) + 0.04 W<sub>2</sub>O<sub>2</sub>(g)

\* Third law value adopted in calculation.

Heat Capacity and Entropy.

The tabulated heat capacities and the entropy at 298.15°K were estimated from those of WO<sub>2</sub>(c) and WO<sub>3</sub>(c). Ackermann and Rauh, loc. cit., have found that the composition WO<sub>2.96</sub> probably represents the azeotropic composition of the WO<sub>3</sub>-x solid solution and is the only single phase which evaporates congruently below 1550°K.

Heat of Formation

P. Günther, E. Wassuth, and L. A. Schryver, Z. phys. Chem. 158, 297 (1932), measured ΔS for the reaction O<sub>3</sub>(g) → 3/2 O<sub>2</sub>(g) in a calorimeter calibrated by means of the reaction CO(g) + 1/2 O<sub>2</sub>(g) → CO<sub>2</sub>(g), and found the ratio of the ΔS values for these reactions to be 0.5077 ± 0.0024. The temperature of the experiments is not reported and is assumed to have been 18°C. From the above ratio, ΔH<sub>f</sub><sup>o</sup> 298.15 is calculated to be 33.89 ± 0.36 cal. mole<sup>-1</sup>. A. Kailan and S. Jahn, Z. anorg. Chem. 69, 243 (1910), measured ΔH at an unspecified temperature for the reaction O<sub>3</sub>(g) → 3/2 O<sub>2</sub>(g) in an electrically calibrated calorimeter. If the temperature of the experiments is assumed to have been 18°C and the modern joule-calorie conversion factor is used, ΔH<sub>f</sub><sup>o</sup> 298.15 is found to be 34.3 ± 0.6 kcal. mole<sup>-1</sup>. Variability in the O<sub>3</sub> content of the feed gas is allowed for in the uncertainty. The value adopted here is 34.2 ± 0.4 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy

J. S. Gordon, private communication, April, 1961, has calculated the thermodynamic functions from 298.15° to 6000°K by the method of R. B. Pennington and K. A. Kobe, J. Chem. Phys. 22, 1442 (1954), which takes vibration-rotation interaction and anharmonicity into account. Gordon's data are from I. Pierce, J. Chem. Phys. 24, 139 (1956). The functions below 298.15°K have been calculated for a rigidly rotating harmonic oscillator.

ΔH<sub>f</sub>° = -272.01 ± 1 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub>° 298.15 = -273.66 ± 1 kcal. mole<sup>-1</sup>

S<sub>298.15</sub> = 26.273 ± 0.3 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 1037°K.

Heat of Formation.

The heat of the reaction PbO (red) + SiO<sub>2</sub> → PbSiO<sub>3</sub>(c) was reported by K. K. Kelley, U. S. Bureau of Mines, Report Investigation 5501 (1952). This value for the heat of reaction of the oxides has been converted to the heat of formation using JANAP values for PbO(c) (March 31, 1962) and for SiO<sub>2</sub>(c) (Dec. 31, 1962). The above ΔH<sub>f</sub>° = -3.75 ± 0.12 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

In the low temperature region (53.25-298.15°K.) the C<sub>p</sub> values are those determined by E. G. King, J. Am. Chem. Soc. 81, 799-800 (1959). Above 298.15 C<sub>p</sub> values were estimated by summing the values for the constituent oxides and graphically smoothing these into the low temperature measurements. The entropy was calculated at 53.25°K. using the Debye and Einstein functions D( $\frac{h\nu}{kT}$ ) + E( $\frac{h\nu}{kT}$ ) + 2E( $\frac{h\nu}{kT}$ ) + E( $\frac{h\nu}{kT}$ ) given by E. G. King, J. Am. Chem. Soc. 81, 799-800 (1959). The S<sub>53.25</sub> = 3.662 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.

T<sub>m</sub> was taken from Geller, Creamer and Bunting, J. Research Natl. Bureau of Standards, 13, 237 (1934).

Bond Distance: S-O = 1.43 Å  
Bond Angle: O-S-O = 120°  
Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.0813 X 10<sup>-114</sup> g.<sup>3</sup> cm.<sup>6</sup>  
σ = 6

Heat of Formation.

The heat of formation was calculated from the reaction SO<sub>3</sub> + 1/2 O<sub>2</sub> → SO<sub>3</sub> for which three sets of equilibrium constants are available. A summary of the second and third law treatments of the data is given below.

| Ref. | Temp. Range | Points | ΔH <sub>f</sub> <sup>o</sup> 298 kcal. mole <sup>-1</sup> | 3rd law ΔH <sub>f</sub> <sup>o</sup> 298 kcal. mole <sup>-1</sup> | Drift cal. mole <sup>-1</sup> deg. <sup>-1</sup> |

- Combination of above references, with one point omitted due to failure of a statistical test.

The combined set was adopted though it appears that the three sets are not in excellent agreement, and the combination heavily favors Ref. 2. Although there is a definite trend in all the data it cannot be considered definitive enough for use in the modification of the SO<sub>3</sub> functions.

Heat Capacity and Entropy.

The bond length and angles were taken from the electron diffraction data of K. J. Palmer, J. Am. Chem. Soc. **50**, 2360 (1938). The vibrational frequencies were taken from the infrared studies of R. W. Lovejoy, J. H. Colwell, D. F. Eggers and O. D. Halsey, J. Chem. Phys. **36**, 612 (1962), which are in excellent accord with those of R. Bent and W. R. Ladsner, Spectrochim. Acta **19**, 831 (1963) using different techniques. These values differ from the assignment used by W. H. Stockmayer, O. W. Kavanagh and H. S. Mickley, J. Chem. Phys. **12**, 408 (1944) in their analysis of the thermodynamic properties of SO<sub>3</sub>.

The individual moments of inertia were I<sub>A</sub>=I<sub>B</sub> = 6.146 X 10<sup>-39</sup> g. cm.<sup>2</sup> and I<sub>C</sub> = 16.298 X 10<sup>-39</sup> g. cm.<sup>2</sup>

DITITANIUM TRIOXIDE (Ti<sub>2</sub>O<sub>3</sub>)

(CRYSTAL)

03112

GFW = 143.7982

ΔHf°<sub>298.15</sub> = -361.50 ± 2 kcal/mol  
 ΔHf°<sub>298.15</sub> = -363.49 ± 2 kcal/mol  
 ΔH° = 0.215 kcal/mol  
 ΔHm° = [26.4] kcal/mol

S°<sub>298.15</sub> = 18.83 gibbs/mol

Tt = 473°K

Tm = 2112°K

Heat of Formation

G. L. Humphrey, J. Am. Chem. Soc. 73, 1587 (1951), determined the enthalpy change ΔHr°<sub>298</sub> = -86.11 ± 0.1 kcal/mol for the reaction Ti<sub>2</sub>O<sub>3</sub>(c) + 1/2O<sub>2</sub>(g) = TiO<sub>2</sub>(rutile) using bomb calorimetry. Based on this result and ΔHf°<sub>298</sub> (rutile) = -225.8 kcal/mol, the adopted value of ΔHf°<sub>298</sub> for Ti<sub>2</sub>O<sub>3</sub>(c) is calculated to be -363.49 ± 2 kcal/mol. A value of ΔHf°<sub>298</sub>(Ti<sub>2</sub>O<sub>3</sub>, c) = -362.8 ± 0.6 kcal/mol was reported by S. M. Ariya, M. P. Morozova, and E. Vol'f, Russ. J. Inorg. Chem. (English Transl.) 2, 18 (1957), who measured the heat of combustion of various compositions in the Ti-O system. Ariya et al. used an estimated correction for the formation of TiO<sub>2</sub>-x, while Humphrey obtained values of 0.1 - 1.3 kcal/mol by grinding the product and reburning it with white oil. Most of the assigned uncertainty arises from this problem. [See TiO<sub>2</sub>(rutile) for further details.]

Heat Capacity and Entropy

The low temperature heat capacities, 53 - 296°K, were measured by C. H. Shomate, J. Am. Chem. Soc. 68, 310 (1946). The data indicate a small anomaly in Cp near 240°K. High temperature enthalpies, 375 - 1750°K, were determined by B. F. Naylor, J. Am. Chem. Soc. 68, 1077 (1946), by drop calorimetry. The heat capacities, 298 - 473°K, derived by Naylor, loc. cit., are joined smoothly with the low temperature Cp at 298°K. Cp values above 473°K are calculated from the heat capacity equation for the β phase derived by Naylor.

S. Nomura, T. Kawakubo, and T. Yanagi, J. Phys. Soc. Japan, 16, 706 (1961), measured the specific heat in the range 70 - 250°K with a conduction-type calorimeter. A broad anomaly in the specific heat was observed from 160 to 200°K. Below this region the Cp values are unreasonably small, but near 200°K the data are closer to the adopted values.

The S<sub>298</sub> is calculated from the adopted low temperature Cp based on S°<sub>50</sub> = 0.442 eu. A. D. Pearson, J. Phys. Chem. Solids, 2, 316 (1958), studied the crystal structure of Ti<sub>2</sub>O<sub>3</sub> by X-ray method and found that the agreement between calculated and observed density values is good; in other words, there are no significant vacant sites in Ti<sub>2</sub>O<sub>3</sub> crystal lattice. This was later confirmed by S. C. Abrahams, Phys. Rev. 130, 2230 (1963). Therefore we do not add vacancy entropy to S<sub>298</sub>. Because of the magnetic transition (α-β) at 473°K, we have assumed that no spin-magnetic entropy is likely below 50°K. See Transition Data for more information.

Transition Data

Tt and ΔHt° were obtained from B. F. Naylor, loc. cit. S. Nomura, T. Kawakubo and T. Yanagi, J. Phys. Soc. Japan 16, 706 (1961), derived the much smaller ΔHt° = 0.036 kcal/mol from their observations with a conduction-type calorimeter. These authors suggested that the discrepancy may be due to non-stoichiometry on to impurities in the sample studied by Naylor.

Single-crystal neutron diffraction studied by S. C. Abrahams, Phys. Rev. 130, 2230 (1963), indicate that Ti<sub>2</sub>O<sub>3</sub> undergoes an antiferromagnetic ordering of small magnetic moment, associated with the Ti<sup>3+</sup> cations, below a Néel temperature of about 660°K. The temperature of this transition has been reported variously as about 450 to 600°K based on other properties. A. D. Pearson, J. Phys. Chem. Solids 2, 316 (1958), found no change in the Ti<sub>2</sub>O<sub>3</sub> corundum-type structure, but noted a rapid change in the lattice parameters between 430 and 473°K. Observations of corresponding changes in magnetic susceptibility, resistivity and thermoelectric power have been summarized by the same authors and by J. B. Goodenough, Phys. Rev. 117, 1442 (1960). Goodenough attempted to interpret the earlier observations in terms of strong cation-cation interactions.

The magnetic nature of the transition suggests that any spin-magnetic entropy in Ti<sub>2</sub>O<sub>3</sub> would be included in ΔHt° and in the observed Cp° values for α and β phases. Magnetic contributions are thus unlikely below 50°K.

Melting Data

See Ti<sub>2</sub>O<sub>3</sub>(l) table for details.

Heat of Formation

The heat of formation, ΔHf<sup>0</sup><sub>298</sub>, for Ti<sub>2</sub>O<sub>3</sub>(l) is obtained from that of the crystal by adding ΔHm<sup>0</sup> and the difference between H<sup>0</sup><sub>2112</sub> - H<sup>0</sup><sub>298</sub> for Ti<sub>2</sub>O<sub>3</sub>(c) and Ti<sub>2</sub>O<sub>3</sub>(l).

Heat Capacity and Entropy

The heat capacity of Ti<sub>2</sub>O<sub>3</sub>(l) is estimated on the basis of 7.5 gibbs/g-atom. The S<sup>0</sup><sub>298</sub> is derived in a manner analogous to that of the heat of formation.

Melting Data

The adopted Tm was determined by P. G. Wahlbeck and P. W. Gilles, J. Am. Ceram. Soc. 49, 18 (1966). ΔHm<sup>0</sup> is estimated based on the assumption that at Tm the entropy of melting is 2.5 eu/g-atom. Other Tm values reported are listed as follows:

$\Delta H^{\circ}_0 = -200.11 \pm 0.2$  kcal/mol  
 $\Delta H^{\circ}_{298.15} = -201.46 \pm 0.2$  kcal/mol  
 $\Delta H^{\circ} = 0.355$  kcal/mol  
 $\Delta H^{\circ}_m = 17.55$  kcal/mol  
 $\Delta H^{\circ}_{298.15}$  (to monomer) = 131.46 kcal/mol  
 $\Delta H^{\circ}_{298.15}$  (to dimer) = 82.36 kcal/mol  
 $\Delta H^{\circ}_{298.15}$  (to trimer) = 40.26 kcal/mol  
 $\Delta H^{\circ}_{298.15}$  (to tetramer) = 33.91 kcal/mol

Heat of Formation.

The selected heat of formation,  $\Delta H^{\circ}_{298}$  (WO<sub>3</sub>, c) = -201.46 ± 0.2 kcal/mol, was determined by A. D. Mh, J. Am. Chem. Soc. 81, 1582 (1959), using bomb calorimetry. G. Huff, E. Squitieri and P. E. Snyder, J. Am. Chem. Soc. 70, 3380 (1948), have reviewed the literature heat of formation data and also measured calorimetrically the heat of formation, -201.84 ± 0.1 kcal/mol, which is in good agreement with the value selected. Other combustion values were reported as  $\Delta H^{\circ}_{298} = -199 \pm 1$  kcal/mol by R. C. Griffiths, J. Electrochem. Soc. 105, 398 (1958); and  $\Delta H^{\circ}_{298} = -205.3$  kcal/mol by I. A. Vasil'eva, V. I. Garasimov, and Y. P. Sliamov, Zh. Fiz. Khim. 31, 682 (1957). R. C. Griffiths, J. Electrochem. Soc. 105, 418 (1959), also derived the heat of formation, -202.8 ± 1.4 kcal/mol from equilibrium data.

Heat Capacity and Entropy.

The low temperature (53-298.7°K) heat capacities and high temperature (399.6 - 1835.8°K) enthalpy changes have been measured by E. G. King, W. W. Kellner, and A. U. Christensen, U.S. Bur. Minea R.I. 5664 (1960); and these data have been used to derive the tabulated heat capacities. Low temperature and high temperature values were joined smoothly at 298.15°K. The entropy was calculated from the heat capacities based on  $S^{\circ}_{51} = 1.31$  eu.

King et al. were apparently unaware of the transition near 593°K which was reported by J. A. Perri, E. Banka, and B. Post, J. Appl. Phys. 28, 1272 (1957), and they did not take sufficient points in that region to fix the precise enthalpy curve. We have adopted only one curve through the region because of the inaccuracy of the data and also because the heat effects appear to be small or gradual.

Transition and Melting Data.

The heat of transition, the transition point, the heat of melting and the melting point were derived from the high temperature enthalpy data of King et al., loc. cit.

The melting point, 1746 ± 1°K, has also been quoted by S. J. Schneider, NBS Monograph 68, "Compilation of the Melting Points of the Metal Oxides," October 10, 1963.

In the high temperature X-ray diffractometric studies, Perri et al., loc. cit., indicate that WO<sub>3</sub> undergoes a phase transition from monoclinic to orthorhombic at approximately 593°K and from orthorhombic to tetragonal at 933°K.

Heat of Sublimation.

The values of  $\Delta H^{\circ}_m$  at 298.15°K are calculated as the heat of sublimation of one mole of crystal to one mole of monomer, 1/2 mole of dimer, 1/3 mole of trimer and 1/4 mole of tetramer, respectively.

ΔH<sub>f</sub><sup>o</sup> 0 = -327.3 ± 3.5 kcal. mole<sup>-1</sup>  
ΔH<sub>f</sub><sup>o</sup> 298.15 = -329.3 ± 3.5 kcal. mole<sup>-1</sup>  
S<sub>298.15</sub><sup>o</sup> = 44.654 ± 0.5 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
T<sub>m</sub> = 1016°K.

Heat of Formation.

The heat of the reaction 2PbO(c) + SiO<sub>2</sub>(c) → Pb<sub>2</sub>SiO<sub>4</sub>(c) was reported by O. Kubaschewski and E. L. Evans, Metallurgical Thermochemistry, Pergamon Press, New York (1958). This value for the heat of reaction of the oxides has been converted to the heat of formation using JANAF values for PbO(c) (March 31, 1962) and for SiO<sub>2</sub>(c) (Dec. 31, 1962). The above ΔH<sub>f</sub><sup>o</sup> 298.15 = -7.00 ± 3.5 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

In the low temperature region (53.07-298.15°K.) the C<sub>p</sub> values are those determined by E. G. King, J. Am. Chem. Soc., 81, 799-800 (1959). Above 298.15°K. values were estimated by summing the values for the constituent oxides and graphically smoothing these into the low temperature measurements. The entropy was calculated at 53.07°K. using the Debye and Einstein functions D( $\frac{h\nu}{RT}$ ) + 2E( $\frac{5h\nu}{4RT}$ ) + E( $\frac{3h\nu}{4RT}$ ) given by E. G. King, J. Am. Chem. Soc., 81, 799-800 (1959). The S<sub>53.07</sub><sup>o</sup> = 8.248 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.

T<sub>m</sub> was taken from Geller, Creamer and Bunting, J. Research Natl. Bureau of Standards, 13, 237 (1934).

TRILEAD TETROXIDE (Pb<sub>3</sub>O<sub>4</sub>) (Crystal)

Mol. Wt. = 685.63

ΔH<sub>f</sub><sup>298.15</sup> = -175.31 ± 0.49 kcal. mole<sup>-1</sup>

S<sub>f</sub><sup>298.15</sup> = 50.4 ± 1.6 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Heat of Formation. Calculated from ΔH<sub>f</sub><sup>298.15</sup> = -147.27 kcal. mole<sup>-1</sup> for the reaction: 3Pb(c) + 2O<sub>2</sub>(g) = Pb<sub>3</sub>O<sub>4</sub>(c) given by R. W. Millar, J. Am. Chem. Soc., 51, 207 (1929).

Heat Capacity and Entropy. C<sub>p</sub> (71.5° to 292.6°K.) reported by R. W. Millar, loc. cit. Above 298.15°K., heat capacity values were estimated by comparison with C<sub>p</sub> values for the other lead oxides. The two heat capacity curves were joined smoothly at 298.15°K. by graphical extrapolation.

$\Delta H_f^0 = -481.1 \pm 0.7$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^0 298.15 = -483.7 \pm 0.7$  kcal. mole<sup>-1</sup>

$\Delta H_f^0 298.15 = 20.083 \pm 0.3$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_d = 1811^\circ K.$

ZIRCONIUM ORTHOSILICATE (ZrSiO<sub>4</sub>)

Heat of Formation.

The  $\Delta H_f^0 298.15$  was calculated from the  $\Delta H_f^0 298.15$  of its constituent oxides ZrO<sub>2</sub>(c) + SiO<sub>2</sub>(c) = ZrSiO<sub>4</sub>(c) and from the  $\Delta H_f^0 298.15$  of ZrO<sub>2</sub>(c) (June 30, 1961) and SiO<sub>2</sub>(c) (Dec. 31, 1962) in JANAF tables. The  $\Delta H_f^0 298.15 = -4.736$  kcal. mole<sup>-1</sup> was based on the free energy of formation of its constituent oxides at the decomposition temperature 1811°K.

Heat Capacity and Entropy.

