Bond Distance: B-F = [1.3] Å B-O = [1.36] Å  
 Bond Angle: F-B-O = [120°] O-B-O = [120°]  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.9254 X 10<sup>-112</sup>] g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The enthalpy changes (ΔH<sub>f</sub>°) of the reaction B<sub>2</sub>O<sub>3</sub>(l) + BF<sub>3</sub>(g) = (BOF)<sub>3</sub>(g) were derived by both the second and third law methods, using the equilibrium constant data reported by several investigators. The results are given as follows.

| Investigator                     | Third Law Value | Second Law Value | ΔH <sub>f</sub> ° 298.15° kcal. mole <sup>-1</sup> |
|----------------------------------|-----------------|------------------|--|

<sup>1</sup> D. D. Hildenbrand, L. P. Theard and A. M. Saul, J. Chem. Phys. 33, 1973 (1963).  
<sup>2</sup> H. D. Fisher, J. Kiehl and A. Cane, Report HTC-61-90, June 1961, Hughes Tool Company, Culver City, California.  
<sup>3</sup> D. D. Smith and R. W. Lawrence, Aerojet Report No. 1952, February 1961, Aerojet-General Corporation.  
<sup>4</sup> M. Farber, J. Chem. Phys. 36, 661 (1962). The first ΔH<sub>f</sub>° 298.15 value was evaluated based on K<sub>1000</sub> = 11.8. The second ΔH<sub>f</sub>° 298.15 values refer to the reaction B<sub>2</sub>O<sub>3</sub>(c) + BF<sub>3</sub>(g) = (BOF)<sub>3</sub>(g).  
<sup>5</sup> R. P. Porter, D. R. Biddipati and K. P. Watterson, J. Chem. Phys. 36, 2104 (1962). The ΔH<sub>f</sub>° 298.15 value was derived from ΔH<sub>f</sub>° 700 = 3.46 ± 0.30 kcal. mole<sup>-1</sup>.

The adopted value of ΔH<sub>f</sub>° 298.15 for (BOF)<sub>3</sub>(g) is the weighted average of the six ΔH<sub>f</sub>° 298.15 values listed above.

Heat Capacity and Entropy.

The infra-red spectrum has been reported by D. D. Smith and R. L. Lawrence, loc. cit., and by H. D. Fisher, W. J. Lemmann, and I. Shapiro, J. Phys. Chem. 65, 1166 (1961) who also made a partial assignment. The unassigned bands at 1280 and 1233 from Fisher, et al., can be assigned to the A<sub>1</sub> and A<sub>1</sub> species which may be observed if the selection rules are not rigorously obeyed in the solid. All the unobserved frequencies were estimated by comparison with B<sub>2</sub>O<sub>3</sub>(OH)<sub>2</sub>, B<sub>2</sub>O<sub>3</sub>(OD)<sub>2</sub> from J. L. Parsons, J. Chem. Phys. 33, 1860 (1960) and B<sub>2</sub>O<sub>3</sub>-H<sub>2</sub> and B<sub>2</sub>O<sub>3</sub>-D<sub>2</sub> from S. K. Gupta and R. P. Porter, J. Phys. Chem. 67, 1286 (1963) and G. H. Lee, W. H. Bauer and S. E. Waberley, J. Phys. Chem. 67, 1742 (1963). The D<sub>3h</sub> assumed symmetry has 14 vibrations of the type 3A<sub>1</sub>, 2A<sub>2</sub>, 5E<sub>1</sub>, 2A<sub>2</sub>, 5E<sub>1</sub>, 2A<sub>2</sub> and 2E<sub>1</sub> which are given in order above. The B-F bond distance was assumed to be the same as that in BF<sub>3</sub>. The B-O bond distance was estimated by comparison with other related compounds. The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 4.5832 X 10<sup>-38</sup> g. cm.<sup>2</sup>

ΔH<sub>f</sub>° 0 = Unknown  
 ΔH<sub>f</sub>° 298.15 = -301.7 ± 10 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub>° = Unknown  
 ΔH<sub>g</sub>° 298.15 = 10.7 ± 0.5 kcal. mole<sup>-1</sup>

S°<sub>298.15</sub> = [40 ± 10] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = Unknown

Heat of Formation.

The value of ΔH<sub>f</sub>° 298.15 for B<sub>3</sub>O<sub>3</sub>H<sub>3</sub>(c) was calculated from the ΔH<sub>f</sub>° 298.15 for B<sub>3</sub>O<sub>3</sub>H<sub>3</sub>(g) and ΔH<sub>g</sub>° 298.15 for B<sub>3</sub>O<sub>3</sub>H<sub>3</sub>(c) reported by R. F. Porter and S. K. Gupta, J. Phys. Chem. 68, 280 (1964).

Heat Capacity and Entropy.

The heat capacities (C<sub>p</sub>) were estimated from those for B<sub>2</sub>O<sub>3</sub>(c) and 1/2 B<sub>2</sub>H<sub>6</sub>(g), according to the method suggested by O. Kubaschewski and E. L. Evans, "Metallurgical Thermochemistry", Pergamon Press, New York, 1958. The value of S°<sub>298.15</sub> for B<sub>3</sub>O<sub>3</sub>H<sub>3</sub>(c) was calculated based on ΔS<sub>f</sub>° 298.15 = 6.6 cal. deg.<sup>-1</sup> mole<sup>-1</sup> for the reaction B<sub>3</sub>O<sub>3</sub>H<sub>3</sub>(c) = B<sub>2</sub>O<sub>3</sub>(am) + 1/2 B<sub>2</sub>H<sub>6</sub>(g), which was obtained from the calculated ΔH<sub>f</sub>° 298.15 and measured ΔH<sub>f</sub>° 298.15 evaluated from the vapor pressure reported by W. P. Shollette and R. F. Porter, J. Phys. Chem. 67, 177 (1963).

Heat of Sublimation.

ΔH<sub>g</sub>° 298.15 was taken from R. F. Porter and S. K. Gupta, loc. cit.

Metaboric Acid, Trimeric ((HBO<sub>2</sub>)<sub>3</sub>)

Bond Distance: B-O = [1.36] Å O-H = [1.0] Å

Bond Angle: H-O-B = [120]° B-O-B = [120]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.7712 X 10<sup>-11</sup>] g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The equilibrium constant, K<sub>p</sub> = 0.9, for the reaction H<sub>3</sub>BO<sub>3</sub>(l) + B<sub>2</sub>O<sub>3</sub>(l) = (HBO<sub>2</sub>)<sub>3</sub>(g) was reported by D. J. Meschi, W. A. Chupka and J. Berkowitz, J. Chem. Phys. **33**, 530 (1960), which was determined by means of mass spectrometry. The equilibrium constants of the reactions between water vapor and liquid B<sub>2</sub>O<sub>3</sub> were determined at 1147°K. by J. A. Blauer and M. Farber, J. Phys. Chem. **68**, 2357 (1964), by use of a transpiration method. From the reported value, 1.5 K<sub>2</sub> + 0.5 K<sub>3</sub> = 0.0342 ± 0.0095, the equilibrium constant, K<sub>2</sub>, for the reaction 1.5 B<sub>2</sub>O<sub>3</sub>(l) + 1.5 H<sub>2</sub>O(g) = (HBO<sub>2</sub>)<sub>3</sub>(g) was derived as 0.0168, using K<sub>3</sub> = 0.0181 for the reaction 0.5 B<sub>2</sub>O<sub>3</sub>(l) + 1.5 H<sub>2</sub>O(g) = H<sub>3</sub>BO<sub>3</sub>(g) evaluated by use of JANAF values of ΔH<sub>f</sub><sup>0</sup> for B<sub>2</sub>O<sub>3</sub>(l), H<sub>2</sub>O(g) and H<sub>3</sub>BO<sub>3</sub>(g). Employing the equilibrium constants obtained the respective enthalpy changes (ΔH<sub>f</sub><sup>0</sup>) for the two reactions were calculated by the third law method. The corresponding values of ΔH<sub>f</sub><sup>0</sup> for (HBO<sub>2</sub>)<sub>3</sub>(g) were also derived. The results are presented as follows.

Investigator

| Investigator      | ΔH <sub>f</sub> <sup>0</sup> , 298.15 kcal. mole <sup>-1</sup> | Chemical Reaction   | ΔH <sub>f</sub> <sup>0</sup> , 298.15 kcal. mole <sup>-1</sup> |
|-------------------|--|---|--|
| Meschi, et al.    | 2.800  | H <sub>3</sub> BO <sub>3</sub> (l) + B <sub>2</sub> O <sub>3</sub> (l) = (HBO <sub>2</sub> ) <sub>3</sub> (g) | -7.31  |
| Blauer and Farber | 1.640  | 1.5 B <sub>2</sub> O <sub>3</sub> (l) + 1.5 H <sub>2</sub> O(g) = (HBO <sub>2</sub> ) <sub>3</sub> (g)        | -543.8   |
|                   | 4.019  |   | -542.3   |

The adopted value of ΔH<sub>f</sub><sup>0</sup> (298.15) for (HBO<sub>2</sub>)<sub>3</sub>(g) is the average of those two listed in the above table. The equilibrium constants for the same reactions between B<sub>2</sub>O<sub>3</sub>(l) and H<sub>2</sub>O(g) were also determined by a transpiration method in the temperature region 1000°-1275°K. by S. P. Randall and J. L. Margrave, J. Inorg. Nucl. Chem. **15**, 29 (1960). The reported value, ΔH<sub>f</sub><sup>0</sup> = -537.5 ± 3 kcal. mole<sup>-1</sup> for (HBO<sub>2</sub>)<sub>3</sub>(g), is in good agreement with the value adopted.

Heat Capacity and Entropy.

All the molecular and spectroscopic constants were estimated by D. White, D. E. Mann, P. N. Walsh and A. Sommer, J. Chem. Phys. **32**, 468 (1960). The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 4.4623 X 10<sup>-38</sup> and I<sub>C</sub> = 8.9247 X 10<sup>-38</sup> g. cm.<sup>2</sup>. The infrared absorption spectra for B<sub>3</sub>O<sub>3</sub>(OH)<sub>3</sub>(c) in the 430 to 4000 cm.<sup>-1</sup> was reported by L. J. Parsons, J. Chem. Phys. **33**, 1860 (1960). A partial Raman spectrum was also given.

Bond Distances: B-N = 1.44 Å B-H = 1.20 Å H-N = 1.02 Å

Bond Angle: N-B-N = 120° B-N-B = 120° N-B-H = 120°

 Product of Moments of Inertia:  $I_A I_B I_C = 8.3303 \times 10^{-14} \text{ g.}^3 \text{ cm.}^6$ 

## Heat of Formation.

The heat of combustion for the reaction  $B_3N_3H_6(l) + 15/4 O_2(g) + 3/2 N_2(g) = 3 H_3BO_3(c) + 3/2 H_2O(l)$  was reported to be  $-552.9 \pm 3.0 \text{ kcal. mole}^{-1}$  by M. V. Kilday, W. H. Johnson and E. J. Prosen, *J. Res. Natl. Bur. Std.*, 55 A, 101 (1961).  $\Delta H^\circ_f 298.15 H_2O(l) = -68.317 \text{ kcal. mole}^{-1}$  from Natl. Bur. Std. Circ. 500, "Selected Values of Chemical Thermodynamic Properties", 1952 and  $\Delta H^\circ_f 298.15 H_3BO_3(c) = -263.47 \text{ kcal. mole}^{-1}$  from JANAF tables were used to calculate  $\Delta H^\circ_f 298.15 B_3N_3H_6(l) = -129.0 \pm 3.0 \text{ kcal. mole}^{-1}$ . Vapor pressure data on  $B_3N_3H_6(l)$  reported by A. Stock and E. Pohland, *Ber.*, 59, 2215 (1926) were fitted to a linear least squares.  $\Delta C_p(1-g)$  for borazine was approximated by benzene to calculate a 2nd law  $\Delta H^\circ_{298} = 7.1 \pm 0.1 \text{ kcal. mole}^{-1}$ .

## Heat Capacity and Entropy.

The fundamental frequency assignment was made by B. L. Crawford, Jr. and J. T. Edsall, *J. Chem. Phys.*, 7, 223 (1939). The three frequencies enclosed by brackets are calculated values. The moments of inertia were calculated from molecular constants given by S. H. Bauer, *J. Am. Chem. Soc.*, 60, 524 (1938). The three principal moments of inertia are  $I_A = I_B = 16.09 \times 10^{-39}$  and  $I_C = 32.18 \times 10^{-39} \text{ g. cm.}^2$ .

Heat of Formation.

$\Delta H_f^o 298.15$  was recalculated from the experimental data of L. Shartsis and W. Capps, J. Am. Ceram. Soc. 37, 27-32 (1954). They studied the heat of solution of various alkali borates in 2N nitric acid. Average molecular weights were used for physical mixtures of the oxides  $B_2O_3$  and  $R_2O$  (where R is either Li, Na, or K) rather than for the borate compounds  $R_2O \cdot nB_2O_3$  present. These incorrect molecular weights led to spurious correlations and faulty conclusions. In reinterpreting the data, the steps followed were: (1) The calculation of the correct molecular weights and molar heats of reaction; (2) The establishment that the heat of formation of the borates from the oxides is linear with the mole fraction of  $B_2O_3$  in the total original moles of oxides for the reactions

with the heat of formation being zero at 100 percent  $R_2O$ . (3) The evaluation of the least square fit of the line through the heat of reaction data for reaction I and for reaction II; (4) The use of the proper weighting factors in applying least squares to adjust for both the sample size and the molecular weight of the mixture of borates used in each solution experiment.

Heat Capacity and Entropy.

The enthalpy measurements of G. S. Smith, Ph.D. Thesis, Penn. State Univ., Jan. 1959, L. C. Card No. Mic. 59-2916, in the range 298-973°K were smoothed graphically and were used to obtain a smooth set of  $C_p$  data. The heat capacity was extrapolated smoothly above this region. The entropy at 298°K was estimated from that of  $Na_2B_4O_7(c)$  by using an average entropy change of  $4.5 \pm 1.5 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$  on substituting  $Na_2$  by  $K_2$ .

Melting Data.

$T_m$  was given by A. P. Rollet, Comp. Rend. 200, 1763 (1955). The heat of melting was obtained from the heats of formation of the crystal and glass at 298°K combined with the enthalpy differences between 298 and 1098°K. This involves a slight extrapolation of the crystal data and an uncertainty of about 1.0 kcal. mole<sup>-1</sup>.

S<sub>298.15</sub><sup>o</sup> = [56.7 ± 2.5] cal. deg.<sup>-1</sup> mole<sup>-1</sup> ΔH<sub>f</sub><sup>o</sup> 298.15 = -786.1 kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 1088°K. ΔH<sub>m</sub> = 24.9 ± 1 kcal. mole<sup>-1</sup>

Heat of Formation.

The heat of formation was obtained from reaction (1) given on the crystal table.

Heat Capacity and Entropy.

The enthalpy measurements of G. S. Smith, Ph.D. Thesis, Penn. State Univ., Jan. 1959, L. C. Card No. Mic 59-2916 in the range 298 to 1373°K on the glass and liquid were smoothed graphically and used to determine C<sub>p</sub>. There is a discontinuity (glass transition) in the C<sub>p</sub> curve at 678°K. Above 1373°K the C<sub>p</sub> values were extrapolated smoothly.

The entropy at 298°K was obtained from that of the crystal by adding ΔS<sub>m</sub><sup>o</sup> and the difference between S<sub>1088</sub><sup>o</sup> and S<sub>298</sub> for crystal and liquid.

ΔH<sub>f</sub>° = Unknown

ΔH<sub>f</sub>° 298.15 = -803.6 ± 1.5 kcal. mole<sup>-1</sup>

ΔH<sub>m</sub>° = 28.8 ± 1.5 kcal. mole<sup>-1</sup>

S<sub>298.15</sub>° = [37.2 ± 1.0] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>m</sub> = 1190 ± 2°K.

Heat of Formation.

The heat of formation was calculated from ΔH<sub>f</sub>° 298 = -12.2 kcal. for the reaction Li<sub>2</sub>B<sub>4</sub>O<sub>7</sub>(c) + 2HNO<sub>3</sub>(aq.) + 5H<sub>2</sub>O(l) = 4H<sub>3</sub>BO<sub>3</sub>(aq.) + 2LiNO<sub>3</sub>(aq.). The heat of solution (ΔH<sub>f</sub>°) was interpolated from the heat of solution data of L. Shartels and W. Ceppa, J. Am. Ceram. Soc. 37, 27 (1954). Auxiliary data are from National Bureau of Standards Circular 500 (1952).

Heat Capacity and Entropy.

The enthalpy measurements of G. S. Smith, Ph. D. Thesis, Penn. State Univ., Jan. 1959, L. C. Card No. Mc 59-2916 in the range 298 to 1190°K. were smoothed graphically and used to determine C<sub>p</sub>. A linear extrapolation of C<sub>p</sub> was estimated from 1190 to 2000°K.

S<sub>298</sub>° was estimated by three routes: (1) S<sub>298</sub>° (Li<sub>2</sub>B<sub>4</sub>O<sub>7</sub>) = 37.3 cal. mole<sup>-1</sup> deg.<sup>-1</sup> based on JANAF S<sub>298</sub>° (Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>) = 45.3 and ΔS<sub>298</sub>° (2Na-2Li) = 8 cal. deg.<sup>-1</sup> from W. M. Latimer, J. Am. Chem. Soc. 73, 1480 (1951); (2) S<sub>298</sub>° (Li<sub>2</sub>B<sub>4</sub>O<sub>7</sub>) = 36.7 cal. mole<sup>-1</sup> deg.<sup>-1</sup> in a similar manner based on ΔS<sub>298</sub>° (2Na<sup>+</sup>·2Li<sup>+</sup>) = 8.6 cal. deg.<sup>-1</sup> from K. K. Kelley, Bureau of Mines, private communication, June 1960; and (3) S<sub>298</sub>° (Li<sub>2</sub>B<sub>4</sub>O<sub>7</sub>) = 37.6 cal. mole<sup>-1</sup> deg.<sup>-1</sup> based on addition of the JANAF entropies for 2LiBO<sub>2</sub> and B<sub>2</sub>O<sub>3</sub>. The value adopted is an average of these estimates.

Melting Data.

The value for T<sub>m</sub> is from B. S. R. Sastry and F. A. Hummel, J. Am. Chem. Soc. 42, 216 (1959). A. P. Rollet and R. Bousziz, Compt. rend. 240, 2417 (1955) earlier reported T<sub>m</sub> = 1188°K. ΔH<sub>m</sub>° = 28.8 kcal. mole<sup>-1</sup> is from G. S. Smith loc. cit.

B<sub>4</sub>Li<sub>2</sub>O<sub>7</sub>

| T, °K. | C <sub>p</sub> | S° - (S° - H <sub>298</sub> °)/T | H° - H <sub>298</sub> ° | ΔH <sub>f</sub> ° | ΔF <sub>f</sub> ° | Log K <sub>f</sub> |

$\Delta H_f^\circ 298.15 = -792.79 \pm 1.5 \text{ kcal. mole}^{-1}$   
 $\Delta H_m^\circ = 26.3 \pm 1.5 \text{ kcal. mole}^{-1}$

$S_{298.15}^\circ = (41.564 \pm 1.5) \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_m = 1190 \pm 2^\circ \text{K.}$

Heat of Formation.  
 $\Delta H_f^\circ 298.15(1)$  was calculated from  $\Delta H_f^\circ 298.15(c)$  by adding  $\Delta H_m^\circ$  and the difference between  $H_m^\circ - H_l^\circ$  for crystal and liquid.

Heat Capacity and Entropy.

The enthalpy measurements of G. S. Smith, Ph. D. Thesis, Penn. State Univ., Jan. 1959, L. C. Card No. Mic 58-2918 in the range 298 to 1373°K. were smoothed graphically and used to determine  $C_p$ . The  $C_p$  data have a discontinuity at about 756°K. A linear extrapolation of  $C_p$  was used from 1373 to 3000°K.

The entropy at 298°K. is set so that  $\Delta F$  is equal at  $T_m$  for the crystal and liquid.

Melting Data.

See crystal table for details.

S<sub>298.15</sub> = 12.41 ± 0.06 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>f</sub>° 0 = -25.0 ± 2.0 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub>° 298.15 = -25.1 ± 2.0 kcal. mole<sup>-1</sup>  
 T<sub>d</sub> = [1100]°K.

Heat of Formation.

The equilibrium pressures (1169-1177°K.) of the reaction MgB<sub>4</sub>(c) → Mg(l) + 4B(c) were measured by M. Wright and P. N. Walsh, "The Vaporization of MgB<sub>4</sub>(c)", Technical Research Report OMCC-HEF-55, Jan. 9, 1958, Ohio State University Research Foundation. The third law value of ΔH<sub>f</sub>° 298.15 for this reaction was derived as 60.40 ± 1.5 kcal. mole<sup>-1</sup>. This leads to a ΔH<sub>f</sub>° 298.15 = -25.1 ± 2.0 kcal. mole<sup>-1</sup> for MgB<sub>4</sub>(c). The unit of equilibrium pressures reported should be in atmosphere not in mm Hg as printed. The diameter of the hole drilled through the center of the lid served as the effusion orifice should be 1/16 inch rather than the reported value 1/8 inch.

Heat Capacity and Entropy.

The low temperature (17.34-299.53°K.) heat capacities were measured by R. M. Swift and D. White, J. Am. Chem. Soc. 79, 3641 (1957). Above 298.15°K. the C<sub>p</sub> values were estimated by comparison with those of other related borides. S<sub>298.15</sub> was reported by R. M. Swift and D. White, loc. cit., using S<sub>20</sub>°(extrap.) = 0.022 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Temperature of Decomposition.

T<sub>d</sub> was estimated from the decomposition reaction reported by M. Wright and P. N. Walsh, loc. cit.

**Heat of Formation.**  
The heat of the reaction Na<sub>2</sub>O(c) + 2B<sub>2</sub>O<sub>3</sub>(l) → Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>(c) was reported by L. Shartalis and W. Capps, J. Am. Ceram. Soc. 37, 27-32 (1954) from their heats of solution measurements. Their values for the heat of reaction of the oxides have been converted to the heats of formation using JANAF values for B<sub>2</sub>O<sub>3</sub>(l) (Dec. 31, 1964) and for Na<sub>2</sub>O(c) (June 30, 1962). The above ΔH<sub>f</sub><sup>o</sup> = -85.2 kcal. mole<sup>-1</sup>.

**Heat Capacity and Entropy.**  
In the low temperature region (5-344°K) the C<sub>p</sub> values are those determined by E. P. Westrum, Jr., and O. Grenier, J. Am. Chem. Soc. 79, 1799 (1957). The enthalpy measurements of O. S. Smith, Ph.D. Thesis, Penn. State Univ., Jan. 1959, L. C. Card No. Mic 52-2916 in the range 298 to 1015.6°K were smoothed graphically and used to determine C<sub>p</sub>; the values did not join smoothly with those of Westrum and Grenier and the low temperature values were given greater weight. Above T<sub>m</sub> the heat capacity was extrapolated. S<sub>298.15</sub> was derived from low temperature heat capacities.

**Melting.**  
The value for T<sub>m</sub> is from O. W. Morey and H. E. Merwin, J. Am. Chem. Soc. 58, 2248 (1936). Other reported values for T<sub>m</sub> are: 1008 ± 5°K by S. S. Coles, S. R. Scholes, and C. R. Amberg, J. Am. Ceram. Soc. 19, 59 (1935); 1011°K by H. Menzel, Z. anorg. Chem., 224, 1 (1935); 1005°K by J. P. Ponomareff, Z. anorg. Chem. 89, 383 (1924); 1015°K by A. L. Day and E. T. Allen, "The Isomorphism and Thermal Properties of the Feldspars", Carnegie Inst. of Washington, Publ. No. 31 (1905) p. 29; and 1064°K by C. H. Burgess and A. Holt, Proc. Roy. Soc. (London) 74, 285 (1904). ΔH<sub>m</sub><sup>o</sup> was obtained from the values of ΔH<sub>f</sub><sup>o</sup> for Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>(c) and Na<sub>2</sub>B<sub>2</sub>O<sub>7</sub>(l) at 298°K as described above and the difference between H<sub>1015-H<sub>298</sub></sub> for crystal and liquid.

$S_{298.15}^\circ = 47.513 \pm 1.5$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>       $\Delta H_f^\circ 298.15 = -778.36 \pm 2.0$  kcal. mole<sup>-1</sup>  
 $T_m = 1015.6^\circ\text{K}$ .       $\Delta H_m^\circ = 19.4 \pm 1.5$  kcal. mole<sup>-1</sup>

Heat of Formation.

The heat of reaction  $\text{Na}_2\text{O}(c) + 2\text{B}_2\text{O}_3(l) \rightarrow \text{Na}_2\text{B}_4\text{O}_7(l)$  was reported by L. Shartala and W. Capps, J. Am. Ceram. Soc. 37, 27-32 (1954) from their heats of solution measurements. Their values for the heat of reaction of the oxides have been converted to the heats of formation using JANAF values for  $\text{B}_2\text{O}_3(l)$  (Dec. 31, 1964) and for  $\text{Na}_2\text{O}(c)$  (June 30, 1962). The above  $\Delta H_f^\circ = -80.4$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The enthalpy measurements of G. S. Smith, Ph.D. Thesis, Penn. State Univ., Jan. 1959, I. C. Card No. Mic 59-2916, in the range 298 to 1373°K, were smoothed graphically and used to determine  $C_p$ . These were joined smoothly with the low temperature data of E. P. Heartrum and G. Grenier, J. Am. Chem. Soc. 79, 1799 (1957). At 743°K a glass transition was observed and above this temperature the  $C_p$  adopted as constant.

The entropy at 298°K obtained from that of the crystal by adding  $\Delta S_m^\circ$  and the difference between  $S_{1015.6}^\circ$  and  $S_{298}^\circ$  for crystal and liquid.

Melting.

See the crystal for details.

$\text{B}_4\text{Na}_2\text{O}_7$

Mer. 31, 1962J Dec. 31, 1962J Mar. 31, 1965

ΔH<sub>f</sub><sup>o</sup> = Unknown  
ΔH<sub>f</sub><sup>o</sup> 298.15 = -683 ± 1.5 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = [39.9 ± 3] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Heat of Formation.

See lead diborate table for the complete writeup. W. H. Evans in NBS Report 7192, July 1, 1961, analysed the heats of formation of the lead borate system based upon Shertels and Newman's heats of solution and Mazzetti and DeCarli's phase studies. From the Shertels and Newman paper Evans obtained the following:

and estimated a ΔH<sub>f</sub><sup>o</sup> 298 of 11.4 kcal. mole<sup>-1</sup> for the conversion to the PbO·2B<sub>2</sub>O<sub>3</sub>(crystal). With auxiliary JANAF values the ΔH<sub>f</sub><sup>o</sup> 298.15 was calculated to be -683.00 kcal./mole.

Heat Capacity and Entropy.

The heat capacity employed in this table was obtained by graphically smoothing the summation of the heat capacities of the constituent oxides.

The entropy at 298.15 was obtained from a consideration of the entropies of sodium end calcium borates and those of the constituent oxides, as given by K. K. Kelley and E. O. King, Bureau of Mines Bull. 592 (1961). These indicate for the reaction:

that the simple addition of entropies will give values at least 2.7 e.u. in the case of Na borates and 5.7 e.u. for Ca borates too high for the reaction. The reason for this is probably structural, the B<sub>4</sub>O<sub>7</sub><sup>-</sup> ion is a rigid chain of rings. It was assumed that additional B<sub>2</sub>O<sub>3</sub> would extend the ring structure into a rigid plane and thus the average entropy difference of 4.2 for the reaction was assumed to hold for each additional mole of B<sub>2</sub>O<sub>3</sub>. Therefore the entropy at 298.15 was obtained from S<sub>298.15</sub><sup>o</sup> for PbB<sub>2</sub>O<sub>4</sub> and B<sub>2</sub>O<sub>3</sub> and the subtraction of 4.2 e.u.

(LIQUID)

S<sub>298.15</sub><sup>o</sup> = 44.056  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = 10.240 ± 1.6 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = 1.466 kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 226.34°K.  
 T<sub>b</sub> = 335°K.  
 ΔH<sub>v</sub><sup>o</sup> = 6.79 kcal. mole<sup>-1</sup>

Heat of Formation.

The vapor pressures of B<sub>5</sub>H<sub>9</sub>(l) were measured by H. E. Wirth and E. D. Palmer, J. Phys. Chem. 50, 914 (1956) and H. L. Johnston, E. C. Kerr, J. T. Clarke and N. C. Hallett, "Calorimetric Investigation with the Condensed Gas Calorimeter. IV. The Heat Capacities, Latent Heats and Entropies of Pentaborane from 13 to 298°K.; Heats of Transition, Fusion and Vaporization; Vapor Pressures of the Liquid", TR-6, July 8, 1949, The Ohio State University. By use of both the second and third law methods, the respective heats of vaporization (ΔH<sub>v</sub><sup>o</sup> 298.15) were evaluated. The ΔH<sub>f</sub><sup>o</sup> 298.15 values for B<sub>5</sub>H<sub>9</sub>(l) were calculated from ΔH<sub>f</sub><sup>o</sup> 298.15 for B<sub>5</sub>H<sub>9</sub>(g) and ΔH<sub>v</sub><sup>o</sup> 298.15 for B<sub>5</sub>H<sub>9</sub>(l) obtained previously. The results are presented as follows.

| Investigator     | Second Law Value | Third Law Value | ΔH <sub>f</sub> <sup>o</sup> 298.15 <sup>o</sup> kcal. mole <sup>-1</sup> |
|------------------|------------------|-----------------|---|
| Wirth and Palmer | 7.26 ± 0.02      | 7.26            | 10.24 ± 1.6   |
| Johnston, et al. | 7.23 ± 0.04      | 7.25            | 10.23 ± 1.6   |

\*Calculation based on the third law ΔH<sub>f</sub><sup>o</sup> 298.15 values.

The adopted value is the average of the two ΔH<sub>f</sub><sup>o</sup> 298.15 values obtained.

Heat Capacity and Entropy.

The heat capacities (C<sub>p</sub>), 231.34 - 290.19°K., for B<sub>5</sub>H<sub>9</sub>(l) were measured by Johnston, Kerr, Clarke and Hallett, loc. cit. The C<sub>p</sub> values above 290.19°K. were estimated by graphical extrapolation of the C<sub>p</sub> curve plotted using the experimental data. The value of S<sub>298.15</sub> was derived based on the low temperature C<sub>p</sub>, 13.29 - 221.61°K., and ΔH<sub>m</sub><sup>o</sup> for B<sub>5</sub>H<sub>9</sub>(c) reported by Johnston, Kerr, Clarke and Hallett, loc. cit. and C<sub>p</sub> values, 226.34 - 298.15°K., for B<sub>5</sub>H<sub>9</sub>(l), using S<sub>13.29</sub> = 0.236 cal. deg.<sup>-1</sup> mole<sup>-1</sup> for B<sub>5</sub>H<sub>9</sub>(c).

Melting Data.

The values of T<sub>m</sub> and ΔH<sub>m</sub><sup>o</sup> were taken from Johnston, Kerr, Clarke and Hallett, loc. cit.

Vaporization Data.