At low temperatures  $C_p$  were used from K. K. Kelley, J. Am. Chem. Soc. 53, 2750 (1941). From 288-940°K.  $C_p$  was calculated by using the J. P. Coughlin and E. O. King equation  $C_p = 31.48 + 3.92 \times 10^{-5} T - 8.08 \times 10^{-8} T^2$ , J. Am. Chem. Soc., 72, 2282 (1950), which joined smoothly with the low temperature data. Above 940°K. the data was estimated by extending the curve smoothly. The entropy was calculated at 52.7°K. using the Debye and Einstein functions  $D(\frac{h\nu}{kT}) + 2E(\frac{h\nu}{kT}) + 2E(\frac{h\nu}{kT}) + 2E(\frac{h\nu}{kT})$  given by K. K. Kelley, J. Am. Chem. Soc., 53, 2750 (1941).  $S_{52.7}^0 = 0.65404$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Temperature of Decomposition.

$T_d$  is the temperature at which  $\Delta F_T^0 = 0$  for the reaction  $ZrSiO_4(c) \rightarrow ZrO_2(c) + SiO_2(c)$ .  $T_d = 1811^\circ K.$  was taken from C. E. Curtis and H. G. Sowman, J. Am. Soc., 36, 190 (1953).

TRITITANIUM PENTOXIDE, ALPHA ( $\alpha$ -Ti<sub>3</sub>O<sub>5</sub>)

(CRYSTAL)

OFW = 223.697

$\Delta H_f^\circ = -584.63 \pm 0.7$  kcal/mol  
 $\Delta H_f^{298.15} = -587.75 \pm 3.0$  kcal/mol  
 $\Delta H_f^\circ = [2.81]$  kcal/mol

$S_{298.15}^\circ = 30.935$  gibbs/mol  
 $T_c = 450^\circ K$

Heat of Formation

The enthalpy change,  $\Delta H_f^{298} = -89.65 \pm 0.05$  kcal/mol, for the reaction  $Ti_3O_5(c) + 1/2 O_2(g) = 3 TiO_2(\text{rutile})$  has been measured by O. L. Humphrey, J. Am. Chem. Soc. 73, 1587 (1951), using combustion bomb calorimetry. Based on the reported  $\Delta H_f^{298}$  and  $\Delta H_f^{298}(\text{rutile}) = -225.8$  kcal/mol, the value of  $\Delta H_f^{298}$  for  $Ti_3O_5(\alpha)$  is derived as  $-587.75 \pm 0.7$  kcal/mol. A value of  $-587.0 \pm 1.0$  kcal/mol was obtained by S. M. Ariya, M. P. Morozov, and E. Vol'f, Russ. J. Inorg. Chem. (English transl.) 2, 16 (1957), from a similar calorimetric study on Ti-O compounds of various compositions. The latter authors observed that their combustion product had a composition of about  $Ti_{10.97}O_{16}$ , so they applied an approximate correction to their data. Presumably, the rutile in Humphrey's combustion was also deficient in oxygen, but we have not attempted to make a correction (see  $TiO_2$  (rutile) table for further details).

Heat Capacity and Entropy

Low temperature heat capacities, 53.1 - 236.6°K, were measured by C. H. Shomate, J. Am. Chem. Soc. 68, 310 (1946). High temperature enthalpies, 360.5 - 1340°K, were determined by B. F. Naylor, J. Am. Chem. Soc. 69, 1077 (1946), by use of drop calorimetry. The heat capacities, 298 - 450°K, derived by Naylor are too high to join smoothly at 298°K with the low temperature data, hence they are not used. The Cp values above 296.6°K are obtained by graphical extrapolation of the adopted low temperature Cp.

The samples used by both Shomate and Naylor were prepared by reduction of titanium dioxide with carbon at 1350°C. Analysis of the product gave 99.1%  $Ti_3O_5$ , 0.2%  $TiO$  and 0.7%  $SiO_2$ . X-ray lines from the sample were weak and fuzzy but no data were given. Thus comparison with subsequent studies is not possible. According to Naylor, the enthalpy measurements showed a transition at about 450°K. When  $Ti_3O_5$  was heated above this temperature, it did not return to the original state on cooling. Enthalpies were then systematically higher by up to 10 percent. The change in the enthalpy curve seemed to depend upon both the temperature and time of heating above Tt. Regrinding was the only method found for returning the sample to its original state. Possible explanations are presented in the Transition Data.

$S_{298}^\circ$  is calculated from  $S_{50}^\circ = 0.88$  eu using the low temperature Cp reported by Shomate, loc. cit. It is pertinent to ask if there should be entropy contributions due to vacancies in the crystal lattice or to spin-magnetic effects below 50°K. S. Asbrink and A. Megnell, Acta Cryst. 12, 575 (1959), showed that the X-ray crystallographic density is greater than the experimental density by less than 1%, thus the entropy due to the presence of vacancies is considered to be negligible. We also assume that any spin-magnetic entropy is related to the  $\alpha \rightarrow \beta$  transition, by analogy with the  $\alpha \rightarrow \beta$  transition of  $Ti_2O_3$ . Consistent with this assumption is the observation that the entropy of  $\beta$ - $Ti_3O_5$  is already larger than the sum of entropies for  $\beta$ - $Ti_2O_3$  and  $TiO_2$ .

Transition Data

See  $Ti_3O_5(\beta)$  table.

GFW = 223.697

(CRYSTAL)

TRITITANIUM PENTOXIDE, BETA ( $\beta$ -Ti<sub>3</sub>O<sub>5</sub>)

$$\Delta H_{298.15}^{\circ} = [-585.354] \text{ kcal/mol}$$

$$\Delta H^{\circ} = [2.81] \text{ kcal/mol}$$

$$\Delta H_m^{\circ} = [35] \text{ kcal/mol}$$

$$S_{298.15}^{\circ} = [35.913] \text{ gibbs/mol}$$

$$T_f = 450^{\circ}\text{K}$$

$$T_m = 2047 \pm 10^{\circ}\text{K}$$

Heat of Formation

The value of  $\Delta H_{298}^{\circ}(\beta)$  is obtained from  $\Delta H_{298}^{\circ}(\alpha)$  by adding  $\Delta H_f^{\circ}$  and the difference between  $H_{450}^{\circ} - H_{298}^{\circ}$  for  $Ti_3O_5(\alpha)$  and  $Ti_3O_5(\beta)$ .

Heat Capacity and Entropy

The heat capacities are derived from the enthalpy data, 452 - 1340°K, measured by B. F. Naylor, J. Am. Chem. Soc. **69**, 1077 (1946). The Cp values beyond the experimental range are obtained by linear extrapolation.

The  $S_{298}^{\circ}$  is calculated in a manner analogous to that of the heat of formation. For a discussion pertaining to the entropy uncertainty, see the Transition Data.

Transition Data

Tt and  $\Delta H_f^{\circ}$  are based on the  $\beta$ -phase enthalpy data of Naylor, loc. cit., and on the selected enthalpies of the  $\alpha$ -phase.  $\Delta H_f^{\circ}$  is thus subject to an unknown error since the  $\beta$ -phase enthalpies correspond to a somewhat different state than do the  $\alpha$ -phase values (see  $\alpha$ -Ti<sub>3</sub>O<sub>5</sub>). The enthalpy data also show unusual scatter in the range 452-530°K. Because of these uncertainties, the more recent X-ray studies are summarized below.

S. Abrink and A. Magnelli, *Acta Cryst.* **12**, 575 (1959), found that monoclinic  $\alpha$ -Ti<sub>3</sub>O<sub>5</sub> transforms to a  $\beta$  form of the ansoovite type (slightly deformed pseudo-brookite) at about 393°K, i. e., over 50° lower than Naylor's value. P. G. Wählbeck and P. W. Gilles, *J. Am. Ceram. Soc.* **49**, 190 (1966), confirmed that the transition occurs between 373 and 473°K but did not measure the temperature accurately. In both studies only the  $\alpha$  form was observed on cooling the sample to room temperature. Abrink and Magnelli noted the following in X-ray studies at elevated temperatures. In a wide region around 393°K, the powder reflections of the unstable phase disappeared, while the general characteristics of the stable one formed within considerably less than one hour. Complete development of some reflections of the stable phase took several hours, while some lines appeared with anomalous intensities at temperatures approaching the transformation point, thus "forewarning" the change of structure. Small contents of Fe or Mg stabilized the  $\beta$  form at room temperature.

These observations suggest that the transformation may be considered as a "permt" which occurs over a range of temperatures. The anomalous enthalpy data observed by Naylor may arise from slow completion of the transition and from stabilization of part of the sample in the  $\beta$  form due to impurities. The latter suggestion is consistent with Naylor's observation that regrinding returned the sample to its normal  $\alpha$  form. Correction of the enthalpy data based on these assumptions does not appear practical. Pending new data for a well-characterized sample, we must rely on the results of Naylor.

Melting Data.

P. G. Wählbeck and P. W. Gilles, *J. Am. Ceram. Soc.* **49**, 180 (1966), found that Ti<sub>3</sub>O<sub>5</sub> melts incongruently at 2047 ± 10°K which is adopted.  $\Delta H_m^{\circ}$  is estimated assuming that at Tm the entropy of melting is 2 eu/g-atom. Melting points of 2173 and 1983°K were reported by R. DeVries and R. Roy, *Bull. Am. Ceram. Soc.* **33**, 370 (1954), and G. Brauer and M. Litke, *J. Inorg. Nucl. Chem.* **16**, 67 (1960), respectively.

OPM = 223.697

(LIQUID)

TRITITANIUM PENTOXIDE (Ti<sub>3</sub>O<sub>5</sub>)

$\Delta H_f^{298,15} = [-560.754] \text{ kcal/mol}$   
 $\Delta H_m^\circ = [33] \text{ kcal/mol}$

$S_{298,15}^\circ = [38.679] \text{ gibbs/mol}$   
 $T_m = 2047 \pm 10^\circ \text{K}$

Heat of Formation

The  $\Delta H_f^{298,15}(l)$  is obtained from  $\Delta H_f^{298,15}(s)$  by adding  $\Delta H_m^\circ$  and the difference between  $H_{2047}^\circ - H_{298}^\circ$  for Ti<sub>3</sub>O<sub>5</sub>(s) and Ti<sub>3</sub>O<sub>5</sub>(l).

Heat Capacity and Entropy

The heat capacity is estimated on the basis of 7.0 gibbs/g-atom.  $S_{298}^\circ$  is obtained in a manner analogous to that of the heat of formation.

Melting Data

See Ti<sub>3</sub>O<sub>5</sub>(s) table for details.

| T, K | Cp°    | S°      | -(C°-H° <sub>298</sub> )/T | H°-H° <sub>298</sub> | ΔHf°     | ΔGf°     | Log Kp   |

Dec. 31, 1960 (Sept. 30, 1961) Dec. 31, 1962

DIPHOSPHORUS TRIOXIDE, DIMERIC (P<sub>2</sub>O<sub>5</sub>) (Ideal Gas)

Mol. Wt. = 219.90

ΔH<sub>f</sub><sup>o</sup> 298.15 = -512.5 ± 0 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = 82.6 cal. deg<sup>-1</sup> mole<sup>-1</sup>

Point group = T<sub>d</sub>

Bond Lengths and Angles: P-O distance = 1.65 ± 0.02 Å  
 P-O-P angle = 127.5 ± 1.0° O-P-O angle = 99° ± 1° σ = 12  
 Product of Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 4.632 X 10<sup>-112</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation. ΔH<sub>f</sub><sup>o</sup> 298.15 for Liquid P<sub>2</sub>O<sub>5</sub> was measured by N. E. Koerner and F. Daniels, J. Chem. Phys. 20, 113 (1952). The measurement was made by burning samples of red phosphorus in nitric oxide in a flow calorimeter. Calculation of the heat of formation of the gas was made using ΔH<sub>f</sub><sup>o</sup> 298.15 = 11.46 kcal. mole<sup>-1</sup> as reported by T. D. Farr, Tenn. Valley Authority, Chem. Engr. Report No. 6 (1950).

Heat Capacity and Entropy. The vibrational levels are from the Raman data of H. Gerding, H. van Brederode and H. C. J. de Decker, Rec. Trav. Chim. 51, 549 (1942), and infra-red spectra data of T. A. Sidorenko and M. N. Sobolev, Optics and Spectr., 2, 710 (1957). Bond lengths and angles are from electron diffraction data by G. C. Hampson and A. J. Stosick, J. Am. Chem. Soc. 50, 1814 (1938).

Bond Distance: W-O = [1.81] Å  
Bond Angle: O-W-O = [109.47°], W-O<sub>2</sub>bridge-W = [70.53°]  
Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [5.917 × 10<sup>-112</sup>] g<sup>3</sup> cm<sup>6</sup> σ = [4]

Heat of Formation.  
The adopted value, ΔHf°<sub>298</sub> (W<sub>2</sub>O<sub>3</sub>, g) = -278.2 kcal/mol, was reduced from ΔHf°<sub>1800</sub> = -272.5 kcal/mol, reported by R. J. Ackermann and E. O. Rauh, J. Phys. Chem. 67, 2596 (1963). They have studied the sublimation behavior of the tungsten-oxygen system over the temperature range from 1300 to 1600°K by mass spectrometry, mass effusion, and X-ray diffraction, and also have determined ΔHf° (W<sub>2</sub>O<sub>3</sub>, g) = -272.500 + 54.98T (cal/mol) from partial pressure measurements over the W<sub>2</sub>O<sub>3</sub>(c) system.

J. E. Battles, Ph. D. dissertation, "A Mass Spectrometric Investigation of Tungsten Dioxide and Tungsten Trioxide," The Ohio State University, 1964, has also studied the same system in the temperature range from 1418 to 1527° K. Third law calculation of the partial pressure data gives ΔHf°<sub>298</sub> = 144.0 kcal/mol for 3 W<sub>2</sub>O<sub>3</sub>(c) = W<sub>2</sub>O<sub>6</sub>(g) + W(c) which yields ΔHf°<sub>298</sub> (W<sub>2</sub>O<sub>3</sub>, g) = -278.8 kcal/mol, using all JANAP functions. This value is in good agreement with the value adopted.

J. H. Norman and H. O. Staley, J. Chem. Phys. 43, 3804 (1965), have obtained ΔHf°<sub>1800</sub> = -127 kcal/mol for 2 W<sub>2</sub>O<sub>3</sub>(g) = W<sub>2</sub>O<sub>6</sub>(g) by mass spectrometric study of the vapor over W<sub>3</sub> dissolved in CrO-Al<sub>2</sub>O<sub>3</sub>-SiO<sub>2</sub>. The value of ΔHf° was determined by the second law method from ion intensities and leads to ΔHf°<sub>298</sub> (W<sub>2</sub>O<sub>3</sub>, g) = -275 kcal/mol, using all JANAP functions (dated Sept. 30, 1965). The absolute pressure values reported by Norman and Staley appear to be quite inconsistent with the JANAP functions, since they lead to ΔHf°<sub>298</sub> (W<sub>2</sub>O<sub>3</sub>, g) = -246 kcal/mol by the third law method.

| Investigator     | Chemical Reaction  | Temperature (°K) | ΔHf° <sub>298</sub> (kcal/mol) | Drift (eu)  | ΔHf° <sub>298</sub> (W <sub>2</sub> O <sub>3</sub> , g) (kcal/mol) |
|------------------|--|------------------|--------------------------------|-------------|--|
| Ackermann & Rauh | 3 W <sub>2</sub> O <sub>3</sub> (c) = W <sub>2</sub> O <sub>6</sub> (g) + W(c) | 1300-1600        | 144.54                         | 0.01        | -278.2*  |
| Battles          | 3 W <sub>2</sub> O <sub>3</sub> (c) = W <sub>2</sub> O <sub>6</sub> (g) + W(c) | 1418-1527        | 142.66                         | 0.85 ± 0.40 | -278.8*  |

\* Third law value adopted in calculation.  
\*\* Second law value adopted in calculation.

Heat Capacity and Entropy.  
The heat capacity was approximated by making a tentative choice of the vibrational frequencies of 600 cm<sup>-1</sup> (4), 300 cm<sup>-1</sup> (8), and 172 cm<sup>-1</sup> (6) in order to give the entropy at 1450°K, S<sub>1450</sub> = 164.66 eu, corresponding to ΔSf°<sub>1450</sub> = 54.98 eu which was reported by Ackermann and Rauh. The adopted value, S<sub>298</sub> (W<sub>2</sub>O<sub>3</sub>, g) = 99.3 eu, was reduced from the entropy at 1450°K, using JANAP functions. Second law calculation of the partial pressure data of Battles gives ΔS°<sub>1470</sub> = 63.5 eu for 3 W<sub>2</sub>O<sub>3</sub>(c) = W<sub>2</sub>O<sub>6</sub>(g) + W(c). This yields S°<sub>298</sub> (W<sub>2</sub>O<sub>3</sub>, g) = 97.9 eu.

The molecular configuration for W<sub>2</sub>O<sub>3</sub>(g) was estimated by assuming that the oxygens are tetrahedrally located around the tungsten atom, and two of these tetrahedra share a common oxygen edge to form a planar four-member ring. The bond distance W-O was estimated as 1.81 Å and the bond angle O-W-O = 109.47° and W-O<sub>2</sub>bridge-W = 70.53°. The three principal moments of inertia are: I<sub>A</sub> = 3.481 × 10<sup>-37</sup>, I<sub>B</sub> = 1.363 × 10<sup>-37</sup> and I<sub>C</sub> = 1.247 × 10<sup>-37</sup> g cm<sup>2</sup>.

Tritungsten Octaoxide (W<sub>3</sub>O<sub>8</sub>)  
(Ideal Gas)      GFW = 679.5452

Bond Distance: W-O = [1.81] Å

Bond Angle: O-W-O = [109.47°]

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [7.65 x 10<sup>-111</sup>] g<sup>3</sup> cm<sup>6</sup>

Heat of Formation

R. J. Ackermann and E. G. Rauh, J. Phys. Chem. 67, 2596 (1963), have studied the sublimation behavior of the tungsten-oxygen system over the temperature range from 1300 to 1600°K by mass spectrometry, mass effusion and X-ray diffraction, and also have determined the ΔH<sub>f</sub><sup>0</sup>(W<sub>3</sub>O<sub>8</sub>, g) = -400,900 + 9054 T (cal/mol) from partial pressure measurements over W-WO<sub>2</sub> (c). The adopted value, ΔH<sub>f</sub><sup>298</sup>(W<sub>3</sub>O<sub>8</sub>, g) = -408.7 kcal/mol, was reduced from ΔH<sub>f</sub><sup>1450</sup>(W<sub>3</sub>O<sub>8</sub>, g) = -400.9 kcal/mol, using JANAF functions.

|                  |  |                  |   | -0.04      |

Heat Capacity and Entropy. The heat capacity was approximated by making a tentative choice of the vibrational frequencies of 800 cm<sup>-1</sup>, 350 cm<sup>-1</sup> (4), 242 cm<sup>-1</sup> (8), 199 cm<sup>-1</sup> (3) and 150 cm<sup>-1</sup> (6) in order to give the entropy at 1450°K, S<sub>1450</sub><sup>0</sup> = 208.18 eu, corresponding to ΔS<sub>f</sub><sup>1450</sup> = -90.54 eu, which was reported by Ackermann and Rauh.

The molecular configuration for W<sub>3</sub>O<sub>8</sub>(g) was estimated by assuming that the oxygens are tetrahedrally located around the tungsten atoms, the three tetrahedra are connected by two common edges, and also the three tungsten atoms are in the same axis. The bond distance W-O was estimated as 1.81 Å and the bond angle ∠O-W-O = 109.47°. The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 4.060 x 10<sup>-37</sup> and I<sub>C</sub> = 4.641 x 10<sup>-38</sup> g cm<sup>2</sup>.

Bond Distance W-O = [1.61] Å

Bond Angle O-W-O = [109.47]°, W-O<sub>bridge</sub>-W = [130.53]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [3.895 x 10<sup>-110</sup>] g<sup>3</sup>cm<sup>6</sup>

σ = [6]

The adopted value, ΔH<sub>298</sub><sup>o</sup>(W<sub>3</sub>O<sub>9</sub>,g) = -483.6 kcal/mol, was reduced from ΔH<sub>1450</sub><sup>o</sup>(W<sub>3</sub>O<sub>9</sub>,g) = -474.1 kcal/mol of R. J. Ackermann and E. O. Hahn, *J. Phys. Chem.* 67, 2596 (1963), who studied the sublimation behavior of the tungsten-oxygen system over the temperature range from 1300 to 1600 °K by mass spectrometry, mass effusion, and X-ray diffraction, and determined ΔH<sub>298</sub><sup>o</sup>(W<sub>3</sub>O<sub>9</sub>,g) = -474.100 + 110.26T (cal/mol) from partial pressure measurements over W<sub>2</sub>O<sub>5</sub>(c). They reviewed the previous determinations 1, 2, 3, 4 of the thermodynamic properties of sublimation of W<sub>3</sub>O<sub>9</sub>, and also pointed out that it was not possible to make quantitative observations on stoichiometric W<sub>3</sub>O<sub>9</sub> in vacuo, since it is a "bivalent" system and the ion current is not constant until the composition of the sample reaches W<sub>2</sub>O<sub>9</sub>. This is probably the cause of previous discrepancies in sublimation studies.

J. E. Battison, Ph. D. dissertation, "A Mass Spectrometric Investigation of Tungsten Dioxide and Tungsten Trioxide", The Ohio State University, 1964, has also studied the partial pressure of W<sub>3</sub>O<sub>9</sub>(g) over W-W<sub>2</sub>O<sub>5</sub>(c) in the temperature range from 1399° to 1527°K. Third law calculation of the partial pressure data gives ΔH<sub>298</sub><sup>o</sup> = -148.2 kcal/mol for 4.5 W<sub>2</sub>O<sub>5</sub>(c) = W<sub>3</sub>O<sub>9</sub>(g) + 1.5 W (c), which yields ΔH<sub>298</sub><sup>o</sup>(W<sub>3</sub>O<sub>9</sub>,g) = -465.0 kcal/mol, using all JANAF functions.

J. H. Norman and H. O. Stacy, *J. Chem. Phys.* 23, 3804 (1955), have obtained ΔH<sub>1600</sub><sup>o</sup> = -240 kcal/mol for 3 W<sub>3</sub>O<sub>9</sub>(g) = W<sub>3</sub>O<sub>9</sub>(g) by mass spectrometric study of the vapor over W<sub>3</sub> dissolved in CrO-Al<sub>2</sub>O<sub>3</sub>-SiO<sub>2</sub>. The value of ΔH<sub>298</sub><sup>o</sup> was determined by the second law method from ion intensities and leads to ΔH<sub>298</sub><sup>o</sup>(W<sub>3</sub>O<sub>9</sub>,g) = -483.4 kcal/mol, using all JANAF functions (dated September 30, 1965). The absolute pressure values reported by Norman and Stacy also appear to be quite inconsistent with the JANAF functions, since they lead to -443 kcal/mol by the third law method.

\* Third law value adopted in calculation

\*\* Second law value adopted in calculation

Heat Capacity and Entropy.

The heat capacity was approximated by making a tentative choice of the vibrational frequencies of 800 cm<sup>-1</sup> (8), 396 cm<sup>-1</sup> (3), 330 cm<sup>-1</sup> (9), 200 cm<sup>-1</sup> (6), and 150 cm<sup>-1</sup> (6) in order to give the entropy at 1450°K, S<sub>1450</sub><sup>o</sup> = 219.14 eu, corresponding to ΔS<sub>1450</sub><sup>o</sup> = 110.28 eu, reported by Ackermann and Hahn. The adopted value, S<sub>298</sub><sup>o</sup>(W<sub>3</sub>O<sub>9</sub>,g) = 120.6 eu, was reduced from the entropy at 1450°K, using JANAF functions. Second law calculation of the partial pressure data of Battison gives ΔS<sub>1455</sub><sup>o</sup> = 71.7 eu for 4.5 W<sub>2</sub>O<sub>5</sub>(c) = W<sub>3</sub>O<sub>9</sub>(g) + 1.5 W (c). This yields S<sub>298</sub><sup>o</sup>(W<sub>3</sub>O<sub>9</sub>,g) = 122.4 eu.

The molecular configuration for W<sub>3</sub>O<sub>9</sub>(g) is estimated by assuming that the oxygen atoms are tetrahedrally located around the tungsten atoms, and that each tetrahedron shares two oxygen atoms to form a planar six-member ring. The bond distance W-O is estimated as 1.61 Å and the bond angles O-W-O = 109.47° and W-O<sub>bridge</sub>-W = 130.53°. The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 2.805 x 10<sup>-37</sup> g cm<sup>2</sup> and I<sub>C</sub> = 4.913 x 10<sup>-37</sup> g cm<sup>2</sup>.

ΔH<sub>f</sub><sup>0</sup> = -697.0 ± 2.1 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>298.15</sup> = -702.7 ± 2.1 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>298.15</sup> = 25.34 ± 0.08 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>0</sup> = 54.68 ± 0.10 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>g</sub> = 631°K.

Heat of Formation.

The heat of formation (ΔH<sub>f</sub><sup>298.15</sup>) of P<sub>4</sub>O<sub>10</sub>(c) has been reported by many investigators. The most recent value, ΔH<sub>f</sub><sup>298.15</sup> = -719.4 ± 2.0 kcal. mole<sup>-1</sup> for the reaction P<sub>4</sub>(w, white, c) + 5O<sub>2</sub>(g) = P<sub>4</sub>O<sub>10</sub>(hex. c), was determined by E. P. Egan, Jr. and B. B. Luff, "Heats of Formation of Phosphorus Oxides", June 1, 1963 to Nov. 30, 1963, Tennessee Valley Authority, Office of Agriculture and Chemical Development, Fundamental Research Branch, Wilson Dam, Alabama. This ΔH<sub>f</sub><sup>298.15</sup> value was derived from energy of combustion, ΔE<sub>c</sub> = -716.397 kcal. mole<sup>-1</sup>, which is an average value of many measurements using three different sample forms, i.e. uncoated phosphorus, lucite-coated phosphorus and loose acetate-coated phosphorus. The adopted ΔH<sub>f</sub><sup>298.15</sup> (P<sub>4</sub>O<sub>10</sub>, c) value was recalculated based on the P(red, V, c) as reference state.

The heat of combustion of white phosphorus was determined as -713.2 ± 1.0 kcal. mole<sup>-1</sup> by M. S. Holmes, Trans. Faraday Soc. 58, 1916 (1962), yielding ΔH<sub>f</sub><sup>298.15</sup> (P<sub>4</sub>O<sub>10</sub>, c) = -696.5 ± 1.3 kcal. mole<sup>-1</sup>, based on P(red, V, c) as reference state. The heat of formation of P<sub>2</sub>O<sub>5</sub> from red phosphorus was reported to be -355 ± 2 kcal. mole<sup>-1</sup> by M. E. Koerner and F. Daniels, J. Chem. Phys. 20, 113 (1952). The product, P<sub>2</sub>O<sub>5</sub>, was considered to be a mixture of two forms, i.e. crystalline and amorphous. The other ΔH<sub>f</sub><sup>298.15</sup> (P<sub>4</sub>O<sub>10</sub>, c) values reported by early investigators were reviewed by Egan and Luff, loc. cit.

Heat Capacity and Entropy.

The heat capacities (12-324°K.) and S<sub>298.15</sub><sup>0</sup> adopted were taken from R. J. L. Andon, J. P. Counsell, H. McKeirrell and J. P. Martin, Trans. Faraday Soc. 59, 2702 (1963). The C<sub>p</sub> values above 324°K. were obtained by graphical extrapolation. The S<sub>298.15</sub><sup>0</sup> value was calculated based on S<sub>0</sub><sup>0</sup> = 0.36 e.u.

Low temperature (15-310°K.) and high temperature (298.15-623.15°K.) heat capacities were also measured by Thermal Laboratory, The Dow Chemical Company, private communication, June 18, 1962, and M. Prandsen, J. Res. Natl. Bur. Std. 10, 35 (1933), respectively. The low temperature data were not adopted because they are less satisfactory than the data of Andon et al. The high temperature data were not used because the sample employed for enthalpy measurements was not explicitly reported as pure hexagonal form.

Sublimation Data.

The value of ΔH<sub>f</sub><sup>298.15</sup> was derived from the vapor pressure data by both the second and third law analyses. See the P<sub>4</sub>O<sub>10</sub>(g) table for details. T<sub>g</sub> is the temperature at which the free energy change of the reaction P<sub>4</sub>O<sub>10</sub>(hex. c) = P<sub>4</sub>O<sub>10</sub>(g) approaches zero. Sublimation temperature for P<sub>4</sub>O<sub>10</sub>(c) was derived to be 632°K. (average of three determinations) and 623.7°K. (average of two determinations) by M. Prandsen, loc. cit. from the vapor pressure data reported by J. M. Hoeflaka and M. F. Scheffer, Rec. trav. chim. 45, 191 (1926); A. Saito, Z. physik. Chem. 119, 357 (1930); and A. Saito and A. J. Rutgers, J. Chem. Soc. 125, 2573 (1924), respectively.

Heat of Formation

The value of  $\Delta H_f^\circ$  298.15 (P<sub>2</sub>O<sub>5</sub>, g) was calculated from the heats of formation and sublimation for P<sub>4</sub>O<sub>10</sub> (hex., c). The heat of sublimation ( $\Delta H_s^\circ$  298.15) was derived from vapor pressure data by the second and third law methods. The results obtained are presented as follows.

| Investigator                       | Temperature, °K | Second Law Value | Third Law Value | Drift, e.u. |

1. J. M. A. Hoeflake and P. E. C. Schaffer, Rec. trav. chim. 45, 191 (1926).  
 2. J. C. Southern and R. A. Nelson, J. Am. Chem. Soc. 59, 911 (1937).

The value of  $\Delta H_f^\circ$  298.15 adopted was 25.34 ± 0.08 kcal. mole<sup>-1</sup>. There are many vapor pressure measurements reported but only the above two over P<sub>4</sub>O<sub>10</sub> (hex., c).

It has been shown that P<sub>4</sub>O<sub>10</sub> has three solid phases and two liquid phases. The three solid phases are hexagonal, orthorhombic and tetragonal. As temperature increases, the thermal stability of P<sub>4</sub>O<sub>10</sub> follows the same order. The metastable liquid, according to data of Hoeflake and Schaffer, loc. cit., is from hexagonal form. The stable liquid is from tetragonal form. W. L. Hill, O. T. Faust and S. B. Hendricks, J. Am. Chem. Soc. 55, 794 (1933) reported that molecules of P<sub>4</sub>O<sub>10</sub> having the same structure as in the vapor are present in the hexagonal form of the solid. The vapor pressures of P<sub>4</sub>O<sub>10</sub> over different condensed phases have been measured by many investigators and reviewed by T. D. Farr, "Phosphorus, Properties of the Elements and Some of Its Compounds", Tennessee Valley Authority, Wilson Dam, Alabama, 1950. The complexity of the solid state of P<sub>4</sub>O<sub>10</sub> has also been discussed by A. Smits and A. J. Rutgers, J. Chem. Soc. 195, 2575 (1924); A. Smits, Z. physik. Chem. 149, 337 (1930); A. Smits, J. A. A. Keteleer and J. L. Meyerling, *ibid.*, 181, 87 (1939); and A. Smits, *ibid.*, 185, 45 (1940).

Heat Capacity and Entropy

The molecular structure and constants were obtained from P. A. Akishin, N. O. Rambidi and E. Z. Zaborin, Kristallografiya, 3, 360 (1959). The molecular structure of P<sub>4</sub>O<sub>10</sub>(g) has also been studied by the electron diffraction method by L. R. Maxwell, S. B. Hendricks and L. S. Deming, J. Chem. Phys. 5, 626 (1937), and O. C. Hampson and A. J. Stosick, J. Am. Chem. Soc. 50, 1814 (1928). The model of the P<sub>4</sub>O<sub>10</sub> molecule was later confirmed by the X-ray method reported by H. C. J. Decker and C. H. MacGillivray, Rec. trav. chim. 50, 153 (1931); and spectroscopic studies reported by H. Gerding and H. C. J. Decker, Rec. trav. chim. 64, 191 (1945), and T. A. Sidorov and N. N. Sobolov, Opt. Spectr. (USSR) 2, 717 (1957). All vibrational frequencies were obtained from E. P. Egan, Jr., private communication, Feb. 23, 1960, except nine frequencies, i.e. 170 (3), 470 (3), and 750 (3) cm<sup>-1</sup> which were estimated in order to make the second and third law values of  $\Delta H_f^\circ$  298.15 agree. The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 1.4322 X 10<sup>-37</sup> g cm<sup>2</sup>. The heat capacities (549-1098°K. or 822-1371°K.) of P<sub>4</sub>O<sub>10</sub>(g) have been determined by M. Prandsen, J. Rec. Natl. Bur. Std. 10, 35 (1933). His results are in fair agreement with the calculated ones.

| [800] (8)                   | [240] (8)                   |                |
| [300] (8)                   | [200] (18)                  |                |

Bond Distance: W-O = [1.81] Å  
 Bond Angle: O-W-O [109.47°], W-O-bridge-W = [160.53°]  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [3.854 × 10<sup>-109</sup>] g<sup>3</sup>cm<sup>6</sup>

**Heat of Formation.**  
 The adopted value,  $\Delta H_f^\circ_{298}$  (W<sub>3</sub>O<sub>12</sub>, g) = -670.2 kcal/mol, was reduced from  $\Delta H_f^\circ_{1450}$  (W<sub>3</sub>O<sub>12</sub>, g) = -655.6 kcal/mol of R. J. Ackermann and E. G. Reuh, J. Phys. Chem. **52**, 2596 (1963), who studied the sublimation behavior of the tungsten-oxygen system over the temperature range from 1300 to 1600°K by mass spectrometry, mass effusion and x-ray diffraction, and determined  $\Delta H_f^\circ$  (W<sub>3</sub>O<sub>12</sub>, g) = -655.600 + 160.29 T (cal/mol) from partial pressure measurements over the W-WO<sub>2</sub>(c). They reviewed the previous determinations 1, 2, 3, 4 of the thermodynamic properties of sublimation of WO<sub>3</sub>, and also pointed out that it was not possible to make quantitative observations on stoichiometric WO<sub>3</sub> in vacuo, since it is a "bivalent" system and the ion current is not constant until the composition of the sample reaches WO<sub>2.98</sub>. This is probably the cause of previous discrepancies in sublimation studies.

J. E. Battles, Ph. D. dissertation, "A Mass Spectrometric Investigation of Tungsten Dioxide and Tungsten Trioxide", The Ohio State University, 1964, and also studied the partial pressure of W<sub>3</sub>O<sub>12</sub>(g) over W-WO<sub>2</sub>(c) in the temperature range from 1449 to 1527°K. Third law calculation of the partial pressure data gives  $\Delta H_f^\circ_{298} = 172.0$  kcal/mol for 6 WO<sub>2</sub>(c) = W<sub>3</sub>O<sub>12</sub>(g) + 2 W(c), which yields  $\Delta H_f^\circ_{298}$  (W<sub>3</sub>O<sub>12</sub>, g) = -673.6 kcal/mol, using all JANAF functions.

\* Third law value adopted in calculation.

**Heat Capacity and Entropy.**  
 The heat capacity was approximated by making a tentative choice of the vibrational frequencies of 800 cm<sup>-1</sup>(8), 300 cm<sup>-1</sup>(8), 240 cm<sup>-1</sup>(8), and 200 cm<sup>-1</sup>(18) in order to give the entropy at 1450°K, S<sub>1450</sub> = 278.9 eu, corresponding to  $\Delta S_f^\circ_{1450} = -160.29$  eu, reported by Ackermann and Reuh. The adopted value, S<sub>298</sub> (W<sub>3</sub>O<sub>12</sub>, g) = 144.6 eu, was reduced from the entropy at 1450°K, using JANAF functions. Second law calculation of the partial pressure data of Battles gives  $\Delta S_f^\circ_{1487} = 82.3$  eu for 6 WO<sub>2</sub>(c) = W<sub>3</sub>O<sub>12</sub>(g) + 2W(c). This yields S<sub>298</sub> (W<sub>3</sub>O<sub>12</sub>, g) = 147.4 eu.

The molecular configuration for W<sub>3</sub>O<sub>12</sub>(g) is estimated by assuming that the oxygens are tetrahedrally located around the tungsten atoms, and that each tetrahedron shares two oxygen atoms to form a planar eight-member ring. The bond distance W-O is estimated as 1.81 Å and the bond angles O-W-O = 109.47° and W-O-bridge-W = 160.53°. The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 5.935 × 10<sup>-37</sup> g cm<sup>2</sup>, and I<sub>C</sub> = 1.094 × 10<sup>-36</sup> g cm<sup>2</sup>.

(REFERENCE STATE)

PHOSPHORUS (P)

The selected reference states are:

- 0 to 704°K. Solid Phosphorus (Red.V)
- 704 to 6000°K. Ideal Diatomic Gas

For details see Phosphorus (Red.V) and P<sub>2</sub> (Ideal Gas).

(Crystal) At. Wt. = 30.975

PHOSPHORUS, RED, V, (P) (CRYSTAL) AT. WT. = 30.975

$\Delta H_{f, 298.15}^{\circ} = 0$  kcal. mole<sup>-1</sup>  
 $\Delta H_{g, 298.15}^{\circ} = 7.69 \pm 0.1$  kcal. mole<sup>-1</sup>  
 $T_m = 870^{\circ}\text{K}$   
 $\Delta H_{f, 298.15}^{\circ} = 0$  kcal. mole<sup>-1</sup>  
 $S_{298.15}^{\circ} = 5.45 \pm 0.02$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $\Delta H_m^{\circ} = 4.5 \pm 0.2$  kcal. mole<sup>-1</sup>

Heat of Formation

Zero by definition below 704°K. See P<sub>2</sub>(g) sheet for details above 704°K.

Heat Capacity and Extrapolation

The only reliable low temperature measurements, 15 to 305°K, are reported by R. L. Potter, Dissertation, Massachusetts Institute of Technology (1946). A value at 10°K was obtained by graphical extrapolation and a T<sup>3</sup> function was assumed from 0 to 10°K. High temperature heat capacities were obtained from a smooth curve joining the measurements of O. Kubaschewski and G. Schrag, Z. Elektrochem. 46, 675 (1940), in the range 573 to 773°K and that of V. Regnault, Ann. chim. Phys. 3, 322 (1843) at 331°K with those of Potter. Measurements of A. Wigand, Ann. Physik, 22, 64 (1907), are too high. The uncertainty in the high temperature heat capacity is about 2%.

Melting

The values of  $\Delta H_m$  and  $T_m$  were calculated from the functions of the solid and liquid. This may be compared with a reported triple point of 882.7°K by A. Smits and S. C. Bokhorst, Verh. Akad. Wetenschap. 23, 930 (1914).