The boiling point (T<sub>b</sub>) is calculated as the temperature at which the free energy change of the reaction B<sub>5</sub>H<sub>9</sub>(l) → B<sub>5</sub>H<sub>9</sub>(g) becomes zero. The enthalpy change of the reaction at T<sub>b</sub> is heat of vaporization (ΔH<sub>v</sub><sup>o</sup>).

σ = 4

Heat of Formation.

The enthalpy change ( $\Delta H_f^0$ ) of the reaction B<sub>5</sub>H<sub>9</sub>(g) → 5B(am.) + 9/2 H<sub>2</sub>(g) was reported to be -12.99 ± 0.39 and -9.9 ± 1 kcal. mole<sup>-1</sup> by E. J. Prosen, M. H. Johnson and P. V. Pergiel, J. Res. Natl. Bur. Std. 61, 247 (1958) and S. R. Ounn and L. O. Green, J. Phys. Chem. 65, 2175 (1961), respectively. Using  $\Delta H_f^0 = 298.15 = 1.2 \pm 0.4$  kcal. mole<sup>-1</sup> for the reaction B(c) → B(am.), the corresponding  $\Delta H_f^0$  values for B<sub>5</sub>H<sub>9</sub>(g) were derived as 18.99 and 15.9 kcal. mole<sup>-1</sup>. The adopted value is the average of these two.

Heat Capacity and Entropy.

The molecular structure, a tetragonal pyramid of boron atoms, and constants were obtained from H. J. Hrostowski and R. J. Myers, J. Chem. Phys. 22, 262 (1954). The vibrational frequencies were reported by H. J. Hrostowski and O. C. Finantel, J. Am. Chem. Soc. 76, 998 (1954). The earlier models of pentaborane were assumed to have a hydrocarbon-like structure of low symmetry by S. H. Bauer and L. Pauling, J. Am. Chem. Soc. 58, 2403 (1936) and K. S. Pitzer, J. Am. Chem. Soc. 67, 1126 (1945). However, the electron diffraction and X-ray data by K. Hedberg, M. E. Jones and V. Schomaker, Proc. Natl. Acad. Sci., U. S. 39, 679 (1952) and W. J. Dulmage and W. N. Lipscomb, Acta Cryst. 5, 260 (1952) revealed an unusual pyramidal structure of C<sub>4v</sub> symmetry. The Raman spectrum of liquid B<sub>5</sub>H<sub>9</sub> and the infrared spectrum of the gas B<sub>5</sub>H<sub>9</sub> from 3 to 25 microns have been obtained by W. J. Taylor, C. W. Beckett, J. Y. Rung, R. B. Holden and H. L. Johnson, Phys. Rev. 79, 234 (1950). The near infrared spectrum of B<sub>5</sub>H<sub>9</sub>(l) have been examined at high resolution by F. R. Pondy and H. C. Beechell, J. Chem. Phys. 25, 238 (1956). Ten bands were observed. The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 1.18544 × 10<sup>-38</sup> and I<sub>C</sub> = 1.69172 × 10<sup>-38</sup> g. cm.<sup>2</sup>

$\Delta H_f^0 =$  Unknown  
 $S_{298.15}^0 = [60 \pm 3] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^0 298.15 = -1,107.44 \pm 2.4 \text{ kcal. mole}^{-1}$   
 $T_D = 1098^\circ K$

Heat of Formation.

The heat of reaction  $K_2O(c) + 3B_2O_3(l) \rightarrow K_2B_6O_{10}(c)$  was reported by L. Smartas and W. Capps, J. Am. Ceram. Soc. 37, 27-32 (1954) from their heats of solution measurements. Their values for the heat of reaction of the oxides have been converted to the heats of formation using JANAF values for  $B_2O_3(l)$  (Dec. 31, 1964) and for  $K_2O(c)$  (June 30, 1963). The above  $\Delta H_f^0 = -122.8 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The enthalpy measurements of O. S. Smith, Ph.D. Thesis, Penn. State Univ., Jan. 1955, L. C. Cerd No. Mic 59-2916 in the range 288 to 973°K were graphically smoothed and used to determine  $C_p$ . Above this range  $C_p$  was extrapolated.

The entropy at 298°K was obtained from a consideration of the entropies of sodium and calcium borates and those of the constituent oxides, as given by K. K. Kelley and E. G. King, Bureau of Mines Bull. 592 (1961). These indicate that for the reactions

the simple addition of entropies will give values at least 2.7 e.u. too low for reaction (1) and at least 2.7 e.u. too high for reaction (2). The reason for this is probably structural, the  $B_2O_4^{--}$  ion being a flexible chain while the  $B_4O_7^{--}$  ion probably is a rigid chain of rings. It was assumed that additional  $B_2O_3$  would extend the ring structure into a rigid plane and thus the entropy difference for reaction (2) was assumed to hold for each additional mole of  $B_2O_3$  added. Thus a value for  $MO \cdot B_2O_3$  was estimated to be  $55.5 \pm 1.5$  and then using an average value of  $4.5 \pm 1.5$  e.u. for the difference between  $K_2$  and  $Na_2$  gave  $60 \pm 3$  e.u. for the entropy of  $K_2B_6O_{10}$ .

Decomposition Temperature.

The incongruent melting point was given by A.-P. Rollat, Comp. rend. 200, 1763 (1935), the decomposition products being  $K_2B_4O_7(l)$  and  $K_2B_6O_{13}(c)$ .

$\Delta H_f^\circ 0$  = Unknown  
 $\Delta H_f^\circ 298.15$  = -1,113.74 ± 2.40 kcal. mole<sup>-1</sup>

$S_{298.15}^\circ$  = [45.0 ± 1.0] cal. deg<sup>-1</sup> mole<sup>-1</sup>  
 $T_d$  = 1107 ± 4°K.

Heat of Formation.

The heat of reaction  $\text{Li}_2\text{O}(c) + 3\text{B}_2\text{O}_3(l) \rightarrow \text{Li}_2\text{B}_6\text{O}_{10}(c)$  was reported by L. Shartsis and W. Capps, J. Am. Ceram. Soc. 37, 27-32 (1954) from their heats of solution measurements. Their values for the heat of reaction of the oxides have been converted to the heats of formation using JANAF values for  $\text{B}_2\text{O}_3(l)$  (Dec. 31, 1964) and  $\text{Li}_2\text{O}(c)$  (March 31, 1964). The above  $\Delta H_f^\circ = -72.80$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

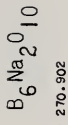

The enthalpy measurement of G. S. Smith, Ph.D. Thesis, Penn. State Univ., Jan. 1959, L. C. Card No. Mic 59-2916 in the range 298 to 823°K. were used to determine  $C_p$ . Above this range  $C_p$  is extrapolated. Entropy at 298°K. is estimated from that of the component oxides and the difference from the oxides observed for twice  $\text{LiBO}_2(c)$ .

Temperature of Decomposition.

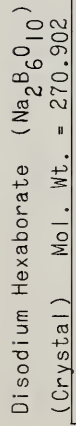

The incongruent melting point reported by E. S. R. Sastry and F. A. Hummel, J. Am. Ceram. Soc. 42, 216-8 (1959) is used here.

Mar. 31, 1962; Dec. 31, 1962; Mar. 31, 1965

$\Delta H_f^o =$  Unknown  
 $\Delta H_f^o$  298.15 = -1094.76 ± 2.2 kcal. mole<sup>-1</sup>  
 $S_{298.15}^o = [55.5 \pm 1.5]$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_D = 1039^\circ K.$

Heat of Formation.

The heat of reaction  $Na_2O(c) + 3B_2O_3(l) \rightarrow Na_2B_6O_{10}(c)$  was reported by L. Shartals and M. Ceppe, J. Am. Ceram. Soc. 37, 27-32 (1954) from their heats of solution measurements. Their values for the heat of reaction of the oxides have been converted to the heats of formation using JANAF values for  $B_2O_3(l)$  (Dec. 31, 1964) and for  $Na_2O(c)$  (June 30, 1962). The above  $\Delta H_f^o = -97.52$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The enthalpy measurements of G. S. Smith, Ph.D. Thesis, Penn. State Univ., Jan. 1959, L. C. Card No. Mic 59-2916 in the range 298 to 1039°K were smoothed graphically and used to determine  $C_p$ . Above this range  $C_p$  was extrapolated. Entropy at 298°K was estimated as described in detail for  $K_2B_6O_{10}(c)$ .

Decomposition Temperature.

The incongruent melting point was reported by G. M. Morey and H. E. Herwin, J. Am. Chem. Soc. 59, 2248 (1936), the products are  $Na_2B_4O_7(l)$  and  $Na_2B_6O_{10}(c)$ .

ΔH<sub>f</sub>° = Unknown  
ΔH<sub>f</sub>° 298.15 = -1003 ± 2.0 kcal mole<sup>-1</sup>

S° 298.15 = {48.6 ± 3} cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Heat of Formation.

See lead diborate table for the complete writeup. W. H. Evans in NBS Report 7192, July 1, 1961, analysed the heats of formation of the lead borate system based upon Shartsis and Newman's heats of solution and Mazzetti and De Carli's phase studies. From the Shartsis and Newman paper Evans obtained the following:

and estimated a ΔH<sub>f</sub>° of 16.0 kcal. mole<sup>-1</sup> for the conversion to the PbO·3B<sub>2</sub>O<sub>3</sub>(crystal). With auxiliary JANAF values the ΔH<sub>f</sub>° 298.15 was calculated to be -1003.00 kcal./mole.

Heat Capacity and Entropy.

The heat capacity employed in this table was obtained by graphically smoothing the summation of heat capacities of the constituent oxides.

The entropy at 298.15 was obtained in the manner described in the PbB<sub>6</sub>O<sub>7</sub> table from S<sub>298.15</sub> for PbB<sub>6</sub>O<sub>7</sub> and B<sub>2</sub>O<sub>3</sub> and the subtraction of 4.2 e.u.

ΔH<sub>f</sub>° O = Unknown  
 ΔH<sub>f</sub>° 298.15 = -1,420.92 ± 1.4 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub>° = 29.9 ± 1.0 kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 1130°K.

Heat of Formation.  
 The heat of reaction K<sub>2</sub>O(c) + 4B<sub>2</sub>O<sub>3</sub>(l) → K<sub>2</sub>B<sub>8</sub>O<sub>13</sub>(c) was reported by L. Sherrata and W. Capps, J. Am. Ceram. Soc. 37, 27-32 (1954) from their heats of solution measurements. Their values for the heat of reaction of the oxides have been converted to the heats of formation using JANAF values for B<sub>2</sub>O<sub>3</sub>(l) (Dec. 31, 1964) and for K<sub>2</sub>O(c) (June 30, 1963). The above ΔH<sub>f</sub>° = -137.00 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.  
 The enthalpy measurements of G. S. Smith, Ph.D. Thesis, Penn. State Univ., Jan. 1959, L. C. Card No. Mic 59-2916 in the range 298 to 1130°K were smoothed graphically and used to determine C<sub>p</sub>. Above this range C<sub>p</sub> is extrapolated.

The entropy at 298°K was obtained by estimating the entropy of Ne<sub>2</sub>B<sub>8</sub>O<sub>13</sub>(c) as 65.7 ± 2.5 e.u., as described on the table for K<sub>2</sub>B<sub>8</sub>O<sub>10</sub>(c) and then using an average value of 4.5 ± 1.5 e.u. for the replacement of Ne<sub>2</sub> by K<sub>2</sub>.

Melting Data.  
 T<sub>m</sub> is given by A.-P. Rollet, Comp. rend., 200, 1763 (1935). ΔH<sub>m</sub>° was obtained from the values of ΔH<sub>f</sub>° for K<sub>2</sub>B<sub>8</sub>O<sub>13</sub>(c) and K<sub>2</sub>B<sub>8</sub>O<sub>13</sub>(l) at 298°K reported above and the enthalpy of the crystal and liquid at T<sub>m</sub>.

$S_{298.15}^{\circ} = [71.295] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^{\circ} 298.15 = -1,403.57 \pm 2.4 \text{ kcal. mole}^{-1}$   
 $\Delta H_m = 29.9 \pm 1.0 \text{ kcal. mole}^{-1}$   
 $T_m = 1130^{\circ} \text{K.}$

Heat of Formation.

The heat of reaction  $K_2O(c) + 4B_2O_3(l) \rightarrow K_2B_8O_{13}(l)$  was reported by L. Shortalis and W. Ceppas, J. Am. Ceram. Soc. 37, 27-32 (1954) from their heats of solution measurements. Their values for the heat of reaction of the oxida have been converted to the heats of formation using JANAP values for B<sub>2</sub>O<sub>3</sub>(l) (Dec. 31, 1964) and for K<sub>2</sub>O(c) (June 30, 1963). The above  $\Delta H_f^{\circ} = -119.65 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The enthalpy measurements of G. S. Smith, Ph.D. Thesis, Penn. State Univ., Jan. 1959, L. C. Card No. Mic 59-2910 in the range 298 to 1373°K on the glass and liquid were smoothed graphically and used to determine  $C_p$ . There is a discontinuity in the  $C_p$  curve, a glass transition at about 873°K. Above 873°K the  $C_p$  values were estimated to be constant.

The entropy was obtained from that of the crystal by adding  $\Delta S_m^{\circ}$  and the difference between  $S_{1130}^{\circ}$  and  $S_{298}^{\circ}$  for crystal and liquid.

Melting Data.

See the crystal table.

LITHIUM OCTABORATE (Li<sub>2</sub>B<sub>8</sub>O<sub>13</sub>)

(CRYSTAL)

MOL. WT. = 308.44

ΔH<sub>f</sub>° = UNKNOWN  
ΔH<sub>f</sub>° 298.15 = -1413.57 ± 2.50 kcal. mole<sup>-1</sup>

S<sub>298.15</sub> = [63.4 ± 1.0] cal. deg<sup>-1</sup> mole<sup>-1</sup>  
T<sub>d</sub> = 908 ± 10°K.

Heat of Formation.

The heat of the reaction Li<sub>2</sub>O(c) + 4B<sub>2</sub>O<sub>3</sub>(l) → Li<sub>2</sub>B<sub>8</sub>O<sub>13</sub>(c) was reported by L. Shartais and V. Cepps, J. Am. Ceram. Soc. 51, 27-32 (1964) from their heats of solution measurements. Their values for the heat of reaction of the oxides have been converted to the heats of formation using JANAP values for B<sub>2</sub>O<sub>3</sub>(l) (Dec. 31, 1964) and for Li<sub>2</sub>O(c) (March 31, 1964). The above ΔH<sub>f</sub>° = -73.35 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The enthalpy measurements of G. S. Smith, Ph.D. Thesis, Penn. State Univ., Jan. 1968, L. C. Card No. MC 59-2316 in the range of 288 to 823°K. were used to determine C<sub>p</sub>. Above this range C<sub>p</sub> is extrapolated. Entropy at 298°K. is estimated from that of the component oxides and the difference from the oxides observed for twice Li<sub>2</sub>O(c).

Temperature of Decomposition. The incongruent melting point reported by B. S. R. Sastry and P. A. Hummel, J. Am. Ceram. Soc. 42, 216-8 (1959) is used here.

$\Delta H_f^{\circ} 0 = 3.4 \pm 4.5 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{\circ} 298.15 = -6.9 \pm 4.5 \text{ kcal. mole}^{-1}$   
 $\Delta H_m^{\circ} = 5.25 \pm 0.01 \text{ kcal. mole}^{-1}$   
 $\Delta H_g^{\circ} 298 = 19.2 \pm 0.2 \text{ kcal. mole}^{-1}$

$S_{298.15}^{\circ} = 42.20 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_m = 371.93^{\circ} \text{K}$

Heat of Formation.

The enthalpy change ( $\Delta H_f^{\circ}$ , 298.15) of the reaction  $B_{10}H_{14}(c) \rightarrow 10B(am) + 7H_2(g)$  was reported to be  $19.8 \pm 1.4$  and  $18.0 \pm 1.0 \text{ kcal. mole}^{-1}$  by W. H. Johnson, M. V. Kilday and E. J. Prosen, *J. Res. Natl. Bur. Std.* **54A**, 521 (1960) and G. L. Gal'chenko, B. I. Timofeev and S. M. Shunstov, *Doklady Akademii Nauk. USSR*, **142**, 1077 (1962), respectively. Using  $\Delta H_f^{\circ} 298.15 = 1.2 \pm 0.4 \text{ kcal. mole}^{-1}$  for the reaction  $B(c) \rightarrow B(am)$ , the corresponding  $\Delta H_f^{\circ} 298.15$  values for  $B_{10}H_{14}(c)$  were calculated to be  $-7.8$  and  $-6.0 \text{ kcal. mole}^{-1}$ . The adopted value of  $\Delta H_f^{\circ} 298.15$  for  $B_{10}H_{14}(c)$  is the average of these two.

Heat Capacity and Entropy.

$C_p$  (60° to 371.93°K.) was given by G. T. Furukawa and R. P. Park, *J. Res. Natl. Bur. Standards*, **55**, 255 (1955). The heat capacity above 371.93° was estimated by comparison with that of the liquid decaborane. Heat capacity (14° to 205°K.) was also reported by E. C. Kerr, N. C. Hallett and H. L. Johnston, *J. Am. Chem. Soc.*, **73**, 1117 (1951). The value of  $S_{298.15}^{\circ}$  was taken from G. T. Furukawa and R. P. Park, *loc. cit.*

Melting Data.

$T_m$  and  $\Delta H_m^{\circ}$  were obtained from G. T. Furukawa and R. P. Park, *loc. cit.*

Heat of Sublimation.

$\Delta H_g^{\circ} 298.15$  was calculated from free energy functions and vapor pressure reported by G. T. Furukawa and R. P. Park, *loc. cit.* See  $B_{10}H_{14}(c)$  table for details.

DECABORANE (B<sub>10</sub>H<sub>14</sub>)

(LIQUID)

B<sub>10</sub>H<sub>14</sub>  
MOL. WT. = 122.312

$\Delta H_f^0$  298.15 = -1.7 ± 2.0 kcal. mole<sup>-1</sup>  
 $\Delta H_m^0$  = 5.25 ± 0.01 kcal. mole<sup>-1</sup>  
 $\Delta H_v^0$  = [10.3] kcal. mole<sup>-1</sup>

$S_{298.15}^0$  = 56.299 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m$  = 371.93°K.  
 $T_b$  = [492]°K.

Heat of Formation.

$\Delta H_f^0$  298.15 was calculated from  $\Delta H_f^0$  298.15 for B<sub>10</sub>H<sub>14</sub>(c) and  $\Delta H_m^0$  reported by G. T. Furukawa and R. P. Park, J. Res. Natl. Bur. Standards, 55, 255 (1955) and the difference  $H_m^0 - H_f^0$  298.15 for crystal and liquid.

Heat Capacity and Entropy.

$C_p$  (371.93° to 380°K) was measured by G. T. Furukawa and R. P. Park, J. Res. Natl. Bur. Standards, 55, 255 (1955). Heat capacities below 371.93° and above 380°K. were estimated by comparison with that of the gaseous decaborane.  $S_{298.15}^0$  was calculated from that of crystal in a manner analogous to that of the heat of formation.

Melting and Vaporization Data.

$T_m$  and  $\Delta H_m^0$  were obtained from G. T. Furukawa and R. P. Park, loc. cit.  $T_b$  and  $\Delta H_v^0$  were calculated from functions for B<sub>10</sub>H<sub>14</sub>(l) and B<sub>10</sub>H<sub>14</sub>(g), respectively.

Point Group C<sub>2v</sub>  
 $\Delta H_f^0 = 22.5 \pm 4.5$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^{298.15} = 11.3 \pm 4.5$  kcal. mole<sup>-1</sup>

 Bond Angle: B-B-B = 108° B-B<sub>apex</sub>-B = 59° 34' B-B<sub>apex</sub>-B<sub>center</sub> = 60° 13'  
 B-H<sub>bridge</sub>-B = 46° 17' B<sub>apex</sub>-B-H = 67° 42' B<sub>center</sub>-B<sub>center</sub>-H = 120°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 6.6710 X 10<sup>-115</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.  
 The vapor pressures of decaborane (B<sub>10</sub>H<sub>14</sub>) were measured by O. T. Furukawa and R. P. Park, J. Res. Natl. Bur. Std. 55, 255 (1955) and O. A. Miller, J. Phys. Chem. 67, 1353 (1963). The heats of vaporization ( $\Delta H_v^0$ ) were derived by both the second and third law methods. Using the average value of  $\Delta H_v^0$ , the respective heats of formation ( $\Delta H_f^0$ ) for B<sub>10</sub>H<sub>14</sub>(g) were calculated. The results are presented as follows.

Investigator  
 Furukawa and Park  
 Miller

The adopted value of  $\Delta H_f^0$  298.15 for B<sub>10</sub>H<sub>14</sub>(g) is the weighted average of the three  $\Delta H_f^0$  298.15 values listed in the above table.

Heat Capacity and Entropy.  
 The molecular structure of B<sub>10</sub>H<sub>14</sub>(c) were reported by J. S. Kasper, C. M. Lucht and D. Harker, Acta Cryst. 3, 436 (1950); E. B. Moore, Jr., R. E. Dickerson and W. N. Lipscomb, J. Chem. Phys. 21, 209 (1957) and W. N. Lipscomb, Boron Hydrides, W. A. Benjamin, Inc., New York, 1953. For the calculation of the moments of inertia for B<sub>10</sub>H<sub>14</sub>(g) a simplified molecular model is adopted. The molecule is assumed to be composed of two regular pentagonal pyramids with a common base edge. The angle between the base planes of these pyramids is 73° 30'. Each of 10 H atoms is attached to a single B atom above the base plane. The remaining 4 H atoms, each bridge two B atoms. The vibrational frequencies were obtained from W. H. Evans, National Bureau of Standards Report 7033 (Jan. 1, 1961), which were derived based on the infrared and Raman spectra reported by J. E. Stewart, National Bureau of Standards, private communication, 1957 and W. E. Kellar and H. L. Johnston, J. Chem. Phys. 20, 1749 (1952). The three principal moments of inertia are: I<sub>A</sub> = 4.53925 X 10<sup>-38</sup>, I<sub>B</sub> = 3.51508 X 10<sup>-38</sup> and I<sub>C</sub> = 5.43559 X 10<sup>-38</sup> g. cm.<sup>2</sup>

Process  
 B<sub>10</sub>H<sub>14</sub>(c) → B<sub>10</sub>H<sub>14</sub>(g)  
 B<sub>10</sub>H<sub>14</sub>(l) → B<sub>10</sub>H<sub>14</sub>(g)  
 B<sub>10</sub>H<sub>14</sub>(c) → B<sub>10</sub>H<sub>14</sub>(g)

$\Delta H_f^{\circ} 0 =$  Unknown  
 $\Delta H_f^{\circ} 298.15 = -1694 \pm 3$  kcal. mole<sup>-1</sup>

$S_{298.15}^{\circ} = [84.3 \pm 3]$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Heat of Formation.

See lead diborate for the complete writeup. W. H. Evans in NBS. Report 7192, July 1, 1961, analysed the heats of formation of the lead borate system based upon Sharvats and Newman's heats of solution and Mazzetti and DeCarli's phase studies. From the Sharvats and Newman paper Evans obtained the following:

and estimated a  $\Delta H_f^{\circ}$  of 26.8 kcal. mole<sup>-1</sup> for the conversion to the  $2PbO \cdot 5B_2O_3$  (crystal). With auxiliary JANAF values the  $\Delta H_f^{\circ} 298.15$  was calculated to be -1694.00 kcal./mole.

Heat Capacity and Entropy.

The heat capacity employed in this table was obtained by graphically smoothing the summation of the heat capacities of the constituent oxides.

The entropy at 298.15 was obtained in the manner described in the  $Pb_2O_3$  table from  $S_{298.15}^{\circ}$  of  $Pb \cdot 2B_2O_3$  and  $Pb \cdot 3B_2O_3$  and the subtraction of 4.2 e.u.

Solid state to the melting point 1556°K.  
 Liquid state from 1556°K. to the boiling point 2757°K.  
 Ideal monatomic gas state above 2757°K.

See Crystal, Liquid, Ideal Monatomic Gas for details.

Beryllium (Be)

$\Delta H_f^0 = 0$

$S_{298.15}^0 = 2.260 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

$T_m = 2800 \pm 500 \text{ cal. mole}^{-1}$

Heat of Formation.

Zero by definition.

Heat Capacity and Extrapolation.

Heat capacity measurements have been reported by F. Simon and M. Ruheman, (71° to 79°K.), Z. Physik. Chem. 129, 321 (1935); S. Cristescu and F. Simon, (10° to 300°K.), Z. Physik. Chem. 259, 273 (1934); E. J. Lewis, (97° to 463°K.), Phys. Rev. 34, 1575 (1925); D. C. Ginnings, T. B. Douglas and A. F. Ball, (0° to 900°C.), J. Am. Chem. Soc. 73, 1236 (1951), and R. W. Hill and P. L. Smith, (4° to 300°K.), Phil. Mag. 44, 636 (1953).

A five constant equation was fit to both sets of data adopted from Ginnings and co-workers by the method of least squares, standard deviation ± 0.017, and joined smoothly with the C<sub>p</sub> values of Hill and Smith, C<sub>p</sub> from 1200°K. to the melting point was extrapolated.

P. B. Kantor, R. M. Krasovitskaya and A. N. Kisel, Fiz. Metal. i Metalloved., Akad. Nauk. S.S.S.R. 10, 835 (1960), report enthalpy data for pure beryllium, purity not given, from 600° to 1560°K. (crystal) and from 1560° to 2200°K. (liquid). Their values for the crystal are too high.

Entropy.

Third law entropy calculated from C<sub>p</sub>.

Melting.

Data from O. Kubaschewski, P. Brizys, O. Ruchler, R. Jauch, and K. Reinertz, Z. Elektrochem. 54, 275 (1950).

Heat of Sublimation.

ΔH<sub>g</sub> 298.15 was derived from a third law analysis of the vapor pressure data of E. A. Oulbransen and K. P. Andrew, J. Electrochem. Soc. 97, 383 (1952), and of R. B. Holden, R. Speiser, and H. L. Johnston, J. Am. Chem. Soc. 70, 3697 (1948) which are in good agreement. The results of R. Schuman and A. B. Gerratt, J. Am. Chem. Soc. 65, 442 (1944), are too low, and the values given by E. Baur and R. Brunner, Helv. Chim. Acta 17, 958 (1934), have a wrong temperature dependence.

$S_{298.15}^o = [3.954] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_m^o = 2800 \pm 500 \text{ cal. mole}^{-1}$   
 $\Delta H_v^o = 71.137 \text{ kcal. mole}^{-1}$

$\Delta H_f^o 298.15 = [2.681] \text{ kcal. mole}^{-1}$   
 $T_m = 1556^\circ\text{K.}$   
 $T_b = 2757^\circ\text{K.}$

Heat of Formation.

Obtained from  $\Delta H_m$  1556°K.

Heat Capacity and Extrapolation.

Heat capacity from  $T_m$  to 2200°K. taken from P. B. Kestor, R. M. Krasovitskaya and A. N. Kisei, Fiz. Metal. 1 Metalloved., Akad. Nauk S.S.S.R. 10, 635 (1960).  $C_p$  values below  $T_m$  and above 2200°K. were extrapolated.

Entropy.

Third law entropies between  $T_m$  and  $T_b$  extrapolated in both directions by means of extrapolated heat capacities.

Vaporization Phenomena.

$T_b$  and  $\Delta H_v$  derived from e third law analysis of the vapor pressure data of E. A. Gulbransen and K. F. Andrew, J. Electrochem. Soc. 57, 365 (1952), and of R. B. Holden, R. Speiser, and H. L. Johnston, J. Am. Chem. Soc. 70, 3697 (1948).

A mass spectrometric study and review undertaken by O. T. Mikitin and L. N. Gorkov, Zhur. Neorg. Khim. 8, 224 (1961), on the composition of beryllium vapor reveals that beryllium vaporizing both below and above the melting point, 1556°K., consists only of monatomic Be.

Heat of Formation.

The heat of formation was calculated from the equation: Be(g) + e<sup>-</sup> → Be<sup>+</sup>(g) with the JANAF auxiliary value for Be(g); using an I.P. = 7.519229 X 10<sup>6</sup> cm<sup>-1</sup> (215.001 kcal/mole) obtained from C. E. Moore, "Atomic Energy Levels", Vol. I, Circular of the National Bureau of Standards 467, June 15, 1949.

Heat Capacity and Entropy.

The electronic levels and quantum weights were obtained from C. E. Moore loc. cit. The electronic levels above 1 X 10<sup>6</sup> cm<sup>-1</sup> were omitted because their contribution is negligible below 6000°K. The H<sup>+</sup>-H<sup>+</sup> value at 0°K. is -1.481 kcal./mole.

Heat of Formation.

The dissociation energy was estimated from the experimental energies for BeF(g), BeCl(g), and the gaseous lithium halides. The resulting value, 97.1 kcal. mole<sup>-1</sup>, was combined with JANAF heats of formation for Be(g) and Br(g) in arriving at ΔH<sub>f</sub><sup>0</sup> 298.15°.

Heat Capacity and Entropy.

The vibrational frequency was estimated from those of BeF(g), BeCl(g), and the gaseous lithium halides. The ground term was assumed to be similar to that of BeCl(g) and BeF(g), tabulated by G. Herzberg, "Molecular Spectra and Molecular Structure I. Spectra of Diatomic Molecules", D. Van Nostrand Co., Inc., New York, 1950. A correlation of the interatomic distances for the alkali halides, BeF(g), and BeCl(g) was employed in deriving r<sub>e</sub>.

BERYLLIUM DIBROMIDE (BeBr<sub>2</sub>) (CRYSTAL)

MOL. WT. = 168.8302

ΔH<sub>f</sub>° = Unknown  
 ΔH<sub>f</sub>° 298.15 = [-88.4 ± 8] kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub>° = [4.5] kcal. mole<sup>-1</sup>  
 ΔH<sub>g</sub>° 298.15 = 29.8 ± 1.5 kcal. mole<sup>-1</sup>

S° 298.15 = [25.4 ± 2.0] cal. mole<sup>-1</sup> deg.<sup>-1</sup>  
 T<sub>m</sub> = 761°K.

Heat of Formation.

The heat of formation was estimated from the work of W. Blitz and C. Messerbrecht, Z. Anorg. Chem. 148, 157 (1925) and Blitz, Klante and Rahlfs, Z. Anorg. Chem. 166, 339 (1927) as reported in N. B. S. Circular 500, Washington, 1952. They measured the heat of solution of BeBr<sub>2</sub> in eq. HCl to an unknown concentration. This value was apparently adjusted and used with Be<sup>++</sup> and 2Br<sup>-</sup> to obtain ΔH<sub>f</sub>° of the crystal. However Be<sup>++</sup> was estimated by N. B. S. An uncertainty of 8 kcal. is thought to be realistic.

Heat Capacity and Entropy.

The heat capacity was estimated graphically by comparison with BeCl<sub>2</sub> and BeF<sub>2</sub>. The entropy was also estimated by comparing with Ca-BeCl<sub>2</sub> and BeF<sub>2</sub> and using additive entropy values for the halide ions.

Melting Data.

The melting point has been reported by O. Rahlfs and W. Fischer, Z. Anorg. Chem. 211, 351 (1933) and by Lebean, Ann. Chim. Phys. 15, 472 (1899) as reported in N. B. S. Circular 500, Washington, 1952. The heat of melting was estimated by comparison with the sum of the heat of transition and melting for BeF<sub>2</sub> and BeCl<sub>2</sub>.

Sublimation Data.

The heat of sublimation was obtained from an analysis of the vapor pressure data of Rahlfs and Fischer, loc. cit. from 624-695°K. The 3rd law analysis gave ΔH<sub>sub</sub> 298 = 29.78 with a drift of -2.1 ± 0.8 cal. mole<sup>-1</sup> deg.<sup>-1</sup>. A 2nd law analysis gave ΔH<sub>sub</sub> 298 = 31.1 ± 0.5 kcal. mole<sup>-1</sup>. The 2nd law result was adopted in order to yield a real liquid region, no attempt was made to eliminate the drift since this would have caused the liquid region to become unreal.

$\Delta H_f^\circ 298.15 = [28.07] \text{ cal. mole}^{-1} \text{ deg.}^{-1}$   
 $\Delta H_m^\circ = [-85.88 \pm 3] \text{ kcal. mole}^{-1}$   
 $\Delta H_v^\circ = [4.5] \text{ kcal. mole}^{-1}$   
 $\Delta H_f^\circ = [23.9] \text{ kcal. mole}^{-1}$

$T_m = 761^\circ \text{K.}$   
 $T_b = [794]^\circ \text{K.}$

Heat of Formation.

The heat of formation was obtained from that of BeBr<sub>2</sub>(c) by adding  $\Delta H_m^\circ$  and the difference between H<sub>298</sub> for crystal and liquid.

Heat Capacity and Entropy.

The heat capacity was estimated by comparison with the measured value for BeCl<sub>2</sub>. A glass transition was assumed at 500°K. below which the heat capacity is that of the crystal. The entropy was obtained in a manner analogous to the heat of formation.

Melting Data.

See BeBr<sub>2</sub>(c) table for details.

Vaporization Data.

The temperature and heat of vaporization were calculated from the cross over between BeBr<sub>2</sub>(l) and (g).

Bond Distances: Be-Br = 1.90 Å  
 Bond Angle: Br-Be-Br = 180°  
 Rotational Constant: B<sub>0</sub> = 0.02922 cm.<sup>-1</sup>  
 Heat of Formation.

The heat of formation was obtained from that of the crystal plus  $\Delta H_g^{298.15}$  see BeBr<sub>2</sub>(c) for details.  
 The linear structure was assumed with BeCl<sub>2</sub>. The bond length was reported by F. A. Akhshin, V. P. Spiridonov and O. A. Sobolev, Dokl. Akad. Nauk. SSSR 118, 1134 (1956) from electron diffraction measurements. The vibrational frequencies were estimated by assuming a set of force constants k<sub>i</sub> for the BeF<sub>2</sub>, BeCl<sub>2</sub>, BeBr<sub>2</sub>, BeI<sub>2</sub> series and also assuming  $k_1/k_2/l^2 = 50$  as for BeF<sub>2</sub>. The principal moment of inertia is 95.7984 x 10<sup>-39</sup> g. cm.<sup>2</sup>

Heat Capacity and Entropy.

Heat of Formation.

Novikov<sup>1</sup> measured 39 bands in the ultraviolet spectrum of BeCl(g). A linear extrapolation leads to a ground state and first excited states had a common dissociation limit. However, in the analogous case of BeF, treated in the same way by the above authors, it was shown by Mamm<sup>2</sup> that these assumptions were not correct. If it is assumed that the excited state dissociates  $A^1\Pi \rightarrow Be(^3P) + F(^2P)$  and the ground state  $X^2\Sigma^+ \rightarrow Be(^1S_0) + F(^2P)$ , then  $\nu_{00} + D^{\circ}$  should equal  $D^{\circ} + \text{excitation energy of Be atom}$ . We find  $\nu_{00} + D^{\circ} = 27,960 + 30,390 = 58,350$  and  $D^{\circ} + E_e = 36,555 + 21,981 = 58,536$  which is in excellent agreement. Thus the dissociation energy to ground state atoms is taken as 104.5 kcal/mol, which leads to a heat of formation of 3 kcal/mol using reaction a.

Greenbaum et al.<sup>3</sup> report equilibrium constants for reaction b in the temperature range 1573 - 1724°K using the molecular flow effusion method. Also Hildenbrand et al.<sup>4</sup> report equilibrium constants for reactions c and d which were calculated from mass spectrometric ion intensities. The  $\Delta H^{\circ}_{f298.15}$  values by second and third law analysis for these data and the corresponding  $\Delta H^{\circ}_{f298.15}$  values are listed below.

| Author         | Method                    | Reaction                                      | T°K       | $\Delta H^{\circ}_{f298.15}$ kcal/mol | Drift      |

The equilibrium data of Greenbaum et al.<sup>3</sup> was not weighted, since calculations indicated the possibility of reaction of BeCl(g) with the Al<sub>2</sub>O<sub>3</sub> tube at the temperatures and pressures used. The data of Hildenbrand et al.<sup>4</sup>, which reflect the true gas phase equilibria and appear consistent with each other, were adopted, yielding  $\Delta H^{\circ}_{f298.15} = 14.5 \text{ kcal/mol}$ .

Heat Capacity and Entropy.

The vibrational constants used to calculate the functions were derived by Novikov<sup>1</sup> from a two constant equation  $(\omega_e - (2\nu'' + 1)\omega_e x_e = \omega_0'' = \omega_0''(\nu''))$ . The electronic levels were obtained from Herzberg<sup>5</sup>.  $E_e$  was obtained from the estimated bond length, which was taken to be slightly less than that in BeCl<sub>2</sub>(g), and  $\alpha_e$  was estimated from the Morse potential function.

 α<sub>e</sub> = [0.0071] cm<sup>-1</sup>

Heat of Formation

Krausov (1) has reported calculations of the ionization potentials (IP) for the monoalkides (MX, where X = F, Cl, Br, and I) of Group IIA elements (M = Mg, Ca, Sr, and Ba). Based on his data we obtain graphically the value IP(BeCl, g) = 8.9 ± 0.5 eV. The value of ΔH<sub>f</sub><sup>o</sup>(BeCl, g) is derived as 219 ± 15 kcal/mol, using ΔH<sub>f</sub><sup>o</sup>(BeCl, g) = 13.9 kcal/mol. Beckett (2) reported the ionization potential of BeCl(g) to be approximately 9 ± 1 eV, yielding ΔH<sub>f</sub><sup>o</sup>(BeCl<sup>+</sup>, g) = 222 ± 23 kcal/mol. Hildenbrand (3) measured the appearance potential (AP) of BeCl<sup>+</sup>(g) to be 9.5 ± 0.7 eV which is on the same order of the above IP values, and assumed that IP(BeCl<sup>+</sup>, g) = AP(BeCl<sup>+</sup>, g) = 9.5 ± 0.7 eV. Using this IP value, we obtain ΔH<sub>f</sub><sup>o</sup>(BeCl<sup>+</sup>, g) = 234 ± 20 kcal/mol which is adopted.

Heat Capacity and Entropy

The six electronic states are obtained from Fougere (3). The electronic levels are estimated by comparison with those of the isoelectronic molecules, BeS (4), BeO (5, 6), and MgO (5, 7). The values of ω<sub>0</sub>, ω<sub>0</sub>x<sub>e</sub> are estimated by comparison with those for BeCl(g) and LiCl(g). B<sub>e</sub> and α<sub>e</sub> are calculated using the method suggested by Herzberg (8). The bond distance is estimated (9). The moment of inertia is 3.865 × 10<sup>-39</sup> g cm<sup>2</sup>. The enthalpy at 0°K is -2.15 kcal/mol.

Bond Distance: Be-Cl = [1.77] Å  
Bond Angle: Cl-Be-F = [180°]  
Rotational Constant: B<sub>0</sub> = 0.12970 cm.<sup>-1</sup>  
Be-F = [1.43] Å  
σ = 1

Heat of Formation  
The heat of formation was estimated by assuming ΔH<sub>f</sub><sup>o</sup> = 0 for the reaction BeF<sub>2</sub> + BeCl<sub>2</sub> → 2BeClF

Heat Capacity and Entropy

The structure, bond lengths and frequencies were all estimated from the properties of BeCl<sub>2</sub> and BeF<sub>2</sub>.  
The principal moment of inertia is 21.579 x 10<sup>-39</sup> g. cm.<sup>2</sup>

W. H. Johnson and A. A. Olliland, J. Res. Nat'l. Bur. Stand. 65A, 59 (1961) have directly reacted beryllium and chlorine and obtained  $\Delta H_f^\circ = -118.03 \pm 0.56$  though the crystal form of the product was unknown. P. Oross, C. Hayman, P. D. Greene and J. T. Bingham, Fulmar Research Institute, Report R. 163/SR.1/Sept. 1964 under Contract AF61(052)-447 also by direct combustion of the elements obtain  $\Delta H_f^\circ = -117.1 \pm 0.4$  kcal. mole<sup>-1</sup>. The crystal form of the sample was deduced to be  $\alpha'$  by a comparison experiment, the assumption is made here that  $\alpha$  and  $\alpha'$  are identical. C. J. Thompson, O. C. Sinks and D. R. Stull, J. Chem. Eng. Data 7, 380 (1962) by solution calorimetry report a  $\Delta H_f^\circ = -118.25 \pm 0.5$  kcal. mole<sup>-1</sup>. Initially this sample was reported to be of unknown crystal form. However, O. C. Sinks, private communication February 1965, reports that an x-ray of the sample used has been reinterated, in the light of more recent data, as being approximately 50%  $\alpha'$  and 50%  $\beta$ . Using the heats of transition adopted for these tablas heats of formation of  $-117.3 \pm 0.8$  kcal. mole<sup>-1</sup> for  $\alpha$  and  $-118.6 \pm 0.8$  kcal. mole<sup>-1</sup> for  $\beta$  have been adopted as being the most consistent with all measurements.

Heat Capacity and Entropy.  
 R. A. McDonald and F. L. Oetting, J. Phys. Chem. scheduled for publication in the Nov. 1965 issue have measured the heat capacity of the  $\alpha'$  form from 13° to 304°K. and the enthalpy (relative to the  $\alpha'$  form) from 676° to 688°K. The assumption has been made that the  $\alpha$  and  $\alpha'$  forms are identical and the heat capacity curve between 304° and 676°K. has been estimated graphically. The entropy was obtained by integration of the heat capacity curve assuming  $S_{13} = 0.16$  cal. mole<sup>-1</sup> deg<sup>-1</sup>. The sample was identified as  $\alpha'$  by x-ray diffraction both before and after the experiments.

Melting Data.  
 The temperature and heat of melting were reported by McDonald and Oetting, loc. cit. Several investigations of the melting point are in disagreement mainly due to the uncertainty of the crystal form of the material and a solid state transition just below the pure  $\alpha$ -liquid melting point.

Sublimation Data.  
 The adopted heat of sublimation was derived from that of the  $\beta$  form and heat of the  $\alpha$ - $\beta$  transition at 298°K.

 $\Delta H_g^\circ 298.15 = 32.5$  kcal. mole<sup>-1</sup>

Heat of Formation.

See table for  $\alpha$ -BeCl<sub>2</sub> for details.

Heat Capacity and Entropy.

R. A. McDonald and F. L. Oetting, J. Phys. Chem. scheduled for publication in the November 1965 issue have measured the heat capacity of the  $\beta$ -form from 13 to 304°K. and the enthalpy of the  $\beta$ -form from 298° to 676°K. The entropy was obtained by integration of the heat capacity curve based on  $S_{13} = 0.06$  cal. mole<sup>-1</sup> deg.<sup>-1</sup>. The sample was identified as  $\beta$ -BeCl<sub>2</sub> both before and after the low temperature experiments.

Melting Data.

The temperature and heat of melting were obtained from cross over point of the tables for  $\beta$ -BeCl<sub>2</sub> and liquid BeCl<sub>2</sub>.

Transition Data.

The temperature of the  $\beta$  to  $\alpha$  transition was obtained from McDonald and Oetting, loc. cit. The heat of the transition is a function of the heat capacity curve chosen for  $\alpha$ -BeCl<sub>2</sub> between 298 and 676°K. A straight line interpolation was used by McDonald and Oetting, which gives a different result (1.49 kcal. mole<sup>-1</sup>) than the curve employed here. It should also be noted that the transitional heat is not included in this table, which is for  $\beta$ -BeCl<sub>2</sub> only.

Sublimation Data.

The heat of sublimation was determined by 2nd and 3rd law analysis of vapor pressure data as described fully on the table for BeCl<sub>2</sub> (g).

$\Delta H_f^{\circ} 298.15 = 19.095 \pm 1$  cal. mole<sup>-1</sup> deg.<sup>-1</sup>

$\Delta H_f^{\circ} 298.15 = -117.4 \pm 1.5$  kcal. mole<sup>-1</sup>

$\Delta H_m^{\circ} = 2.07 \pm 0.06$  kcal. mole<sup>-1</sup>

$\Delta H_v^{\circ} = 25.0 \pm 2$  kcal. mole<sup>-1</sup>

T<sub>m</sub> = 688°K.

T<sub>b</sub> = 895°K.

Heat of Formation.

The heat of formation was obtained from that of the  $\alpha$ -BeCl<sub>2</sub> plus the difference of H<sub>899</sub>-H<sub>298</sub> for crystal and liquid.

Heat Capacity and Entropy.

H. A. McDonald and P. L. Oetting, J. Phys. Chem. scheduled for publication in the November 1965 issue have measured the enthalpy of the liquid, relative to  $\alpha$ -BeCl<sub>2</sub>, from 688° to 713°K. The heat capacity was assumed constant above this point and also below the melting point to 400°K, where a glass transition was assumed. Below 418°K, the heat capacity was assumed to be that of  $\beta$ -BeCl<sub>2</sub>. The entropy was calculated in a manner analogous to the heat of formation.

Melting Data.

See the table for  $\alpha$ -BeCl<sub>2</sub> (c) for details.

Vaporization Data.

The boiling point and heat of vaporization were obtained from the cross over point of the BeCl<sub>2</sub> (l) and (g) tables. The analysis of the liquid vapor pressure data is given on the table for BeCl<sub>2</sub> (g).

Beryllium Dichloride (BeCl<sub>2</sub>)

Heat of Formation.

The vapor pressure data over the crystal was assumed to be for the β-form. The 2nd and 3rd law analyses of the data are summarized below after conversion to a common process. The data were also analyzed using gaseous free energy functions based on a bending frequency of 170 cm<sup>-1</sup> but no significant improvement of the results was noted.

| Ref. | Temperature Range °D. | ΔH <sub>298</sub> sub β-BeCl <sub>2</sub> kcal. mole <sup>-1</sup> | 3rd law | Drift in 3rd law cal. mole <sup>-1</sup> deg. <sup>-1</sup> |

It is obvious that there is no real agreement between the data sets, and some of this is undoubtedly due to the difficulty of keeping a single crystal form throughout a series of measurements. It is also doubtful that water vapor was adequately excluded in some experiments. We have adopted the only piece of work which shows adequate 2nd and 3rd law agreement, and no third law trend, that is ΔH<sub>sub</sub> = 32.5 ± 1 kcal. mole<sup>-1</sup> from ref. 4. It is interesting to note that all the other data can be made much more precise and its drift removed if a constant pressure is added to all points. The addition which varied from 20-30% of the lowest pressure in each data set serves to indicate the magnitude of possible systematic errors.

Heat Capacity and Entropy.

The linear structure of BeCl<sub>2</sub>(g) has been confirmed by the electric deflection experiments of A. Eichler, A. D. Little, Inc. Progress Report No. 8, 31st Dec. 1963 under contract No. DA-19-020-ORD-5584. The bond length was obtained from the electron diffraction data of F. A. Akshinin, V. P. Spiridonov and O. A. Sobolev, Dokl. Akad. Nauk SSSR **118**, 1134 (1959). A. Eichler and W. Klemperer, J. Chem. Phys. **29**, 121 (1958) have reported the infra-red spectrum and assigned 1113 as the asymmetric stretch ν<sub>3</sub> and 462 as the bending frequency ν<sub>2</sub>. However, A. Shelnov, IIT Research Institute, Report No. ITRI-C6013-4 May 1964 under contract No. DA-31-124-AO(D)-111 using matrix isolation experiments has shown this second band to be due to beryllium chloride solid. The unobserved frequencies were estimated from a valence force field treatment by assuming that the ratio of stretching to bending force constant was 50:1 the same as for BeF<sub>2</sub>(g). This gives a 230 cm<sup>-1</sup> for ν<sub>2</sub> and 375 cm<sup>-1</sup> for the symmetric stretch. The principal moment of inertia is 36.884 x 10<sup>-39</sup> g. cm<sup>2</sup>.

BeF

Heat of Formation.

The selected  $\Delta H_f^0_{298.15}$  was calculated from the experimental data of M. A. Greenbaum, R. E. Yates, M. L. Arin, M. Arshadi, J. Melner, and M. Ferber, *J. Phys. Chem.* **67**, 703 (1963). A molecular flow effusion method was employed by Ferber, et al., for the reaction  $\text{BeF}_2(g) + \text{Be}(c, 1) = 2\text{BeF}(g)$  from 1425-1675°K. Using the data reported by Ferber, et al. partial pressures, and equilibrium constants were calculated and used to obtain a third law heat for this reaction. From this third law heat the selected  $\Delta H_f^0_{298.15}$  was calculated. The following auxiliary data was used:  $\Delta H_f^0_{298.15} = -168 \pm 3 \text{ kcal. mole}$  and free energy functions from the JANAF Table for  $\text{BeF}_2(g)$ , dated June 30, 1963.

The vapor pressure of an equal mixture of Be powder and  $\text{BeF}_2(c)$  was measured in a graphite cell by a torsion-effusion method over the temperature range 600°-900°K by D. L. Hildenbrand, L. P. Theard, and N. D. Potter, *Aeronautic Technical Report U-1606*, March 15, 1962. No vapor pressure increase over pure  $\text{BeF}_2$  was detected. Assuming a detection limit of 20% of the  $\text{Be}_2$  vapor pressure they calculated that  $D_0^0 < 6.8 \text{ e.v.}$  for BeF. In a similar manner mass spectrometric and effusion pressure measurements on a  $\text{BeF}_2\text{-Al}$  system by D. L. Hildenbrand, L. P. Theard, and P. Ju, *Aeronautic Technical Report U-1988*, Jan. 31, 1963, and D. L. Hildenbrand, *Aeronautic*, private communication, April 19, 1963 lead to a  $D_0^0 < 6.7 \text{ e.v.}$  for BeF.

J. L. Margrave and co-workers, University of Wisconsin, private communication, Dec. 13, 1962, have mass spectrometrically measured the species formed when a reducing agent (Al) was added to  $\text{BeF}_2$ ,  $\text{SrF}_2$ ,  $\text{CaF}_2$ , and  $\text{MgF}_2$ . The  $D_0^0$  values found for the species, BeF, SrF, CaF, and MgF, suggested to Margrave that the  $D_0^0$  of  $\text{BeF}$  was likely to be in the range  $5 \pm 1 \text{ e.v.}$

V. M. Tatevskii, L. N. Tuntskii, and M. Navikov, *Optics and Spectroscopy* **5**, 521 (1958), measured the emission spectra of BeF. On the basis of their analysis of the vibrational structure they gave a rather high value ( $6.0 \pm 0.5 \text{ e.v.}$ ) for the  $D_0^0$  of BeF. In a recent report on the dissociation energy of BeF, D. E. Mann, National Bureau of Standards Preliminary Report No. 7587, July 1, 1962, has analyzed the spectral data in the literature including the Russian work and concludes that a  $D_0^0 \approx 6.2 \text{ e.v.}$  is probable.

A. G. Gaydon, Imperial College, London, private communication, Sept. 5, 1962, and W. C. Price, King's College, London, private communication, March 1, 1963, suggested the Russians have chosen the wrong dissociation products. Therefore, the  $D_0^0$  value they reported was about  $2.5 \text{ e.v.}$  too high.

Heats of formation and  $D_0^0$  values for BeF(g) are summarized as follows:

| $D_0^0$                    | $\Delta H_f^0_{298.15}$                 | Remarks  |
|----------------------------|---|--|
| $5 \pm 1 \text{ e.v.}$     | $-19.2 \text{ kcal. mole}^{-1}$         | J. L. Margrave (loc. cit.)   |
| $5.5 \text{ e.v.}$         | $-30.7 \text{ kcal. mole}^{-1}$         | A. G. Gaydon (loc. cit.) and W. C. Price (loc. cit.)                     |
| $6.2 \text{ e.v.}$         | $-45.8 \text{ kcal. mole}^{-1}$         | D. E. Mann (loc. cit.)   |
| $6.3 \text{ e.v.}$         | $-48.3 \pm 2.5 \text{ kcal. mole}^{-1}$ | Calculated from the 2nd law $\Delta H_f^0$ of Ferber, et al.             |
| $6.5 \text{ e.v.}$         | $-49.7 \pm 2.0 \text{ kcal. mole}^{-1}$ | The selected value.  |
| $< 6.7 \text{ e.v.}$       | $> -56 \text{ kcal. mole}^{-1}$         | Vapor Pressure of a $\text{BeF}_2\text{-Al}$ system. Hildenbrand, et al. |
| $< 6.8 \text{ e.v.}$       | $> -60 \text{ kcal. mole}^{-1}$         | Vapor pressure of a $\text{BeF}_2\text{-Be}$ system. Hildenbrand, et al. |
| $8.0 \pm 0.5 \text{ e.v.}$ | $-86.3 \text{ kcal. mole}^{-1}$         | V. M. Tatevskii et al., (loc. cit.)                                      |

Heat Capacity and Entropy.

The molecular constants used for this table were taken from O. Herzberg, "Molecular Spectra and Structure I. Spectra of Diatomic Molecules," D. van Nostrand Co., Inc., New York, 1950. To facilitate a comparison with Herzberg's constants, the molecular constants reported by Tentskii, et al., were changed to the equilibrium state. The two sets of constants showed very slight differences.

$\Delta H_f^{\circ} = -244.8 \pm 1.0$  kcal/mol  
 $\Delta H_f^{\circ}{}_{298.15} = -245.4 \pm 1.0$  kcal/mol  
 $\Delta H^{\circ} = 0.0526$  kcal/mol  
 $\Delta H_m^{\circ} = 1.137$  kcal/mol  
 $\Delta H_s^{\circ}{}_{298.15} = 55.15$  kcal/mol

## Heat of Formation

$\Delta H_f^{\circ}$  is the value selected by Parker (1), based on a thorough review of data for BeF<sub>2</sub>(c, vitreous, aqueous) and BeO(c). Parker's analysis remains essentially unchanged for BeO(c) and BeF<sub>2</sub>(c), even though the results for BeF<sub>2</sub>(HF, aqueous) become more negative by 0.93 kcal/mol due to JANAF selections for HF(aqueous). Three values derived by Parker for BeF<sub>2</sub>(c) from PbF<sub>2</sub>(c) are changed due to JANAF auxiliary data; these values become -246.9, -246.0 and -247.2 for the three paths used by Parker.

The adopted  $\Delta H_f^{\circ}$  was derived by combination of calorimetric data for Be(c) + F<sub>2</sub>(g) → BeF<sub>2</sub>(vitreous) and BeF<sub>2</sub>(c) + fluorine of polytetrafluoroethylene and mixtures of Be(c) with polytetrafluoroethylene.  $\Delta H_f^{\circ}{}_{298.15}(c \rightarrow \text{vitreous}) = 1.125 \pm 0.016$  kcal/mol was measured via solution calorimetry by Taylor and Gardner (3).

## Heat Capacity and Entropy

Cp° is based on JANAF curve fits of measurements by adiabatic calorimetry (8-300°K) and by ice calorimetry (354-776°K) as reported by Taylor and Gardner (3). The sample was estimated as approximately 99.5% BeF<sub>2</sub>. Analyses indicated that the major impurity was about 0.3% oxygen, mainly in the form of absorbed water. Petrographic examination and X-ray diffraction showed the sample to be composed almost completely of quartz-type crystals. The entropy is derived from the smoothed Cp° based on the extrapolation S° = 0.0065 gibbs/mol. The adopted Cp° above 300°K agrees closely with the relative enthalpy data and shows a remarkable similarity to that of SiO<sub>2</sub> (low quartz, high quartz).

## Transition Data

Tt is the value selected by Taylor and Gardner (3) from their relative enthalpy data.  $\Delta H^{\circ}$  is the corresponding difference in relative enthalpy from the JANAF curve fits for the two crystalline forms. Levina (4) studied the polymorphism of BeF<sub>2</sub> by observing the peaks in Cp near the transition temperatures. For low quartz → high quartz, Levina's peak began near 438°K, was complete near 503°K, and gave  $\Delta H = 0.17$  kcal/mol. Levina found a second transition attributed to a form analogous to tridymite; this began above 670°K, was complete by 740°K, and gave  $\Delta H = 0.24$  kcal/mol. There is no evidence for this transition in the relative enthalpy data, so we suspect that its occurrence may be due to impurities in Levina's sample. Levina also found that the cristobalite-like phase transformed in the region 380 to 420°K with  $\Delta H = 1.27$  kcal/mol.

## Melting Data

See the table for BeF<sub>2</sub>(t).

## Heat of Sublimation

See the table for BeF<sub>2</sub>(g).

Beryllium Difluoride (BeF<sub>2</sub>)

BeF<sub>2</sub>

2

Heat of Formation

$\Delta H_f^{\circ}$  is obtained from that of the crystal by means of  $\Delta H_r^{\circ} = 1.125 \pm 0.016$  kcal/mol for BeF<sub>2</sub>(c) + BeF<sub>2</sub>(vitreous) at 298.15°K. Further details are given in the section on Melting Data.  $\Delta H_f^{\circ}(l)$  actually is based on the direct determination of  $\Delta H_f^{\circ}$ (vitreous) by Churney and Armstrong (1) as discussed on the crystal table.

Heat Capacity and Entropy

$C_p$  is based on a JANAF curve fit of relative enthalpies of Taylor and Gardner (2) for the liquid (826-1183°K) and vitreous (320-473°K) forms of BeF<sub>2</sub>. The combined data yield a normal  $C_p$  curve and reveal no need for a glass transition. Scatter in the data is somewhat larger than for the crystal, presumably due to minor variations in the vitreous state at the conclusion of each drop.  $S^{\circ}_{298.15}(l)$  is calculated from that of the crystal by addition of  $\Delta S_m^{\circ}$  and the difference for crystal and liquid of  $(5.826 - 5.298.15)^{\circ}$ .

Melting Data

$T_m$  is the value selected by Taylor and Gardner (2) from their relative enthalpy data. These showed premelting starting near 80°K and complete melting above 828°K. Cooling of the liquid produced the vitreous state.  $T_m$  has also been reported as 815 (3), 821 (4), 818 (5) and 816  $\pm$  5°K (6).

Solution calorimetry (2) gave  $\Delta H_r^{\circ} = 1.125 \pm 0.016$  kcal/mol for BeF<sub>2</sub>(Low quartz) + BeF<sub>2</sub>(vitreous) at 298.15°K. Confirmation of this result came from transposed temperature-drop calorimetry (1) and calorimetric conversion (8). These gave 1.1  $\pm$  0.2 and 1.1  $\pm$  0.5 kcal/mol, respectively. Combination of  $\Delta H_r^{\circ} = 1.125$  with JANAF enthalpies yields  $\Delta H_m^{\circ} = 1.137$  kcal/mol.

Vaporization Data

$T_b$  is the calculated temperature at which  $\Delta G_r^{\circ} = 0$  for BeF<sub>2</sub>(l) + BeF<sub>2</sub>(g).  $\Delta H_v^{\circ}$  is the corresponding value of  $\Delta H_r^{\circ}$ . These calculations neglect the presence of dimer, which is assumed to be negligible based on extrapolation of the equations of Belousov (9). Cantor (10) obtained  $T_b = 1442^{\circ}K$  by extrapolation of his vapor pressures (1146-1372°K).

 Bond Angle: F-Be-F = 180°  
 Rotational Constant: B<sub>0</sub> = 0.22635 cm<sup>-1</sup>

Heat of Formation

ΔH<sub>f</sub><sup>0</sup> is calculated from that of the crystal by means of ΔH<sub>f,298.15</sub> = 55.15 ± 0.1 kcal/mol. The selected value of ΔH<sub>f</sub><sup>0</sup> is an average of those obtained by third-law analysis of vapor pressures measured by manometry (2), torsion effusion (1) and entrainment (8-10). Mass-spectrometric data (1, 2) are in reasonable agreement and so is the average of two Knudsen-effusion studies (6, 7). Several techniques (2, 1, 5) were used to show that the amount of dimer in the vapor is negligible up to at least 1000°K. JANAF analyses of the vaporization data are summarized as follows:

| Source                  | Method            | T, °K     | ΔH <sub>f,298.15</sub> , kcal/mol |

\*ΔS = ΔS<sup>0</sup>(2nd law) - ΔS<sup>0</sup>(3rd law)

Heat Capacity and Entropy

The bond length and angle are those derived by Aikshin et al. (11) from electron-diffraction data for the vapor. Linearity of BeF<sub>2</sub> was confirmed by electric-deflection studies (12) of the vapor and by infrared studies (13) of matrix-isolated BeF<sub>2</sub>. Infrared absorptions were found near 330 and 1540 cm<sup>-1</sup> in neon matrices, leading to gas-phase estimates of 345 and 1555 cm<sup>-1</sup> (13). The latter absorption was observed (14) at 1520 cm<sup>-1</sup> in the infrared spectra of the vapor at 1000°C. We adopt a compromise of 1530 cm<sup>-1</sup> and use this value in the valence-force-field approximation to estimate 670 cm<sup>-1</sup> for the symmetric stretching mode.

LITHIUM TRIFLUOROBERYLLATE (LiBeF<sub>3</sub>) (CRYSTAL)

$\Delta H_f^\circ =$  Unknown  
 $\Delta H_f^\circ_{298.15} = -390.2 \pm 0.7$  kcal/mol  
 $\Delta H_m^\circ =$  Unknown

$S^\circ_{298.15} = [21.3 \pm 2]$  gibbs/mol  
 $T_m = 633^\circ K$

Heat of Formation.

The  $\Delta H_f^\circ_{298.15} = -390.2 \pm 0.7$  kcal/mol was calculated from the  $\Delta H_r^\circ_{298.15} = -2.24 \pm 0.08$  kcal/mol of the reaction  $LiF(c) + LiBeF_3(c) = Li_2BeF_4(c)$  measured (calorimetrically) by P. Gross, Fulmer Research Institute, Administrative Report No. 4, January 1966.

Heat Capacity and Entropy.

The heat capacity (298 - 1100°K) was estimated from the difference of the Cp° values for Li<sub>2</sub>BeF<sub>4</sub>(c) and LiF(c). Above 1100°K the values were extrapolated graphically. The entropy was estimated by addition of S<sub>298</sub>° for BeF<sub>2</sub>(c) and LiF(c).

Melting Data.

T<sub>m</sub> was obtained from the phase diagram of a mixture of LiF(c) and BeF<sub>2</sub>(c) reported by A. L. Mathews and C. F. Bass, Jr., ORNL-TM 1129, May 1965.