Heat of Sublimation

Vapor pressure measurements on the triclinic allotrope, T. V. A. designation V, are reported by T. D. Farr, Tennessee Valley Authority Chemical Engineering Report No. 8 (1950). These data lead to a sublimation point of 704°K and  $\Delta H_g$  298.15 of 30.77 ± 0.4 kcal. mole<sup>-1</sup> of P<sub>4</sub>. A. Smits and S. C. Bokhorst, Z. Phys. Chem. 91, 248 (1916), measured the vapor pressure of a sample whose preparation indicates that it was probably P, V. These results lead to  $\Delta H_g$  298.15 = 30.6 ± 1 kcal. An unpublished value of 30.84 kcal. mole<sup>-1</sup> of P<sub>4</sub> by C. C. Stephenson is quoted by J. S. Kane, Thesis Univ. of California (1955).

D. P. Stevenson and D. M. Yost, J. Chem. Phys. 9, 403 (1941), show that the vapor density measurements of A. Stock, O. E. Gibson and E. Stamm, Ber. 45, 3527 (1912) are best explained by a vapor essentially composed of only P<sub>4</sub>(g) below 800°K. This conclusion is supported by recent mass spectrometer measurements of J. S. Kane and J. H. Reynolds, J. Chem. Phys. 25, 342 (1956).

 $T_t = 195.4 \pm 0.1^{\circ}\text{K}$  (white  $\beta \rightarrow$  white  $\alpha$ )  
 $T_m = 317.30 \pm 0.05^{\circ}\text{K}$

Heat Capacity and Extrapolation

Low temperature measurements, 15-315°K, were made by R. T. Maples, Dissertation, Massachusetts Institute of Technology (1949). A Debye  $\theta$  temperature of 124 was used to extrapolate to 0°K. P. E. Young and J. H. Hildenbrand, J. Am. Chem. Soc. 64, 859 (1942), obtained heat capacities from enthalpy measurements that are 4% higher than those from the low temperature calorimeter which are preferred because of the proximity to the melting point.

Transition

Observed by Maples.

Melting

The selected heat of fusion is that observed by Maples. Young and Hildenbrand obtain 125 cal. mole<sup>-1</sup> for the same quantity. Maples' value is consistent with vapor pressures and other thermochemical data; see P(11q) and P<sub>4</sub>(g) sheets.

Heat of Sublimation

The vapor pressure measurements of F. S. Dainton and H. M. Kimberly, Trans. Faraday Soc. 46, 912 (1950), are the most precise and lead to  $\Delta H_g 298.15 = 14.09 \pm 0.2 \text{ kcal. mole}^{-1}$  of P<sub>4</sub>. Measurements of A. Jollibois, Compt. rend. 149, 287 (1908), A. Smits and S. C. Bokhorst, Z. Phys. Chem. 91, 248 (1916), and M. Centzwer, Z. phys. Chem. 85, 99 (1913) lead to values that agree within the assigned uncertainty.

Heat of Formation

The heat of formation is obtained from the heats of sublimation represented by reaction I and II at 298.15°K. See P, V sheet for details.

- (I)  $4P_4(g) = P_4(g)$  14.08 kcal.
- (II)  $4P_4(c) = P_4(g)$  30.71 kcal.

Of the calorimetric determinations only those of H. Gira, Ann. Chim. Phys. 30, 203 (1903) result in a reliable value for the heat of formation,  $4.4 \pm 0.4 \text{ kcal. mole}^{-1}$ . A comprehensive review is given by H. J. Rodewald, Helv. Chim. Acta 43, 878 (1960).

PHOSPHORUS (P)

(LIQUID)

At. Wt. = 30.975

$\Delta H_{f, 298.15}^{\circ} = 5.2 \pm 0.3 \text{ kcal. mole}^{-1}$   
 $\Delta H_{f, 298.15}^{\circ} = 10.25 \pm 0.03 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_m^{\circ}, P_{\alpha} \rightarrow P(\text{liq}) = 157.43 \pm 0.5 \text{ cal. mole}^{-1}$   
 $\Delta H_m^{\circ}, P_{\gamma} \rightarrow P(\text{liq}) = 4.5 \pm 0.2 \text{ kcal. mole}^{-1}$   
 $\Delta H_v, 298.15 = 3.37 \pm 0.03 \text{ kcal. mole}^{-1}$   
 $P_c = [95.3] \text{ atm.}$

$\Delta H_{f, 0}^{\circ} = 5.2 \pm 0.3 \text{ kcal. mole}^{-1}$   
 $T_m = 317.30 \pm 0.05^{\circ}\text{K}, P_{\alpha} \rightarrow P(\text{liq})$   
 $T_m = 870^{\circ}\text{K}, P_{\gamma} \rightarrow P(\text{liq})$   
 $T_b = 550 \pm 3^{\circ}\text{K}$   
 $T_c = 935.8^{\circ}\text{K}$

Heat of Formation

Derived from the  $\Delta H_m^{\circ}$  by the following cycle:

- (I)  $P \text{ 317.30} = P(\text{liq}) \quad 0.157 \text{ kcal.}$
- (II)  $P_{\alpha} \text{ 298.15} = P_{\alpha} \text{ 317.30} \quad 0.113$
- (III)  $P(\text{liq}) \text{ 317.30} = P(\text{liq}) \text{ 298.15} \quad -0.121$
- (IV)  $P_{\gamma} \text{ 298.15} = P_{\alpha} \text{ 298.15} \quad 4.08$

The  $\Delta H_{f, 298.15}^{\circ}$  obtained from vapor pressure measurements on  $P_{\gamma}$  and on the liquid is  $4.32 \text{ kcal. mole}^{-1}$  in agreement with that derived from the melting point.

Heat Capacity

P. E. Young and J. H. Hildenbrand, J. Am. Chem. Soc. 64, 839 (1942), obtained an equation from enthalpy measurements which decreased with temperature. However, a better fit to the thermochemical data results if a constant heat capacity is assumed.

Entropy

Derived from low temperature measurements on P, White. See P, White sheet for details.

Vaporization Phenomena

D. MacRae and C. G. Van Voorhis, J. Am. Chem. Soc. 43, 547 (1921), determinations of the vapor pressure, 44 to 150°C, are the most precise and lead to a  $\Delta H_v, 298.15$  of  $13.504 \pm 0.1 \text{ kcal. mole}^{-1}$  of  $P_{\alpha}$ . A vapor pressure equation derived by T. D. Farr, Tennessee Valley Authority Chemical Engineering Report No. 8 (1950) to fit the measurements reported in the literature leads to a value of  $13.6 \pm 0.1 \text{ kcal. mole}^{-1}$  of  $P_{\alpha}$ . The boiling point is calculated from the functions of  $P(\text{liq})$  and  $P_{\alpha}(\text{g})$ , and may be compared with the values of 552.7 and 553.7 resulting from Farr's equation and observations of A Smits and S. G. Bokhorst, Proc. Akad. Wetenschap. 18, 106 (1915) respectively.

Critical Phenomena

$T_c$  determined and  $P_c$  estimated by W. Marchewald and R. Heilmholz, Z. anorg. Chem. 124, 81 (1922).

The ΔH<sub>f</sub><sup>o</sup> 298.15 was derived by the following cycle:

- (1) 4 P<sub>red</sub>(v) [298.15°] = P<sub>4</sub>(g) [298.15°] ΔH<sub>f</sub><sup>o</sup> = 30.77 kcal. mole<sup>-1</sup> of P<sub>4</sub> See P<sub>red</sub>(v) sheet under Heat of Sublimation.
- (2) P<sub>4</sub>(g) [298.15°] = 2P<sub>2</sub>(g) [298.15°] ΔH<sub>f</sub><sup>o</sup> = 54.59 kcal. mole<sup>-1</sup> of P<sub>4</sub> See P<sub>2</sub>(g) sheet under Heat of Formation.
- (3) 2P<sub>2</sub>(g) [298.15°] = 2P<sub>2</sub>(g) [0°] ΔH<sub>f</sub><sup>o</sup> = 2(-2.128) kcal. mole<sup>-1</sup> of P<sub>4</sub> See P<sub>2</sub>(g) table.
- (4) 2P<sub>2</sub>(g) [0°] = 4P(g) [0°] ΔH<sub>f</sub><sup>o</sup> = 2(116.075) kcal. mole<sup>-1</sup> of P<sub>4</sub> A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules," Chapman and Hall, 1953.
- (5) 4 P(g) [0°] = 4 P(g) [298.15°] ΔH<sub>f</sub><sup>o</sup> = 4(1.481) kcal. mole<sup>-1</sup> of P<sub>4</sub> See P(g) table.

D<sub>0</sub><sup>o</sup> for reaction (4) was given by A. G. Gaydon (loc. cit.). He reported a predissociation limit at 51,958 ± 9 cm.<sup>-1</sup>. He considered the dissociation to be P<sub>2</sub> → P(4s) + P(3d). From the predissociation limit and the energy level of the excited P(2D) state [11,360.8 cm.<sup>-1</sup>] Gaydon (loc. cit.) obtained a D<sub>0</sub><sup>o</sup> = 5.033 e.v. or 116.075 kcal. mole<sup>-1</sup>. As a check, a graphical Birge-Sponer extrapolation by Gaydon (loc. cit.) [Σ<sub>v=0</sub><sup>∞</sup> (v+1/2)ΔG<sub>v</sub>] agrees with a D<sub>0</sub><sup>o</sup> = 5.0 e.v.

The vapor equilibrium data of G. Freurer and I. Brockmoller, Z. Physik Chem. 81, 129 (1913) gave a ΔH<sub>f</sub><sup>o</sup> for reaction (4) which was much lower than the spectroscopic value i.e. 31.5(1073°K) vs. 116(0°) kcal. mole<sup>-1</sup> of P<sub>2</sub>. D. P. Stevenson and D. M. Yost, J. Chem. Phys. 9, 403 (1941) reported that the vapor equilibrium measurements of G. Freurer and I. Brockmoller (loc. cit.) were doubtful while the measurements of A. Stock, G. E. Gibson, and E. Stamm Ber 45, 3527 (1913) were correct. Stock et al. (loc. cit.) have shown that the reaction P<sub>2</sub>(g) → 2P(g) is extremely slight even at 1473°K which is the highest temperature of the vapor equilibrium studies.

Heat Capacity and Entropy.

The thermodynamic functions were calculated from the electronic levels which were evaluated by averaging the spectroscopic values of W. C. Martin, J. Opt. Soc. Am. 49, 1071, (1959).

Monophosphorus Monosulfide (PS)

| 34594                        | 2     |

$\omega_e = 743.5 \pm 3.8 \text{ cm}^{-1}$        $\omega_e X_e = 3.8 \pm 0.9 \text{ cm}^{-1}$        $\sigma = 1$   
 $B_e = [0.29] \text{ cm}^{-1}$        $\sigma_e = [0.0016] \text{ cm}^{-1}$        $r_e = [1.92] \text{ \AA}$

Heat of Formation

The dissociation energy ( $D_0^\circ$ ) of PS(g) is estimated to be  $140 \pm 25 \text{ kcal/mol}$  by comparison with the corresponding quantity for PO(g) and from a linear Birge-Sponer extrapolation of the third excited ( $C^2\Sigma$ ) electronic state potential function. It is assumed that the  $C^2\Sigma$  state dissociates to S(g) in its ground ( $^3P$ ) state and P(g) in its first excited ( $^3D$ ) state. The fundamental vibrational frequency in the  $C^2\Sigma$  state ( $\omega_e$ ) is  $531.8 \pm 2.5 \text{ cm}^{-1}$  and the corresponding anharmonic term ( $\omega_e X_e$ ) is  $2.6 \pm 0.5 \text{ cm}^{-1}$ . These constants are calculated from a reanalysis of the spectral data of Dressler (1). The corresponding heat of formation of PS(g) is  $37.3 \pm 25 \text{ kcal/mol}$ . The excited state ( $C^2\Sigma$ ) data are used to calculate  $D_0^\circ$  instead of the ground state(X $^3D$ ) data because the vibrational constants of the upper level are known more accurately and because the extrapolation is 50 kcal/mol smaller for this level.

Heat Capacity and Entropy

The spectra of PS(g) have been studied by Dressler (1) in the near UV and visible regions. He reported the above electronic levels which correspond to the doublet pi ground state and two of the excited levels ( $B^2\Pi, C^2\Sigma$ ). The level of the first excited electronic state ( $A^2\Sigma$ ) is estimated by analogy with NO(g).

Dressler (1) estimated the value of the rotational constant  $B_e$ . The value of  $\omega_e$  is calculated from the Morse potential function. The bond distance is calculated from  $B_e$ . The fundamental vibrational frequency  $\omega_e$  and the anharmonic vibrational term  $\omega_e X_e$  are calculated from a reanalysis of the spectral data reported by Dressler (1).

June 30, 1961

D<sub>0</sub><sup>o</sup> = 116 ± 1 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = 42.68 ± 0.5 kcal. mole<sup>-1</sup>  
 S<sub>298</sub><sup>o</sup> = 52.11 ± 0.1 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔG<sub>f</sub><sup>o</sup> = 760.43 cm.<sup>-1</sup>  
 ΔG<sub>f</sub><sup>o</sup> = 0.30327 cm.<sup>-1</sup>  
 D<sub>e</sub> = 0.21 X 10<sup>-6</sup> cm.<sup>-1</sup>  
 r<sub>e</sub> = 1.6943 Å

Heat of Formation

D. P. Stevenson and D. M. Yoast, J. Chem. Phys. 9, 403 (1941), have shown that the vapor density measurements of A. Stock, O. E. Oibson and E. Stamm, Ber. 45, 3527 (1912), best fit a vapor composed of P<sub>2</sub> and P<sub>4</sub> molecular species. From these data T. D. Parr, Tennessee Valley Authority, Chemical Engineering Report No. 8, calculated the equilibrium constants which lead to a ΔH<sub>f</sub><sup>o</sup> of P<sub>2</sub> is obtained based upon a ΔH<sub>f</sub><sup>o</sup> 298.15 of 30.77 kcal. mole<sup>-1</sup> of P<sub>4</sub>(g).

(I) P<sub>4</sub>(g)/298.15 = P<sub>2</sub>(g)/298.15

ΔH<sub>f</sub><sup>o</sup> = 54.59 ± 0.1 kcal. mole<sup>-1</sup>

Heat Capacity and Entropy

Molecular end spectroscopic constants are those listed by G. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Co. Inc., New York, 1945. More recent measurements of K. Dressler, Helv. Phys. Acta 28, 563 (1955) are in agreement with the values selected by Herzberg.

The dissociation energy is given by A. G. Oaydon, "Dissociation Energies", Chapman and Hall, Ltd., London, 1953.

Phosphorus, Tetratomic (P<sub>4</sub>)  
(Ideal Gas) Mol. Wt. = 123.90

June 30, 1961

PHOSPHORUS, TETRATOMIC (P<sub>4</sub>) (IDEAL GAS) MOL. WT. = 123.90

ΔH<sub>f</sub><sup>o</sup> 298.15 = 30.77 ± 0.5 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = 86.89 ± 0.1 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 Point Group T<sub>d</sub>

Vibrational Levels and Multiplicities

| (ω), cm. <sup>-1</sup> |  |
|------------------------|--|
| 606 (1)                |  |
| 363 (2)                |  |
| 464.5 (3)              |  |

Bond Lengths and Angles P-P = 2.21 ± 0.2 Å ∠P-P-P = 109°.28

Moments of Inertia I<sub>A</sub> = I<sub>B</sub> = I<sub>C</sub> = 25.1 × 10<sup>-39</sup> g. cm.<sup>2</sup> ρ = 12

Heat of Formation

Taken as the heat of sublimation of P (Red, V).

Heat Capacity and Entropy

The frequency and multiplicities are those assigned by H. S. Gutowsky and G. S. Hoffman, J. Am. Chem. Soc. 72, 5751 (1950). Molecular parameters of the gas were determined from electron diffraction measurements by L. R. Maxwell, S. B. Hendricks and V. M. Moseley, J. Chem. Phys. 23, 699 (1955). C. D. Thomas and N. S. Gingrich, J. Chem. Phys. 5, 659 (1938) obtained a P-P distance of 2.25 Å from x-ray studies on the liquid. On the basis of the selected values for P, White (see sheet) a third law entropy of 66.89 cal. deg.<sup>-1</sup> mole<sup>-1</sup> is derived for P<sub>4</sub>(g) at 298.15°K.

Tetraphosphorus Trisulfide (P<sub>4</sub>S<sub>3</sub>)  
 (Solid) Mol. Wt. = 220.098

LEAD (Pb)

(CRYSTAL)

At. Wt. = 207.21

$\Delta H_{f0}^{\circ} = 0$   
 $\Delta H_g^{\circ} 298.15 = 46.75 \pm 0.13 \text{ kcal. mole}^{-1}$   
 $\Delta H_m^{\circ} = 1.141 \text{ kcal. mole}^{-1}$   
 $T_m = 600.58 \pm 0.00^{\circ}\text{K}$

Heat of Formation.

Zero by definition.

Heat Capacity and Entropy.

Heat capacity measurements have been reported by M. Horowitz, A. A. Silvidi, S. P. Malaker and J. O. Daunt, *Q. J. Chem. Soc.*, (1952); P. P. Maada, W. R. Foraythe and W. P. J. Am. Chem. Soc. **53**, 1902 (1941); T. B. Douglas and J. L. Dever, (298.16° to 1200°K.), *J. Am. Chem. Soc.* **76**, 4824 (1954), and many others whose work is listed by K. K. Kelley, U. S. Bur. Mines Bull. 584 (1960).

Heat capacities from 15° to 300° and 1° to 4°K. (in superconducting state) were taken from Meads, Foraythe, and Giauque, and Horowitz, Silvidi, Malaker, and Daunt, respectively. The missing data below the melting point were obtained by graphical extrapolation and joined smoothly to data of Douglas and Dever on approaching the melting point.

Melting.

The melting point of pure Pb(c) was found by E. H. McLaren and E. G. Mardock, *Can. J. Phys.* **38**, 577 (1960) to be  $327.426 \pm 0.002^{\circ}\text{C}$ .  $\Delta H_m$  given by Douglas and Dever, loc. cit.

Heat of Sublimation.

$\Delta H_g^{\circ} 298.15$  was derived from third law analysis of the vapor pressure data of W. H. Rodebush and A. L. Dixon, *J. Am. Chem. Soc.* **47**, 1036 (1925) and *Phys. Rev.* **25**, 851 (1925); A. C. O. Egerton, *Proc. Roy. Soc. (London)* **A103**, 469 (1923); P. Hartack, *Z. Physik. Chem.* **134**, 1 (1928); A. T. Aldeed and J. N. Pratt, *Trans. Faraday Soc.* **57**, 611 (1961); E. Baur and R. Brunner, *Helv. Chim. Acta.* **17**, 958 (1934), and J. Fischer, *Z. anorg. Chem.* **219**, 1, 367 (1934), which are in good agreement. Most weight was given to the results of Rodebush and Dixon. Older vapor pressure data of lower accuracy have not been used.

Pb

LEAD (Pb)

(LIQUID)

At. Wt. = 207.21

$$\Delta H_f^{\circ} 298.15 = [1.025] \text{ kcal. mole}^{-1}$$

$$T_m = 600.58 \pm 0.00^{\circ}\text{K}$$

$$T_b = 2026^{\circ}\text{K}$$

$$S_{298.15}^{\circ} = [17.141] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$\Delta H_m^{\circ} = 1.141 \text{ kcal. mole}^{-1}$$

$$\Delta H_v^{\circ} = 42.53 \pm 0.13 \text{ kcal. mole}^{-1}$$

Heat of Formation.

Obtained from  $\Delta H_m^{\circ}$ .

Heat Capacity and Extrapolation.

Heat capacity from  $T_m$  to 1200°K taken from T. B. Douglas and J. L. Dever, J. Am. Chem. Soc., 76, 4824 (1954).  $C_p$  values below  $T_m$  and above 1200°K were extrapolated, a glass transition being assumed at 400°K.

Entropy.

Calculated from that of crystal.

Vaporization Phenomena.

$T_b$  and  $\Delta H_v^{\circ}$  calculated from  $\Delta H_f^{\circ} 298.15$  and functions for condensed and gaseous states.

From the vapor pressure, the free energy functions of Pb(g) and Pb<sub>2</sub>(g), and the dissociation energy of Pb<sub>2</sub>(g), it appears that below the boiling point the amount of Pb<sub>2</sub>(g) in the vapor is negligible.

Mar. 31, 1962; June 30, 1963; Sept. 30, 1963.

Ground State Configuration [3<sup>2</sup>S<sup>2</sup>]  
 $\Delta H_f^0 = 80.4 \pm 4.6 \text{ kcal. mole}^{-1}$   
 $S_{298.15}^0 = [67.216] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^0 = 79.5 \pm 4.6 \text{ kcal. mole}^{-1}$

Electronic Levels and Quantum Weight

$$\frac{\sum_i g_i e^{-\epsilon_i/kT}}{O} [3]$$

$$\omega_e x_e = 2.98 \text{ cm.}^{-1}$$

$$\omega_e = [0.01727] \text{ cm.}^{-1}$$

$$B_e = [0.00020] \text{ cm.}^{-1}$$

$$\sigma^- = 2$$

$$r_g = [3.08] \text{ \AA}$$

Heat of Formation.

Heat of formation was calculated from the dissociation energy of Pb<sub>2</sub>(g) reported by A. G. Oaydon, "Dissociation Energies," Chapman and Hall Ltd., London, 1963.

Heat Capacity and Entropy.

The values of  $\omega_e$  and  $\omega_e x_e$  were obtained from G. Herzberg, "Spectra of Diatomic Molecules," D. Van Nostrand Company, Inc., New York, 1950. Those for  $B_e$  and  $\sigma^-$  were estimated according to the method suggested by G. Herzberg, loc. cit. The bond distance ( $r_g$ ) was calculated from the moment of inertia,  $I = 1650 \times 10^{-40} \text{ g. cm.}^2$ , estimated by K. K. Kelley and E. G. King, U. S. Bur. Mines Bull. 592, 1961. The ground state configuration was assumed to be  $5\sum^-$  by comparison to that for Si<sub>2</sub>(g) reported by A. E. Douglas, Can. J. Phys. 33, 801 (1955).

Pb<sub>2</sub>

Sulfur (S)

(Reference State) At. Wt. = 32.064

SULFUR (S)

(CRYSTAL)

AT. WT. = 32.064

$\Delta H_f^0 = 0$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^0$  298.15 = 0 kcal. mole<sup>-1</sup>  
 $\Delta H_{t_1}^0 = 96.01 \pm 0.5$  cal. mole<sup>-1</sup>  
 $\Delta H_{t_2}^0 = 0.38 \pm 0.2$  cal. mole<sup>-1</sup>  
 $\Delta H_m^0 = 410.52 \pm 0.5$  cal. mole<sup>-1</sup>  
 $\Delta H_g^0$  298.15 = 66.68 ± 0.3 kcal. mole<sup>-1</sup>

$S_{298.15}^0 = 7.63 \pm 0.5$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_{t_1} = 368.54^\circ\text{K.}$   
 $T_{t_2} = 374^\circ\text{K.}$   
 $T_m = 368.36^\circ\text{K.}$

Heat of Formation.

Zero by definition.

Heat Capacity and Entropy.

E. D. Eastman and W. C. McDevock, J. Am. Chem. Soc. **59**, 145 (1937), have measured the low temperature heat capacities of sulfur from 15° to 375°K. E. D. West, J. Am. Chem. Soc. **81**, 29 (1959), has measured the high temperature heat capacities from 298° to 678°K. These two sets of data were joined smoothly at 298.15 K. by a graphical method.

The values of entropy at 110°C and above in E. D. West's paper (table VIII) have been lowered by 0.5841 joule. deg.<sup>-1</sup> mole<sup>-1</sup> because of a calculational error which was pointed out by J. P. McCullough and D. W. Scott, private communication, Sept. 27, 1960.

The entropy of rhombic sulfur at 298.15°K. was taken from E. D. Eastman and W. C. McDevock, loc. cit., based on an extrapolation of  $S_{15}^0 = 0.12$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Transition Data.

The enthalpies of transition at 368.54°K. and 374°K. were obtained from E. D. West, loc. cit. The first transition at 368.54°K. was the known rhombic-monoclinic transition, but the second one near 374°K. was a previously unreported transition.

Melting Data.

The heat of melting and the temperature were obtained from E. D. West, loc. cit.

Heat of Sublimation.

The heat of sublimation of sulfur (c) is the heat of formation of monatomic sulfur (g). See S(g) table for details. Since  $S_8$  and lower polymers are major vapor species at room temperature, the heat of sublimation to the equilibrium gas is much smaller. See  $S_8(g)$  table for details.

$$\Delta H_f^{\circ} 298.15 = 0.34 \pm 0.01 \text{ kcal. mole}^{-1}$$

$$\Delta H_m^{\circ} = 410.52 \pm 0.5 \text{ cal. mole}^{-1}$$

$$\Delta H_v^{\circ} = [2.30] \text{ kcal. mole}^{-1}$$

$$S_{298.15}^{\circ} = 8.44 \pm 0.5 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$T_m = 398.36^{\circ}\text{K.}$$

$$T_b = 717.75^{\circ}\text{K.}$$

#### Heat of Formation.

The  $\Delta H_f^{\circ} 298.15$  (S, l) was obtained from that of the crystal by adding  $\Delta H_m^{\circ}$  and the difference between  $H_{398.36}^{\circ}$  and  $H_{298.15}^{\circ}$  for crystal and liquid.

#### Heat Capacity and Entropy.

The heat capacity of the liquid phase was obtained from E. D. West, J. Am. Chem. Soc. **81**, 29 (1959). No simple equation fits the curve of  $C_p$  against  $T$  which shows a peak.

The value of  $S_{298.15}^{\circ}$  (S, l) was obtained in a manner analogous to that of the heat of formation. The heat capacity of sulfur (liquid) below the melting point was assumed to be constant as  $7.579 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$ , and above the boiling point, it was assumed as  $7.694 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$ .

#### Melting Data.

The heat of melting and the temperature were obtained from E. D. West, loc. cit.

#### Vaporization Data.

According to the international practical temperature scale, the boiling point is  $717.75^{\circ}\text{K.}$  The heat of vaporization to the equilibrium vapor mixture was estimated by D. R. Stull and G. C. Sinker, "Thermodynamic Properties of the Elements," American Chemical Society, Washington, D.C., 1956. The equilibrium vapor involves monomeric and several polymeric species; S<sub>2</sub> and S<sub>3</sub> predominate above  $1000^{\circ}\text{K.}$  while S<sub>8</sub>, S<sub>6</sub> and possible S<sub>4</sub> and S<sub>3</sub> are favored at lower temperatures.

Heat of Formation.

L. Brewer, J. Chem. Phys. 31, 1143 (1959), has reviewed the three possible values of  $D_0^o(S_2)$ , i.e. 4.4 e.v., 3.6 e.v. and 3.3 e.v., which were due to the ambiguity of defining the excitation state of the atomic products resulting from predissociation in the spectroscopic measurements. The value of 4.4 e.v. (101.5 kcal. mole<sup>-1</sup>) is shown to be the most probable one. Since this review, further support for his value have been given by the following investigators. J. R. Marquart, Dissertation Abstract 24, 5027 (1964), has found that the value of  $D_0^o(S_2)$  to be consistent with the note in proof. A. N. Singh and D. K. Rai, J. Chem. Phys. 43, 2151 (1965), have selected the heat value of  $D_0^o(S_2) = 4.4$  e.v. in their mass-spectrometric studies. R. Colth, P. Goldfinger and M. Jeunehomme, Trans. Faraday Soc. 60, 306 (1964), have found  $D_0^o(S_2) = 97 \pm 5$  kcal. mole<sup>-1</sup> in their mass-spectrometric studies of the vaporization of  $CS_2$ ,  $CS_2$  and  $CS_2$ , but they reported a revised value, i.e.  $D_0^o(S_2) = 101 \pm 1$  kcal. mole<sup>-1</sup>, which was given in the note in proof. A. N. Singh and D. K. Rai, J. Chem. Phys. 43, 2151 (1965), have selected the heat value of  $D_0^o(S_2) = 4.4$  e.v. in theoretical comparisons of the potential-energy curve. As pointed out by L. Brewer, loc. cit., and A. O. Gaydon, "Dissociation Energies", Chapman and Hall Ltd., 2nd. Ed., London, 1953, the old vapor pressure measurements which are not consistent with  $D_0^o(S_2) = 4.4$  e.v. (101.5 kcal. mole<sup>-1</sup>) are probably not reliable.

The value  $D_0(S_2, g) = 4.4$  e.v. (101.5 kcal. mole<sup>-1</sup>) was selected as the dissociation energy of diatomic sulfur, and combination of this value with heat of formation of diatomic sulfur gives the heat of formation of monatomic sulfur,  $\Delta H_f^o = 66.68$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The ground state configuration, electronic levels and quantum weight were obtained from C. E. Moore, "Atomic Energy Levels", Vol. 1, National Bureau of Standards Circular 467, June, 1949.

Silicon Monosulfide (SiS)  
(Ideal Gas) Mol. Wt. = 60.156

December 31, 1980.

Silicon Monosulfide (SiS) (Ideal Gas)

Mol. Wt. = 60.156

ΔH<sub>f</sub><sup>o</sup> 298.15 = 16.926 kcal. mole<sup>-1</sup>  
 ΔS<sub>f</sub><sup>o</sup> 298.15 = 53.427 cal. deg.<sup>-1</sup>. mole<sup>-1</sup>  
 Ground State Configuration 1Σ<sup>+</sup>

Electronic Level and Multiplicity

$$\frac{\epsilon \text{ cm.}^{-1}}{0} \frac{g_i}{1}$$

ω<sub>e</sub> = 7493.5 cm.<sup>-1</sup> ω<sub>e</sub>x<sub>e</sub> = 2.56 cm.<sup>-1</sup>  
 B<sub>e</sub> = 0.303653 cm.<sup>-1</sup> α<sub>e</sub> = 0.00149 cm.<sup>-1</sup>  
 ϵ = 1 r<sub>e</sub> = 1.9288 Å

Heat of Formation. ΔH<sub>f</sub><sup>o</sup> 298.15 was found in J. S. Gordon, Thiokol Chemical Corp., Reaction Motors Division, Denville, N. J., "Thermodynamic Data for Combustion Products", January, 1960.

Heat Capacity and Entropy. Molecular constants were taken from J. S. Gordon, op. cit.

Sulfur, Diatomic (S<sub>2</sub>)  
(Ideal Gas) Mol. Wt. = 64.128

Heat of Formation.

The standard enthalpy of formation of gaseous diatomic sulfur,  $\Delta H_f^{\circ} = 30.84 \text{ kcal. mole}^{-1}$ , was calculated from  $\Delta H_f^{\circ} = -20.30 \text{ kcal. mole}^{-1}$  for the reaction  $\text{H}_2(\text{g}) + 0.5 \text{ S}_2(\text{g}) \rightarrow \text{H}_2\text{S}(\text{g})$  with JANAP value  $\Delta H_f^{\circ} = 298(\text{H}_2\text{S}, \text{g}) = -4.88 \pm 0.15 \text{ kcal. mole}^{-1}$ . The  $\Delta H_f^{\circ}$  of  $\text{S}_2$  was obtained by the second and third law analyses of equilibrium constants which have been determined by G. Preuner and W. Schupp (ref. 1) and M. Randall and P. R. Bichowsky (ref. 2). The results obtained are presented as follows:

| Ref. | Temp. Range | Pointa | ΔH <sub>f</sub> <sup>o</sup> , 298 kcal. mole <sup>-1</sup> | 2nd law ΔH <sub>f</sub> <sup>o</sup> , 298 kcal. mole <sup>-1</sup> | 3rd law ΔH <sub>f</sub> <sup>o</sup> , 298 kcal. mole <sup>-1</sup> | Drift cal. mole <sup>-1</sup> deg. <sup>-1</sup> |

The third law value of the combination set was selected to calculate the heat of formation of diatomic sulfur. The dissociation energy of gaseous diatomic sulfur,  $D_0^{\circ}(\text{S}_2) = 101.5 \text{ kcal. mole}^{-1}$ , was chosen. For discussions see JANAP monatomic sulfur (g) and sulfur monoxide (g) tables.

Heat Capacity and Entropy.

The molecular constants which were taken from G. Herzberg, "Spectra of Diatomic Molecules", 2nd Ed., D. Van Nostrand Company, New York, have been modified for the natural isotopic abundances reported by D. Strominger, J. M. Hollander and G. T. Saaborg, Rev. Mod. Phys. 30, 585 (1958).

December 31, 1960.

Silicon Disulfide (SiS<sub>2</sub>) (Crystal)

Mol. Wt. = 92.222  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -50.7 kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub><sup>o</sup> = [16.0] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 1363°K.  
 ΔH<sub>m</sub> = [5.0] kcal. mole<sup>-1</sup>

Heat of Formation. ΔH<sub>f</sub><sup>o</sup> 298.15 was calculated from the measured ΔH<sub>f</sub><sup>o</sup>'s of the following reactions:

ΔH<sub>R1</sub> was taken from R. Rocquet, M. T. Ancey-Maret, Bull. Soc. Chim. France 1954, 1039 (1954); ΔH<sub>R2</sub> was from D. Torgeson and Th. G. Semaha, J. Am. Chem. Soc. 70, 2156 (1948). ΔH<sub>f</sub><sup>o</sup> 298.15 of SiS<sub>2</sub> was recalculated using the corrected value for ΔH<sub>f</sub><sup>o</sup> 298.15 of SiO<sub>2</sub>.

Heat Capacity and Entropy. C<sub>p</sub> and S<sub>298.15</sub> values are estimated.

Melting Data. T<sub>m</sub> was from National Bureau of Standards Circular 500, "Selected Values of Chemical Thermodynamic Properties", 1952. ΔH<sub>m</sub> was estimated.

Silicon Disulfide (SiS<sub>2</sub>)  
(Liquid) Mol. Wt. = 92.222

Heat of Formation.  
 The vapor pressure of S(c) has been measured by many investigators. Using the seven more recent vapor pressure data, the respective heat of sublimation ( $\Delta H_f^{\circ} 298.15$ ) was calculated by both the third and second law methods. The values obtained are tabulated as follows:  

| Investigator   | Temperature Range, °K. | Third Law Value | Second Law Value |
|----------------|------------------------|-----------------|------------------|
| West-Menzies 1 | 376.8 - 448.8          | 24.29           | 21.29            |
| Neumann 2      | 332.6 - 362.1          | 24.35           | 26.47            |
| Fouretier 3    | 304.1 - 351.6          | 24.36           | 24.10            |
| Tallade 4      | 303.6 - 352.5          | 24.29           | 24.87            |
| Bradley 5      | 288.3 - 305.7          | 24.29           | 23.60            |
| Magee 6        | 331.9 - 368.0          | 24.11           | 24.44            |
| Brake 7        | 352.7 - 367.4          | 24.12           | 23.88            |
|                | 275.2 - 313.2          | 24.28           | 24.00            |

 7 C. Brake, N. H. Hartshorne and D. R. Stranks, J. Chem. Soc. (London), 1200 (1960).

Due to the presence of S<sub>2</sub>(g) in S<sub>8</sub>(g), the measured total pressures were corrected to give the partial pressures of S<sub>8</sub>(g) for the first five sets of vapor pressure data, according to D. W. Scott, U. S. Bureau of Mines, Bartlesville, Oklahoma, private communication, May 22, 1964. However, the magnitude of the correction is only 0.1 - 0.2 kcal. mole<sup>-1</sup>. The adopted value is the weighted average of both the third and second law values.  
 Heat Capacity and Entropy.  
 The vibrational frequencies were taken from D. W. Scott, J. F. McCullough and F. H. Kruse, "Vibrational Assignment and Force Constants of S<sub>8</sub> (condensed states) from a Normal-Coordinate Treatment", Prepublication Report 64, U. S. Bureau of Mines, May 20, 1963. Four of the eighteen frequencies, i.e. 86(2) and 218(2) cm.<sup>-1</sup>, were changed to 56(2) and 248(2) cm.<sup>-1</sup>, respectively, suggested by D. W. Scott, loc. cit., private communication, April 23, 1964. The molecular structure and bond distance and angle were reported by J. Donohue, A. Caron and E. Goldfarb, J. Am. Chem. Soc. **83**, 3748 (1961). The three principle moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 1.28594 x 10<sup>-37</sup> and I<sub>C</sub> = 2.36042 x 10<sup>-37</sup> g. cm.<sup>2</sup>.

Dec. 31, 1960; Dec. 31, 1962; Dec. 31, 1966

$\Delta H_f^\circ = 0$  kcal/mol  
 $\Delta H_f^\circ_{298.15} = 0$  kcal/mol  
 $\Delta H_m^\circ = 12.0 \pm 0.1$  kcal/mol  
 $\Delta H_f^\circ_{298.15} = 107.7 \pm 1$  kcal/mol

$S^\circ_{298.15} = 4.498 \pm 0.01$  gibbs/mol  
 $T_m = 1685 \pm 3$  °K

Heat of Formation.  
 Zero by definition.

Heat Capacity and Entropy.  
 Low temperature heat capacities are based on the precise data (8-300°K) of Flubacher, Leadbetter and Morrison. The entropy is obtained from the heat capacity using  $S^\circ = 0.0003$  eu. The selected values are consistent with recent data of Keesom and Seidel (1.2 - 4.2°K) and Kalishvich et al. (60-300°K). Earlier data have been reviewed by R. Hultgren, R. L. Orr and K. K. Kelley, "Supplement to Selected Values of Thermodynamic Properties of Metals and Alloys," Univ. of California, Berkeley, November, 1965.

High temperature studies are summarized below, along with the pertinent low temperature studies. The selected heat capacities above 300°K are obtained from a Shomate plot of the adopted low temperature heat capacities and the enthalpies reported or derived from the work of Dennison (1953), Kantor et al. (1960), Olette (1956), Serebrennikov and Oel'd (1952), and Magnus (1923). Discrepancies are apparent in the enthalpy data, particularly in the range of 370 to 1100°K, where only the recent study of Dennison made use of a high purity sample. Enthalpies from Dennison join most smoothly with the low temperature Cp° but deviate increasingly at higher temperatures, being 1-2% lower than the other measurements above 1000°K. The selected functions agree with Dennison below 600°K, with Magnus from 600 to 1200°K, and with Kantor et al. above 1200°K. The resulting heat capacities are slightly different from those selected by Hultgren et al., loc. cit.; the latter are 0.07 gibbs/mol higher at 800°K and 0.21 gibbs/mol lower at the melting point.

Single crystal, high purity, resistance measured at 100°C. Carrier Concentration  $\leq 10^{15}$  cm<sup>-3</sup>

| Investigators               | Method                 | Quantity Reported | T Range, °K | Sample   |

Melting Data.

See the Si(1) table for details.

Heat of Sublimation.

 $\Delta H_f^\circ_{298.15}$  is calculated as the difference between  $\Delta H_f^\circ_{298.15}$  for Si(g) and Si(c).

Silicon (Si)  
(Liquid)

GFW = 28.086

SILICON (Si) (LIQUID) GFW = 28.086

$\Delta H_f^{298.15} = 11.585$  kcal/mol  
 $\Delta H_m^{\circ} = 12.0 \pm 0.1$  kcal/mol  
 $\Delta H_v^{\circ} = [92.047]$  kcal/mol  
 $\Delta H_v^{\circ} = [85.8]$  kcal/mol

$S_{298.15}^{\circ} = 10.666$  gibbs/mol  
 $T_m = 1685 \pm 3$  K  
 $T_b = [3513.8]$  °K (to monomer only)  
 $T_b = [3492]$  °K (to equilibrium mixture)

Heat of Formation.