 Moment of inertia:  $I_{A, B, C} = 2.160 \times 10^{-14}$  g. cm<sup>2</sup>  $\sigma = (5)$

Heat of Formation,  $\Delta H_f^0, 298.15$  was calculated from  $\Delta H_f^0, 298.15 = 53$  kcal. mole for the reaction,  $LiF(g) + Be_2(g) = LiBeF_3(g)$  reported by J. Berkowitz and N. A. Chupka, Ann. N. Y. Acad. Sci., **72**, 1075 (1960).

Heat Capacity and Entropy. The molecular structure was assumed to be pyramidal with Li atom at the top and BeF<sub>3</sub> located at the bottom. Beryllium atom was taken at the center of the equilateral triangle formed by the three F atoms. The Be-F distance was estimated from that of BeF<sub>2</sub>(g). The bond distance of Li-F was taken from R. F. Porter and E. Zoller, J. Chem. Phys., **33**, 858 (1960). Vibrational frequencies were estimated by comparison with related fluorides.

$\Delta \text{H}^\circ_{\text{f}} = \text{Unknown}$   
 $\Delta \text{H}^\circ_{\text{f}} \text{Li}_2\text{BeF}_4 = -539.0 \pm 1.3 \text{ kcal/mol}$   
 $\Delta \text{H}^\circ_{\text{f}} = 10.606 \text{ kcal/mol}$   
 $S^\circ_{298.15} = [29.8 \pm 2] \text{ gibbs/mol}$   
 $T_m = 745^\circ \text{K}$

Heat of Formation:  
 The  $\Delta \text{H}^\circ_{\text{f}} \text{Li}_2\text{BeF}_4 = -539.0 \pm 1.3 \text{ kcal/mol}$  was calculated from the  $\Delta \text{H}^\circ_{\text{f}} \text{BeF}_2 = -5.05 \pm 0.06 \text{ kcal/mol}$  of the reaction  $2\text{LiF}(c) + \text{BeF}_2(c) = \text{Li}_2\text{BeF}_4(c)$  measured (calorimetrically) by F. Gross, Fulmer Research Institute, R.163/23/May 1966. A value of  $\Delta \text{H}^\circ_{\text{f}} \text{Li}_2\text{BeF}_4 = 1.17 \text{ kcal/mol}$  was used for  $\text{BeF}_2(c) \rightarrow \text{BeF}_2(g)$ .

Heat Capacity and Entropy:  
 The heat capacity is based on the enthalpy data (323-723°K) of T. B. Douglas and W. H. Payne, Nati. Bur. Std. Report 8186, January, 1964. The entropy was estimated by addition of values for the component fluorides.

Melting Data:  
 $T_m$  and  $\Delta \text{H}^\circ_m$  were obtained from Douglas et al., loc. cit., who measured the high temperature enthalpies.

DILITHIUM TETRAFLUOROBERYLLATE (Li<sub>2</sub>BeF<sub>4</sub>) (LIQUID)

GFW = 98.8838

S°<sub>298.15</sub> = [39.3 ± 2] gibbs/mol

ΔHf°<sub>298.15</sub> = -531.2 ± 1.3 kcal/mol

T<sub>m</sub> = 745°K

ΔH<sub>m</sub>° = 10.506 kcal/mol

Heat of Formation.

The ΔHf°<sub>298.15</sub> was obtained from ΔHf°<sub>298.15</sub>(c) by adding ΔH<sub>m</sub>° and the difference between H°<sub>298.15</sub> for crystal and liquid.

Heat Capacity and Entropy.

A glass transition was assumed at 500°K. The heat capacity below 500°K was obtained from the heat capacity of the crystal. Above 500°K the heat capacity was assumed constant at 55.5 gibbs/mol calculated from the liquid enthalpy equation given by T. B. Douglas and W. H. Payne, Natl. Bur. Std. Report No. 8186, Washington, 1964. The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See Li<sub>2</sub>BeF<sub>4</sub>(c) table.

Ground State Configuration  $2s^2 2p^1$   
 $\Delta H_f^0 = 76 \pm 7$  kcal. mole $^{-1}$   
 $\Delta H_f^0 = 42.236$  cal. deg. $^{-1}$  mole $^{-1}$   
 $\Delta H_f^0 = 298.15 = 77 \pm 7$  kcal. mole $^{-1}$

Electronic Level and Multiplicity  
 $\epsilon$ , cm. $^{-1}$   $\frac{g_1}{g_2}$

$\omega_e \nu_e = 2058.6$  cm. $^{-1}$   
 $\nu_e = 10.308$  cm. $^{-1}$   
 $\nu_e = 35.5$  cm. $^{-1}$   
 $\nu_e = 0.300$  cm. $^{-1}$   
 $\sigma^- = 1$   
 $r_e = 1.3431$  Å

Heat of Formation.  
 Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules," Chapman and Hall Ltd., London, 1953, selected a value of 2.3 ± 0.3 e.v. (53 ± 7 kcal. mole $^{-1}$ ) for D $_0$ . Herzberg, "Molecular Spectra and Molecular Structure I. Spectra of Diatomic Molecules", D. Van Nostrand Co., Inc., New York, 1950, estimated D $_0$  as being 2.2 e.v. (50.7 kcal. mole $^{-1}$ ). Gaydon's value was used in this table.

Heat Capacity and Entropy.  
 Molecular constants were found in Herzberg, op. cit.

Heat of Formation

The heat of formation was calculated from the equation  $\text{BeH}(g) \rightarrow \text{BeH}^+(g) + e^-$  with the JANAF auxiliary data for  $\text{BeH}(g)$ , using an ionization potential =  $8.6 \pm 0.4$  eV ( $198.34 \pm 9.23$  kcal/mol) obtained from C. W. Beckett, NBS Report 8828, Jan. 1, 1985.

The dissociation energy,  $D_0$  ( $\text{Be}^+ - \text{H}$ ) =  $3.2 \pm 0.2$  eV ( $73.8$  kcal/mol), has been reported by A. G. Gaydon, "Dissociation Energies," 2nd Ed., Chapman and Hall Ltd., London, 1953. This yields  $\Delta H_f^{\circ}(\text{BeH}^+, g) = 270.0$  kcal/mol, which is in agreement with the value adopted.

Heat Capacity and Entropy

The molecular constants were obtained from the ultraviolet spectroscopic studies by W. W. Watson and R. P. Humphreys, Phys. Rev. 52, 318 (1937).

The ground state configuration was given by O. Herzberg, "Spectra of Diatomic Molecules," D. Van Nostrand Company, New York, 1950. The estimated electronic level and quantum weight were obtained by assuming that a  $3\Sigma$  level lies below the first observed excited state ( $1^3\Sigma$ ) at 40,000 cm<sup>-1</sup>.

Bond Distance: Be-O = [1.4] Å    O-H = [0.96] Å  
 Bond Angle: Be-O-H = [120°]    σ = 1

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [0.447] X 10<sup>-117</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

D. L. Hildenbrand, L. P. Theard, and F. Ju, Ford Motor Co., Aeronautic Division, Third Quarterly Report, U-2231, April-June, 1963, studied the equilibrium Be<sub>2</sub>O(g) + H<sub>2</sub>O(g) → 2BeOH(g) in a mass spectrometer. Using the JANAF values for the free energy functions and heats of formation yielded ΔH<sub>f</sub>° 298 BeOH(g) = -24.8 ± 10 kcal. mole<sup>-1</sup>, which was rounded to -25 ± 10 kcal. mole<sup>-1</sup>. This value is a minimum one, that is, it is the most negative possible value.

Heat Capacity and Entropy.

The molecule was assumed to be nonlinear, the OH stretch was estimated as 3600 cm.<sup>-1</sup>, the Be-O stretch as 1500 cm.<sup>-1</sup>, from BeO(g), and the bending frequency as 1200 cm.<sup>-1</sup>. The Be-O bond length was taken as a little larger than in BeO(g) while the O-H bond length is that in H<sub>2</sub>O(g). The bond angle was taken arbitrarily to be 120° and changes in this will have negligible effect on the functions unless it goes to 180°. The molecule contains one free electron and so was assumed to have a statistical weight of 2.

Beryllium Monohydroxide Unipositive Ion (BeOH<sup>+</sup>)

BeHO<sup>+</sup>

June 30, 1968

BERYLLIUM MONOHYDROXIDE UNIPOSITIVE ION (BeOH<sup>+</sup>)

(IDEAL GAS)

GFW = 26.01902

Point Group [C<sub>∞v</sub>]

ΔH<sub>f</sub><sup>o</sup> = [194 ± 30] kcal/mol

S<sup>o</sup><sub>298.15</sub> = [48.0] gibbs/mol

ΔH<sub>f</sub><sup>o</sup><sub>298.15</sub> = [194 ± 30] kcal/mol

Ground State Quantum Weight = [1]

Vibrational Frequencies and Degeneracies

ω<sub>i</sub> cm<sup>-1</sup>  
 [1300] (1)  
 [1100] (2)  
 [3500] (1)

O-H = [0.96] Å

σ = 1

Bond Distance: Be-O = [1.4] Å  
 Bond Angle: Be-O-H = [180°]  
 Rotational Constant: B<sub>0</sub> = [1.2602] cm<sup>-1</sup>

Heat of Formation

The ionization potential (IP) of BeOH(g) is estimated as 9.5 ± 1 eV by comparison with the values IP(BeI, g) = 9.1 ± 0.5, IP(MgF, g) = 7.8 ± 0.3 (1) and IP(MgOH, g) = 8.5 eV. (JANAF value). Based on IP(BeOH, g) = 9.5 eV or 219 kcal/mol and ΔH<sub>f</sub><sup>o</sup>(BeOH, g) = -25 ± 10 kcal/mol, we derive the heat of formation at 298°K for BeOH<sup>+</sup>(g) as 194 ± 30 kcal/mol, which is tentatively adopted.

Heat Capacity and Entropy

The BeOH<sup>+</sup>(g) molecule has eight valence electrons. Based on the criterion given by Walsh (2) that ABH molecules (H = hydrogen atom) containing ten or less valence electrons will be linear in their ground state, we assume that the structure of BeOH<sup>+</sup>(g) is linear. The vibrational frequencies are estimated by comparison with those for BeOH(g) and LiOH(g). The Be-O and O-H bond distances are assumed to be the same as those in BeOH and H<sub>2</sub>O molecules, respectively. The ground state quantum weight of BeOH<sup>+</sup>(g) is assumed to be the same as that of the isoelectronic molecule LiOH(g). The moment of inertia is 2.21 × 10<sup>-40</sup> g cm<sup>2</sup>. The enthalpy at 0°K is -2.11 kcal/mol.

BeH<sub>2</sub>O<sub>2</sub>

BERYLLIUM DIHYDROXIDE, ALPHA ( $\alpha$ -Be(OH)<sub>2</sub>) (CRYSTAL)

GFW = 43.02694

ΔHf<sup>o</sup> = Unknown

ΔHf<sup>o</sup><sub>298.15</sub> = -215.75 ± 0.5 kcal/mol

S<sup>o</sup><sub>298.15</sub> = [11.8 ± 2] gibbs/mol

Td = [407]°K

Heat of Formation.

The heat of formation is based on ΔHf<sup>o</sup><sub>298.15</sub> = -79.16 ± 0.5 kcal/mol for the reaction Be(c) + 2H<sub>2</sub>O(l) = Be(OH)<sub>2</sub>(α,c) + H<sub>2</sub>(g). The heat of this reaction is obtained by combination of the calorimetric heats of solution for pure beryllium metal and α-Be(OH)<sub>2</sub> in aqueous HF, measured by I. J. Bear and A. G. Turnbull, J. Phys. Chem. **69**, 2828-33 (1965).

Heat Capacity and Entropy.

The heat capacity was assumed the same as that of the beta phase. The entropy is calculated from the value of ΔG<sup>o</sup><sub>298.15</sub> = -0.50 kcal/mol for the change α-Be(OH)<sub>2</sub> → β-Be(OH)<sub>2</sub> which is obtained from the solubilities in concentrated alkali measured by R. Fricke and H. Humme, Z. Anorg. Allgem. Chem. **17B**, 400 (1929). This is combined with the ΔHf<sup>o</sup><sub>298.15</sub> difference and gives a change in entropy, ΔS<sup>o</sup><sub>298.15</sub> = -0.8 eu and an entropy of α-Be(OH)<sub>2</sub>, S<sup>o</sup><sub>298.15</sub> = 11.8 ± 2 eu.

Decomposition Data.

Td is calculated as the temperature at which ΔGf<sup>o</sup> equals zero for Be(OH)<sub>2</sub>(α,c) = BeO(c) + H<sub>2</sub>O(g).

$\Delta H_f^\circ =$  Unknown  
 $\Delta H_f^\circ_{298.15} = -216.50 \pm 0.5$  kcal/mol

$S^\circ_{298.15} = [11.0 \pm 2]$  gibbs/mol  
 $T_d = [417]^\circ K$

**Heat of Formation.**  
 The heat of formation is based on  $\Delta H_f^\circ_{298.15} = -79.89 \pm 0.5$  kcal/mol for the reaction  $Be(c) + 2H_2O(l) = Be(OH)_2(\beta, c) + H_2(g)$ . The heat of this reaction is obtained by combination of the calorimetric heats of solution measured by Bear and Turnbull for pure beryllium metal and  $\beta$ -Be(OH)<sub>2</sub> in aqueous HF. Third law analyses of two studies of the decomposition pressure of water vapor over the  $\beta$ -phase are in good agreement with the selected heat of formation, as summarized below. Fricke and Severin observed a decomposition temperature of 105°C at a pressure of 100 mm, while Bear and Lecocq found 223°C for equilibrium with saturated water vapor at 24.2 atm. We have reduced the latter data to a standard state value of  $\Delta G^\circ_{196.15} = -3028$  cal/mol for the decomposition reaction given below.

**Heat Capacity and Entropy.**

The heat capacity is estimated from that for Mg(OH)<sub>2</sub> by subtracting the values for MgO and adding those for BeO. The entropy is estimated by extrapolation to beryllium of the differences in  $S^\circ_{298}$  between the chlorides and hydroxides of magnesium and calcium. Entropies of Mg(OH)<sub>2</sub>, MgCl<sub>2</sub> and BeCl<sub>2</sub> are taken from the JANAP tables, while those of Ca(OH)<sub>2</sub> and CaCl<sub>2</sub> are taken to be 19.9 ± 0.1 and 25.0 ± 1.0 eu, respectively. [Recent low temperature data for SrCl<sub>2</sub> and BaCl<sub>2</sub> suggest that the CaCl<sub>2</sub> extrapolation should be  $S^\circ_{298} = 2.4 \pm 1.0$  eu rather than the original value of  $S^\circ_{298} = 4.59$  eu used by K. K. Kelley and G. E. Moore, J. Am. Chem. Soc. **65**, 782 (1943)]. Confirmation of the adopted entropy is obtained from the good agreement between the calorimetric heat of formation and the third law values derived from the equilibrium data.

**Decomposition Data.**

T<sub>d</sub> is calculated as the temperature at which  $\Delta G_r^\circ$  equals zero for  $Be(OH)_2(\beta, c) = BeO(c) + H_2O(g)$ .

Bond Distances: Be-O = [1.35] Å  
O-H = [0.97] Å

Bond Angles: Be-O-H = [100°]  
O-B-O = [180°]

Angle between Be-O-H planes = [95°]

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [32.26] × 10<sup>-117</sup> g<sup>3</sup>cm<sup>6</sup>

Heat of Formation.

The equilibrium reaction (A) BeO(c) + H<sub>2</sub>O(g) → Be(OH)<sub>2</sub>(g) has been studied by several investigators<sup>1</sup> all of them inferred that Be(OH)<sub>2</sub>(g) was the major product, but there has been no direct proof of this. D. F. Hildenbrand, L. P. Theard and F. Ju, Aeronautic, Jrd Quarterly Technical Report No. U-2231, Contract AF 04(611)-8823, 31 July 1963, have examined the BeO-H<sub>2</sub>O system at 2300°C mass-spectroscopically and report only BeOH and Be(OH)<sub>2</sub>. They report a maximum value of the equilibrium constant for reaction (B) BeO(g) + H<sub>2</sub>O(g) → Be(OH)<sub>2</sub>(g) → Be(OH)<sub>2</sub>(g) at 3.5 × 10<sup>3</sup> atm<sup>-1</sup> at 2327°K; this yields ΔH<sub>f</sub><sup>o</sup> 298.15 (Be(OH)<sub>2</sub>, g) ≥ -157.7 ± 10 kcal/mol using JANAF functions.

L. I. Grossweiner and R. L. Seifert, J. Am. Chem. Soc. 74, 2701 (1952); W. A. Young, J. Phys. Chem. 54, 1003 (1950); and M. I. Stuart and O. H. Price, J. Nucl. Mater. 14, 417 (1964), have all studied reaction (A) under similar conditions. Each of these investigators varied and H<sub>2</sub>O(g) flow rate without detectable change of K<sub>p</sub> values. However, Grossweiner and Seifert used a considerably larger flow rate than the other investigators, and the reaction that they studied may not have been quite at equilibrium. The residence times in all cases were quite comparable. A second and third law analysis of the above data are shown below.

J. Blauer, M. A. Greenbaum and M. Farber, J. Phys. Chem. 70, 973 (1966), have also studied reaction (A) using the molecular flow effusion technique. They obtained a large variation of K<sub>p</sub> with surface area, although the sample area and size were comparable to that in the earlier investigations. They operated at 300μ pressure, which is at the upper limits of the molecular flow regime. Also encountered was an unexpected variation of the blank experiments with sample size. All the samples investigated were relatively coarse with surface areas <60 cm<sup>2</sup>/g; it seems likely that surface area effects would have been found in the three earlier investigations with up to threefold variation in sample weights. We conclude that the variation observed by Blauer et al. is not wholly caused by sample size. A second and third law analysis of the data are shown below.

O.R.B. Elliott, UCRL 1831 (1962), has also investigated reaction (A), but details of the sample are not available and the results show considerable scatter.

A. Baur and A. Lecoq, Comm. Energie At. (France), Rapport, CEA-R2611, Direction des Matériaux et Combustibles Nucleaires, Nov. 1964, cite the results of Morize, Roudier and Elison, DM/948, in equation form.

\*calculated using the 3rd law ΔH<sub>f</sub><sup>o</sup> 298<sup>o</sup>

ΔH<sub>f</sub><sup>o</sup> 298 (Be(OH)<sub>2</sub>, g) = -156.4 ± 5 kcal/mol is adopted, with a large uncertainty to cover errors due to the functions as well as the experimental uncertainty.

Heat Capacity and Entropy.

The structure is that assumed by R. L. Altman, J. Chem. Eng. Data 8, 534 (1965). One vibrational frequency was reported by M. Farber, M. A. Greenbaum, M. A. Frisch et al., Rocket Power, Inc., Final Report APRIL-TR-66-220, Contract AF 04(611)-10929, September 1966. The remaining frequencies were estimated and adjusted to give reasonable agreement between the second and third law heats of reaction. The three principal moments of inertia are I<sub>A</sub> = 2.865 × 10<sup>-40</sup>, I<sub>B</sub> = 10.60 × 10<sup>-39</sup>, and I<sub>C</sub> = 10.62 × 10<sup>-39</sup> g cm<sup>2</sup>.

Heat of Formation.

The dissociation energy was estimated from the experimental energies for BeF(g), BeCl(g), and the gaseous lithium halides. The resulting value, 79.1 kcal. mole<sup>-1</sup>, was combined with JANAF heats of formation for Be(g) and I(g) in arriving at ΔH<sub>f</sub><sup>0</sup> 298.15.

Heat Capacity and Entropy.

The vibrational frequency was estimated from those of BeF(g), BeCl(g), and the gaseous lithium halides. The ground term was assumed to be similar to that of BeCl(g) and BeF(g), tabulated by G. Herzberg, "Molecular Spectra and Molecular Structure I. Spectra of Diatomic Molecules", D. Van Nostrand Co., Inc., New York, 1950. A correlation of the interatomic distances for the alkali halides, BeF(g), and BeCl(g) was employed in deriving r<sub>e</sub>.

BERYLLIUM DIIODIDE (BeI<sub>2</sub>) (CRYSTAL)

$\Delta H_f^o = [28.8 \pm 2] \text{ cal. mole}^{-1} \text{ deg.}^{-1}$   
 $\Delta H_f^o = [-50.6 \pm 8] \text{ kcal. mole}^{-1}$   
 $\Delta H_m^o = [5] \text{ kcal. mole}^{-1}$   
 $\Delta H_g^o = 298.15 = 30.3 \pm 2.0 \text{ kcal. mole}^{-1}$   
 $T_m = 753^\circ\text{K.}$   
 $\Delta H_f^o = \text{Unknown}$

Heat of Formation.

The heat of formation was estimated from the work of W. Biltz and C. Messerknecht, Z. anorg. Chem. 148, 157 (1925) and Biltz, Klatte and Rehlf, Z. anorg. Chem. 166, 339 (1927) as reported in N.B.S. Circular 500, Washington 1952. They measured the heat of solution of BeI<sub>2</sub> in aq. HCl to an unknown concentration. This value was apparently adjusted and used with Be<sup>++</sup> and 2I<sup>-</sup> to obtain  $\Delta H_f^o$  of the crystal. However Be<sup>++</sup> was estimated by the Bureau and a total uncertainty of 8 kcal. is thought to be realistic.

Heat Capacity and Entropy.

The heat capacity was estimated graphically by comparison with BeCl<sub>2</sub> and BeF<sub>2</sub>. The entropy was also estimated by comparing with  $\alpha$ -BeCl<sub>2</sub> and BeF<sub>2</sub> and using additive entropy values for the halide ions. K. N. Semenovko and T. N. Naumova, Zhur. Strukt. Khim. 4, 67 (1963) have reported that between 563 and 643°C BeI<sub>2</sub> exists in a  $\beta$  form and above 643°C a  $\beta$  form and an unknown form also exist. No allowance has been made for these modifications in the present table.

Melting Data.

The melting point was reported by O. Rehlf and W. Fischer, Z. anorg. Chem. 211, 351 (1953). The heat of melting was estimated by comparison with the heats of transition and melting for BeCl<sub>2</sub> and BeF<sub>2</sub>.

Sublimation Data.

The heat of sublimation was obtained from a third law analysis of the vapor pressure data of Rehlf and Fischer, loc. cit. from 578-703°K. This gave  $\Delta H_g^o = 30.34 \text{ kcal. mole}^{-1}$  with a drift of  $3.2 \pm 1.1 \text{ cal. mole}^{-1} \text{ deg.}^{-1}$ . A second law analysis gave  $\Delta H_g^o = 28.1 \pm 0.7 \text{ kcal. mole}^{-1}$ . No attempt was made to change the functions to eliminate the drift, since a correlation with BeCl<sub>2</sub>, BeBr<sub>2</sub> and BeI<sub>2</sub> indicated that the drift was probably due to the data rather than the functions.

ΔH<sub>f</sub>° 298.15 = [-47.45 ± 3] kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub>° = [5] kcal. mole<sup>-1</sup>  
 ΔH<sub>v</sub>° = [23] kcal. mole<sup>-1</sup>

S<sub>298.15</sub>° = [32.4] cal. mole<sup>-1</sup> deg.<sup>-1</sup>  
 T<sub>m</sub>° = 753°K.  
 T<sub>b</sub>° = [755]°K.

Heat of Formation.

The heat of formation was obtained from that of the crystal by adding ΔH<sub>m</sub>° and the difference between H<sub>755</sub>-H<sub>298</sub> for crystal and liquid.

Heat Capacity and Entropy.

The heat capacity was estimated by comparison with the measured value for BeCl<sub>2</sub>. A glass transition was assumed at 500°K. below which the heat capacity was that of the crystal. The entropy was obtained in a manner analogous to the heat of formation.

Melting Data.

See BeI<sub>2</sub>(c) table for details.

Vaporization Data.

The temperature and heat of vaporization were calculated from the cross over point BeI<sub>2</sub>(l) and (g).

[770](1)

Bond Distance: Be-I = 2.12 Å  
Bond Angle: I-Be-I = [180°]  
Rotational Constant: B<sub>0</sub> = 0.01478 cm.<sup>-1</sup>

Heat of Formation.  
The heat of formation was obtained from that of the crystal plus ΔH<sub>g</sub> 239; see BeI<sub>2</sub> (c) table for details.

Heat Capacity and Entropy.

The linear structure was assumed by analogy with BeCl<sub>2</sub>. The bond length was reported by P. A. Akhshin, V. P. Spirodinov and G. A. Sobolev, Dokl. Akad. Nauk SSSR, 116, 1134 (1958) from electron diffraction measurements. The vibrational frequencies were estimated by assuming a set of force constants k<sub>1</sub> for the BeF<sub>2</sub>, BeCl<sub>2</sub>, BeBr<sub>2</sub> and BeI<sub>2</sub> series and also assuming k<sub>1</sub>/k<sub>1</sub>' = 50 as for BeF<sub>2</sub>. The principal moment of inertia is 189.402 x 10<sup>-59</sup> g. cm.<sup>2</sup>

Ground State Configuration [2H]  
 $\Delta H_f^0 = [49.87] \text{ cal deg}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^0 = [101] \text{ kcal mole}^{-1}$   
 $\Delta H_f^0 = [102] \text{ kcal mole}^{-1}$

Electronic Levels and Multiplicities

Heat of Formation

The heat of formation was estimated by J. S. Gordon, Astronomers International, Livingston, New Jersey, private communication, April 25, 1963.

Molecular Constants

The molecular constants were taken from J. S. Gordon, loc. cit.

$\Delta H_f^o = -142.3 \pm 0.1$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^o 298.15 = -143.1 \pm 0.1$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^o = 0.06 \pm 1.0$  kcal. mole<sup>-1</sup>  
 $\Delta H_m^o = 15.1 \pm 0.4$  kcal. mole<sup>-1</sup>  
 $\Delta H_m^o 298.15 = 174.1 \pm 3.0$  kcal. mole<sup>-1</sup>

(CRYSTAL)

BERYLLIUM OXIDE (BeO)

MOL. WT. = 25.013

Heat of Formation.

L. A. Cosgrove and P. E. Snyder, J. Am. Chem. Soc. 75, 3102 (1953) have reviewed earlier determinations of the heat of formation and have made a very careful oxygen bomb calorimeter determination, their value is adopted here.

Heat Capacity and Entropy.

The high temperature enthalpy of BeO(c) has been reported by A. Magnus and H. Denz, Ann. Physik. [4] 81, 407 (1926) up to 1172°K; E. N. Rodigina and K. Z. Gornel'skii, Zhur. Fiz. Khim. 35, 1828 (1961) up to 1128°K; V. V. Kandyba, P. B. Kantor, R. M. Krasovitskaya and E. N. Ponomarev, Doklady. Akad. Nauk. S.S.S.R. 131, 566 (1960) up to 2840°K; B. E. Walker, C. T. Ewing, and R. R. Miller, private communication, U. S. Naval Research Laboratory 18th April 1963 up to 1100°K; A. C. Victor and T. B. Douglas, J. Res. Natl. Bureau Standards 67A, 325 (1963) up to 1173°K. A high temperature phase transition has been reported by S. B. Austerman, Bull. Am. Physical Soc. II 7 (1), 28 (1962) and has been confirmed using high temperature X-rays by T. W. Baker and P. J. Baldock, Nature 193, 1172 (1962). K. K. Kelley, J. Am. Chem. Soc. 81, 1217 (1959) has reported the low temperature heat capacities from 55.5 to 292.4°K. The heat capacity was assumed to follow the T<sup>3</sup> law below 55.5°K. and this gave S<sub>298.15</sub> = 0.045 cal. deg.<sup>-1</sup> mole<sup>-1</sup>. The high temperature enthalpy data was smoothed using both 18 and 27 point groupings and was assumed to be discontinuous at 2325°K. The heat capacity obtained from the smoothed enthalpy was linearly smoothed graphically so as to fit with the low temperature heat capacity. The data of Kandyba, et al., show no effect of the transition at 2325° and a value of 0.06 kcal. mole<sup>-1</sup> was adopted simply to provide a somewhat improved fit of the data above 2325°K. The data above 2700°K. were not included because of apparent premelting effects and the heat capacity curve from 2700 to 2820°K. is extrapolated.

Transition Data.

See heat capacity and entropy.

Melting Data.

Obtained from the enthalpy measurements of Kandyba, et al., loc. cit.

Heat of Sublimation.

The gas above BeO(c) is complex and the value given is for the reaction BeO(c) → BeO(g) and simply read from the respective tables.

$\Delta H_f^{298.15} = 8.04 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^{298.15} = -129.562 + 0.5 \text{ kcal. mole}^{-1}$   
 $\Delta H_m^0 = 15.1 + 0.4 \text{ kcal. mole}^{-1}$

$T_m = 2820^\circ\text{K.}$   
 $T_b = [4060]^\circ\text{K.}$

Heat of Formation.

The heat of formation was obtained from that of the crystal by adding  $\Delta H_m^0$  and the difference between  $H_{298}^0$  and  $H_{298}$  for crystal and liquid.

Heat Capacity and Entropy.

The enthalpy of three points in the liquid phase was determined by V. V. Kandyba, P. B. Kantor, R. M. Krasovitskiy and E. N. Pomchev, Dokl. Akad. Nauk. S.S.S.R. 131, 566 (1960). These values were used to obtain a heat capacity for the liquid which was assumed constant. At 1900°K. a glass transition was assumed below which the heat capacity was that of the solid. The entropy at 298°K. was obtained in a manner analogous to the heat of formation.

Melting Data.

See the table for BeO(c).

Vaporization Data.

The vapor composition over BeO(c) at any 2300°K. is composed of Be(g), O(g), BeO(g), (BeO)<sub>2</sub>(g), (BeO)<sub>3</sub>(g), (BeO)<sub>4</sub>(g), (BeO)<sub>5</sub>(g), (BeO)<sub>6</sub>(g) and other species and thus a boiling point becomes almost meaningless and the value given here is the point at which the total pressure reaches 1 atm.

Ground State Configuration  $1s^2 +$   
 $S^{\circ}_{298.15} = 47.2 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H^{\circ}_f = 30 \pm 3 \text{ kcal. mole}^{-1}$   
 $\Delta F^{\circ}_f = 298.15 = 31 \pm 3 \text{ kcal. mole}^{-1}$

Electronic Levels and Quantum Weight

$$\frac{\epsilon_i \text{ cm.}^{-1}}{g_i} \quad 0 \quad 1$$

$\omega_e x_e = 1487.323 \text{ cm.}^{-1}$

$\omega_e = 0.0190 \text{ cm.}^{-1}$

$B_e = 1.6510 \text{ cm.}^{-1}$

Heat of Formation.

W. A. Chupke, J. Berkowitz, and C. F. Geese, J. Chem. Phys. 30, 827 (1959) obtained a value of  $106 \pm 3$  kcal. mole<sup>-1</sup> for  $D_0$  from the reactions  $\text{BeO}(g) \rightarrow \text{Be}(g) + \text{O}(g)$  and  $\text{BeO}(g) + \text{O}(g) \rightarrow \text{Be}(g) + \text{O}_2(g)$ . The reactions were followed mass spectrometrically at low electron energies in order to eliminate fragmentation of higher polymers. A Lagerqvist, Arkiv. Fysik 7, 473 (1954) had previously reported a value for  $D_0 = 110 \pm 10$  kcal. mole<sup>-1</sup> based on the dissociation limit of the lowest  $1^1\Pi$  state which was assumed to dissociate to  $\text{Be}(^1s)$  and  $\text{O}(^1D)$ . The  $\Delta H^{\circ}_f$  298  $\text{BeO}(g) = 31 \pm 3$  kcal. mole<sup>-1</sup> from  $D_0 = 106 \pm 3$  kcal. mole<sup>-1</sup> was adopted.