The heat of formation is obtained from that of the crystal by adding  $\Delta H_m^{\circ}$  and the difference between  $H_m^{\circ} - H_{298.15}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy.

Enthalpy data for high purity samples in quartz or vitreous silica capsules have been reported for the range 1698-1915°K by P. B. Kantor, A. M. Kisil and E. M. Fomichev, Ukrain. Fiz. Zhur. 5, 358 (1960), and for the range 1686-1625°K by M. Olette, Phys. Chem. Steelmaking, Proc. Dedham, Mass., 1955, 18-26 (Pub. 1958). Due to the limited temperature range and the experimental uncertainty, the data do not appear to justify more than a constant heat capacity. A value of 6.5 gibbs/mol is selected, intermediate between the values of 6.75 and 6.15 obtained from the separate experiments. The entropy is obtained in a manner analogous to that of the heat of formation.

Melting Data.

Modern determinations of the melting point range from 1683 ± 1 to 1690 ± 4 °K, the former from the specific volume study of L. D. Lucas and G. Urbain, Compt. Rend. 255, 2414 (1962), and the latter from the enthalpy study of Kantor et al. The selected value of  $T_m = 1685$ °K is taken from R. Hultgren, R. L. Orr and K. K. Kelley, "Supplement to Selected Values of Thermodynamic Properties of Metals and Alloys," Univ. of California, Berkeley, November, 1965, who have reviewed the melting data. The heat of melting is calculated from the selected enthalpy of the crystal and the liquid enthalpy measurements of Kantor et al. and Olette, who reported comparable values of  $\Delta H_m^{\circ} = 11.95 \pm 0.18$  and 12.095 ± 0.1 kcal/mol, respectively.

Vaporization Data.

$T_b$  is calculated as the temperature for which the  $\Delta G_r^{\circ} = 0$  for  $Si(l) = Si(g)$ .  $\Delta H_v^{\circ}$  is calculated as the difference between  $\Delta H_f^{\circ}(g)$  and  $\Delta H_f^{\circ}(l)$  at  $T_b$ . The normal boiling for the equilibrium vapor is calculated as the temperature at which  $Si_1$ ,  $Si_2$  and  $Si_3$  attain a total pressure of one atm.  $\Delta H_v^{\circ}$  at this temperature is calculated as the enthalpy of vaporization of one GFW of liquid to vapor containing 92.1, 7.0 and 0.9 mole percent of monomer, dimer and trimer, respectively. Tetramer and higher polymers, which are ignored in the equilibrium calculation, are probably negligible at this temperature.

Heat of Formation.

The heat of formation is the heat of sublimation,  $\Delta H_{298.15}^\circ = 107.7$  kcal/mol, selected from third law analyses of the vapor pressure data reviewed below. Langmuir, Knudsen and transport studies are all in satisfactory agreement throughout the range of 1400 - 2000°K. In addition, O. C. Trullson and P. O. Schissel, Condensation Evaporation Solids Proc. Symp., Dayton, Ohio 1962, 313-17 (Pub. 1964), have experimentally verified that the vaporization coefficient is about 0.8 at 1300°K. This was accomplished by mass spectrometric determination of the Langmuir and Knudsen rates of sublimation from a single crystal sample in a cell designed to give Knudsen effusion from one end and free evaporation from the other end.

The recent studies confirm the mass spectrometric data of R. E. Honig, J. Chem. Phys. 22, 1610 (1954), and substantiate the author's postulate that vapor pressures obtained in early boiling point experiments are too large due to reaction or decomposition of the alumina and silicon carbide containers. In their review of the earlier experiments, R. Hultgren, R. L. Orr and K. K. Kelley, "Supplement to Selected Values of Thermodynamic Properties of Metals and Alloys," Univ. of California, Berkeley, November, 1965, calculated apparent heats of sublimation of less than 90 kcal/mol from the data. Neither these values nor the value of 92 kcal/mol, obtained from the Knudsen data (1485 - 1893°K) of A. V. Tsepelyeva, Yu. A. Priselkov and V. V. Karelin, Vestnik Moskov. Univ., Ser. 2 Khim. 15, No. 5, 36 (1960), were considered in the JANAF selection. It is not clear why Tsepelyeva et al. obtain pressures larger by a factor of 200 from their molybdenum cell.

Heat Capacity and Entropy.

Electronic levels and quantum weights are from L. J. Redziemski and K. L. Andrew, J. Opt. Soc. Am. 55, 474 (1965), and V. Kaufman, L. J. Redziemski and K. L. Andrew, ibid. 55, 911 (1966). An additional level with quantum weight of 200 is estimated above the observed levels and below the dissociation limit; however, the effect of this level on the entropy at 6000°K is negligible. Levels above 39000 cm<sup>-1</sup> are averaged.

Heat of Formation.

The selected value is based on the spectroscopic and equilibrium data summarized below. Verms and Worsop<sup>1</sup> concluded from analysis of the absorption spectra that D<sub>0</sub> = 70 ± 4 kcal/mol. Predissociation of the H state suggested the upper limit D<sub>0</sub> ≤ 74.0, while linear Birge-Sponer extrapolations of the H and K states gave 78.4 and 68.9 kcal/mol for the ground state. By assuming that the true extrapolation would not reduce the linear extrapolation for the H state by more than half, i.e. from 26 to 13 kcal, the authors arrived at the lower limit of D<sub>0</sub> ≥ 65.5 for the ground state.

Drowart and co-workers have used the Knudsen effusion-mass spectrometric technique to determine the vapor equilibrium over the systems SiC-graphite<sup>2</sup>, SiC-silicon<sup>3</sup> and boron-carbon-silicon<sup>4</sup>. Third law analysis of the partial pressures of Si<sub>2</sub> and Si over the three systems yields D<sub>0</sub> values of 73.3, 74.3 and 70.4 kcal/mol, which are in good agreement with the spectroscopic values. The selected value, ΔH<sub>298</sub><sup>o</sup> = 141 ± 3 kcal/mol, corresponds to D<sub>0</sub> = 73.0 kcal/mol.

\*For the reaction Si<sub>2</sub>(g) = 2 Si(g)

Heat Capacity and Entropy.

Vibrational and rotational constants are those obtained by Verms and Worsop<sup>1</sup> through combination of their data for the H-X system with those of Douglas<sup>5</sup>. Observation of the same H-X system in matrix isolation by Weltner and McLeod<sup>6</sup> confirms that the lower state is the ground state. Comparison with the isoelectronic molecules C<sub>2</sub>, BN, BeO and MgO (7,9,10) suggests that there are several possible low-lying excited states in Si<sub>2</sub>. Tentative estimates for these levels are given above, based on this comparison and on the observed states (1,5). These estimates are relatively uncertain and probably yield an upper limit for the entropy at temperatures where Si<sub>2</sub> is significant. A probable lower limit may be obtained by increasing the two 3Π states by 8000 cm<sup>-1</sup> and omitting the other estimated levels. This would reduce the entropy by 1.7 eu at 2000°K, corresponding to a change of 3.4 kcal/mol in ΔH<sub>298</sub><sup>o</sup> values based on equilibrium data.

Bond Angle: Si-Si-Si = [180]<sup>o</sup>  
Rotational Constant: B<sub>0</sub> = [0.05928] cm<sup>-1</sup>

Heat of Formation.  
The selected value is an average based on the equilibrium data summarized below. Drowart and co-workers have used the Knudsen effusion-mass spectrometric technique to determine the vapor species over the systems SiC-graphite<sup>1</sup> and SiC-silicon<sup>2</sup>. Third law analysis of the partial pressures of Si<sub>3</sub> and Si yields the values 154.0 and 149.9 kcal/mol. Both drifts suggest that the entropy may be lower than the tabulated values. It is unlikely that the entropy is in error by more than 5 eu so that most of the drift is inherent in the data. The adopted value of ΔH<sub>f,298</sub><sup>o</sup> = 152 ± 10 kcal/mol includes allowance for an error of up to 5 eu.

\*For reaction Si<sub>3</sub>(g) = 3 Si(g)

Heat Capacity and Entropy.

Waltner and McLean<sup>3</sup> observed an absorption band near 4660 Å in matrix isolation studies. Their tentative assignment of this band as the <sup>3</sup>Σ<sub>g</sub><sup>-</sup> ← <sup>3</sup>Σ<sub>g</sub><sup>-</sup> transition of Si<sub>3</sub> is adopted here. A <sup>1</sup>Π<sub>u</sub> state is assumed at 18000 cm<sup>-1</sup>, which is 7000 and 2000 cm<sup>-1</sup> below the analogous levels<sup>3</sup> for C<sub>3</sub> and C<sub>2</sub>Si. Also a <sup>3</sup>Π<sub>u</sub> level is assumed at 10000 cm<sup>-1</sup>, presumably arising from the same molecular orbital configuration as the <sup>1</sup>Π<sub>u</sub> state. The molecule is assumed to be linear with a bond distance equal to that in Si<sub>2</sub>. Vibrational frequencies are estimated from a valence bond calculation using k<sub>1</sub> = 2.16 × 10<sup>10</sup> and kd/2 = 0.11 × 10<sup>10</sup> dyn/cm. The stretching force constant is obtained from Si<sub>2</sub>, while the bending force constant is based on C<sub>2</sub>Si and the <sup>1</sup>Π<sub>u</sub> excited state<sup>3</sup> of C<sub>3</sub>. The moment of inertia is 47.22 × 10<sup>-39</sup> g cm<sup>2</sup>.

 Heat of Formation.  
 Zero by definition.  
 Heat Capacity and Entropy.  
 The low temperature heat capacities, 1.1 - 305.51°K, have been measured by many investigators. Their measured temperature range, specimen purity and value of  $S_{298.15}^\circ$  reported are listed in the following table. The Cp values, below 298°K, adopted were mainly derived from the data obtained from references 3, 5 and 6, which are in good agreement with other sets of Cp data.

| Investigator                    | Temperature, °K | Purity, % | $S_{298.15}^\circ$ , eu |

The adopted Cp values, 298.15 - 1155°K, were mainly derived from the Cp data reported by reference 7. The low temperature and high temperature Cp data were joined smoothly at 298°K. The Cp values above 1155°K were estimated by graphical extrapolation.  $S_{298.15}^\circ$  was derived from the adopted Cp, based on  $S_{13}^\circ = 0.015$  eu.

Transition Data.  
 See the T<sub>f</sub> (β, c) table for details.

Heat of Sublimation.  
 $\Delta H_{298.15}^\circ$  is calculated as the difference between  $\Delta H_{298.15}^\circ$  for Ti(g) and T<sub>f</sub> (c).

Sept. 30, 1956

ΔH°<sub>0</sub> = Unknown  
 ΔH°<sub>298.15</sub> = 1.433 kcal/mol  
 ΔH° = 0.99 kcal/mol  
 ΔS° = [4.45] kcal/mol  
 ΔS°<sub>298.15</sub> = [111.57] kcal/mol

ΔH°<sub>298.15</sub> = 8.691 gibbs/mol  
 T<sub>0</sub> = 1155 ± 3 °K  
 T<sub>m</sub> = 1933 ± 10 °K

**Heat of Formation.**  
 The heat of formation (ΔH°<sub>298.15</sub>) was obtained from ΔH°<sub>298.15</sub> (α, c) by adding ΔH° and the difference H°<sub>T</sub> - H°<sub>298.15</sub> for Ti (α, c) and Ti (β, c).

**Heat Capacity and Entropy.**

The heat capacities, 1155 - 1856°K, have been determined by many investigators. See the Ti (α, c) table for details. The selected Cp values were evaluated based on the data reported by C. W. Kothen, Ph. D. dissertation, The Ohio State University, 1952, and R. Kohlhaas, M. Braun and O. Vollmer, Z. Naturforsch. **20A**, 1077 (1965). The heat capacities below 1155°K and above 1800°K were estimated by graphical extrapolation. The entropy was obtained in a manner analogous to that of the heat of formation.

**Transition Data.**

Titanium has two crystal forms, i.e., the hexagonal close-packed low-temperature form and the body-centered cubic high-temperature form. The α-β transition temperature has been determined and reported over a range of temperatures, 1154-1167°K, by many investigators. The value of T<sub>t</sub> is affected by the impurities in the specimen or adsorbed by the specimen during the measurement and the method used for the determination. The following table indicates the values of T<sub>t</sub> reported by different investigators. Also included are the heats of transition (ΔH°<sub>t</sub>), purity of specimen and property measured. The value of T<sub>t</sub> adopted is 1155 ± 3°K, and the value of ΔH°<sub>t</sub> is selected as 0.99 kcal/mol.

| Investigator  | T <sub>t</sub> , °K | ΔH° <sub>t</sub> , kcal/mol | Purity, %  | Method or Property Measured |

**Melting Data.**

See the Ti(l) table for details.

**Heat of Sublimation.**

ΔH°<sub>298.15</sub> is calculated as the difference between ΔH°<sub>298.15</sub> for Ti(g) and Ti(β, c).

Titanium (Ti)  
(Liquid) GFW = 47.90

| T, °K  | Cp*    | S°<br>-(C°-H°)/T | -(C°-H°)/T | H°-H° <sub>298.15</sub> | ΔHf°<br>kcal/mol | ΔGf°  | Log Kp |
|--------|--------|------------------|------------|-------------------------|------------------|-------|--------|

Dec. 31, 1960; Sept. 30, 1966

TITANIUM (Ti)

$S_{298.15}^{\circ} = [10.695]$  gibbs/mol  
 $T_m = 1933 \pm 10^{\circ}K$   
 $T_b = [3591]^{\circ}K$

(LIQUID)

$\Delta H_f^{\circ} 298.15 = [5.433]$  kcal/mol  
 $\Delta H_m^{\circ} = [4.45]$  kcal/mol  
 $\Delta H_v^{\circ} = [101.65]$  kcal/mol

OPW = 47.90

Heat of Formation.

The heat of formation ( $\Delta H_f^{\circ} 298.15$ ) was obtained from  $\Delta H_f^{\circ} 298.15$  ( $\beta$ , c) by adding  $\Delta H_m^{\circ}$  and the difference between  $H_{T_m}^{\circ} - H_{298.15}^{\circ}$  for Ti ( $\beta$ , c) and Ti(l).

Heat Capacity and Entropy.

A glass transition temperature at 1300°K was assumed. The heat capacities below 1300°K were obtained from those for Ti ( $\beta$ , c). The cp value above 1300°K was estimated by comparison with those for the other transition elements and assumed to be constant in the temperature range 1300 - 4500°K. The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

Because of the highly reactive nature of Ti(c), the accurate determination of the melting point is difficult. The results reported by different investigators show wide discrepancies. The  $T_m$  value adopted was determined by Schofield and Bacon (1953) and later confirmed by Westrum and Feick (1963). The other values of  $T_m$  reported are presented in the table below. The heat of melting was calculated based on an estimated entropy of melting,  $\Delta S_m^{\circ} = 2.3$  eu.

Volatilization Data.

$T_b$  is the temperature at which the Gibbs energy change ( $\Delta G_f^{\circ}$ ) for the reaction  $Ti(l) = Ti(g)$  approaches zero. The difference between  $\Delta H_f^{\circ}$  (Ti,g) and  $\Delta H_f^{\circ}$  (Ti,l) at  $T_b$  is  $\Delta H_v^{\circ}$ .

Heat of Formation

The vapor pressure of Ti(β), 1510-1822°K, has been measured in three separate investigations. Based on the vapor pressures, the enthalpies of sublimation ( $\Delta H_{sub}^\circ$ ) are evaluated by both the second and third law methods. The results obtained are presented in the following table. The adopted value of  $\Delta H_f^\circ$  for Ti(g) is  $113.0 \pm 1.0$  kcal/mol.

| Reference | Temperature, °K | $\Delta H_f^\circ$ , kcal/mol | Drift eu   |
|-----------|-----------------|-------------------------------|------------|
| 1         | 1510 - 1822     | Second Law Value              | -1.3 ± 1.2 |
| 2         | 1658 - 1808     | Third Law Value               | -1.1 ± 3.7 |
| 3         | 1587 - 1764     | Third Law Value               | -0.2 ± 0.6 |

\*Calculation based on the third law  $\Delta H_{sub}^\circ$  and  $\Delta H_f^\circ$  (β) = 1.43 kcal/mol.

Heat Capacity and Entropy

The electronic levels and quantum weights are obtained from C. E. Moore, National Bureau of Standards Circular 467 (1949). However, above the level  $\epsilon_i = 15877.17$  cm<sup>-1</sup>, the values of  $\epsilon_i$  and  $g_i$  listed in the above table are average values calculated from those given by Moore. The  $^2S_0$  level of the ground multiplet which has not been observed is estimated to lie at 12000 cm<sup>-1</sup> by comparison with the corresponding levels for Ti<sup>4+</sup> ion, Zr and Zr<sup>4+</sup> ion reported by C. E. Moore, loc. cit.

Titanium Unipositive Ion (Ti<sup>+</sup>)  
(Ideal Gas)

GEW = 47.89945

TITANIUM UNIPosITIVE ION (Ti<sup>+</sup>) (IDEAL GAS)

GEW = 47.89945

Ground State Configuration  $1s^2 3s^2 3p^2$   
 $S_{298.15} = 43.854 \pm 0.01$  gibbs/mol  
 $\Delta H_f^\circ = 269.62 \pm 1.0$  kcal/mol  
 $\Delta H_f^\circ = 269.62 \pm 1.0$  kcal/mol

Heat of Formation

The heat of formation is calculated from the reaction  $\text{Ti(g)} = \text{Ti}^+(\text{g}) + e^-(\text{g})$  with the JANAF auxiliary value for  $\text{Ti(g)}$  and an ionization potential = 6.82 eV or 157.276 kcal/mol, obtained from C. E. Moore, "Atomic Energy Levels," Natl. Bur. Std. Circ. 467, 1949.