Heat Capacity and Entropy.

The spectroscopic constants are from G. Herzberg, "Molecular Spectra and Molecular Structure. I. Spectra of Diatomic Molecules," D. Van Nostrand Co., Inc., New York 1950. The ground state configuration has been confirmed by B. A. Thrush, Proc. Chem. Soc. (London), 339 (1960) using absorption spectroscopy.

$\Delta H_f^\circ = -284.4 \pm 0.8$  kcal/mol  
 $\Delta H_f^{298.15} = -287.0 \pm 0.8$  kcal/mol  
 $\Delta H_f^\circ = [0.266]$  kcal/mol  
 $\Delta H_f^\circ = [4.673]$  kcal/mol  
 $T_1 = 863^\circ\text{K}$   
 $T_2 = 908^\circ\text{K}$

Heat of Formation.

Bear et al. measured the heats of solution of Be(c) and BeSO<sub>4</sub>(α) in concentrated HF and the heat of reaction of H<sub>2</sub>SO<sub>4</sub>(aq) with BeSO<sub>4</sub>(aq HF). Combination of these yields reaction (a) below. Taylor et al. measured heats of solution of Be(c) and BeSO<sub>4</sub>(α) in H<sub>2</sub>SO<sub>4</sub>(aq) which yields reaction (b). Marchal measured the total vapor pressure of BeSO<sub>4</sub>(c) in the temperature range 863-1103°K. Partial pressures of SO<sub>3</sub>(g) were calculated from Marchal's data using JANAF values for the SO<sub>3</sub> - SO<sub>2</sub> equilibrium. Third law analysis of these data yields ΔH<sup>o</sup> for reaction (c) as given below. This was converted to ΔH<sup>o</sup> for α-BeSO<sub>4</sub> using JANAF heats of transition.

| Author            | Method          | Reaction  | T°K | ΔH <sup>o</sup> <sub>298.15</sub><br>kcal/mol |
|-------------------|-----------------|---|-----|---|
| 1. Bear (1966)    | Calorimetric    | (a) Be(c) + H <sub>2</sub> SO <sub>4</sub> (109 H <sub>2</sub> O) = H <sub>2</sub> (g) + α-BeSO <sub>4</sub>    | 294 | -74.47  |
| 2. Taylor (1966)  | Calorimetric    | (b) Be(c) + H <sub>2</sub> SO <sub>4</sub> (47.848 H <sub>2</sub> O) = H <sub>2</sub> (g) + α-BeSO <sub>4</sub> | 298 | -76.38  |
| 3. Marchal (1925) | Kp (975-1083°K) | (c) BeSO <sub>4</sub> (γ) = BeO(c) + SO <sub>3</sub> (g)  | 298 | +43.92  |

The adopted ΔH<sup>o</sup><sub>298.15</sub> = -287.0 ± 0.8 is an average value of reactions (a) and (b). This value is for relatively finely divided crystals of BeSO<sub>4</sub> as was indicated by Bear et al.

Heat Capacity and Entropy.

Low temperature heat capacities (12-301°K) and high temperature enthalpies (366-864°K) were measured by A. R. Taylor, Jr., T. E. Gardner and D. P. Smith, U. S. Bureau of Mines, Report No. 6240, 1963. These data were joined smoothly at 298°K and extrapolated graphically above 864°K. The entropy was obtained from the heat capacities using S<sub>12.56</sub> = 0.034 eu.

Transition Data.

I. I. Bosik, A. V. Novoselova and Yu. P. Simenov, Russ. J. Inorg. Chem. 5, 1295 (1961); observed two endothermic effects at 863-883°K and 908-913°K on the heating and cooling curves of BeSO<sub>4</sub>(c); thus we have adopted T<sub>1</sub>(α-β) = 863°K and T<sub>2</sub>(β-γ) = 908°K. ΔH<sup>o</sup>(α-β) = 0.266 kcal/mol was obtained from the single enthalpy point at 863.9°K observed by Taylor, Gardner and Smith. ΔH<sup>o</sup>(β-γ) = 4.673 kcal/mol was chosen in order to give good agreement with the equilibrium data of Marchal, loc. cit.

BERYLLIUM SULFATE, BETA ( $\beta$ -BeSO<sub>4</sub>)

$\Delta H_f^0$  = Unknown  
 $\Delta H_f^{298.15}$  = [-286.734] kcal/mol  
 $\Delta H_f^1$  = [0.266] kcal/mol  
 $\Delta H_f^2$  = [4.673] kcal/mol

$S^0_{298.15}$  = [18.943] gibbs/mol  
 $Tt_1$  = 863°K  
 $Tt_2$  = 908°K

Heat of Formation.

The heat of formation was calculated from that of the alpha phase by adding  $\Delta H_f^1$ , since the heat capacities of both phases are assumed the same.

Heat Capacity and Entropy.

The heat capacity was assumed to be the same as that of alpha phase. The entropy was obtained in a manner analogous to that of the heat of formation.

Transition Data.

See alpha phase.

$\Delta H^{\circ}_0$  = Unknown

$\Delta H^{\circ}_{298.15}$  = [-282.06] kcal/mol

$\Delta H^{\circ}_1$  = [-0.286] kcal/mol

$\Delta H^{\circ}_2$  = [-4.673] kcal/mol

$S^{\circ}_{298.15}$  = [24.088] g cal/mole

$T^{\circ}_1$  = 863°K

$T^{\circ}_2$  = 908°K

Heat of Formation.

The heat of formation was calculated from that of the beta phase by adding  $\Delta H^{\circ}_2$ , since the heat capacities of both phases are assumed the same.

Heat Capacity and Entropy.

The heat capacity was assumed to be the same as that of alpha phase. The entropy was obtained in a manner analogous to that of the heat of formation.

Transition Data.

See alpha phase.

ΔHm° = Unknown

Heat of Formation.  
The heat of formation, ΔHf°<sub>298</sub>(BeWO<sub>4</sub>, c) = -361.7 kcal/mol, is calculated from ΔHf°<sub>298</sub> = -17.1 kcal/mol for BeO(c) + WO<sub>3</sub>(c) → BeWO<sub>4</sub>(c). The value of ΔHf°<sub>298</sub> is assumed to be the same as that for MgO(c) + WO<sub>3</sub>(c) → MgWO<sub>4</sub>(c), using -143.7, -143.1, -201.5 and -362.3 kcal/mol for the heats of formation of MgO(c), BeO(c), WO<sub>3</sub>(c) and MgWO<sub>4</sub>(c), respectively.

Heat Capacity and Entropy.  
Heat capacities are estimated by comparison with those of CaWO<sub>4</sub>(c), BeO(c)<sup>2</sup>, and CaO(c)<sup>3</sup>.

The entropy, S°<sub>298</sub> = 21.12 eu, is calculated from ΔS°<sub>298</sub> = -0.4 eu for BeO(c) + WO<sub>3</sub>(c) → BeWO<sub>4</sub>(c). The value of ΔS°<sub>298</sub> is assumed to be the same as that for MgO(c) + WO<sub>3</sub>(c) → MgWO<sub>4</sub>(c), using 6.44, 3.38, 18.14 and 24.18 eu for MgO(c), BeO(c), WO<sub>3</sub>(c) and MgWO<sub>4</sub>(c), respectively.

Bond Distance: Be-Cl = [1.71] Å  
 Bond Angle: Cl'-Be-Cl' (in ring) = [88°]  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 2.62616 x 10<sup>-112</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The heat of formation was estimated by assuming that the concentration of dimer in equilibrium with the monomer was ~5% at 500°K. as reported by D. L. Hildenbrand, L. P. Theard, E. Mured and P. Ju, Aeronutronic Div. of Philco Corp., Report U-3068, April 1965 under contract AF O4(611)-8523, giving an effective  $K_p = 5.5 \times 10^{-4}$  for  $2\text{BeCl}_2(g) \rightarrow \text{Be}_2\text{Cl}_4$  at 500°K.

Heat Capacity and Entropy.

The structure was assumed planar with a D<sub>2h</sub> symmetry, the bond lengths were estimated from the values for BeCl<sub>2</sub> (g), a lengthening being assumed in the ring. The frequencies were estimated using K<sub>2</sub>Cl<sub>2</sub> as a basis for the ring vibrations. Two polymeric frequencies had been observed by A. Shelton, IIT Research Institute, Report No. IITRI-C6013-4, May 1964, under Contract No. DA-31-124-AHQ(D)-111. These were observed in matrix isolated BeCl<sub>2</sub> gas and were ascribed to polymeric species on account of their warm up behavior. They are here assigned to the B<sub>3u</sub> asymmetric stretching mode and the B<sub>1u</sub> asymmetric out of plane wag of the non ring chlorines. The order of the frequencies listed above is arbitrary and not related to their specie types. The individual moments of inertia are: I<sub>A</sub> = 18.386 x 10<sup>-39</sup> g. cm.<sup>2</sup>, I<sub>B</sub> = 110.638 x 10<sup>-39</sup> g. cm.<sup>2</sup> and I<sub>C</sub> = 129.034 g. cm.<sup>2</sup>

Heat of Formation.

D. L. Hildenbrand, L. P. Theard, and P. Ju, Ford Motor Co., Aeronautic Division, Third Quarterly Technical Report U-2231, April-June 1963, have reported the heat of formation. Equilibrium constants were determined in a mass spectrometer for the reactions  $2BeO(g) \rightarrow Be_2O(g) + O(g)$  and  $Be_2O(g) \rightarrow BeO(g) + O(g)$  and  $Be_2O_2(g) \rightarrow BeO(g) + O(g) - (3)$ . Using our own free energy functions we obtain  $\Delta H_f^\circ 298 Be_2O(g) = -13.1, -14.5, \text{ and } -16.7$  kcal. mole<sup>-1</sup>, all  $\pm 10$ ; the end law treatment of reaction 1 gives  $-18.3 \pm 10$  kcal. mole<sup>-1</sup>. We adopt a median value  $-15 \pm 10$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

A. Buchler, J. L. Stauffer, W. Klemperer and C. Wharton, A. D. Little, Inc., Interim Technical Report No. 5, 1963, have shown Li<sub>2</sub>O to be linear. Also A. D. Walsh, J. Chem. Soc. London 2269 (1953) predicted that Be<sub>2</sub>O molecules with less than 16 bonding electrons would be linear. Thus Be<sub>2</sub>O was taken to be linear and asymmetrical, with a Be-O bond length of 1.4 Å, which is a little longer than in BeO(g). The vibrational frequencies were estimated by taking  $\omega_3$  to be larger than the stretch in BeO(g) and then calculating  $\omega_4$  from the valence force field assumption. The bending force constant was estimated as 1/20th of the stretching force constant. The two outermost electrons were considered unpaired and so gave a  $\frac{3}{2}\Sigma$  ground state.

Heat of Formation.

W. A. Chupke, J. Berkowitz, and C. F. Gleese, J. Chem. Phys. 30, 827 (1959) studied the temperature dependence of the (BeO)<sub>2</sub> ion in a mass spectrometer and obtained a second law heat of vaporization of 172 ± 8 kcal. mole<sup>-1</sup> at 2150°K. No correction was made for fragmentation of higher polymers and this is reflected in the uncertainty. We adopted a heat of sublimation of 178 kcal. mole<sup>-1</sup> in order to match more closely the equilibrium constant found by Chupke, et al. However, it was not possible to alter either the heat or entropy sufficiently to obtain exact agreement, the predicted pressure being too high by a factor of 20.

Heat Capacity and Entropy.

A planer ring configuration was assumed which has six vibrational frequencies of the type 2A<sub>1g</sub>, E<sub>1g</sub>, E<sub>2g</sub>, E<sub>2u</sub>, E<sub>2u</sub>, and B<sub>2u</sub>. These were estimated by comparison with (IO)<sub>2</sub> for which values have been calculated by D. White, K. Seahadri, D. P. Dever, D. E. Mann, and M. J. Linevsky, prepublication communication, July, 1963. It seems unlikely that any other structure than that of a ring is possible, es, in order to approach the observed equilibrium constant an even lower entropy is needed. A non-linear chain would have a higher entropy due to the change in symmetry number and the two odd electrons. A linear chain would have approximately the same entropy due to cancellation of opposite effects. The vibrational frequencies were also made as high as possible by normalizing them using B<sub>2u</sub> equal to the BeO stretch in BeO(g). The bond length was taken as the sum of the covalent radii of O and Be, which is in general agreement with other polymeric structures which generally increase in bond length by 10-20% in going from monomer to polymer. The bond angle was chosen arbitrarily, however, changes in the angle would change the entropy less than 1 eu.

The individual moments of inertia were I<sub>A</sub> = 7.057, I<sub>B</sub> = 3.976, and I<sub>C</sub> = 11.033 X 10<sup>-39</sup> g. cm.<sup>2</sup>

ΔH<sub>f</sub><sup>0</sup> = -503.1 ± 7 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>0</sup> 298.15 = [-506.0 ± 7] kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 1833°K.

S<sub>298.15</sub> = 15.342 ± 0.1 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 1833°K.

Heat of Formation.

The ΔH<sub>f</sub><sup>0</sup> 298.15 was estimated from the ΔH<sub>f</sub><sup>0</sup> 298.15 of Mg, Ca and Be oxides with SiO<sub>2</sub> given by K. K. Kelley in the report of investigations 5801, U. S. Department of the Interior, Bureau of Mines 1962, and from the ΔH<sub>f</sub><sup>0</sup> 298.15 of BeO(c) (Sept. 30, 1963) and SiO<sub>2</sub>(c) (Dec. 31, 1962) in JANAP tables. The ΔH<sub>f</sub><sup>0</sup> 298.15 = 0 ± 7 kcal. mole<sup>-1</sup> was estimated for the reaction 2BeO(c) + SiO<sub>2</sub>(c) → Be<sub>2</sub>SiO<sub>4</sub>(c).

Heat Capacity and Entropy.

At low temperatures C<sub>p</sub> was used from K. K. Kelley, J. Am. Chem. Soc., 61, 1217 (1939). Above 298.15°K. C<sub>p</sub> values were estimated by summation of the component oxides using JANAP tables, BaO (Sept. 30, 1963) and SiO<sub>2</sub>(c) (Dec. 31, 1962). The entropy was calculated at 54.7°K. using the Debye and Planck-Einstein functions  $D(\frac{422}{T}) + 2E(\frac{227}{T})$  given by K. K. Kelley, J. Am. Chem. Soc., 61, 1217 (1939). The value of S<sub>54.7</sub> = 13.59 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.

The incongruent melting point was taken from Kubaschewski and Evans, "Metallurgical Thermochemistry" 3rd edition, Pergamon Press., New York 1958.

ΔHf° = -136.6 ± 0.3 kcal/mol  
 ΔHf°<sub>298.15</sub> = -140.6 ± 0.3 kcal/mol  
 ΔHm° = [30.9] kcal/mol

S°<sub>298.15</sub> = 6.157 gibbs/mol  
 Tm = 2475°K

Heat of Formation.

P. Orson, C. Hayman, F. D. Oreene and J. T. Bingham, Trans. Faraday Soc. 52, 271.9 (1956), have measured the heat of chlorination of α-Be<sub>3</sub>N<sub>2</sub> to α-BeCl<sub>2</sub>, and the heat of reaction of Be with ammonia. The chlorination reaction (A) α-Be<sub>3</sub>N<sub>2</sub>(c) + 3Cl<sub>2</sub>(g) → 3 α-BeCl<sub>2</sub>(c) + 3/2(g) had a ΔHf°<sub>298</sub> = -210.3 ± 1.1 kcal/mol, which, combined with the value of -117.1 ± 0.4 kcal/mol for α-BeCl<sub>2</sub> reported in the same paper, yields ΔHf°<sub>298</sub>(α-Be<sub>3</sub>N<sub>2</sub>,c) = -141.0 ± 1.6 kcal/mol. Reaction (B) 3 Be(c) + 2 NH<sub>3</sub>(g) = α-Be<sub>3</sub>N<sub>2</sub>(c) + 3 H<sub>2</sub>(g) had a ΔHf°<sub>298</sub> = -214.6 ± 0.3 kcal/mol, which, combined with the JANAP value for NH<sub>3</sub>(g), yields ΔHf°<sub>298</sub>(α-Be<sub>3</sub>N<sub>2</sub>,c) = -140.3 ± 0.3 kcal/mol. A weighted mean value of the above two determinations is adopted.

The decomposition Be<sub>3</sub>N<sub>2</sub>(c) = 3 Be(g) + 3/2(g) has been studied by R. E. Yates, M. A. Oreenbaum and M. Farber, J. Phys. Chem. 69, 2682 (1964), using the torsion effusion technique. The same decomposition has also been investigated by C. L. Hoening, UCRL-7521, April 1964, using the Knudsen technique. An analysis of these data sets by 2nd and 3rd law methods is given below.

| Reference   | Range     | Points | ΔHf° <sub>298</sub> kcal/mol | Drift    | **ΔHf° <sub>298.15</sub> Be <sub>3</sub> N <sub>2</sub> kcal/mol |

| Hoening - 3 | 1648-1893 | 10     | 416.9±8.4                    | 383.15   | -148.38  |

\*Points rejected due to failure of statistical test.

\*\*Calculated from 3rd law ΔHf°<sub>298</sub>.

The data of Yates et al. are seen to be in good agreement with the adopted ΔHf°<sub>298</sub>.

Heat Capacity and Entropy.

The low temperature heat capacity of α-Be<sub>3</sub>N<sub>2</sub> has been measured, from 25° - 310°K, by B. H. Justice, The Dow Chemical Co., 1st Quarterly Report under Contract AFO4611-67-C-0009, April 1967. These measurements are joined smoothly with the high temperature enthalpies reported by T. B. Douglas and W. H. Payne, Natl. Bur. Std. Report 7587, July 1962. Above 1200°K the values were smoothly extrapolated to a limiting value of 6.2 gibbs/g-atom. The entropy at 298° was calculated by integration of the low temperature data based on S°<sub>25</sub> = 0.002 eu.

Melting Data.

See Be<sub>3</sub>N<sub>2</sub>(1) for details.

Beryllium Nitride (Be<sub>3</sub>N<sub>2</sub>)  
(Liquid) GFW = 55.050

BERYLLIUM NITRIDE (Be<sub>3</sub>N<sub>2</sub>) (LIQUID)

OPW = 55.050

$\Delta H_f^{298,15} = [9.425] \text{ gbbbs/mol}$

$\Delta H_f^{298,15} = [-116.4] \text{ kcal/mol}$

$\Delta H_m^{\circ} = [30.9] \text{ kcal/mol}$

$S^{\circ}_{298,15} = [9.425] \text{ gbbbs/mol}$

$T_m = 2473^{\circ} \text{ K}$

Heat of Formation.

The heat of formation of Be<sub>3</sub>N<sub>2</sub>(l) is calculated from  $\Delta H_f^{\circ}(\text{c})$  by adding  $\Delta H_m^{\circ}$  and the difference between  $H_{2473} - H_{298}$  for crystal and liquid.

Heat Capacity and Entropy.

The heat capacity is estimated to be constant and slightly greater than the maximum for Be<sub>3</sub>N<sub>2</sub>(c). The entropy at 298°K is estimated in a manner analogous to that of the heat of formation.

Melting Data.

The melting point was reported by P. Fichter and E. Brunner, Z. Anorg. Allgem. Chem. 93, 84 (1915). The heat of melting was calculated on the assumption that each g-atom contributed 2.5 gibbs to  $\Delta S_m^{\circ}$ .

Dec. 31, 1960; Sept. 30, 1963

BERYLLIUM OXIDE TRIMERIC ( $\text{Be}_3\text{O}_3$ )

(IDEAL GAS)

MOL. WT. = 75.039

Point Group  $[D_{3h}]$

$\Delta H_f^\circ = -250.7 \pm 9 \text{ kcal. mole}^{-1}$

$S_{298}^\circ = [65.3] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

$\Delta H_f^\circ 298.15 = -252 \pm 9 \text{ kcal. mole}^{-1}$

Ground State Quantum Weight = [1]

Vibrational Frequencies and Degeneracies

Bond Distances: Be-O = [1.63] Å

Bond Angle: Be-O-Be = [120°]

Product of the Moments of Inertia:  $I_A I_B I_C = [9.0658] \times 10^{-114} \text{ g.}^3 \text{ cm.}^6$

$\sigma = [6]$

Heat of Formation.

W. A. Chupka, J. Barkowitz, and C. P. Gleason, J. Chem. Phys. **30**, 827 (1959) measured the change in the intensity of the  $(\text{BeO})^+$  ion with temperature and obtained a second law heat of vaporization of  $161 \pm 6 \text{ kcal. mole}^{-1}$  at 2150°K. The uncertainty is large because of an approximate correction of 8 kcal. mole<sup>-1</sup> and the neglect of fragmentation effects. We adopted a heat of sublimation at 2150°K. of 163 kcal. mole<sup>-1</sup> in order to bring the equilibrium vapor pressure into agreement with that measured by Chupka, et al.

Heat Capacity and Entropy.

The assumed  $D_{3h}$  symmetry implies eight vibrational frequencies of the types  $2A_1$ ,  $A_2$ ,  $A_2'$ ,  $3E'$ , and  $E_2'$ . The frequencies were estimated by comparison with the values for the  $\text{Be}_2\text{O}^+$  skeleton as given by J. L. Parsona, J. Chem. Phys. **33**, 1860 (1960) and the partial assignment of Borstein by S. K. Gupta and R. P. Porter, J. Phys. Chem. **67**, 1286 (1963). The bond length was taken as that in  $\text{Be}_2\text{O}_2(\text{g})$ , while the bond angle was arbitrarily taken as 120°. The individual moments of inertia were  $I_A = I_B = 16.550$ ,  $I_C = 33.010 \times 10^{-39} \text{ g. cm.}^2$

Bond Distances Be-O = [1.63] Å  
 Bond Angle Be-O-Be = [115°] O-Be-O = [155°]  
 Product of the Moments of Inertia I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.11656] X 10<sup>-112</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation

W. A. Chupka, J. Benkowitz, and C. F. O'Leary, J. Chem. Phys. 30, 827 (1959) measured the variation of intensity of the (BaO)<sub>4</sub> ion with temperature in a mass spectrometer. They reported a second law heat of vaporization of 177 ± 8 kcal. mole<sup>-1</sup> at 2150°K., which included an approximate correction of 9 kcal. mole<sup>-1</sup>, and this value was adopted here.

Heat Capacity and Entropy

The assumed D<sub>4h</sub> structure has 14 vibrational frequencies of the types 2A<sub>1g</sub>, A<sub>2g</sub>, 2E<sub>g</sub>, 2E<sub>g</sub>, 2E<sub>g</sub>, E<sub>g</sub>, A<sub>2u</sub>, E<sub>2u</sub>, E<sub>1u</sub>, and 3E<sub>1u</sub>. The frequencies were estimated by comparison with (BaO)<sub>3</sub> and cyclobutane from G. W. Rathjens, N. K. Freeman, W. D. O'Leary, and K. S. Fitzer, J. Am. Chem. Soc. 75, 5634 (1953). The estimated structure and frequencies gave an entropy which was in excellent agreement with the experimental heat and equilibrium constant determined by Chupka, et al.

The bond lengths were taken equal to those in Be<sub>2</sub>O<sub>2</sub>(g) and the angles were chosen so that O-Be-O was almost linear. The individual moments of inertia were calculated to be I<sub>A</sub> = I<sub>B</sub> = 38.219, I<sub>C</sub> = 76.438 X 10<sup>-39</sup> g. cm.<sup>2</sup>

Beryllium Oxide, Pentameric (Be<sub>5</sub>O<sub>5</sub>)

Bond Distances: Be-O = [1.65] Å  
 Bond Angle: Be-O-Be = [110°]  
 Product of the Moment of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [6.9653] X 10<sup>-112</sup> g.<sup>3</sup> cm.<sup>6</sup>  
 $\sigma = [10]$

Heat of Formation.  
 W. A. Chupka, J. Berkowitz, and C. F. Giese, J. Chem. Phys. **30**, 827 (1959) measured the variation in intensity of the (BeO)<sub>5</sub> ion with temperature in a mass spectrometer. They calculated a second law heat of vaporization of 193 ± 12 kcal. mole<sup>-1</sup> at 2150°K, the uncertainty reflects the inclusion of an approximate correction of 10 kcal. mole<sup>-1</sup>. This value was adopted here.

Heat Capacity and Entropy.  
 The assumed D<sub>5h</sub> structure has 14 vibrations of the type 2A<sub>1</sub>, A<sub>2</sub>, 3E<sub>1</sub>, 4E<sub>2</sub>, E<sub>1</sub>, and 2E<sub>2</sub>. These were estimated by comparison with similar motions in other ring structures including (BaO)<sub>3</sub> and (BeO)<sub>4</sub>. The estimated structure and frequencies gave an entropy in good agreement with the experimental heat and equilibrium constant determined by Chupka, et al.

The bond length was assumed to be the same as in Be<sub>2</sub>O<sub>2</sub>(g) and the angles were chosen so as to make O-Be-O almost linear. The individual moments of inertia are calculated to be I<sub>A</sub> = I<sub>B</sub> = 70.356, I<sub>C</sub> = 140.713 X 10<sup>-39</sup> g. cm.<sup>2</sup>.

Bond Distance: Be-O = [1.63] Å σ = [12]

Bond Angle: Be-O-Be = [110°] O-Be-O = [190°]

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [3.1266] X 10<sup>-111</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

W. A. Chupka, J. Berkowitz, and C. F. Giese, J. Chem. Phys. **30**, 827 (1959) measured the temperature dependence of the (BeO)<sub>6</sub><sup>+</sup> ion in a mass spectrometer. They calculated a second law heat of vaporization of 203 ± 15 kcal. mole<sup>-1</sup> which was adopted here. The uncertainty reflects in part an approximate correction of 10 kcal. mole<sup>-1</sup> and the small observed intensities.

Heat Capacity and Entropy.

The assumed symmetry D<sub>3h</sub> has 20 vibrational frequencies of the type 2A<sub>1g</sub>,<sup>4</sup> A<sub>2g</sub>,<sup>2</sup> B<sub>1g</sub>,<sup>2</sup> B<sub>2g</sub>,<sup>4</sup> E<sub>1g</sub>,<sup>4</sup> 4E<sub>2g</sub>,<sup>4</sup> A<sub>2u</sub>,<sup>2</sup> 2E<sub>1u</sub>,<sup>2</sup> 3E<sub>2u</sub>,<sup>2</sup> and 2F<sub>2u</sub>.<sup>2</sup> The frequencies were estimated by comparison with similar motions in other ring molecules including benzene, (BeO)<sub>3</sub> and (BeO)<sub>4</sub>. The assumed structure and vibrational frequencies gave an entropy in good agreement with the heat and equilibrium constant determined by Chupka, et al. The bond length was taken equal to that in BeO<sub>2</sub>(g) the angles were chosen so that the O-Be-O angle was almost linear but with the Be-O-Be angle less than 120°. The individual moments of inertia were calculated to be I<sub>A</sub> = I<sub>B</sub> = 116.089, I<sub>C</sub> = 232.118 X 10<sup>-39</sup> g. cm.<sup>2</sup>

Thermodynamic Functions.

Thermodynamic functions were calculated using electronic levels and multiplicities listed by C. E. Moore [Nat'l. Bur. Standards Circ. 467 (1949)]. Higher levels were averaged. The results are in good agreement with W. H. Evans, T. R. Munson, and D. D. Wegman [J. Research Nat'l. Bur. Standards 55, 147 (1955)], who used essentially the same data.

Heat of Formation.

The heat of formation is calculated from the dissociation energy of bromine selected by Evans, Munson, and Wegman (loc. cit.) and the heat of sublimation derived for diatomic bromine. Evans, Munson, and Wegman list experimental vapor density measurements from the literature which agree with the spectroscopic value within their estimated uncertainty.

Ground State Configuration  $1\Sigma^+$   
 $S_{298.15}^{\circ} = 57.337 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^{\circ} = 5.28 \pm 0.30 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{\circ} 298.15 = 3.50 \pm 0.3 \text{ kcal. mole}^{-1}$

Electronic Levels and Quantum Weights

$\epsilon$ ,  $\text{cm.}^{-1}$   $g_1$   
 0 1  
 $\omega_e x_e = 1.8 \text{ cm.}^{-1}$   
 $\omega_e = 0.150797 \text{ cm.}^{-1}$   
 $\alpha_e = 0.0007597 \text{ cm.}^{-1}$   
 $r_e = 2.136 \text{ \AA}$

Heat of Formation.

The average  $\Delta H_f^{\circ} 298.15 = -0.406 \text{ kcal. mole}^{-1}$  for the reaction  $\text{Br}_2(g) + \text{Cl}_2(g) = 2\text{BrCl}(g)$  and the  $\Delta H_f^{\circ} 298.15 = -3.694 \text{ kcal. mole}^{-1}$  for  $1/2 \text{ Br}_2(g)$  from JANAP tables were used to calculate the  $\Delta H_f^{\circ} 298.15 = 3.5 \pm 0.3 \text{ kcal. mole}^{-1}$ . Other equilibrium measurements not included below have been summarized by Beeson and Yost, loc. cit.

Third Law  $\Delta H_f^{\circ} 298.15$

Heat Capacity and Entropy.

All spectroscopic and molecular constants were obtained from W. H. Evans, T. R. Munson and D. D. Wagman, J. Res. Natl. Bur. of Standards, 55, 147 (1955) except  $r_e$  which was calculated from B. The value of  $r_e$  was reported to be 2.13 Å and 2.11 Å by C. M. Beeson and D. M. Yost, J. Am. Chem. Soc. 61, 1432 (1939) and L. O. Cole and G. W. Elverum Jr., J. Chem. Phys., 20, 1543 (1952), respectively. Ground state configuration was taken from G. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Co., New York, 1950.

June 30, 1962; Sept. 30, 1965

Ground State Configuration  $1\sum^+$   
 $S_{298.15}^{\circ} = 54.700 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^{\circ} = -12.1 \pm 0.4 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{\circ} = -14.0 \pm 0.4 \text{ kcal. mole}^{-1}$

Electronic Levels and Quantum Weight

$$\frac{\epsilon, \text{ cm.}^{-1}}{\sigma, \text{ cm.}^{-1}} = \frac{g_i}{1}$$

$$\omega_e x_e = 4 \text{ cm.}^{-1}$$

$$\sigma_e = 0.005206 \text{ cm.}^{-1}$$

$$r_e = 1.7555 \text{ \AA}$$

Heat of Formation.