Heat Capacity and Entropy

The electronic levels and quantum weights are taken from C. E. Moore, "Atomic Energy Levels," Natl. Bur. Std. Circ. 467, Vol. I, 1949. The electronic levels above 4700  $\text{cm}^{-1}$  are averaged. The  $H^\circ - H_{298}^\circ$  value at 0°K is -1.886 kcal/mol.

| T, °K | $C_p^\circ$ | $S^\circ - (C^\circ - H_{298}^\circ)/T$ | $H^\circ - H_{298}^\circ$ | kcal/mol $\Delta H_f^\circ$ | $\Delta G_f^\circ$ | Log K <sub>p</sub> |

$\Delta H_f^\circ = 0$  kcal/mol  
 $\Delta H_f^\circ 298.15 = 0$  kcal/mol  
 $\Delta H_m^\circ = [8.46 \pm 2.5]$  kcal/mol  
 $\Delta H_f^\circ 298.15 = 203.4 \pm 1.5$  kcal/mol

$S_{298.15}^\circ = 7.806$  gibbs/mol  
 $T_m = 3680 \pm 20^\circ K$

**Heat of Formation.**  
 Zero by definition.

**Heat Capacity and Entropy.**  
 There have been several investigations of the low temperature heat capacity of tungsten; F. Lange, Z. Physik. Chem. 110, 343 (1924), covered the range 26-91°K. M. Horowitz and J. O. Daunt, Phys. Rev. 91, 1099 (1953), reported values in the range 1-77°K, while T. R. Waite, R. S. Craig, and W. E. Wallace, Phys. Rev. 104, 1240 (1956), worked from 4-15° and W. Desorbo, J. Phys. Chem. 62, 985 (1958), from 15-90°K. C. Zwilker and G. Schmidt, Z. Physik. 52, 688 (1928) covered the range from 90 to 2521°K. K. Clausius and P. Franzosini, Z. Naturforsch. 14d, 99 (1959), made a thorough study of the heat capacity in the range 12-274°K, and their measurements were adopted leading to  $S_{298}^\circ = 7.806$  eu based on  $S_{12.5}^\circ = 0.0088$  eu. This value is in disagreement with the quoted value of 7.83 eu but agrees exactly with a separate integration by V. A. Kirillin, A. E. Sheindlin, V. Ye. Chekhovskoi and V. A. Petrov, Zhur. Fiz. Khim. 37, 2249 (1963). In the intermediate temperature range the adiabatic heat capacity measurements of H. L. Bronson, H. M. Chisholm and S. M. Docketty, Can. J. Res. B, 282 (1953), from 253 to 773°K joined well with the low temperature measurements and were adopted. The high temperature enthalpies have been measured by several investigators from which were selected the values of P. M. Jaeger and E. Rosenbom, Rec. trav. chim. 51, 1 (1932), from 273-1800°K; A. Magnus and H. Holzmam, Ann. Physik Ser. 5, 3, 595 (1929), who covered the range 373 to 1173°K; M. Hoch and H. L. Johnston, J. Phys. Chem. 55, 855 (1951) who made measurements between 1382 and 2900°K; Kirillin et al., loc. cit., who have made several determinations over the range 600 to 3100°K, and have also analysed the above data and have presented smooth functions from 0 to 3500°K. The present table agrees with that of Kirillin et al. up to 2700°K. Above this temperature the values of Cp adopted follow those reported by I. I. Novikov and P. G. Strelnikov, Vestnik Akad. Nauk SSSR 34, 26(1964), measured by an electric modulation method, up to the melting point. These values rise rapidly above 2700°K and are not inconsistent with the individual measurements of Kirillin et al. at their highest temperatures.

**Melting Data.**  
 I. Langmuir, Phys. Rev. 5, 138 (1915), determined the melting point as 3540°K from intrinsic brilliance measurements; this was later corrected to 3655 ± 30°K by H. A. Jones, I. Langmuir and O. M. J. Mackay, Phys. Rev. 30, 201 (1927). M. Firani and H. Alterthum, Z. Elektrochem. 29, 5 (1923), from pyrometer measurements on a black body hole found 3650 ± 60°K. Using the same technique C. P. Zalabak, NASA Tech. Note D-761 (1961), reports 3660°K on a low carbon specimen; he reports a decrease of the melting point with increasing carbon content. E. Rudy and S. Windisch, Aerojet-General Tech. Rept. No. APWL-TR-65-2 Part 1, Vol. III July 1965, report a melting point of 3698 ± 20°K. The value adopted was 3680 ± 20°K. The heat of melting was obtained by assuming an entropy of melting of 2.3 eu obtained from a comparison of several high melting metals (Fe, Cu, Co, Mg, Al).

**Sublimation Data.**  
 See W(g) for details.

Dec. 31, 1961, June 30, 1966

TUNGSTEN (W) (LIQUID) GFW = 183.85

$S^{\circ}_{298.15} = 10.923$  gibbs/mol  
 $\Delta H^{\circ}_{298.15} = 11.223$  kcal/mol  
 $\Delta H^{\circ} = [8.46 + 2.5]$  kcal/mol  
 $\Delta H^{\circ} = [192.824]$  kcal/mol

$T_m^{\circ} = 3680 \pm 20^{\circ}K$   
 $T_b^{\circ} = [5936]^{\circ}K$   
 Heat of Formation.  
 The heat of formation at 298°K was calculated from that of the crystal by adding  $\Delta H_m^{\circ}$  and the difference between  $H_{3680}^{\circ}$  and  $H_{298}^{\circ}$  for (c) and (l).

Heat Capacity and Entropy.

The heat capacity was estimated as 8.5 gibbs/g-atom by analogy with other monatomic metals. The entropy at 298°K was calculated in a manner analogous to that of the heat of formation. At 2500°K a glass transition was assumed, below which the heat capacity was that of the crystal.

Melting Data.

See crystal table for details.

Vaporization Data.

The boiling point and heat of vaporization were calculated from the adopted functions and heat of sublimation in order to maintain proper thermodynamic consistency.

Heat of Formation.

ΔH<sub>f</sub><sup>0</sup> is the heat of sublimation of the crystal at 298°K; this has been obtained by 2nd and 3rd law analysis of the vapor pressure data of three investigators. The results are summarized below:

| Ref. | Range°K*  | ΔH <sub>f</sub> <sup>0</sup> 298.15 kcal/mol |             |                  |
|------|-----------|--|-------------|------------------|
|      |           | 2nd law                                      | 3rd law     | 3rd law drift eu |
| 1    | 2511-3053 | 12*  | 200.9 ± 3.6 | 201.57 ± 1.6     |
| 2    | 2383-3123 | 14   | 214.8 ± 1.4 | 202.17 ± 2.5     |
| 3    | 2574-3183 | 10   | 202.4 ± 2.7 | 203.35 ± 1.2     |

\*1 point rejected due to failure of a statistical test.

\*\*All temperatures are taken from Ref. 3, in which the earlier measurements have been corrected.

The values are remarkably good, since even at the highest temperature the pressures are less than 10<sup>-6</sup> atm; all workers used the Langmuir technique. Since the data of Refs. 1 and 3 do not drift, it may be assumed that the accommodation coefficient is unity or close to unity. The drift in the second set cannot be eliminated by assuming a non-unity accommodation coefficient, nor does there appear to be a constant pressure error. Most probably the drift is due to slight errors in temperature. For example, if the readings were 24° high at the low end and 10° low at the high end, the drift would be eliminated; errors of this magnitude are quite possible. The value adopted for ΔH<sub>f</sub><sup>0</sup>298.15 is 203.4 ± 1.5 kcal/mol.

Heat Capacity and Entropy.

The electronic energy levels were taken from those listed by C. E. Moore, U. S. Natl. Bur. Std. Circular 467 (1958). Levels above 25000 cm<sup>-1</sup> were averaged.

Heat of Formation.

The heat of formation is obtained by adding the heat of ionization at 0°K to the ΔHf° W(g). The heat of ionization, 184.036 kcal (7.98 eV), is obtained from C. E. Moore, Natl. Bur. Std. Circular 467, Vol. III, Washington D. C. (1958).

Heat Capacity and Entropy.

The electronic energy levels are obtained from C. E. Moore, loc. cit. In the low lying configuration [Xe] 4f<sup>14</sup>5d<sup>5</sup> the F<sub>2</sub>, G<sub>2</sub>, F<sub>4</sub>, H and S multiplets have not been observed. The total degeneracy of these levels (70) is split among three estimated levels of 20000, 21000, and 22000 cm<sup>-1</sup>, obtained by analogy with Mo<sup>+</sup>. A realistic uncertainty in these levels would produce a maximum uncertainty of 0.03 gibbs/mol in the free energy function and 0.09 gibbs/mol in the entropy at 6000°K.

The enthalpy at 0°K is -1.487 kcal/mol.

S°<sub>298.15</sub> = 9.314 ± 0.10 Gibbs/mol

T<sub>t</sub> = 1135 ± 5°K

$\Delta H^{\circ}_0 = 0$  kcal/mol

$\Delta H^{\circ}_{298.15} = 0$  kcal/mol

$\Delta H^{\circ} = 0.96$  kcal/mol

$\Delta H^{\circ}_{298.15} = 148.3 \pm 3.5$  kcal/mol

Heat of Formation

Zero by definition.

Heat Capacity and Entropy

The low temperature heat capacities, 1.1 - 288.2°K, have been measured by Todd (1), Skinner (2), Eastermann (3), Wolcott (4), Bunk (5), and Kneip (6). Values of Cp<sub>298.15</sub> were reported as 6.19 and 6.01 Gibbs/mol by Todd (1) and Skinner (2), respectively. The difference (beginning at 150°K) is probably caused by different amounts of impurities (e.g. O<sub>2</sub>, H<sub>2</sub>, N<sub>2</sub>) in the samples. Neither sample was analyzed for hydrogen and oxygen content. Small amounts of either of these impurities would cause important changes in Cp. Remasurement of Cp using a high purity sample is desirable to resolve the difference. Tentatively, we adopt smooth Cp values which are intermediate between those of Todd and Skinner in the temperature range 200 - 298°K. The curve at lower temperatures is based on references 1, 2, 4, 5 and 6. S°<sub>298.15</sub> is derived from the adopted Cp based on S°<sub>1.16</sub> = 0.0008 eu.

Enthalpies have been measured using drop calorimetry by Jaeger (7), Coughlin (8), Skinner (9), Redmond (10), Adenstedt (11) and Douglas (13). Cp above 298°K has been measured by Scott (12) and Vollmer (15) using adiabatic calorimetry and by Klein (14) using pulse heating. The data lead to differences in Cp which are even greater than those noted at 298°K. Observed Cp's are lower than the adopted curve by roughly 3 to 6 per cent, but the observed enthalpies are generally higher by 0 to 10 per cent. Impurities are partly to blame but there also may be a systematic difference between the methods. The purest and best characterized samples are those of Douglas (13) and Vollmer (15). Even the high-purity sample of Douglas gives H values which are abnormally high at 573°K, suggesting the presence of thermal effects of solid solution and precipitation due to a small amount of hydrogen in the sample (12).

The adopted Cp is based mainly on Douglas (13), but references (7, 8, 15) were also given some weight. Deviations of (13) from the adopted values range from +3.3 per cent at 573°K to +0.3 at 1123°K. Other deviations (each in order of increasing T) are 3 to 0 per cent (7), 1.3 to -1.7 per cent (8), -4 to -6 per cent (15), 5.4 to 1.7 per cent (9) and -1 to 9.5 per cent (10) in terms of enthalpy. Cp is extrapolated linearly above 1133°K.

Transition Data

See Zr(β) table for details.

Heat of Sublimation

$\Delta H^{\circ}_{298.15}$  is calculated as the difference between  $\Delta H^{\circ}_{298.15}$  for Zr(g) and Zr(α).

Dec. 31, 1967

S<sup>298.16</sup> = 11.152 gibbs/molT<sub>c</sub> = 1135 ± 10°KT<sub>m</sub> = 2125 ± 2 °KΔH<sup>f</sup><sub>298.15</sub> = 1.706 kcal/molΔH<sup>f</sup>\* = 0.96 kcal/molΔH<sup>m</sup>\* = 5.0 ± 0.3 kcal/mol

## Heat of Formation

The heat of formation is obtained from ΔH<sup>f</sup><sub>298</sub>(α) by adding ΔH<sup>f</sup>\* and the difference between H<sup>o</sup><sub>T</sub> - H<sup>o</sup><sub>298</sub> for Zr(α) and Zr(β).

## Heat Capacity and Entropy

The enthalpies and Cp of Zr(β), at temperatures 1135 - 2116.2 °K, have been measured by many investigators (see Zr(α) table for details). The selected Cp values are based on the data reported by Douglas (1) and Skinner (2). Deviations from the adopted enthalpies are -1.4 to 0.8 per cent (1), -0.4 to 0.3 (2), and 0.2 to 3.0 per cent (2). Deviations of the measured Cp from the adopted values are -5 to -3 per cent (1) and about -6 per cent (10). The heat capacities below 1143.2 end above 1798°K are estimated by linear extrapolation.

The entropy is obtained in a manner analogous to that of the heat of formation.

## Transition Data

Zirconium has two crystal forms, i.e., the hexagonal-close-packed α-form and the cubic-body-centered β-form (3, 4, 5). The value and range of Tt for α + β depends strongly on the kind and amount of impurities (5, 13). For example, nitrogen and oxygen increase Tt while hydrogen decreases it. The adopted value is Tt = 1135 ± 10°K, although recent measurements using purer samples indicate a somewhat higher value. These are summarized below along with the data for ΔH<sup>f</sup>\*. The value ΔH<sup>f</sup>\* = 0.96 kcal/mol is derived from the adopted enthalpy and Cp data on Zr(α) and Zr(β).

| Investigator         | Tt, °K  | ΔH <sup>f</sup> , kcal/mol | Purity, Percent | Method or Property Measured     |

S°<sub>298.15</sub> = [13.289] gibbs/mol

Tm = 2125 ± 5 °K

Tb = [4776.9] °K

ΔHf°<sub>298.15</sub> = [6.351] kcal/mol

ΔHm° = 5.0 ± 0.4 kcal/mol

ΔHV° = 141.13 kcal/mol

**Heat of Formation**  
The heat of formation is obtained from ΔHf°<sub>298</sub>(β) by adding ΔHm° and the difference between H°<sub>2125</sub> - H°<sub>298</sub> for Zr(β) and Zr(L).

**Heat Capacity and Entropy**

A glass transition temperature at 1400°K is assumed. The heat capacities below 1400°K are taken from those for Zr(β). The Cp value above 1400°K is estimated by comparison with that of Zr(β) at Tm and assumed to be constant in the temperature range 1400 - 3500°K. The entropy is obtained in a manner analogous to that of the heat of formation.

**Melting Data**

The melting point of Zr(β) has been determined by many investigators. The results reported show wide discrepancies, probably caused by the differences in purity of the samples used for determination. The Tm value adopted is obtained from Oriani and Jones. The other values of Tm reported are presented in the table below.

The adopted heat of melting was determined calorimetrically by V. P. Elyutin, M. A. Maurakh and G. M. Sverdlov, Izv. Vysshikh Uchebn. Zavedenii, Tsvein. Met. 10, No. 2, 87 (1967). Zirconium samples from two different sources were melted in an Arc-crucible furnace. The crucible contained an insert of graphite which had a thick lining (presumably of zirconium carbide) in order to minimize carbonization of Zr(L). The molten Zr was poured through an opening in the bottom of the crucible into a calorimeter containing molten Mg as the calorimetric fluid. The method of calculating the value of ΔHm° was described in detail by V. P. Elyutin, M. A. Maurakh, V. Y. Mishuk, and G. M. Sverdlov, Izv. Vysshikh Uchebn. Zavedenii, Tsvein. Met. 10, 60 (1967). The authors estimated the uncertainty as about 7 percent in ΔHm°.

**Vaporization Data**

Tb is the temperature at which the Gibbs energy change (ΔGr°) for the reaction Zr(L) = Zr(g) approaches zero. The difference between ΔHf°(Zr, g) and ΔHf°(Zr, l) at Tb is ΔHv°.

## Heat of Formation

Vapor pressures of Zr( $\beta$ ) and Zr( $\delta$ ) were measured, using the Langmuir free-vaporization method, by Skinner (1) and Koch (3), respectively. Based on the reported results, the corresponding enthalpies of sublimation and vaporization are evaluated by the second and third law methods. See the table below for details. The values of evaporation rate and vapor pressure given by Koch in Table 2 on page 9 are too big by a factor of 10 due to typographical errors. The samples employed by Koch were prepared from iodide-process zirconium of 99.9 percent purity by tungsten-electrode melting in an inert atmosphere. The measured weight losses were in general more than one hundred times greater than those reported by Skinner. The value of  $\Delta H_{f,298}^{\circ}$  (Zr,  $\beta$ ) adopted is 148.3  $\pm$  3.5 kcal/mol, which is derived using the data of Koch.

Trouson (2) used a mass spectrometer with a high temperature Knudsen effusion source to obtain the vapor pressure for Zr( $\beta$ ) and Zr( $\delta$ ). Based on the reported vapor pressures the values of heat of sublimation of Zr( $\beta$ ) are evaluated by the second and third law methods. The results are presented in the table below. Because of the uncertainties in obtaining absolute pressures from ion intensities, these results are not adopted.

Zwikker (4) determined the vapor pressures of Zr( $\beta$ ) by the Langmuir method. However, the zirconium sample was reported to be covered by an oxide layer during the measurement. Therefore, the pressures obtained are probably not the vapor pressures of pure zirconium and are not used for evaluation.

| Investigator      | Temperature, °K | No. of Points | $\Delta H_{f,298}^{\circ}$ , kcal/mol |           | $\Delta H_{f,298}^{\circ}$ , kcal/mol |
|-------------------|-----------------|---------------|---------------------------------------|-----------|---------------------------------------|
|                   |                 |               | Second Law                            | Third Law |                                       |
| 1. Skinner (1951) | 1951 - 2074     | 12            | 138.642.1                             | 144.2     | 145.9                                 |
| 2. Trouson (1965) | 1968 - 2274     | 22            | 141.341.5                             | 142.1     | 143.8                                 |
| 3. Koch (1968)    | 2229 - 2795     | 16            | 142.744.3                             | 141.9     | 143.3                                 |

\*Calculation based on the third law  $\Delta H_{f,298}^{\circ}$ ,  $\Delta H_{f,298}^{\circ}(\beta) = 1.706$  and  $\Delta H_{f,298}^{\circ}(\delta) = 6.351$  kcal/mol.

## Heat Capacity and Entropy

The electronic levels and quantum weights are obtained from Moore (5). Above the level  $\epsilon_i = 15932.10 \text{ cm}^{-1}$ , the values of  $\epsilon_i$  and  $g_i$  listed in the above table are average values calculated from those given by Moore. The entropy contributed by the unobserved electronic is estimated to be less than 0.1 eu at 6000°K.

Heat of Formation

The heat of formation is calculated from the reaction  $Zr(g) - e^{-}(g) = Zr^{+}(g)$  with the JANAF auxiliary value for  $Zr(g)$ ; and an ionization potential = 6.84 eV or 157.737 kcal/mol, obtained from C. E. Moore, "Atomic Energy Levels," Natl. Bur. Std. Circ. 467, Vol. II, 1952 and Vol. III, 1958.

Heat Capacity and Entropy

The electronic levels and quantum weights are taken from C. E. Moore, "Atomic Energy Levels," Natl. Bur. Std. Circ. 467, Vol. II, 1952 and Vol. III, 1958. The electronic levels above 2500  $\text{cm}^{-1}$  are averaged. The  $H^{\circ} - H_{298}^{\circ}$  value at 0°K is -1.786 kcal/mol.