The equilibrium constant for the reaction  $\text{Br}_2(\text{g}) + \text{BrF}_3(\text{g}) = 3\text{BrF}(\text{g})$  has been measured over the temperature range 328-380°K. by R. K. Steunenberg, R. C. Vogel and J. Fischer, *J. Am. Chem. Soc.* **79**, 1320 (1957). Third law analysis of the data yields  $\Delta H_f^{\circ} = 11.785 \pm 0.2 \text{ kcal. mole}^{-1}$ , with a drift of  $-0.6 \pm 1.2 \text{ cal. mole}^{-1} \text{ deg.}^{-1}$ . Second law analysis yields  $\Delta H_f^{\circ} = 11.98 \pm 0.45 \text{ kcal. mole}^{-1}$ , thus it is obvious that the data is thermodynamically self consistent. There is an uncertainty in the entropy of  $\text{BrF}_3(\text{g})$  of  $\pm 1 \text{ cal. mole}^{-1} \text{ deg.}^{-1}$  but this corresponds only to  $\pm 0.35 \text{ kcal. mole}^{-1}$  in  $\Delta H_f^{\circ}$ . In  $\Delta H_f^{\circ}$  298, thus a best value of  $\Delta H_f^{\circ} = 11.78 \pm 0.5 \text{ kcal. mole}^{-1}$  is adopted. This yields  $\Delta H_f^{\circ} = -13.973 \pm 0.4 \text{ kcal. mole}^{-1}$ , the uncertainty in the heat of formation being a maximum value comprising the sum of the uncertainties in  $\text{Br}_2$ ,  $\text{BrF}_3$  and  $\Delta H_f^{\circ}$ .

Attempts have been made to analyze the spectra of BrF to obtain a  $D_0^{\circ}$  value. P. H. Brodersen and J. E. Sicra, *Z. Physik* **141**, 515 (1955) obtained two dissociation limits for BrF of 66.52 kcal. mole<sup>-1</sup> and 54.98 kcal. mole<sup>-1</sup>. The difference corresponds to the  $\text{Br}(^2P_{1/2}) - \text{Br}(^2P_{3/2})$  excitation energy, indicating that the upper state goes to  $\text{F}(^2P_{3/2})$  and  $\text{Br}(^2P_{3/2})$ . This yields a heat of formation of BrF of -10.23 kcal. mole<sup>-1</sup>. Since this value is well outside the possible uncertainty limits of the equilibrium data we must conclude that the extrapolation is in error. W. H. Evans, T. R. Munson and D. D. Wagman, *J. Res. Natl. Bur. Std.* **55**, 147 (1955) have also analyzed the spectra and conclude that a heat of formation of -14.4 kcal. mole<sup>-1</sup> is possible. However M. H. Evans, private communication Nov. 1965, now believes that the dissociating state was too strongly perturbed for meaningful extrapolation.

Heat Capacity and Entropy.

All molecular constants were obtained from W. H. Evans, T. R. Munson, and D. D. Wagman, *J. Res. Natl. Bur. of Standards* **55**, 147 (1955) except  $r_e$  and ground state configuration which were taken from G. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Co., New York, 1950.

Bond Distances: Br-F<sub>1</sub> = Br-F<sub>3</sub> = 1.8081 Å    Br-F<sub>2</sub> = 1.721 Å  
 Bond Angle: F<sub>1</sub>-Br-F<sub>2</sub> = 86° 12.6'    F<sub>2</sub>-Br-F<sub>3</sub> = 86° 12.8'    F<sub>1</sub>-Br-F<sub>3</sub> = 187° 34.8'

Product of the Moment of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 4.519225 X 10<sup>-114</sup> g.<sup>3</sup> cm.<sup>3</sup>

Heat of Formation.

The ΔH<sub>f</sub><sup>o</sup> 298.15 = -61.087 ± 0.7 kcal. mole<sup>-1</sup> is from L. Stein, J. Phys. Chem. 69, 288 (1962) and was derived from heats of reaction of Br<sub>2</sub> with Br<sub>2</sub> which were measured in an adiabatic calorimeter. Stein's value for the ΔH<sub>f</sub><sup>o</sup> 298.15 = -64.78 kcal. mole<sup>-1</sup> was based upon gaseous Br<sub>2</sub>, which has been adjusted to the liquid Br<sub>2</sub> reference state at 298.15°K.

Heat Capacity and Entropy.

D. W. Magnuson, Report No. K-1179, Carbide and Carbon Chemicals Co., K-25 plant, Oak Ridge, Tennessee (December, 1954) determined the moments of inertia and quadrupole coupling coefficients of both Br<sup>79</sup>F<sub>3</sub> and Br<sup>81</sup>F<sub>3</sub> from a number of microwave transitions. From the moment of inertia of the bromine trifluoride molecule was found to have a distorted -T<sub>h</sub> structure with one short, 1.721 Å, and two long, 1.810 Å Br-F bonds. The FBrF angle was found to be 86° 12.6'.

H. H. Claassen, B. Weinstock, and J. O. Malm, J. Chem. Phys. 28, 285 (1958), observed two of the six vibrational levels in the vapor, and calculated the other four levels from a normal coordinate treatment of the molecule. They also obtained a measured entropy of BrF<sub>3</sub>(g), from low temperature data combined with vapor pressure data and an approximate correction for dimerization. This value is 71.9 e.u. at 316.27°K. compared with a value of 70.82 e.u. from this table, the difference is probably within the uncertainty of the data. The three principal moments of inertia are: I<sub>A</sub> = 7.7514 X 10<sup>-39</sup>, I<sub>B</sub> = 2.05791 X 10<sup>-38</sup> and I<sub>C</sub> = 2.83308 X 10<sup>-38</sup> g. cm.<sup>2</sup>

Bond Distances: Br-F<sub>(equatorial)</sub> = 1.79 Å Br-F<sub>(axial)</sub> = 1.68 Å

Bond Angles: F<sub>(equatorial)</sub>-Br-F<sub>(equatorial)</sub> = [90°] and F<sub>(axial)</sub>-Br-F<sub>(equatorial)</sub> = [90°]

Product of the Moment of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 3.2035 X 10<sup>-113</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The ΔH<sub>f</sub>° 298.15 = -102.466 ± 0.5 kcal. mole<sup>-1</sup> is from L. Stein J. Phys. Chem. 66, 289 (1962) and was derived from heats of reaction of F<sub>2</sub> with Br<sub>2</sub> which were measured in an adiabatic calorimeter. Stein's value for the ΔH<sub>f</sub>° 298.15 = -106.16 kcal. mole<sup>-1</sup> was based upon gaseous Br<sub>2</sub> which has been adjusted to the liquid Br<sub>2</sub> reference state at 298.15°K.

Heat Capacity and Entropy.

O. M. Begun, W. H. Fletcher and D. F. Smith, J. Chem. Phys. 42, 2235 (1965) report the infrared (gas phase) and Raman (liquid phase) spectra and correlate the observations by means of normal coordinate calculations for the similar molecules BrF<sub>3</sub>, IF<sub>3</sub>, ClF<sub>3</sub> and XeOF<sub>4</sub>. The fundamental frequencies are taken from Begun, et al., except for ν<sub>9</sub> which was beyond the range of their infrared measurements. The value ν<sub>9</sub> = 245 cm<sup>-1</sup> for the gas has been observed by R. S. Mcbowell and L. B. Asprey, J. Chem. Phys. 37, 165 (1962) and is confirmed by 237 cm<sup>-1</sup> found in the Raman spectra of the liquid. Raman values from the liquid were used for the infrared inactive fundamentals ν<sub>4</sub> and ν<sub>5</sub>. One Raman active frequency, presumably ν<sub>6</sub>, is not observed in any of the four molecules. The value ν<sub>6</sub> = 261 cm<sup>-1</sup> was obtained from the normal coordinate calculation. Previous Raman studies were reported by C. V. Stephenson and E. A. Jones, J. Chem. Phys. 20, 1830 (1952).

A tetragonal pyramidal structure (C<sub>4v</sub> symmetry) with the above parameters was used by Begun, et al., in the analysis of the spectra. This symmetry is consistent with the NMR spectra of H. S. Outowsky and C. J. Hoffman, J. Chem. Phys. 19, 1259 (1951), with the dipole moment determined by M. T. Rogers, R. D. Pruett, H. B. Thompson and J. L. Speirs, J. Am. Chem. Soc. 79, 44 (1956), and with the X-ray crystal structure obtained by R. D. Burbank and F. N. Benesy, J. R. Chem. Soc. 21, 982 (1957). Bond distances were based on those in the crystal and the bond angle was assumed to be 90°, slightly larger than those in the crystal (90.5-86.5°). Begun, et al., indicate that the angle in the gaseous molecule is probably not exactly 90° but that the normal coordinate calculations are not sensitive to this angle. The three principal moments of inertia are I<sub>A</sub> = 2.61497 X 10<sup>-38</sup>, I<sub>B</sub> = 2.61497 X 10<sup>-38</sup> and I<sub>C</sub> = 4.04277 X 10<sup>-38</sup> g. cm.<sup>2</sup>.

Heat of Formation.

The enthalpy change,  $\Delta H_f^0$  376.2 =  $-12.47 \pm 0.13$  kcal. mole<sup>-1</sup>, for the reaction (1)  $1/2 \text{ H}_2(\text{g}) + 1/2 \text{ Br}_2(\text{g}) = \text{HBr}(\text{g})$  was reported by J. R. Lecher, L. Casali and J. D. Park, J. Phys. Chem. 60, 608 (1956). Using  $\Delta H_f^0$  298.15 (Br<sub>2</sub>, g) = 7.39 kcal. mole<sup>-1</sup>, the  $\Delta H_f^0$  298.15 (HBr, g) was derived as  $-8.71 \pm 0.13$  kcal. mole<sup>-1</sup>.

The heat of oxidation of aqueous sulfur dioxide with gaseous chlorine and liquid bromine were determined by calorimetric methods by W. H. Johnson and J. R. Ambrose, J. Res. Natl. Bur. Std. 67A, 427 (1963) and W. H. Johnson and S. Sumner, Acta Chem. Scand., 17, 1917 (1963), respectively. The results were given as  $\Delta H_f^0$  298.15 =  $-77.28 \pm 0.14$  kcal. mole<sup>-1</sup> ( $\text{X}_2 = \text{Cl}_2(\text{g})$ ) and  $-55.47 \pm 0.11$  kcal. mole<sup>-1</sup> ( $\text{X}_2 = \text{Br}_2(\text{l})$ ) for the reaction  $\text{X}_2 + \text{SO}_2 + 2500 \text{ H}_2\text{O} + 2 \text{ H}_2\text{O}(\text{l}) = \text{H}_2\text{SO}_4 + 2500 \text{ H}_2\text{O} + 2 \text{ HX}(\text{aq})$ . The enthalpy change for the reaction  $\text{Cl}_2(\text{g}) + 2 (\text{HBr} \cdot 1250 \text{ H}_2\text{O}) = \text{Br}_2(\text{l}) + 2 \text{ HCl} \cdot 1250 \text{ H}_2\text{O}$  was calculated to be  $-21.82 \pm 0.18$  kcal. mole<sup>-1</sup>. Using  $\Delta H_f^0$  298.15 (HCl · 1250 H<sub>2</sub>O) =  $-59.93 \pm 0.05$  kcal. mole<sup>-1</sup>, the heat of formation for HBr · 1250 H<sub>2</sub>O was derived to be  $-26.352 \pm 0.10$  kcal. mole<sup>-1</sup>. Employing  $\Delta H_f^0$  (HBr · 1250 H<sub>2</sub>O) =  $-20.350 \pm 0.012$  kcal. mole<sup>-1</sup> for the reaction  $\text{HBr}(\text{g}) = \text{HBr}(\text{aq}) + 1250 \text{ H}_2\text{O}$ , the heat of formation ( $\Delta H_f^0$  298.15) for HBr(g) was evaluated as  $-8.67 \pm 0.10$  kcal. mole<sup>-1</sup>.

The heats of oxidation of As<sub>2</sub>O<sub>3</sub> in aqueous solution with Br<sub>2</sub>(l) and Cl<sub>2</sub>(g) were measured by L. Bjellerup, S. Sumner and I. Wedde, Acta Chem. Scand., 11, 1761 (1957) and S. Thoren, Symposium on Thermodynamics and Thermochemistry, Lund, Sweden, July, 1963. Using the values  $\Delta H_f^0 = -56.61 \pm 0.11$  kcal. mole<sup>-1</sup> ( $\text{X}_2 = \text{Br}_2(\text{l})$ ) and  $-100.09 \pm 0.08$  kcal. mole<sup>-1</sup> ( $\text{X}_2 = \text{Cl}_2(\text{g})$ ) for the reaction  $\text{As}_2\text{O}_3(\text{aq}) + 2\text{X}_2 + 2 \text{ H}_2\text{O}(\text{aq.}) \rightarrow \text{As}_2\text{O}_5(\text{aq.}) + 4 \text{ HX}(\text{aq.})$  obtained from H. A. Skinner, Pure Appl. Chem., 9, 95 (1966), the enthalpy change for the reaction  $2\text{HBr}_2(\text{l}) + 4\text{HCl}(\text{aq.}) = 2\text{Cl}_2 + 4\text{HBr}(\text{aq.})$  was calculated to be  $+43.48 \pm 0.14$  kcal. mole<sup>-1</sup>. Based on  $\Delta H_f^0$  (HCl, ∞ H<sub>2</sub>O) =  $-39.93 \pm 0.05$  kcal. mole<sup>-1</sup>, the value of  $\Delta H_f^0$  298.15 (HBr, ∞ H<sub>2</sub>O) was derived to be  $-28.06 \pm 0.06$  kcal. mole<sup>-1</sup>, yielding  $\Delta H_f^0$  298.15 (HBr, g) =  $-8.71 \pm 0.06$  kcal. mole<sup>-1</sup>.

The value of  $\Delta H_f^0$  298.15 (HBr, g) adopted is  $-8.71 \pm 0.10$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The values of  $\omega_e$ ,  $\omega_e x_e$ ,  $\omega_e$  and  $\omega_e x_e$  were taken from T. C. James and R. J. Thibault, J. Chem. Phys., 42, 1450 (1965), and corrected to the average isotopic species. Submillimeter-wave spectra of HBr were measured by G. Jones and W. Gordy, Phys. Rev., 135, A 1223 (1964). The molecular constants derived were close to the values adopted. The ground state configuration was obtained from G. Herzberg, Spectra of Diatomic Molecules, D. Van Nostrand Company, Inc., New York, 1950, in which molecular constants for HBr(g) were also given. A precise measurement of the infrared fundamental bands of HBr has been made by E. K. Plyler, J. Res. Natl. Bur. Std., 64, 377 (1960). The corresponding rotational and vibrational constants have been calculated from the observed data. The moment of Inertia is  $3.30514 \times 10^{-40}$  g. cm.<sup>2</sup>

AMMONIUM BROMIDE (NH<sub>4</sub>Br)

MOL. WT. = 97.94758

(CRYSTAL)

BrH<sub>4</sub>N

ΔH<sub>f</sub><sup>o</sup> = -60.9 ± 0.3 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -84.9 ± 0.3 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> = 0.77 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = Unknown

S<sub>298.15</sub> = 26.87 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>c</sub> = 411 °K.  
 T<sub>m</sub> = 815.2 °K.  
 T<sub>d</sub> = 670 °K.

Heat of Formation.

The equilibrium pressures for the reaction NH<sub>4</sub>Br(c) → NH<sub>3</sub>(g) + HBr(g) have been measured by several investigators. Using the densi-tensimeter, A. Smits and R. Purcell, J. Chem. Soc. 2944 (1928), determined both the equilibrium pressures and vapor densities of the decomposition products, simultaneously, at several temperatures. In order to check the density values obtained, the authors applied the "extrapolation method", from which it was calculated that the corresponding vapor density agreed with complete dissociation. Based on this conclusion, the reported equilibrium pressures were employed to evaluate the enthalpy changes (ΔH<sub>f</sub><sup>o</sup>) of the decomposition reaction by both the second and third law methods. The results obtained are presented as follows.

| Investigator          | Temperature, °K. | Second Law Value | Third Law Value | Equipment Used     |
|-----------------------|------------------|------------------|-----------------|--------------------|
| Smith and Calvert (1) | 576.40-676.02    | 45.12 ± 0.13     | 44.93           | Isotenscope        |
| Smits and Purcell (2) | 604.95-668.15    | 45.50 ± 0.17     | 45.08           | Densiti-tensimeter |
| Johnson (3)           | 573.15-667.75    | 45.41 ± 0.44     | 44.85           | Spiral Manometer   |

(1) A. Smith and R. P. Calvert, J. Am. Chem. Soc. 56, 1363 (1934).  
 (2) A. Smits and R. Purcell, J. Chem. Soc. 2944 (1928).  
 (3) F. W. G. Johnson, Z. Physik. Chem. 65, 38 (1909).

The value of ΔH<sub>f</sub><sup>o</sup> 298.15 adopted is 45.2 ± 0.2 kcal. mole<sup>-1</sup>. Using ΔH<sub>f</sub><sup>o</sup> 298.15 = -10.97 and -8.71 kcal. mole<sup>-1</sup> for NH<sub>3</sub>(g) and HBr(g), respectively, the value of ΔH<sub>f</sub><sup>o</sup> 298.15 for NH<sub>4</sub>Br(c) is evaluated as -64.9 ± 0.3 kcal. mole<sup>-1</sup>. The corresponding ΔH<sub>f</sub><sup>o</sup> 298.15 value evaluated from solution data, selected by V. B. Parker, "Thermal Properties of Aqueous Uni-univalent Electrolytes", NBS-RS-NBS2, National Bureau of Standards, April 1, 1965, is 45.5 ± 0.2 kcal. mole<sup>-1</sup>.

The vapor densities (573-661 °K.) of dissociation products of NH<sub>4</sub>Br(c) were also measured by A. Smith and R. H. Lombard, J. Am. Chem. Soc. 57, 38 (1935). Using the equilibrium pressures reported by A. Smith and R. P. Calvert, loc. cit., they derived the corresponding degrees of dissociation of NH<sub>4</sub>Br(c) at different temperatures. The calculated results indicated that only 46% of NH<sub>4</sub>Br(c) decomposed at 573 °K. and as reaction temperatures increased to 661 °K. the degree of dissociation decreased to 10%. This conclusion was stated to be erroneous by Smits and Purcell, loc. cit., probably because of incorrect density determinations.

Heat Capacity and Entropy.

The low temperatures (13-305 °K.) heat capacities and S<sub>298.15</sub> were obtained from M. Sorai, H. Suga and S. Seki, Bull. Chem. Soc. Japan, 38, 1125 (1965). The C<sub>p</sub> values above 305 °K. were estimated by comparison with those for NaCl(c), NaBr(c) and NH<sub>4</sub>Cl(c). The low temperature heat capacities were also measured by R. Ewald, Ann. Physik, 44, 123 (1914), 139-301 °K., and P. Simon, C. V. Simon and M. Rubemann, Z. phys. Chem. 129, 339 (1927), 201.2-277.1 °K.

Transition Data.

The temperature (T<sub>c</sub>) and heat of transition (ΔH<sub>f</sub><sup>o</sup>) were given by P. W. Bridgman, Proc. Am. Acad. Arts Sci. 52, 91 (1916-17). T<sub>c</sub> = 419.5 ± 0.6 °K. was reported by M. M. Markowitz and D. A. Boryta, J. Phys. Chem. 66, 1477 (1962), which was determined by differential thermal analysis. According to Sorai, Suga and Seki, loc. cit., there are 3 solid phase transitions, namely Phase IV (CsCl) → Phase III (tetragonal) at 108 °K., Phase III (tetragonal) → Phase II (CsCl) at 235 °K. and Phase II (CsCl) → Phase I (NaCl) at 411 °K.

Melting Temperature.

The value of T<sub>m</sub> was taken from H. Rasnow, Z. anorg. Chem. 114, 117 (1920), determined under pressure.

Temperatures of Decomposition.

The temperature of decomposition (T<sub>d</sub>) was calculated as the temperature at which the total pressure of the decomposition products for the reaction NH<sub>4</sub>Br(c) → NH<sub>3</sub>(g) + HBr(g) equals 1 atm. T<sub>d</sub> = 674 and 888.4 °K. were reported by N. W. Laft, Ind. Chemist, 31, 502 (1955) and M. M. Markowitz and D. A. Boryta, loc. cit., respectively.

Heat of Formation  
 A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules," 2nd Ed., Chapman and Hall, London 1951, gives  $0.7 \pm 0.4$  e.v. for the dissociation energy into gaseous atoms.

Heat Capacity and Entropy  
 Vibrational constants from K. Wieland, Zeits. f. Electrochemie 64, 701 (1960) were weighted according to their natural isotopic abundances. Rotational constants were estimated using equation III, 123 p. 108, G. Herzberg, "Spectra of Diatomic Molecules," van Nostrand, New York, 1950. The bond length was estimated to be 0.965 of the mercuric bond length by analogy with the mercury chlorides.

Iodine Monobromide (IBr) (Ideal Gas)

GFW = 206.8134

IODINE MONOBROMIDE (IBr) (IDEAL GAS)

GFW = 206.8134

Heat of Formation.

The equilibrium constants for the reaction (A)  $I_2(g) + Br_2(g) = 2 IBr(g)$  were determined to be 0.01124 and 0.01303 at 547.7 and 578°K, respectively, by W. Müller, Z. Physik. Chem. 123, 1 (1926), who studied the rate of reaction between  $H_2(g)$  and  $Br_2(g)$  in the presence of  $I_2(g)$ . M. Bodenstein and A. Schmidt, Z. Physik. Chem. 123, 28 (1926), derived two values of the equilibrium constants at 1495°K for the same reaction by vapor density studies on the system  $I_2, I, Br_2, Br$  and  $IBr$ . The equilibrium between  $CuBr_2(c), I_2(g), CuBr(c)$  and  $IBr(g)$  was investigated by J. McMorris and D. M. Yost, J. Am. Chem. Soc. 53, 2825 (1931), and the equilibrium constants at 115.0, 151.2 and 176.0°C for reaction (A) were evaluated. Based on these reported equilibrium constants, the corresponding enthalpy changes for reaction (A) are calculated by both the second and third law methods.

R. M. Badger and D. M. Yost, Phys. Rev. 37, 1548 (1931), observed the infrared bands of  $IBr$  and classified them as the  $A'' - \Pi - X\Sigma^+$  transition. They have shown that the dissociation products of the upper state are normal atoms. M. O. Brown, Phys. Rev. 42, 355 (1932), assigned a faint set of bands in the red as the  $B''\Pi_0 - X\Sigma^+$  system. By means of a vibrational analysis he found that the absorption spectrum of  $IBr$  is analogous to that of  $ICl$ . The heat of dissociation for  $IBr$  was evaluated to be  $14,860 \pm 5 \text{ cm}^{-1}$  or  $1.817 \text{ eV}$ . Hence the enthalpy change for the reaction (B)  $IBr(g) = I(g) + Br(g)$  is calculated as  $41.92 \text{ kcal/mol}$ .

The heats of formation for  $IBr(g)$  derived from the enthalpy changes for reaction (A) and (B) are presented in the following table. The value of  $\Delta H_f^{\circ}(IBr, g)$  adopted is  $9.77 \pm 0.02 \text{ kcal/mol}$ .

| Investigator                  | Reaction | Temperature, °K | No. of Points | Second Law Value | Third Law Value | Drift eu   | $\Delta H_f^{\circ}(IBr, g)$ , kcal/mol |

| Brown (1932)                  | "        | 298             | -             | -                | 41.92**         | -          | 9.77**                                  |

\*Calculation based on third law  $\Delta H_f^{\circ}(IBr, g)$  value.

\*\*The value is derived from  $D_0^{\circ}(I-Br)$ .

Heat Capacity and Entropy.

The ground state configuration, electronic levels, quantum weights,  $w_e$  and  $w_e x_e$  are obtained from G. Herzberg, 'Spectra of Diatomic Molecules,' D. Van Nostrand, Inc., New York, 1950. The values of  $B_e, \alpha_e$  (corrected to the average isotopic species) and  $r_e$  were reported by T. S. Jaseja, J. Mol. Spectry. 5, 445 (1960), who analyzed the microwave spectrum of  $IBr$ , corresponding to the transitions  $J = 4 - 5$  and  $J = 5 - 6$ . For the two isotopic species,  $^{127}Br^{79}I$  and  $^{127}Br^{81}I$ , the moment of inertia is  $5.007 \times 10^{-38} \text{ g cm}^2$ .

The infrared absorption spectrum of  $IBr$  at 8000 - 6800  $\text{cm}^{-1}$ , associated with a  $3\Pi_1 - X\Sigma^+$  transition, was observed by L. E. Selin, Arkiv Fysik 21, 479 (1962). The derived rotational constants are different from those reported by Jaseja, loc. cit.

$$\Delta H_f^\circ = -92.42 \pm 0.1 \text{ kcal/mol}$$

$$\Delta H_f^\circ(298.15) = -94.12 \pm 0.1 \text{ kcal/mol}$$

$$\Delta H_m^\circ = 8.1 \text{ kcal/mol}$$

$$\Delta H_a^\circ(298.15 \text{ (to monomer)}) = 51.08 \text{ kcal/mol}$$

$$\Delta H_a^\circ(298.15 \text{ (to dimer)}) = 59.04 \text{ kcal/mol}$$

## Heat of Formation.

The heat of solution ( $\Delta H_{sol}$ ) of KBr(c) in  $H_2O(l)$  has been measured by many investigators. The results were reviewed in detail by V. B. Parker, U. S. Natl. Bur. Std. NBSRD-2, 1965. Eight pertinent  $\Delta H_{sol}$  values are reproduced in the table below. Adopting the best value,  $\Delta H_{sol} = 4.75 \pm 0.02 \text{ kcal/mol}$ , for the reaction  $KBr(c) + K^+(\infty H_2O) + Br^-(\infty H_2O) = -94.12 \text{ kcal/mol}$  for KBr(c). The auxiliary values  $\Delta H_f^\circ(298) = -60.32$  and  $-29.05 \text{ kcal/mol}$  for  $K^+(\infty H_2O)$  and  $Br^-(\infty H_2O)$ , respectively, are obtained from U. S. Natl. Bur. Std. Tech. Note 270-1, 1965.

## Heat Capacity and Entropy.

The low temperature heat capacities, 2.9 - 272.2°K, were measured by W. T. Berg and J. A. Morrison, Proc. Roy. Soc. (London) A242, 467 (1957), using an adiabatic calorimeter. The high temperature heat capacities, 325.25 - 711.75°K, are taken from A. Mustajoki, Ann. Acad. Sci. Fennicae, Ser. A I, 98, 7 (1951). These two sets of Cp data are joined smoothly at 298°K. The Cp values at temperatures, 720 - 1007°K, are extrapolated graphically, so that the derived antherly change ( $H^\circ_{1007} - H^\circ_{298}$ ) = 9.9 kcal/mol agrees with that determined by A. S. Dworkin, private communication, Oak Ridge National Laboratory, Oak Ridge, Tennessee, Dec. 1, 1964. The derived enthalpies at 700, 800 and 900°K are also in good agreement with those measured by S. M. Skuratov and S. A. Lapushkin, J. Gen. Chem. USSR (Eng. Transl.) 21, 2485 (1951). The Cp values above 1007°K are obtained by graphical extrapolation.

The  $S^\circ_{298}$  is calculated from the adopted low temperature Cp, based on  $S^\circ_{2.9} = 0.0015 \text{ eu}$ .

The heat capacities of KBr(s) were also measured by W. Nernst and F. A. Lindemann, Z. Elektrochem. 17, 817 (1911), 78.7 - 89.2°K; F. Korf, Ann. Physik 4, 49 (1911), 137 - 234°K; and K. Cluauze, J. Ooldmann, and A. Parlick, Z. Naturforsch. 4b, 424 (1949). The enthalpies of KBr(c) were determined by A. Magnus, Phys. Z. 14, 5 (1913), and C. B. Cooper, J. Chem. Phys. 21, 777 (1953). The results are in reasonable agreement with the adopted functions except for those reported by Cooper.

## Melting Data.

See KBr(l) table for details.

## Heat of Sublimation.

The heats of sublimation to monomer and dimer are calculated as the enthalpy changes for the following two reactions:  $KBr(c) = KBr(g)$  and  $2 KBr(c) = K_2Br_2(g)$ .

POTASSIUM BROMIDE (KBr)

(LIQUID)

GFW = 119.011

 $S_{298}^{298,15} = 25.225$  gibbs/mol $T_m = 1007^\circ\text{K}$  $T_b = 1671^\circ\text{K}$  $\Delta H_f^{298,15} = -89.984$  kcal/mol $\Delta H_m^\circ = 6.1$  kcal/mol $\Delta H_v^\circ = 35.65$  kcal/molHeat of Formation.

The heat of formation ( $\Delta H_f^{298}$ ) for KBr(l) is obtained from  $\Delta H_f^{298}$ (KBr, c) by adding  $\Delta H_m^\circ$  and the difference between  $H_{1007}^\circ - H_{298}^\circ$  for crystal and liquid.

J. Tøgruri, H. Flood and T. Forland, Acta Chem. Scand. **17**, 1502 (1963), studied the chemical equilibrium for the reaction  $\text{KBr}(l) + \text{HCl}(g) = \text{KCl}(l) + \text{HBr}(g)$ . They obtained  $\Delta H_r^\circ_{1073} = 3.50 \pm 0.08$  and  $3.54$  kcal/mol from partial pressure data and emf data, respectively. The corresponding value calculated from these tables is  $3.78$  kcal/mol. Combination of the experimental results with JANAF auxiliary data leads to  $-89.70$  and  $-89.74$  kcal/mol for  $\Delta H_f^{298}$ .

Heat Capacity and Entropy.

The heat capacity of  $16.7$  gibbs/mol was derived by A. S. Dworkin, private communication, Oak Ridge National Laboratory, Oak Ridge, Tennessee, Dec. 1, 1964, from enthalpy data in the range  $1010 - 1100^\circ\text{K}$ . This Cp value is adopted here for the temperature range  $298 - 2500^\circ\text{K}$ .

The entropy is obtained in a manner analogous to that of the heat of formation.

Melting Data.

The adopted  $T_m$  and  $\Delta H_m^\circ$  were determined by J. W. Johnson and M. A. Bredig, J. Phys. Chem. **52**, 604 (1956), and A. S. Dworkin and M. A. Bredig, J. Phys. Chem. **64**, 269 (1960), respectively.

Heats of melting of  $6.2$  kcal/mol from phase diagram studies and  $6.7$  kcal/mol from calorimetric measurements were obtained by E. Aukrust, B. Bjørgs, H. Flood, and T. Forland, Annales of the New York Academy of Sciences **79**, Art. 11, 830 (1960).

Vaporization Data.

The boiling point,  $T_b = 1671^\circ\text{K}$ , is calculated as the temperature at which the sum of the partial pressures of KBr(g) and  $\text{K}_2\text{Br}_2$ (g) over KBr(l) equals one atmosphere. The value of  $\Delta H_v^\circ$  is calculated as the heat required to produce one mole of vapor mixture, which contains  $19.5\%$  dimer ( $\text{K}_2\text{Br}_2$ ) and  $80.5\%$  monomer (KBr).

T<sub>b</sub> was reported to be  $1648$  and  $1668^\circ\text{K}$  by H. von Wartenberg and P. Albrecht, Z. Elektrochem. **27**, 162 (1921), and O. Ruff and S. Mugdan, Z. Anorg. Chem. **117**, 147 (1921), respectively.

## Heat of Formation.

The heat of formation is derived from the sublimation and vaporization data analyzed below. Numerous investigators have obtained total pressures by static methods or "apparent" pressures by effusion or transpiration. These pressures are converted to monomer pressures by use of functions [see  $K_{Br_2}(g)$  table] which are consistent with the dimer-monomer equilibrium data of Hagemark et al.(6). Second and third law analyses of the monomer pressures show remarkable consistency over temperatures from 637 to 1668°K. The selected value of  $\Delta H^{\circ}_{f,298} = -43.0 \pm 0.5 \text{ kcal/mol}$  may be compared with  $-43.8 \text{ kcal/mol}$  derived from  $D_0 = 3.95 \text{ eV}$  which is reported by Gaydon(14) based on atomic fluorescence data.

\*Based on the third law  $\Delta H^{\circ}_{f,298}$  value. (A)  $KBr(1) = KBr(g)$ , (B)  $KBr(c) = KBr(g)$ .

## Heat Capacity and Entropy.

Rusk and Gordy(10) have investigated the pure rotational spectra of KBr in the 1.5 to 5.0 mm range of the microwave region by millimeter wave molecular beam spectroscopy. The reported values of  $\omega_e, \omega_e x_e, \nu_e$  and  $r_e$  are adopted here and corrected to the average isotopic species. The value of  $\alpha_e$  is obtained from Fabricand et al.(11). Molecular constants for KBr(g) have also been reported by Herzberg(12) and Rice and Klemperer(13). They are in good agreement with the values adopted. Herzberg(12) also lists an A state at 31770  $\text{cm}^{-1}$  based on observed electronic spectra. The moment of inertia is  $3.4604 \times 10^{-38} \text{ g cm}^2$ .

LITHIUM BROMIDE (LiBr)

(CRYSTAL)

GFW = 86.848

ΔH<sup>o</sup> = Unknown  
 ΔH<sup>o</sup><sub>298.15</sub> = -83.87 ± 0.1 kcal/mol  
 ΔH<sup>o</sup> = -4.22 kcal/mol

S<sup>o</sup><sub>298.15</sub> = [17.7] gibbs/mol  
 T<sub>m</sub> = 823°K

Heat of Formation.

The heat of formation, ΔH<sup>o</sup><sub>298</sub> (LiBr, c) = -83.87 kcal/mol, was calculated from the heat of solution of lithium bromide (c) at infinite dilution and the ionic heats of formation of Li<sup>+</sup>(∞H<sub>2</sub>O) and Br<sup>-</sup>(∞H<sub>2</sub>O).

V. B. Parker, "Thermal Properties of Aqueous Uni-univalent Electrolytes," NBSUS-NBS 2, April 1, 1955, reviewed the heat of solution data in the literature and gave the "best" value, ΔH<sub>so</sub> = -11.670 ± 50 cal/mol for LiBr(c) → LiBr(∞H<sub>2</sub>O) at 298.15°K. The ionic heat of formation, ΔH<sup>o</sup><sub>298</sub> (Li<sup>+</sup>∞H<sub>2</sub>O) = -66.49 kcal/mol, was calculated from ΔH<sup>o</sup><sub>298</sub> (LiOH∞H<sub>2</sub>O) = -121.46 kcal/mol (see JANAF LiOH(c) table, Mar. 31, 1966) with ΔH<sup>o</sup><sub>298</sub> (OH<sup>-</sup>∞H<sub>2</sub>O) = -54.97 kcal/mol from NBS Technical Note 270-1, "Selected Values of Chemical Thermodynamic Properties," Oct. 1, 1955. The value ΔH<sup>o</sup><sub>298</sub> (Br<sup>-</sup>∞H<sub>2</sub>O) = -29.05 kcal/mol was also obtained from NBS Technical Note 270-1. Combination of the ionic heats of formation of Li<sup>+</sup>(∞H<sub>2</sub>O) and Br<sup>-</sup>(∞H<sub>2</sub>O) gives the heat of formation of LiBr(∞H<sub>2</sub>O), ΔH<sup>o</sup><sub>298</sub> = -95.54 kcal/mol.

Heat Capacity and Entropy.

A. S. Dworkin, private communication, Oak Ridge National Laboratory, Dec. 1964, has measured the enthalpy changes by the drop method (723-883°K), yielding H<sub>298</sub>-H<sub>298</sub> = 7.0 kcal/mol for the crystal at the melting point. Heat capacities derived from his data were Cp 773° = 15.1 and Cp 853° = 15.6 gibbs/mol for the crystal and liquid, respectively. The tabulated heat capacities were estimated based on these values and on the heat capacities of LiCl(c), NaCl(c) and NaBr(c).

The entropy, S<sup>o</sup><sub>298.15</sub> = 17.7 eu, was estimated by adding the entropy difference between NaBr(c) and NaCl(c) to the entropy of lithium chloride (c) at 298.15°K. Comparisons with other alkali halides give results within ± 0.5 eu of this value. K. K. Kelley, U. S. Bur. Min. Bull. 584 (1960) and 592 (1961), has estimated the heat capacities (Cp = 11.50 + 3.02 X 10<sup>-3</sup>T gibbs/mol) and the entropy (S<sup>o</sup><sub>298</sub> = 16.0 ± 0.5 eu)

Melting Data.

The selected heat of fusion (ΔH<sup>o</sup><sub>298</sub> = 4.22 kcal/mol) was obtained from enthalpy measurements in a drop calorimeter by A. S. Dworkin and M. A. Bredig, J. Phys. Chem. 54, 269 (1960).

K. K. Kelley, U. S. Bur. Min. Bull. 393 (1936), reviewed some phase diagram studies of the lithium bromide system in the literature, and gave the heat of fusion ΔH<sup>o</sup><sub>298</sub> = 2.50 kcal/mol. M. Blanc, Compt. rend. 245, 570 (1958), reported the heat of fusion ΔH<sup>o</sup><sub>298</sub> = 3.095 kcal/mol by a cryoscopic method. Both values are too low.

Sept. 30, 1961, June 30, 1968

$\Delta H_{298.15}^{\circ} = -80.839$  kcal/mol  
 $\Delta H_{298.15}^{\circ} = -80.839$  kcal/mol  
 $\Delta H_{298.15}^{\circ} = -80.839$  kcal/mol  
 $\Delta H_{298.15}^{\circ} = -80.839$  kcal/mol

$S_{298.15}^{\circ} = [20.220]$  gibbs/mol  
 $T_m = 823^{\circ}K$   
 $T_b(\text{to equilibrium mixture}) = 1562^{\circ}K$   
 $T_b(\text{to monomer only}) = [1611]^{\circ}K$

Heat of Formation.

The heat of formation was calculated from that of the crystal by adding the heat of fusion and the difference between  $H_{823}^{\circ}$ - $H_{298}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy.

A. S. Dworkin, private communication, Oak Ridge National Laboratory, Dec. 1964, has derived the heat capacity ( $C_p = 15.6$  gibbs/mol) from enthalpy measurements ( $823^{\circ} - 803^{\circ}K$ ) by the drop method. The liquid heat capacity was assumed to be a constant, 15.6 gibbs/mol. The entropy ( $S_{298}^{\circ} = 20.220$  eu) was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See LiBr(c) table for detail.

Vaporization Data.

$T_b$  (to monomer only) is taken as the temperature at which the calculated Gibbs energy change is zero for  $LiBr(l) \rightarrow LiBr(g)$ , while  $\Delta H_v^{\circ}$  (to monomer only) is the corresponding heat of reaction.

$T_b$  (to equilibrium mixture) is taken as the temperature at which the sum of the calculated partial vapor pressures of  $LiBr(g)$  and  $Li_2Br_2(g)$  reaches one atmosphere (trimer and higher polymers have been neglected in calculation). This value ( $1562^{\circ}K$ ) is in good agreement with the boiling point of  $1563^{\circ}K$  obtained from total vapor pressure measurements by H. von Wartenberg and H. Schulz, Z. Elektrochem. 21, 588 (1921), and also the boiling point of  $1538^{\circ}K$  by O. Ruff and S. Muggen, Z. anorg. Chem. 117, 147 (1921).  $\Delta H_v^{\circ}$  (to equilibrium mixture) at the boiling point is calculated as the heat of vaporization of one mole of liquid to vapor containing 29.23 mole percent of dimer. For detailed information see LiBr(g) and  $Li_2Br_2(g)$  table.

Heat of Formation.

The heat of formation ( $\Delta H^0_{298}$  (LiBr, g) =  $-36.8 \pm 3$  kcal/mol) was calculated from the selected heat of vaporization and the heat of formation for lithium bromide (1). Lithium bromide vaporizes to a mixture of monomeric and dimeric gases. (Higher polymers have been neglected in the calculation.) The heats of vaporization to monomer and to dimer were chosen to satisfy (1) the total vapor pressure data measured by H. von Wartenberg and H. Schulz, Z. Elektrochem. 27, 568 (1921), and O. Ruff and S. Mugden, Z. anorg. Chem. 117, 147 (1921); (2) the partial vapor pressures of monomer and dimer derived from R. C. Miller and P. Kuech, J. Chem. Phys. 25, 860 (1956), 28, 981 (1958), in an analysis of the velocity distribution of molecules in alkali halide vapor. The selected heats of vaporization are  $\Delta H^0_{298}$  (to monomer) =  $44.0 \pm 3$  kcal/mol and  $\Delta H^0_{298}$  (to dimer) =  $42.0 \pm 5$  kcal/mol which combine with the heat of formation of lithium bromide (1) ( $\Delta H^0_{298} = -80.64$  kcal/mol) to give the standard heats of formation of LiBr(g) and Li<sub>2</sub>Br<sub>2</sub>(g) =  $-36.8$  and  $-119.7$  kcal/mol, respectively. The derived heat of dissociation is  $\Delta H^0_{298} = 46.0$  kcal/mol for Li<sub>2</sub>Br<sub>2</sub>(g)  $\rightarrow$  2LiBr(g).

J. Berkowitz, H. A. Tassan and W. A. Chupka, J. Chem. Phys. 36, 2170 (1962), have measured mass-spectrometrically the heat of dissociation  $\Delta H^0_{850} = 45.9$  kcal/mol ( $\Delta H^0_{298} = 46.9$  kcal/mol) for Li<sub>2</sub>Br<sub>2</sub>(g)  $\rightarrow$  2LiBr(g) in a double oven apparatus by the second law method. D. L. Hildenbrand, L. F. Theard, W. F. Hall and N. D. Potter, Philco Report U-2289, under Contract N061-0905-C, Sept. 15, 1963, have determined mass-spectrometrically the heats of sublimation of lithium bromide by the second law method as  $\Delta H^0_{740}$  (to monomer) =  $46.9$  and  $\Delta H^0_{740}$  (to dimer) =  $45.0$  kcal/mol (equivalent to  $\Delta H^0_{298}$  (to monomer) =  $45.82$  kcal/mol and  $\Delta H^0_{298}$  (to dimer) =  $41.95$  kcal/mol). These values are in reasonable agreement with those selected in the tabulation.

Heat Capacity and Entropy.

The bond distance ( $r_e$ ) was obtained from the microwave studies by A. Honig, M. Mandel, M. L. Stitch and C. H. Townes, Phys. Rev. 96, 623 (1954). The vibrational constants ( $\omega_e$  and  $\omega_e x_e$ ) were determined from the infrared spectrum by W. Klempner, W. G. Norris, A. Buehler, and A. G. Emalis, J. Chem. Phys. 33, 1534 (1960). The rotational constants which have been corrected to the average isotopic species were obtained by A. J. Herbert, F. W. Breivogel, Jr., and K. Street, Jr., J. Chem. Phys. 41, 2368 (1964), using microwave spectra. Their data are in good agreement with those reported by Honig et al., loc. cit., and J. R. Rusk and W. Gordy, Phys. Rev. 127, 817 (1962).

The tabulated thermodynamic functions are in reasonable agreement with those calculated by R. L. Wilkins, J. Chem. Eng. Data 5, 337 (1960), who used slightly different molecular constants.

MAGNESIUM MONOBROMIDE (MgBr) (IDEAL GAS) OFW = 104.221

Ground State Configuration  $2 \sum$   
 $S_{298.15} = 58.481 \pm 0.5$  gibbs/mol  
 $\Delta H_f^0 = -11$  kcal/mol  
 $\Delta H_f^0_{298.15} = -13 \pm 7$  kcal/mol

Heat of Formation.

The heat of formation was calculated from that of MgBr<sub>2</sub>(g) using the relation  $D(\text{MgBr})/\Delta H_{\text{atom}}(\text{MgBr}_2) = 0.46 + 0.04$  which has been shown to apply to several dihalides. This results in  $\Delta H_f^0 = -13 + 7$  and  $D_0 = 74.4 + 7$  kcal/mol. The selected value is in good agreement with  $D_0 \leq 77$  kcal/mol obtained from predissociation by O. Herzberg, "Spectre of Diatomic Molecules," second edition, D. van Nostrand Co., Inc., New York, 1950, and with the linear Birge-Sponer extrapolation of  $D_0 = 74$  kcal/mol given by A. O. Aylton, "Disassociation Energies," second edition, Chapman and Hall Ltd. London, 1953. Aylton's selected value of  $D_0 = 58 \pm 23$  kcal/mol was discounted since it would require the unlikely ratio  $D(\text{MgBr})/\Delta H_{\text{atom}}(\text{MgBr}_2) = 0.28$ .

Heat Capacity and Entropy.

The molecular constants  $\omega_e$ ,  $\omega_e x_e$  and ground state configuration ( $2 \sum$ ) were taken from O. Herzberg, loc. cit., while  $\alpha_e$  was calculated from the above constants. The bond distance was estimated to be the same as in MgBr<sub>2</sub>(g).

ω<sub>e</sub> x<sub>e</sub> = 4.7 cm.<sup>-1</sup> σ = 1  
 α<sub>a</sub> = 0.00399 cm.<sup>-1</sup> r<sub>e</sub> = 1.79 Å

Heat of Formation.

E. R. V. Miller and H. B. Dunford, J. Chem. Phys. 35, 1202 (1961) have extrapolated the ground state vibrational levels and obtain D<sub>0</sub><sup>o</sup> = 67 ± 5 kcal. mole<sup>-1</sup> or ΔH<sub>f</sub><sup>o</sup> = 73.7 ± 5 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

Miller and Dunford loc. cit. give all the vibrational and rotational constants, which have been adjusted to the normally occurring isotopic mixture for bromine.

Heat of Formation

The chemical equilibrium of the reaction  $2NO(g) + Br_2(g) = 2NOBr(g)$  has been studied by Trautz and Dala<sup>1</sup>, Blair, Bross and Yoal<sup>2</sup>, and Krausz<sup>3</sup>, respectively. Using the reported equilibrium constants, the enthalpy changes ( $\Delta H_{298.15}^{\circ}$ ) of this reaction are evaluated by both the second and third law methods. Based on the third law  $\Delta H_{298.15}^{\circ}$  values, the heats of formation for NOBr(g) are derived. The results obtained are presented in the table below. The value of  $\Delta H_{298.15}^{\circ}$  (NOBr,g) adopted is  $19.63 \pm 0.2$  kcal/mol.

Heat Capacity and Entropy

The molecular structure of NOBr(g) has been determined by electron diffraction by J. A. A. Ketelaar and K. J. Palmer, *J. Am. Chem. Soc.*, **59**, 2829 (1937). The results were confirmed later by T. L. Weatherly and C. Williams, *J. Chem. Phys.*, **25**, 717 (1956), who studied the microwave spectrum of NOBr(g) in the region 20,000 - 40,000 Mc/sec and analyzed the  $J = 2-3$  transition. The values of bond length and angle adopted are obtained from Ketelaar and Palmer, loc. cit. The infrared absorption spectrum of NOBr(g) has been examined from 400 to 5303  $\text{cm}^{-1}$  by W. O. Burns and H. J. Bernstein, *J. Chem. Phys.*, **18**, 1689 (1950). The authors observed the first two fundamental vibrational frequencies and obtained the third from combination and overtone. These assignments are adopted. The three principal moments of inertia are:  $I_A = 9.404 \times 10^{-40}$ ,  $I_B = 2.2985 \times 10^{-38}$  and  $I_C = 2.3906 \times 10^{-38}$  g cm<sup>2</sup>.

(CRYSTAL)

ΔH<sub>f</sub><sup>o</sup> = -84.68 ± 0.10 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -86.38 ± 0.10 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = 6.24 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> 298.15 = 51.98 kcal. mole<sup>-1</sup> to monomer gas

Heat of Formation.

The heat of solution of NaBr(c) in water has been measured by F. A. Askew, E. Bullock, H. T. Smith, R. K. Tinkler, O. Gatty and J. H. Wolfenden, J. Chem. Soc. 1368 (1934) and W. E. Wallace, J. Am. Chem. Soc. 71, 2485 (1949) to be +0.01 and -0.14 kcal. mole<sup>-1</sup>, respectively. Using ΔH<sub>f</sub><sup>o</sup> 298.15 (Na<sup>+</sup>, aq.) = -57.39 and ΔH<sub>f</sub><sup>o</sup> 298.15 (Br<sup>-</sup>, aq.) = -29.05 kcal. mole<sup>-1</sup>, obtained from D. D. Wagman, National Bureau of Standards, private communication, July 2, 1964, the respective value of ΔH<sub>f</sub><sup>o</sup> 298.15 for NaBr(c) was found to be -86.3 and -86.45 kcal. mole<sup>-1</sup>. The adopted value is the average of these two.

Heat Capacity and Entropy.

The low temperature heat capacities (7.21 - 301.63°K.) were measured by T. E. Gardner and A. R. Taylor, Jr., U. S. Bur. Mines RI 6455 (1964). The high temperature enthalpy changes (280 - 645, 290 - 816°K.) were determined by A. Wagner, Phys. Z. 14, 5 (1913). Based upon the latter data the high temperature heat capacities were derived. The two sets of C<sub>p</sub> data were joined smoothly at 298°K. by graphical method. S<sub>298.15</sub> was obtained from T. E. Gardner and A. R. Taylor, Jr., loc. cit., using S<sub>10</sub><sup>o</sup> = 0.054 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.

T<sub>m</sub> and ΔH<sub>m</sub><sup>o</sup> were reported by A. S. Dworkin and M. A. Bredig, J. Phys. Chem. 54, 269 (1960). The values, T<sub>m</sub> = 101.4°K. and ΔH<sub>m</sub><sup>o</sup> = 5.52 kcal. mole<sup>-1</sup>, reported by M. Blanc, Compt. Rend., 246, 570 (1958), were not used.

Heat of Sublimation.

The value of ΔH<sub>s</sub><sup>o</sup> 298.15 was derived from six sets of vapor pressure data by both the second and third law methods. See NaBr(g) table for detail.

$S_{298.15}^o = [24.940] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

$\Delta H_f^o 298.15 = [-81.105] \text{ kcal. mole}^{-1}$

$T_m = 1020^\circ \text{K.}$

$\Delta H_m^o = 6.24 \text{ kcal. mole}^{-1}$

$T_b = [1720]^\circ \text{K.}$

$\Delta H_v^o = 39.42 \text{ kcal. mole}^{-1}$  to monomer gas

#### Heat of Formation.

$\Delta H_f^o 298.15(l)$  was obtained from  $\Delta H_f^o 298.15(c)$  by adding  $\Delta H_m^o$  and the difference between  $H^o - H_{298.15}^o$  for crystal and liquid. The equilibrium constant of the reaction  $\text{NaBr}(l) + \text{HCl}(g) = \text{NaCl}(l) + \text{HBr}(g)$  has been determined by J. Toguri, H. Flood and T. Forland, *Acta Chem. Scand.* **17**, 1502 (1963). From the reported data,  $\ln K_{900}^o = -1.19 \pm 0.01$ , the heat of reaction ( $\Delta H_r^o 298.15$ ) was derived to be  $2.11 \text{ kcal. mole}^{-1}$ . Using  $\Delta H_f^o 298.15 (\text{HCl}, g) = -22.062$ ,  $\Delta H_f^o 298.15 (\text{NaCl}, l) = -92.24$  and  $\Delta H_f^o 298.15 (\text{HBr}, g) = -8.70 \text{ kcal. mole}^{-1}$ , the value of  $\Delta H_f^o 298.15$  for  $\text{NaBr}(l)$  was evaluated to be  $-81.0 \pm 0.5 \text{ kcal. mole}^{-1}$  which is in reasonable agreement with the value adopted. The values of  $\Delta H_f^o 298.15$  for  $\text{HCl}(g)$  and  $\text{HBr}(g)$  were obtained from D. D. Wagman, National Bureau of Standards, private communication, July 2, 1964.

#### Heat Capacity and Entropy.

Heat capacity for  $\text{NaBr}(l)$  was estimated by comparison with those for  $\text{NaCl}(c)$ ,  $\text{AgCl}(c)$  and  $\text{AgCl}(l)$ . The entropy was obtained in a manner analogous to that of the heat of formation.

#### Melting Data.

$T_m$  and  $\Delta H_m^o$  were reported by A. S. Dworin and M. A. Bredig, *J. Phys. Chem.* **64**, 269 (1960). The values,  $T_m = 1014^\circ \text{K.}$  and  $\Delta H_m^o = 5.52 \text{ kcal. mole}^{-1}$ , reported by M. Blanc, *Compt. Rend.*, **246**, 570 (1958), were not used.

#### Vaporization Data.

The boiling point,  $T_b$ , was calculated as the temperature at which the value of  $\Delta H_v^o$  becomes zero for the reaction  $\text{NaBr}(l) \rightarrow \text{NaBr}(g)$ . The difference between  $\Delta H_f^o$  for  $\text{NaBr}(l)$  and  $\text{NaBr}(g)$  at  $T_b$  is the heat of vaporization,  $\Delta H_v^o$ .

## Heat of Formation.

The heat of formation ( $\Delta H_f^{298.15}$ ) was calculated from  $\Delta H_f^{298.15}$  and  $\Delta H_f^{298.15}$  for NaBr(c). The latter was derived from six sets of corrected vapor pressure data, due to the presence of dimeric species in the vapor, by both the second and third law methods. The results are listed as follows.

| Investigator                         | Reaction          | Third Law Value | Second Law Value | $\Delta H_f^{298.15}$ , kcal. mole <sup>-1</sup> |
|--------------------------------------|-------------------|-----------------|------------------|--|
| Niwe <sup>1</sup>                    | NaBr(c) → NaBr(g) | 51.97           | 50.31            | -35.24   |
| Cogin and Kimball <sup>2</sup>       | NaBr(c) → NaBr(g) | 52.26           | 52.14            | -34.18   |
| Meyer and Mintzer <sup>3</sup>       | NaBr(c) → NaBr(g) | 52.59           | 65.30            | -33.79**   |
| Ruff and Hugden <sup>4</sup>         | NaBr(l) → NaBr(g) | 46.43           | 47.48            | -34.15   |
| Wertenberg and Albrecht <sup>5</sup> | NaBr(l) → NaBr(g) | 46.38           | 47.54            | -34.15   |
| Bloom et al. <sup>6</sup>            | NaBr(l) → NaBr(g) | 46.23           | 51.53            | -34.88**   |

\*Based on the average of the second and third law values.

\*\*Only the third law value being used.

1 K. Niwe, J. Rec. Sci., Hokkaido Univ., Ser. III, 2, 201 (1938).

2 O. E. Cogin and O. E. Kimball, J. Chem. Phys., 16, 1035 (1948).

3 J. E. Meyer and I. H. Mintzer, J. Chem. Phys., 5, 301 (1938).

4 O. Ruff and S. Hugden, Z. anorg. allgem. Chem., 117, 147 (1921).

5 H. von Wertenberg and P. Albrecht, Z. Electrochem., 27, 162 (1921).

6 H. Bloom, J. O. M. Bockris, M. E. Richards and R. O. Taylor, J. Am. Chem. Soc., 80, 2044 (1958).

The value of  $\Delta H_f^{298.15}$  for NaBr(g) adopted is the average value of the six  $\Delta H_f^{298.15}$  values listed in the above table. The dissociation energy ( $D_0^0$ ) was calculated to be 66.28 kcal. mole<sup>-1</sup> or 3.74 e.v. which is in good agreement with the value,  $D_0^0 = 3.84 \pm 1$  and 3.65 e.v., reported by A. G. Oeydon, "Disassociation Energies", Chapman and Hall Ltd., London, 1953 and O. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Company, New York, 1950, respectively. According to L. Brewer, private communication, October 23, 1964, Oeydon's original reported value,  $D_0^0 = 3.8$ , is an average of the value of 3.84 e.v. from atomic fluorescence and the value of 3.75 e.v. calculated for Oeydon by Brewer from pressure data available at that time.

## Heat Capacity and Entropy.

The values of  $\omega_e$ ,  $\omega_e x_e$ ,  $\sigma$  and  $\alpha_e$  were taken from S. A. Rice and W. Klemperer, J. Chem. Phys., 27, 573 (1957). The adopted bond distance ( $r_e$ ) was reported by A. Honig, M. Mendel, M. L. Sticht and C. H. Townes, Phys. Rev., 96, 629 (1954), which was derived from microwave spectrum. By electron-diffraction method, the Ne-Br bond distance was determined as  $2.64 \pm 0.01$  Å by L. R. Maxwell, S. B. Hendricks and V. M. Kowaley, Phys. Rev., 52, 968 (1937). The discrepancy may be due to the presence of a large proportion of dimer at the higher pressures used in the electron-diffraction determination. The ground state configuration was reported by O. Herzberg, loc. cit.

June 30, 1963; Dec. 31, 1963

Ground State Configuration [Σ] ΔH<sub>f</sub><sup>o</sup> = [45] kcal. mole<sup>-1</sup>  
S<sup>o</sup><sub>298.15</sub> = [59.5] cal. deg.<sup>-1</sup> mole<sup>-1</sup> ΔH<sub>f</sub><sup>o</sup><sub>298.15</sub> = [43] kcal. mole<sup>-1</sup>

Electronic Levels and Multiplicities

$$\frac{\sum_{i=1}^n \epsilon_i \text{ cm.}^{-1} g_i}{0} \quad (3)$$

$$\omega_e x_e = [400] \text{ cm.}^{-1} \quad \sigma = 1$$

$$B_e = [0.1519] \text{ cm.}^{-1} \quad \alpha_e = [0.0008] \text{ cm.}^{-1}$$

$$r_e = [2.23] \text{ \AA}$$

Heat of Formation.

ΔH<sub>f</sub><sup>o</sup> 0 was estimated as 40.8 kcal. mole<sup>-1</sup> by J. S. Gordon, Astrosystems International, Livingston, New Jersey, private communication, August 25, 1961. This ΔH<sub>f</sub><sup>o</sup><sub>298.15</sub> was changed from the white (Σ) to red (V) phosphorus reference state.

Heat Capacity and Entropy.

Molecular constants were estimated by J. S. Gordon, loc. cit.

Lead Monobromide (PbBr)

Heat of Formation. ΔH<sub>f</sub><sup>0</sup> 298.15 was calculated from the dissociation energy of PbBr(g) reported by A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules," Chapman and Hall, Ltd., London, 1953.

Heat Capacity and Entropy. Ground state configuration, ω<sub>e</sub> and ω<sub>e</sub>x<sub>e</sub> were obtained from O. Herzberg, "Spectra of Diatomic Molecules," Van Nostrand, New York (1950). B<sub>e</sub> and α<sub>e</sub> were estimated by J. S. Gordon, AstroSystems, Inc., private communication, May, 1962. Electronic levels and multiplicities were estimated from those for Pb(g).

Heat of Formation

The heat of formation,  $\Delta H_f^\circ$ , of TiBr (g) is calculated from the dissociation energy,  $D_0$ , which is estimated as 10<sup>4</sup> kcal/mol. This estimate is obtained from the relation  $D(\text{TiBr}_2) < D_0(\text{TiBr}) < D_0(\text{TiBr}_3)$ , where D represents the average energy per bond, which is valid for the titanium fluorides. The dissociation energy of TiF(g) from which the relation is derived was estimated relative to that of TiF<sub>2</sub>(g) by Zmbov and Margrave (1).

Heat Capacity and Entropy

The vibrational frequency,  $\omega_e$ , and the anharmonic vibrational term,  $\omega_e X_e$ , are estimated from those of TiCl(g) and comparisons of the mercury and alkali monohalides. The internuclear distance is estimated from Guggenheimer's relation (2).  $B_e$  is calculated from  $r_e$ . The ground state term and electronic levels are estimated from the ground state multiplet of Ti<sup>3+</sup> (3).  $\sigma_e$  is estimated from the Morse potential function.

$\omega_e X_e = [0.80] \text{ cm}^{-1}$   
 $B_e = [0.05254] \text{ cm}^{-1}$   
 $\sigma = 1$   
 $r_e = [2.40] \text{ \AA}$

Heat of Formation

The heat of formation,  $\Delta H_f^\circ$  (WBr, g) = 140.1 kcal/mol, is calculated from the bond dissociation energy,  $D_{298}^\circ(\text{W-Br}) = 90 \pm 20 \text{ kcal/mol}$ . This value of  $D_{298}^\circ$  is estimated to be slightly higher than the average bond dissociation energy of WBr<sub>2</sub>(g), by analogy with the WCl<sub>2</sub> system.

Heat Capacity and Entropy

The bond distance is estimated to be the same as that in WBr<sub>2</sub>(g). This distance is then used with Guggenheimer's relation for polar molecules to calculate the fundamental vibrational frequency,  $\omega_e$  (K. M. Guggenheimer, Proc. Phys. Soc. (London) 58, 486 (1946)). The anharmonicity correction  $x_e$  is estimated roughly by assuming  $x_e = \omega_e/4(D_0^\circ + 0.5 \omega_e) = 0.0025$ . The rotational constant  $B_e$  is calculated from the estimated bond distance. The value of  $\sigma_e$  is calculated from the Morse potential function. The moment of inertia is  $53.27 \times 10^{-39} \text{ g cm}^2$ .

The ground state configuration, low lying electronic levels and their quantum weights are assumed to be the same as those estimated for WF(g). See WF(g) table (March 31, 1967) for details.

Zirconium Monobromide (ZrBr)

(Ideal Gas) GFW = 171.129

Ground State Configuration [4f]

S°<sub>298.15</sub> = [63.4 ± 2] gibbs/mol

ΔHf° = [73.9 ± 10] kcal/mol

ΔHf°<sub>298.15</sub> = [72 ± 10] kcal/mol

(IDEAL GAS)

ZIRCONIUM MONOBROMIDE (ZrBr)

Ground State Configuration [4f]

S°<sub>298.15</sub> = [63.4 ± 2] gibbs/mol

ΔHf° = [73.9 ± 10] kcal/mol

ΔHf°<sub>298.15</sub> = [72 ± 10] kcal/mol

Electronic Levels and Quantum Weights

Table with columns: E, cm⁻¹; g; i. Rows include energy levels and their quantum weights.

ωe = [317] cm⁻¹; ωeXe = [0.69] cm⁻¹; σ = 1

Be = [0.065] cm⁻¹; αe = [0.00018] cm⁻¹; r = [2.47] Å

Heat of Formation

The heat of formation, ΔHf°<sub>298</sub>(ZrBr, g) = 72 kcal/mol, is derived from the estimated bond dissociation energy, D°<sub>298</sub>(Zr-Br) = 103.5 ± 10 kcal/mol. The value of D°<sub>298</sub>(Zr-Br) is calculated from the relation D°<sub>298</sub>(Zr-Br)/D°<sub>298</sub>(Ti-Br) = 87.9 kcal/mol and D°<sub>298</sub>(Ti-Cl) = 89.0 kcal/mol, all calculated from JANAF ΔHf°<sub>298</sub> for ZrBr<sub>4</sub>(g), TiBr<sub>4</sub>(g), TiCl<sub>4</sub>(g), Zr(g), Ti(g) and Br(g).