Mar. 31, 1965

Electronic Levels and Multiplicities

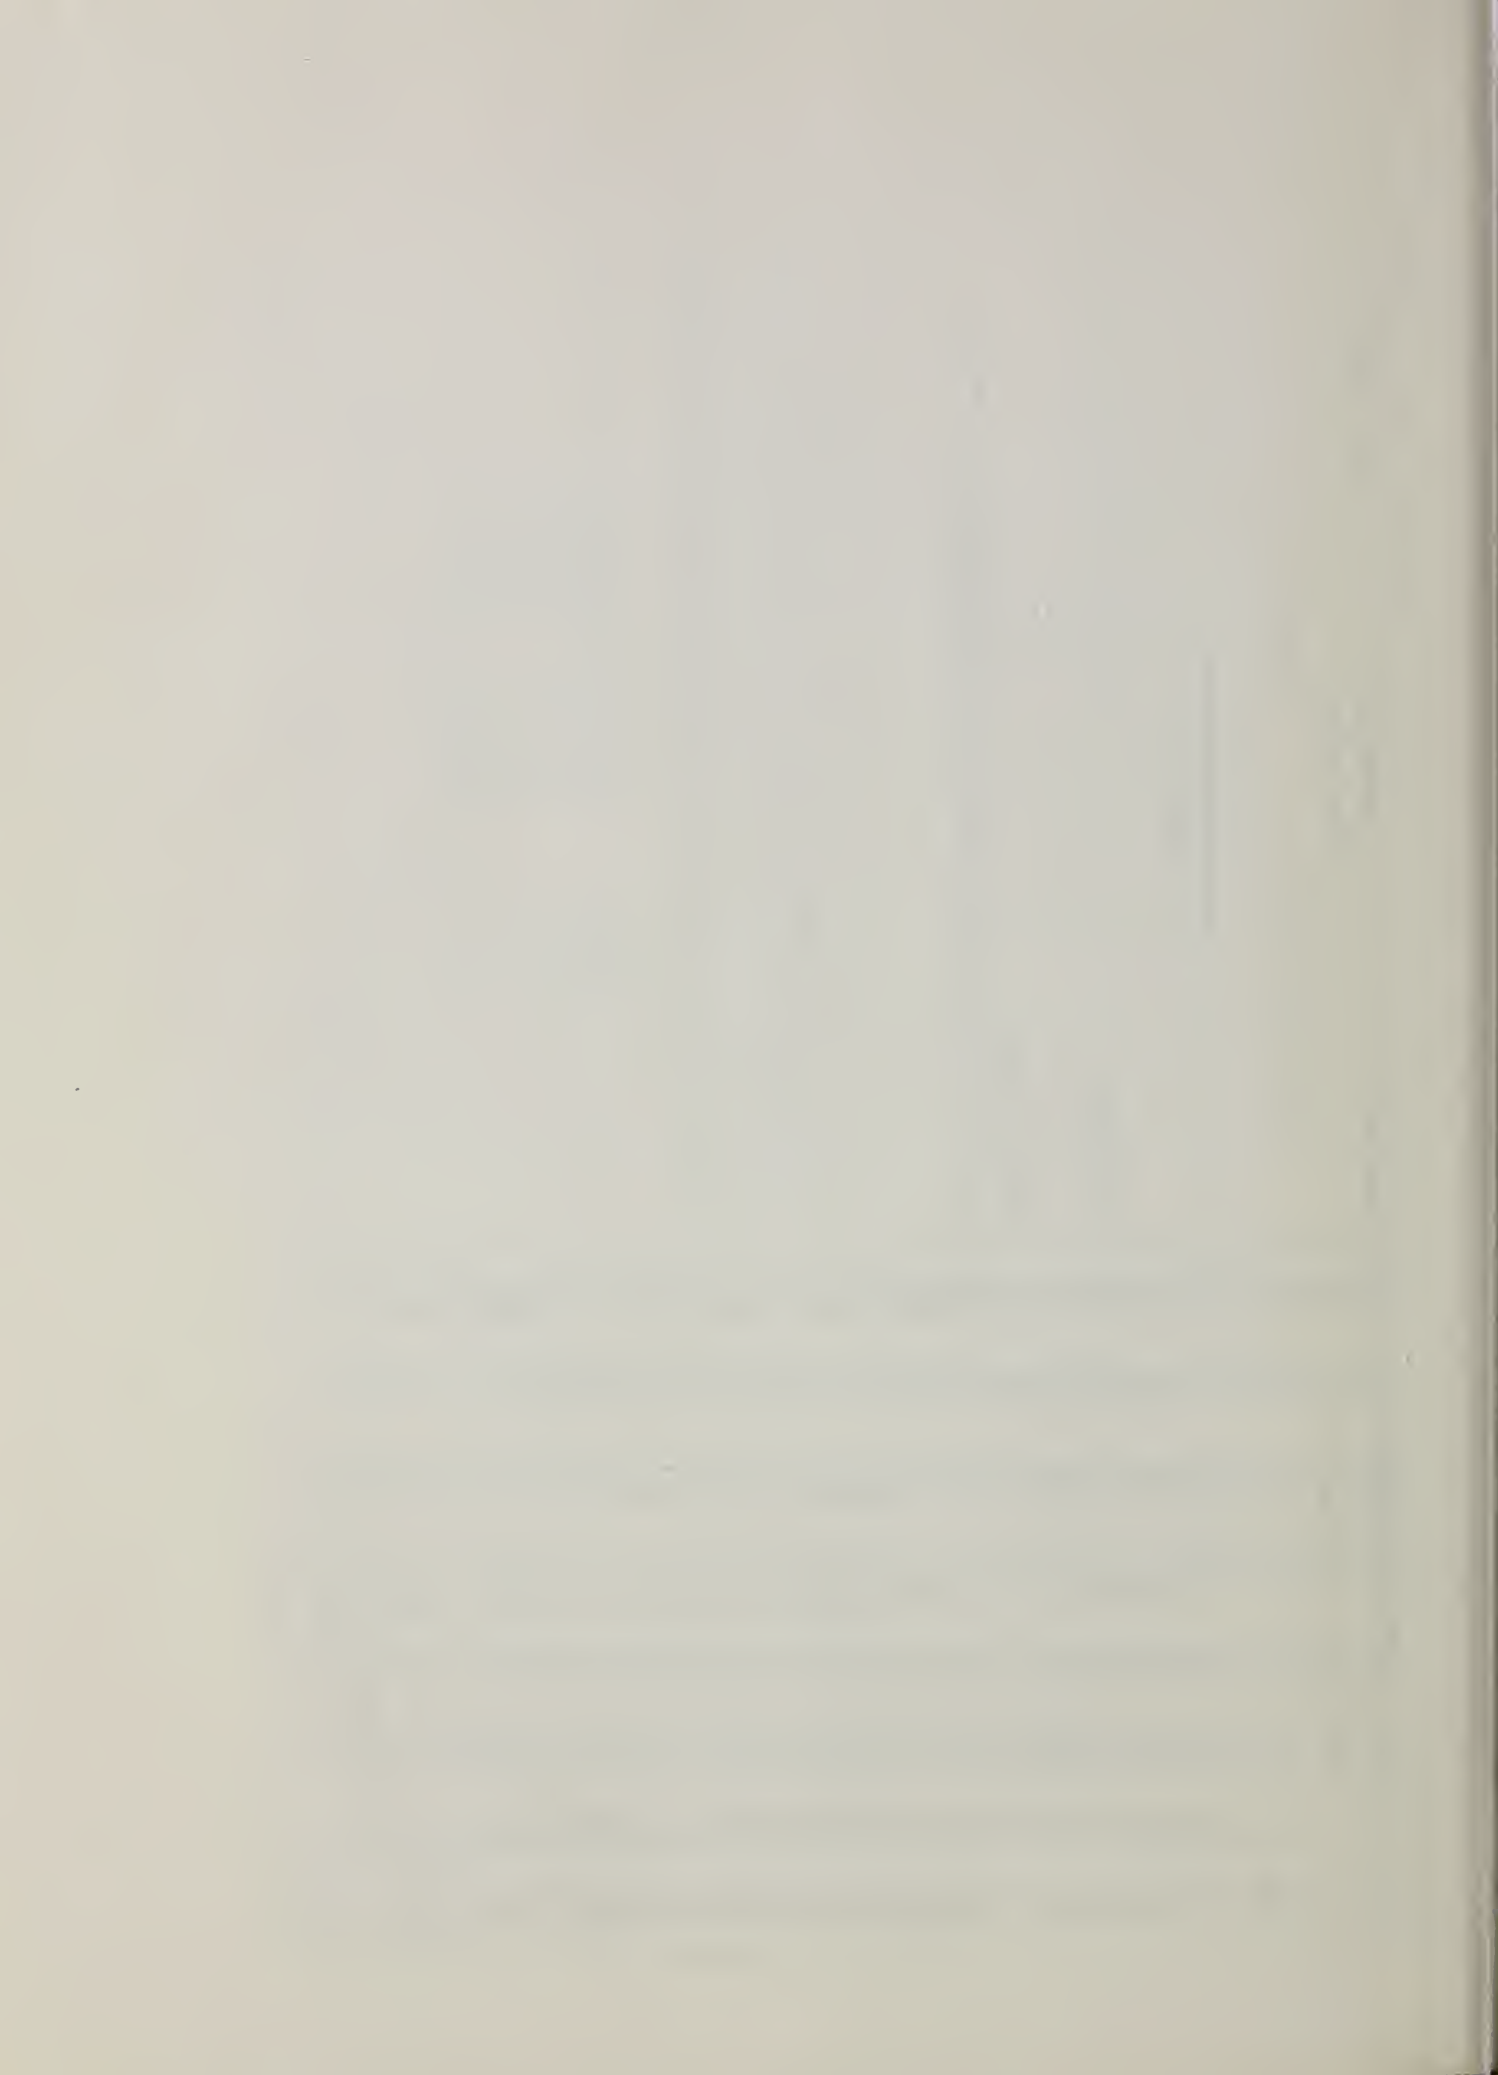

$$\frac{g_i \text{ cm.}^{-1}}{0} \frac{g_i}{2}$$

Heat of Formation.

Zero by definition.

Heat Capacity and Entropy.

Calculated by assuming to be an ideal monatomic gas of mass 0.00054876 with two equivalent spin states. The enthalpy between 298 and 0°K. is 1.481 kcal. mole<sup>-1</sup> as for all unexcited monatomic gases.

# Publications in the National Standard Reference Data Series National Bureau of Standards

You may use this listing as your order form by checking the proper box of the publication(s) you desire or by providing the full identification of the publication you wish to purchase. The full letter symbols with each publication number and full title of the publication and author must be given in your order, e.g. NSRDS-NBS-17, Tables of Molecular Vibrational Frequencies, Part 3, by T. Shimanouchi.

Pay for publications by check, money order, or Superintendent of Documents coupons or deposit account. Make checks and money orders payable to Superintendent of Documents. Foreign remittances should be made either

by international money order or draft on an American bank. Postage stamps are not acceptable.

No charge is made for postage to destinations in the United States and possessions, Canada, Mexico, and certain Central and South American countries. To other countries, payments for documents must cover postage. Therefore, one-fourth of the price of the publication should be added for postage.

Send your order together with remittance to Superintendent of Documents, Government Printing Office, Washington, D.C. 20402.

- NSRDS-NBS 1, National Standard Reference Data System—Plan of Operation, by E. L. Brady and M. B. Wallenstein, 1964 (15 cents), SD Catalog No. C13.48:1.
- NSRDS-NBS 2, Thermal Properties of Aqueous Uni-univalent Electrolytes, by V. B. Parker, 1965 (45 cents), SD Catalog No. C13.48:2.
- NSRDS-NBS 3, Sec. 1, Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables, Si II, Si III, Si IV, by C. E. Moore, 1965 (35 cents), SD Catalog No. C13.48:3/Sec.1.
- NSRDS-NBS 3, Sec. 2, Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables, Si I, by C. E. Moore, 1967 (20 cents), SD Catalog No. C13.48:3/Sec.2.
- NSRDS-NBS 3, Sec. 3, Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables, C I, C II, C III, C IV, C V, C VI, by C. E. Moore, 1970 (\$1), SD Catalog No. C13.48:3/Sec.3.
- NSRDS-NBS 3, Sec. 4, Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables, N IV, N VI, N VII, by C. E. Moore, (in press).
- NSRDS-NBS 4, Atomic Transition Probabilities, Volume I, Hydrogen Through Neon, by W. L. Wiese, M. W. Smith and B. M. Glennon, 1966 (\$2.50), SD Catalog No. C13.48:4/Vol.1.
- NSRDS-NBS 5, The Band Spectrum of Carbon Monoxide, by P. H. Krupenie, 1966 (70 cents), SD Catalog No. C13.48:5.
- NSRDS-NBS 6, Tables of Molecular Vibrational Frequencies, Part 1, by T. Shimanouchi, 1967 (40 cents), SD Catalog No. C13.48:6/Pt.1.
- NSRDS-NBS 7, High Temperature Properties and Decomposition of Inorganic Salts, Part 1, Sulfates, by K. H. Stern and E. L. Weise, 1966 (35 cents), SD Catalog No. C13.48:7/Pt.1.
- NSRDS-NBS 8, Thermal Conductivity of Selected Materials, by R. W. Powell, C. Y. Ho, and P. E. Liley, 1966 (\$1), PB189698
- NSRDS-NBS 9, Tables of Bimolecular Gas Reactions, by A. F. Trotman-Dickenson and G. S. Milne, 1967 (\$2), SD Catalog No. C13.48:9.
- NSRDS-NBS 10, Selected Values of Electric Dipole Moments for Molecules in the Gas Phase, by R. D. Nelson, Jr., D. R. Lide, Jr., and A. A. Maryott, 1967 (40 cents), SD Catalog No. C13.48:10.
- NSRDS-NBS 11, Tables of Molecular Vibrational Frequencies, Part 2, by T. Shimanouchi, 1967 (30 cents), SD Catalog No. C13.48:11/Part 2.
- NSRDS-NBS 12, Tables for the Rigid Asymmetric Rotor: Transformation Coefficients from Symmetric to Asymmetric Bases and Expectation Values of  $P_2^2$ ,  $P_2^0$ , and  $P_2^{-2}$ , by R. H. Schwendeman, 1968 (60 cents), SD Catalog No. 13.48:12.
- NSRDS-NBS 13, Hydrogenation of Ethylene on Metallic Catalysts, by J. Horiuti and K. Miyahara, 1968 (\$1), SD Catalog No. C13.48:13.
- NSRDS-NBS 14, X-Ray Wavelengths and X-Ray Atomic Energy Levels, by J. A. Bearden, 1967 (40 cents), SD Catalog No. C13.48:14.
- NSRDS-NBS 15, Molten Salts, Vol. 1, Electrical Conductance, Density, and Viscosity Data, by G. J. Janz, F. W. Dampier, G. R. Lakshminarayanan, P. K. Lorenz, and R. P. T. Tomkins, 1968 (\$3), SD Catalog No. C13.48:15/Vol.1.
- NSRDS-NBS 16, Thermal Conductivity of Selected Materials, Part 2, by C. Y. Ho, R. W. Powell, and P. E. Liley, 1968 (\$2), SD Catalog No. C13.48:16/Pt.2.
- NSRDS-NBS 17, Tables of Molecular Vibrational Frequencies, Part 3, by T. Shimanouchi, 1968 (30 cents), SD Catalog No. C13.48:17/Pt.3.
- NSRDS-NBS 18, Critical Analysis of the Heat-Capacity Data of the Literature and Evaluation of Thermodynamic Properties of Copper, Silver, and Gold From 0 to 300°K, by G. T. Furukawa, W. G. Saba, and M. L. Reilly, 1968 (40 cents), SD Catalog No. C13.48:18.
- NSRDS-NBS 19, Thermodynamic Properties of Ammonia as an Ideal Gas, by L. Haar, 1968 (20 cents), SD Catalog No. C13.48:19.
- NSRDS-NBS 20, Gas Phase Reaction Kinetics of Neutral Oxygen Species, by H. S. Johnston, 1968 (45 cents), SD Catalog No. C13.48:20.
- NSRDS-NBS 21, Kinetic Data on Gas Phase Unimolecular Reactions, by S. W. Benson and H. E. O'Neal, 1970 (\$7), SD Catalog No. C13.48:21.
- NSRDS-NBS 22, Atomic Transition Probabilities, Vol II, Sodium Through Calcium, A Critical Data Compilation, by W. L. Wiese, M. W. Smith, and B. M. Miles, 1969 (\$4.50), SD Catalog No. C13.48:22/Vol.II.
- NSRDS-NBS 23, Partial Grotrian Diagrams of Astrophysical Interest, by C. E. Moore and P. W. Merrill, 1968 (55 cents), SD Catalog No. C13.48:23.
- NSRDS-NBS 24, Theoretical Mean Activity Coefficients of Strong Electrolytes in Aqueous Solutions from 0 to 100° C, by Walter J. Hamer, 1968 (\$4.25), SD Catalog No. C13.48:24.
- NSRDS-NBS 25, Electron Impact Excitation of Atoms, by B. L. Moiseiwitsch and S. J. Smith, 1968 (\$2), SD Catalog No. C13.48:25.
- NSRDS-NBS 26, Ionization Potentials, Appearance Potentials, and Heats of Formation of Gaseous Positive Ions, by J. L. Franklin, J. G. Dillard, H. M. Rosenstock, J. T. Herron, K. Draxl, and F. H. Field, 1969 (\$4), SD Catalog No. C13.48:26.
- NSRDS-NBS 27, Thermodynamic Properties of Argon from the Triple Point to 300 K at Pressures to 1000 Atmospheres, by A. L. Gosman, R. D. McCarty, and J. G. Hust, 1969 (\$1.25), SD Catalog No. C13.48:27.
- NSRDS-NBS 28, Molten Salts, Vol. 2, Section 1, Electrochemistry of Molten Salts: Gibbs Free Energies and Excess Free Energies From Equilibrium-Type Cells, by G. J. Janz and C. G. M. Dijkhuis. Section 2, Surface Tension Data, by G. J. Janz, G. R. Lakshminarayanan, R. P. T. Tomkins, and J. Wong, 1969 (\$2.75), SD Catalog No. C13.48:28/Vol.2.
- NSRDS-NBS 29, Photon Cross Sections, Attenuation Coefficients and Energy Absorption Coefficients from 10 keV to 100 GeV, by J. H. Hubbell, 1969 (75 cents), SD Catalog No. C13.48:29.
- NSRDS-NBS 30, High Temperature Properties and Decomposition of Inorganic Salts, Part 2, Carbonates, by K. H. Stern and E. L. Weise, 1969 (45 cents), SD Catalog No. C13.48:30.
- NSRDS-NBS 31, Bond Dissociation Energies in Simple Molecules, by B. deB. Darwent, 1970 (55 cents), SD Catalog No. C13.48:31.
- NSRDS-NBS 32, Phase Behavior in Binary and Multicomponent Systems at Elevated Pressures: *n*-Pentane and Methane-*n*-Pentane, by V. M. Berry and B. H. Sage, 1970 (70 cents), SD Catalog No. C13.48:32.
- NSRDS-NBS 33, Electrolytic Conductance and the Conductances of the Halogen Acids in Water, by W. J. Hamer and H. J. DeWane, 1970 (50 cents), SD Catalog No. C13.48:33.
- NSRDS-NBS 34, Ionization Potentials and Ionization Limits Derived from the Analyses of Optical Spectra, by C. E. Moore, 1970 (75 cents), SD Catalog No. C13.48:34.

**Announcement of New Publications in  
National Standard Reference Data Series**

Superintendent of Documents,  
Government Printing Office,  
Washington, D.C. 20402

Dear Sir:

Please add my name to the announcement list of new publications to be issued in the series: National Standard Reference Data Series—National Bureau of Standards.

Name \_\_\_\_\_

Company \_\_\_\_\_

Address \_\_\_\_\_

City \_\_\_\_\_ State \_\_\_\_\_ Zip Code \_\_\_\_\_

(Notification key N-337)

| 16. ABSTRACT (A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here.)<br><br>This monograph is the second edition of the JANAF Thermochemical Tables. It contains thermodynamic properties for some 1099 chemical species. The following properties are tabulated as functions of temperatures: $C_p^\circ$ , $S^\circ$ , $(F^\circ - H_{298}^\circ)/T$ , $H^\circ - H_{298}^\circ$ , $\Delta H_f^\circ$ and $\log K_p$ . |  |  |                              |
| 17. KEY WORDS (Alphabetical order, separated by semicolons) Evaluated Data; Thermal Functions; Thermodynamic Properties of Materials; Thermodynamics.   |  |  |                              |
| 18. AVAILABILITY STATEMENT<br><br><input checked="" type="checkbox"/> UNLIMITED.<br><br><input type="checkbox"/> FOR OFFICIAL DISTRIBUTION. DO NOT RELEASE TO NTIS.   |  | 19. SECURITY CLASS (THIS REPORT)<br><br>UNCLASSIFIED         | 21. NO. OF PAGES<br><br>1141 |