Heat Capacity and Entropy

The bond distance is assumed to be the same as that in ZrBr<sub>4</sub>(g), which was estimated as 2.47 Å by Godnev, Aleksandrovskaia and Rigina, Optics and Spectroscopy, 1, 172 (1959). The estimated bond distance is then used with Guggenheimer's relation for polar molecules to calculate the fundamental frequency ωe (K. M. Guggenheimer, Proc. Phys. Soc. (London) 58, 416 (1946)). The anharmonicity correction X<sub>e</sub> is estimated roughly by assuming X<sub>e</sub> = ωe/4 (D<sub>0</sub> + 0.5 ωe) = 0.0021. The rotational constant Be is calculated from the estimated bond distance. The value of αe is calculated from the Morse potential function. The moment of inertia is 42.148 x 10⁻³⁹ gm².

The ground state configuration is taken from the ground state multiplet of Zr⁺ reported by C. E. Moore, 'Atomic Energy Levels,' Vol. II, Natl. Bur. Std. Circ. 467, 1952. The electronic levels and quantum weights are estimated to be the same as those of Zr(g).

Main thermodynamic data table with columns: T, K; Cp; -[G° - H°(298)]/T; H° - H°(298); ΔHf°; Log Kp. Rows range from 0 to 6000 K.

|---------------------------------|-------|
| 0                               | [4]   |
| [9000]                          | [2]   |
| [15000]                         | [20]  |

$\omega_e x_e = [0.80]$  cm<sup>-1</sup>       $\sigma = 1$   
 $\omega_e = [321.4]$  cm<sup>-1</sup>       $\tau_e = [2.40]$  Å  
 $B_e = [0.0754]$  cm<sup>-1</sup>       $\alpha_e = [0.00015]$  cm<sup>-1</sup>

Heat of Formation

The heat of formation,  $\Delta H_f^\circ(\text{WB}_r, g)$ , is calculated from the bond dissociation energy,  $D_{298}^\circ(\text{W-Br}) = 90 \pm 20$  kcal/mol. This value of  $D_{298}^\circ$  is estimated to be slightly higher than the average bond dissociation energy of  $\text{WB}_r(g)$ , by analogy with the  $\text{WCl}_x$  system.

Heat Capacity and Entropy

The bond distance is estimated to be the same as that in  $\text{WB}_r(g)$ . This distance is then used with Guggenheimer's relation for polar molecules to calculate the fundamental vibrational frequency,  $\omega_e$  (K. M. Guggenheimer, Proc. Phys. Soc. (London) 52, 446 (1946)). The anharmonicity correction  $x_e$  is estimated roughly by assuming  $x_e = \omega_e/4(D_0 + 0.5 \omega_e) = 0.0025$ . The rotational constant  $B_e$  is calculated from the estimated bond distance. The value of  $\alpha_e$  is calculated from the Morse potential function. The moment of inertia is  $53.27 \times 10^{-39}$  g cm<sup>2</sup>.

The ground state configuration, low lying electronic levels and their quantum weights are assumed to be the same as those estimated for  $\text{WF}_6(g)$ . See  $\text{WF}_6(g)$  table (March 31, 1967) for details.

Zirconium Monobromide (ZrBr)

GFW = 171.129

Ground State Configuration [4f]

S<sup>298.15</sup> = [63.4 ± 2] gibbs/mol

ω<sub>e</sub>x<sub>e</sub> = [0.69] cm<sup>-1</sup>     σ = 1  
 ω<sub>e</sub> = [317] cm<sup>-1</sup>     r = [2.47] Å  
 B<sub>e</sub> = [0.068] cm<sup>-1</sup>     ω<sub>e</sub> = [0.00018] cm<sup>-1</sup>

Heat of Formation

The heat of formation, ΔH<sub>f</sub><sup>0</sup>(ZrBr, g) = 72 kcal/mol, is derived from the estimated bond dissociation energy, D<sub>298</sub><sup>0</sup>(Zr-Br) = 103.5 ± 10 kcal/mol. The value of D<sub>298</sub><sup>0</sup>(Zr-Br) is calculated from the relation D<sub>298</sub><sup>0</sup>(Zr-Br)/D<sub>298</sub><sup>0</sup>(Ti-Br) = 87.9 kcal/mol and D<sub>298</sub><sup>0</sup>(Ti-Cl) = 89.0 kcal/mol, all calculated from JANAF ΔH<sub>f</sub><sup>0</sup> for ZrBr<sub>4</sub>(g), TiBr<sub>4</sub>(g), TiCl<sub>4</sub>(g), Zr(g), Ti(g) and Br(g).

Heat Capacity and Entropy

The bond distance is assumed to be the same as that in ZrBr<sub>4</sub>(g), which was estimated as 2.47 Å by Godnev, Aleksandrovaika and Rigina, Optics and Spectroscopy, 2, 172 (1959). The estimated bond distance is then used with Guggenheim's relation for polar molecules to calculate the fundamental frequency ω<sub>e</sub> (K. M. Guggenheimer, Proc. Phys. Soc. (London) 58, 416 (1946)). The anharmonicity correction x<sub>e</sub> is estimated roughly by assuming x<sub>e</sub> = ω<sub>e</sub>/4 (D<sub>0</sub> + 0.5 ω<sub>e</sub>) = 0.0021. The rotational constant B<sub>e</sub> is calculated from the estimated bond distance. The value of ω<sub>e</sub> is calculated from the Morse potential function. The moment of inertia is 42.1488 × 10<sup>-39</sup> g cm<sup>2</sup>.

The ground state configuration is taken from the ground state multiplet of Zr<sup>+</sup> reported by C. E. Moore, "Atomic Energy Levels," Vol. II, Natl. Bur. Std. Circ. 467, 1952. The electronic levels and quantum weights are estimated to be the same as those of ZrF(g).

Heat of Formation.

Zero by definition.

Heat Capacity of Crystal and Liquid.

Low temperature thermal data have been adopted from the work of D. L. Hildenbrand, W. R. Kramer, R. A. McDonald, and D. R. Stull [J. Am. Chem. Soc. **80**, 4129 (1958)]. References to older work are given by Hildenbrand, et al., and are not given any weight here.

Heat of Melting and Melting Point.

Hildenbrand, et al., (loc. cit.) report T<sub>m</sub> = 285.90°K and ΔH<sub>m</sub> = 2.527 kcal. mole<sup>-1</sup>.

Heat of Sublimation, Ideal Gas Functions.

See ideal gas tables for details.

$\Delta H_f^{298} = 0$   
 $\Delta H_m = 2.527 \text{ kcal. mole}^{-1}$   
 $\Delta H_v = 7.084 \text{ kcal. mole}^{-1}$

$T_m = 265.90^\circ\text{K.}$   
 $T_b = 332.62^\circ\text{K.}$

Heat of Formation.

The heat of formation at 298.15°K is zero by definition.

Heat Capacity.

The liquid heat capacity data of D. L. Hildenbrand, W. R. Kramer, R. A. McDonald, and D. R. Stull [J. Am. Chem. Soc. 80, 4129 (1958)] were extrapolated to a constant value of 18.0 cal. mole<sup>-1</sup> deg.<sup>-1</sup>

Entropy.

The entropy is that given by Hildenbrand, et al., (loc. cit.) for liquid bromine at 298.15°K.

Vaporization.

See ideal gas tables for details.

Br<sub>2</sub>

MOL. WT. = 159.832

(IDEAL GAS)

$\Delta H_f^\circ = 10.922 \pm .030 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^\circ 298 = 7.387 \text{ kcal. mole}^{-1}$   
 $S_{298}^\circ = 56.847 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

$C_p = 323.22 \text{ cm}^{-1}$   
 $C_p^\circ = 1.070 \text{ cm}^{-1}$   
 $\alpha = 0.000275 \text{ cm}^{-1}$   
 $\sigma = 2$

Thermodynamic Functions.

Spectroscopic data listed by O. Herzberg [Spectra of Diatomic Molecules, D. Van Nostrand Company, New York, 1950] have been adjusted to the isotopic mixture (50.5% Br-79, 49.4% Br-81). The calculated functions are in good agreement with those of W. H. Evers, T. R. Munson, and D. D. Wagman [J. Research NBS, Bur. Standards 55, 147 (1955)] who used the same spectroscopic data.

Heat of Formation.

The heat of vaporization at 298.15°K was reported by D. L. Hildenbrand, W. R. Kremer, R. A. McDonald, and D. R. Stull [J. Am. Chem. Soc. 80, 4129 (1958)] as 7.387 ± .027 kcal. mole<sup>-1</sup>, which calculates to 10.922 kcal. mole<sup>-1</sup> at 0°K. Vapor pressure data from the literature and the above adopted thermodynamic functions for liquid and gas were used to calculate  $\Delta H_f^\circ$  as follows:

| $\Delta H_f^\circ$ , kcal. mole <sup>-1</sup> |
|---|
| 10.905 ± .019                                 |
| 10.924 ± .008                                 |
| 10.906 ± .018                                 |

Liquid range

|   |               |
|---|---------------|
| Fischer and Bingle <sup>1</sup> (298° to 389°K)                 | 10.905 ± .019 |
| Ramsay and Young <sup>2</sup> (265° to 329°K)                   | 10.924 ± .008 |
| Scheffer and Voogd <sup>3</sup> (270° to 362°K)                 | 10.906 ± .018 |
| Scheffer and Voogd <sup>3</sup> (253° to 264°K)                 | 10.961 ± .014 |
| Frey and Gregory <sup>4</sup> (177° to 195°K)                   | 10.941 ± .029 |
| Henglein, Rosenber, and Muchlinski <sup>5</sup> (177° to 241°K) | 10.932 ± .034 |
| Ramsay and Young <sup>2</sup> (258° to 282°K)                   | 10.966 ± .014 |

For the liquid range, the data of Fischer and Bingle as well as that of Scheffer and Voogd show a decided decrease with increasing temperature, starting at about 10.94 and decreasing to 10.87 kcal. mole<sup>-1</sup>. The data of Ramsay and Young show only a small trend with temperature and are in good agreement with the calorimetric value. For the solid range, the data are too scattered to be conclusive. The calorimetric value, as supported by Ramsay and Young, is adopted as the heat of formation of the ideal gas.

 $\Delta H^o_{298}$  = Unknown $\Delta H^o_{298,15}$  = -59.5 ± 0.5 kcal/mol $\Delta H^o$  = 0.1 kcal/mol $\Delta H^o_{298,15}$  (to monomer) = [49.6] kcal/mol $\Delta H^o_{298,15}$  (to dimer) = [58.5] kcal/molHeat of Formation.

The heats of solution of Fe(c), Br<sub>2</sub>(l) and FeBr<sub>2</sub>(c) in Br<sub>2</sub>-KBr aqueous solution were measured by use of ice calorimeter by (1) W. Hieber and A. Woerner, Z. Elektrochem. **40**, 287 (1934). From the results obtained the heat of formation for FeBr<sub>2</sub>(c) was reported to be -59.87 kcal/mol.

The heats of solution of FeBr<sub>2</sub>(c) in water were determined by (2) J. C. M. Li and N. W. Gregory, J. Am. Chem. Soc. **74**, 4670 (1952) and (3) P. Proletti, Trans. Faraday Soc. **51**, 219 (1965), to be -20.1 ± 0.4 and -20.06 ± 0.08 kcal/mol, respectively. Using  $\Delta H^o_{298,15}$  = -29.05 and -21.3 kcal/mol for Br<sup>-</sup>(aq) and Fe<sup>2+</sup>(aq), the corresponding heats of formation for FeBr<sub>2</sub>(c) were calculated as -59.3 and -59.34 kcal/mol. The value of  $\Delta H^o_{298,15}$  (Br<sup>-</sup>, aq) was taken from "Selected Values of Chemical Thermodynamic Properties," Part I, Technical Note 270-1, by D. D. Wagman, W. H. Evans, I. Halow, V. B. Parker, S. M. Bailey and R. H. Schumm, National Bureau of Standards, 1965. The value of  $\Delta H^o_{298,15}$  (Fe<sup>2+</sup>, aq) was derived from heats of solution and formation for FeCl<sub>2</sub>(c) using  $\Delta H^o_{298,15}$ (Cl<sup>-</sup>, aq) = -39.952 kcal/mol from the same source as  $\Delta H^o_{298,15}$  (Br<sup>-</sup>, aq)

The value of  $\Delta H^o_{298,15}$  (FeBr<sub>2</sub>,c) adopted is -59.5 ± 0.5 kcal/mol.

Heat Capacity and Entropy.

The heat capacities, 323-633°K, were measured by N. W. Gregory and H. E. O'Neal, J. Am. Chem. Soc. **81**, 2649 (1959). Those for temperatures below 323°K and above 633°K were estimated by linear extrapolation. Low temperature heat capacities, 12-110°K, were reported by G. Miljutin and N. Nachimowitch, Phys. Trans. Ukrain. Acad. Sci. **71** (1940). However, these data are inadequate for obtaining an accurate entropy at 298°K. The adopted  $S^o_{298,15}$  value was reported by N. W. Gregory and R. O. MacLaren, J. Phys. Chem. **59**, 110 (1955). It was obtained from E. F. Westrum, Jr., University of Michigan, Ann Arbor, Michigan, by private communication. A magnetic transition at 11°K was reported by H. Bizette, C. Terrier, and B. Tsai, Compt. rend. **245**, 507 (1957).

Transition Data.

Tt and  $\Delta H^o$  were taken from N. W. Gregory and H. E. O'Neal, loc. cit.

Melting Data.

Tm adopted was reported by R. O. MacLaren and N. W. Gregory, J. Phys. Chem. **59**, 184 (1955). The value was calculated from the vapor pressure equations and is slightly above the previously reported value, 684°C (957°K), by A. Ferreri, A. Celeri and F. Giorgi, Atti accad. Nazl. Lincei **9**, 782, 1134 (1929). However, it agrees well with 962 ± 2°K obtained by the differential thermocouple cooling curve analysis by the same authors. The  $\Delta H^o_{298,15}$  value was estimated from the vapor pressure data in order to obtain good agreement between the second and third law heats of vaporization. See the FeBr<sub>2</sub>(g) table for details.

Heat of Sublimation.

$\Delta H^o_{298,15}$  (to monomer) is calculated as the difference between  $\Delta H^o_{298,15}$  for FeBr<sub>2</sub>(g) and FeBr<sub>2</sub>(c).  $\Delta H^o_{298,15}$  (to dimer) is calculated as the difference between those for Fe<sub>2</sub>Br<sub>4</sub>(g) and 2 FeBr<sub>2</sub>(c).

IRON DIBROMIDE (FeBr<sub>2</sub>)      (LIQUID)       $GFW = 215.665$

$S^0_{298.15} = [40.483] \text{ gibbs/mol}$

$T_m = 964^\circ K$

$T_b = [1207]^\circ K$

Heat of Formation.

The value of  $\Delta H_f^0_{298.15} (l)$  was obtained from  $\Delta H_f^0_{298.15} (c)$  by adding  $\Delta H_m^0$  and the difference between  $H_m^0 - H^0_{298.15}$  for FeBr<sub>2</sub>(c) and FeBr<sub>2</sub>(l).

Heat Capacity and Entropy.

The heat capacity was assumed to be constant in the temperature range from 298.15 to 2000°K and was estimated on the basis of 8.5 gibbs/g-atom. The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See FeBr<sub>2</sub>(c) table for details.

Vaporization Data.

$T_b$  is calculated as the temperature at which the total pressure of FeBr<sub>2</sub>(g) and Fe<sub>2</sub>Br<sub>3</sub>(g) over FeBr<sub>2</sub>(l) equals one atmosphere. Based on the vapor composition and the values of  $\Delta H_v^0$  for both the monomer and dimer at  $T_b$ , the heat of vaporization is derived.

Mercury Dibromide (HgBr<sub>2</sub>)

MERCURY DIBROMIDE (HgBr<sub>2</sub>) (Crystal)

Mol. Wt. = 360.442

ΔH<sub>f</sub><sup>o</sup> 298.15 = -40.500 ± 0.5 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = [40.706] ± 1.5 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>m</sub> = 514°K

ΔH<sub>m</sub> = 4.280 ± 0.08 kcal. mole<sup>-1</sup>

Heat of Formation. Taken from National Bureau of Standards (U.S.) Circular 500, "Selected Values of Chemical Thermodynamic Properties," (1952).

Heat Capacity and Entropy. C<sub>p</sub> was assumed to be a linear function of temperature and was fitted to the data of M. Guinchant, Comp. Rend. 145, 320 (1907) and G. J. Janz and J. Goodkin, J. Phys. Chem. 53, 1975 (1959). The entropy was estimated by adjusting its value until the melting, sublimation and vaporization data were in agreement.

Melting. T<sub>m</sub> was taken from National Bureau of Standards (U.S.) Circular 500 (loc. cit.). ΔH<sub>m</sub> was given by G. J. Janz and J. Goodkin (loc. cit.).

MERCURY DIBROMIDE (HgBr<sub>2</sub>)

(Liquid)

Mol. Wt. = 360.442

ΔH<sub>f</sub><sup>a</sup> 298.15 = -37.158 ± 0.58 kcal. mole<sup>-1</sup>S<sub>298.15</sub> = [46.797] ± 1.5 cal. deg.<sup>-1</sup> mole<sup>-1</sup>T<sub>m</sub> = 531°KΔH<sub>m</sub> = 4.280 ± 0.08 kcal. mole<sup>-1</sup>T<sub>b</sub> = 592°KΔH<sub>v</sub> = 14.148 ± 0.25 kcal. mole<sup>-1</sup>Heat of Formation. Calculated from ΔH<sub>f</sub><sup>a</sup>(c).

Heat Capacity and Entropy. C<sub>p</sub> obtained from the data of O. J. Janz and J. Goodkin, J. Phys. Chem. 63, 1975 (1959) in the range 507-543°K, it was assumed constant above and below this value. A glassy transition was assumed at 343°K below which the heat capacity was equal to that of the crystal. The entropy was obtained from S°(c), the entropy of fusion and the estimated heat capacity.

Melting and Vaporization. T<sub>m</sub> and T<sub>b</sub> were taken from National Bureau of Standards (U.S.) Circular 500, "Selected Values of Chemical Thermodynamic Properties," (1952). ΔH<sub>m</sub> was given by O. J. Janz and J. Goodkin (loc. cit.) and ΔH<sub>v</sub> was obtained from the data of E. B. R. Pridoux, J. Chem. Soc. (London) 57, 2032 (1930) and F. M. G. Johnson, J. Amer. Chem. Soc. 53, 777 (1931).

Hg-Br distance = 2.41 Å

Moment of Inertia = 154.12 X 10<sup>-39</sup> g. cm.<sup>2</sup>

σ = 2

Heat of Formation. The heat of formation of the crystal as given in National Bureau of Standards (U.S.) Circular 500, "Selected Values of Chemical Thermodynamic Properties," 1952, was combined with the 3rd law heat of sublimation at 298°K from the data of K. Miya and Z. Shibata, J. Fac. Sci. Hokkaido Imp. Univ. Ser. III 2, 193 (1938) and P. M. G. Johnson, J. Amer. Chem. Soc. 53, 777 (1931).

Heat Capacity and Entropy. The vibrational constants were given by W. Klemperer and L. Lindeman, J. Chem. Phys. 25, 397 (1956). The bond length is an average of the values given by H. Braune and S. Knoke, Zeits. phys. Chemie B23, 163 (1933); A. H. Gregg, G. C. Hampson, G. I. Jenkins, P. L. F. Jones and L. E. Sutton, Trans. Farad. Soc. 33, 852 (1937) and P. A. Akishin, V. P. Spiridinov and A. N. Khodchenkoy, Zhur. Fiz. Khim. 33, 20 (1959).

March 31, 1962

MERCURY MONOBROMIDE, DIMERIC (Hg<sub>2</sub>Br<sub>2</sub>) (crystal)

Mol. Wt. = 561.052  
 ΔH<sub>f</sub><sup>°</sup> 298.15 = -48.800 ± 0.2 kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub><sup>°</sup> = 52.283 ± 0.75 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>sub</sub> = 666°K (decomp.)

Heat of Formation. The average of the values obtained from the cell measurements of T. W. Dakin and D. T. Ewing, J. Am. Chem. Soc. 62, 2280 (1940) and those of F. Iahikawa and Y. Ueda, J. Chem. Soc. Japan 59 (1930) was adopted.

Heat Capacity and Entropy. The heat capacity was estimated by analogy with mercurous chloride. The entropy of formation was obtained from the free energy and heat of formation data listed under heat of formation.

Sublimation. The vapor pressure over mercurous bromide reaches one atmosphere at 666°K according to G. Jung and W. Ziegler Zalta. f. physik. Chem. 130, 139 (1930). At this point the vapor is dissociated into Hg(g) and HgBr<sub>2</sub>(g).

Potassium Bromide, Dimeric ( $K_2Br_2$ )  
(Ideal Gas)  $GFW = 238.022$

POTASSIUM BROMIDE, DIMERIC ( $K_2Br_2$ ) (IDEAL GAS)  $GFW = 238.022$

$\Delta H_f^\circ = -125.0 \pm 4$  kcal/mol

$\Delta H_f^\circ = -129.2 \pm 4$  kcal/mol

$\Delta H_f^\circ = -125.0 \pm 4$  kcal/mol

$\Delta H_f^\circ = -129.2 \pm 4$  kcal/mol

K-Br-K = [78]°  
Br-Br = [2.39] Å  
 $\sigma = [4]$

Heat of Formation  
Vapor densities and vapor pressures of KBr were measured, using a liquid gold isoteniscope, by K. I. Hagemark, M. Blander, and E. B. Luchsinger, J. Phys. Chem. **70**, 276 (1966), and K. I. Hagemark, private communication, 3M Company, St. Paul, Minn., Feb. 6, 1967. Based on the equilibrium constants for the reaction  $2KBr(g) = K_2Br_2(g)$  in the temperature range 1267-1434°K, the enthalpy change ( $\Delta H_f^\circ$ ) of this reaction is evaluated by the second and third law methods to be -42.80 + 4.28 and -43.12 kcal/mol, respectively. The heat of formation for  $K_2Br_2(g)$  is calculated to be -129.2 ± 4 kcal/mol, using the third law  $\Delta H_f^\circ$  value and  $\Delta H_f^\circ$  (KBr,g) = -43.04 kcal/mol. The drift in the third law  $\Delta H_f^\circ$  values is 0.01 ± 3.2 eu.

Heat Capacity and Entropy  
The molecular structure and bond distances were estimated by J. Berkowitz, J. Chem. Phys. **29**, 1386 (1958), and are tentatively adopted. J. Berkowitz, J. Chem. Phys. **32**, 1519 (1960), has calculated vibrational frequencies on the basis of the potential function for an ionic model. These values are adjusted so that the third law  $\Delta H_f^\circ$  value for the reaction  $2KBr(g) = K_2Br_2(g)$  agrees with the second law value. The three principal moments of inertia are:  
 $I_A = 4.667 \times 10^{-38}$ ,  $I_B = 1.513 \times 10^{-37}$ ,  $I_C = 2.000 \times 10^{-37}$  g cm<sup>2</sup>.

Bond Distance: Li-Br = 2.35 Å

Bond Angle: Br-Li-Br = 110°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 4.220745 X 10<sup>-113</sup> g<sup>3</sup> cm<sup>6</sup>

Heat of Formation.

This was obtained from the heat of formation of the liquid and the selected heat of vaporization to the dimer, which derivation has been given in the LiBr(g) table.

Heat Capacity and Entropy.

J. Berkowitz, J. Chem. Phys. 29, 1386 (1958), 32, 1519 (1960), has calculated the molecular structure and vibrational frequencies based on an ionic model. The planar rhombic structure for dimeric lithium bromide, proposed by Berkowitz, has been confirmed by the lack of polarity in electric deflection by A. Buchler, J. L. Stauffer and W. Klemperer, J. Am. Chem. Soc. 85, 4544 (1964). The selected bond distances and angle were obtained from the electron diffraction studies of monomer-dimer vapor by P. A. Kikichin and N. G. Rambidi, Z. Physik Chem. 213, 111 (1960). The bond distances (r<sub>Li-Br</sub> = 4.20 Å and r<sub>Li-Li</sub> = 2.60 Å) calculated by Berkowitz are in reasonable agreement with those selected. The three principal moments of inertia are I<sub>A</sub> = 4.1866 X 10<sup>-39</sup>, I<sub>B</sub> = 98.3352 X 10<sup>-39</sup> and I<sub>C</sub> = 102.5218 X 10<sup>-39</sup> g cm<sup>2</sup>.

S. H. Bauer, T. Ino and R. P. Porter, J. Chem. Phys. 33, 685 (1960), have estimated six vibrational frequencies (576, 576, 202, 250, 329 and 365 cm<sup>-1</sup>) for Li<sub>2</sub>Br<sub>2</sub>(g) in the electron diffraction studies of Li<sub>2</sub>Cl<sub>2</sub>(g). W. Klemperer and W. G. Norris, J. Chem. Phys. 34, 1071 (1961), have observed two fundamental vibrational frequencies (413 and 295 cm<sup>-1</sup>) in the infrared spectrum and tentatively assigned them as B<sub>2u</sub> and B<sub>3u</sub> modes and these have been adopted in the tabulation. The remaining four vibrational frequencies were obtained from J. Berkowitz, loc. cit., because his model and derivation are self-consistent.

MAGNESIUM DIBROMIDE (MgBr<sub>2</sub>) (CRYSTAL) OFW = 184.130

ΔH°<sub>f</sub> = Unknown

ΔH°<sub>f</sub>298.15 = -124.0 ± 1 kcal/mol

ΔH°<sub>m</sub> = 8.3 ± 2 kcal/mol

S°<sub>298.15</sub> = [28.5 ± 2] gibbs/mol

T<sub>m</sub> = 984°K

Heat of Formation

The heat of formation was calculated from ΔH° values for Mg<sup>++</sup>(H<sub>2</sub>O) and Br<sup>-</sup>(H<sub>2</sub>O) and ΔHsol°(H<sub>2</sub>O) for MgBr<sub>2</sub>(c). The value for Br<sup>-</sup> was obtained from D. D. Wagman et al., NBS Tech. Note 270-1, Natl. Bur. of Std., Washington, D.C., 1965. Values for Mg<sup>++</sup> and ΔHsol° were taken from F. D. Rossini et al., NBS Circ. 500, Natl. Bur. of Std., Washington, D.C., 1952, since a survey of the literature revealed no new data which would significantly change these values. ΔHsol° is based on measurements of Beketoff, Bull. acad. sci. Russ. 34, 291 (1892), which Mg<sup>++</sup> is presumably based on data for MgCl<sub>2</sub>.

The selected heat of formation is confirmed by ΔH°<sub>f</sub>073 = -0.267 kcal/mol for MgBr<sub>2</sub>(l) + HCl(g) = MgCl<sub>2</sub>(l) + HBr(g) observed by J. Togrur, H. Flood and T. Forland, Acta Chem. Scand. 7, 1502 (1963). Based on JANAF functions, this leads to ΔH°<sub>f</sub>298 = -124.9 kcal/mol for MgBr<sub>2</sub>(c).

Heat Capacity and Entropy

The entropy and heat capacity were estimated by comparison with the corresponding values for MgCl<sub>2</sub>, NaCl and NaBr. W. M. Latimer, "Oxidation Potentials," 2nd Edition, Prantice-Hall, Inc., New York, 1952, has estimated S°<sub>298</sub> = 29.4 eu which is also a reasonable value. Use of 29.4 eu would give almost exact agreement between the selected ΔH°<sub>f</sub> and the equilibrium data of Togrur et al., but this may be fortuitous because of uncertainties in the enthalpy and heat of melting for MgBr<sub>2</sub>.

Melting Data

T<sub>m</sub> and ΔH°<sub>m</sub> are the values obtained by K. K. Kelley, USNM Bulletin 393, 1956, from phase diagrams for the systems MgBr<sub>2</sub> - NaBr and MgBr<sub>2</sub> - KBr studied by G. Kellner, Z. Anorg. Chem. 99, 137 (1912), and for MgBr<sub>2</sub> - LiBr studied by A. Ferrati and C. Colla, Atti accad. Lincei, ser. 6, 13, 78 (1931).

 $\Delta H_f^{\circ} 298.15 = [-118.337] \text{ kcal/mol}$ 
 $\Delta H_m^{\circ} = 6.3 \text{ kcal/mol}$ 
 $\Delta H_v^{\circ} = [32.9] \text{ kcal/mol}$ 
 $S_{298.15}^{\circ} = [31.968] \text{ gibbs/mol}$ 
 $T_m = 984^{\circ}\text{K}$ 
 $T_b = [1557]^{\circ}\text{K}$ 

## Heat of Formation.

The  $\Delta H_f^{\circ} 298.15$  was obtained from  $\Delta H_f^{\circ} 298.15(c)$  by adding  $\Delta H_m^{\circ}$  and the difference between  $H_{298}^{\circ}$  and  $H_{298.15}^{\circ}$  for crystal and liquid.

## Heat Capacity and Entropy.

The heat capacity was assumed constant and estimated as 23.25 gibbs/mol using 7.75 gibbs/g-atom as suggested by O. Kubaschewski and E. L. Evans, "Metallurgical Thermochemistry," Pergamon Press, New York, 1958. The entropy was obtained in a manner analogous to that of the heat of formation.

## Melting Data.

See MgBr<sub>2</sub>(c) table.

## Vaporization Data.

$T_b$  was calculated as the temperature at which  $\Delta G_r^{\circ} = 0$  for  $\text{MgBr}_2(c) \rightarrow \text{MgBr}_2(g)$ .  $\Delta H_v^{\circ}$  is the corresponding enthalpy change.

(Ideal Gas) GFW = 184.130

Point Group D<sub>∞h</sub>

S<sub>298.15</sub> = [67.5 + 2] gibbs/mol

Ground State Quantum Weight = [1]

ΔH<sub>f</sub><sup>o</sup> = -70.8 kcal/mol

ΔH<sub>f</sub><sup>o</sup><sub>298.15</sub> = -74.6 + 3 kcal/mol

Vibrational Frequencies and Degeneracies

$$\frac{\omega_j \text{ cm}^{-1}}{[179](1)}$$

$$\frac{[220](2)}{491(1)}$$

Bond Distance: Mg-Br = 2.34 Å

Bond Angle: Br-Mg-Br = 180°

Rotational Constant: B = 0.019264 cm<sup>-1</sup>

Heat of Formation.

The ΔH<sub>f</sub><sup>o</sup><sub>298.15</sub> was calculated from the ΔH<sub>f</sub><sup>o</sup><sub>298.15</sub> = 49.4 kcal/mol for the reaction MgBr<sub>2</sub>(c) = MgBr<sub>2</sub>(g), based on third law analysis of pressures at 798 and 842°K determined from Knudsen effusion - mass spectrometric studies by J. Berkowitz and J. R. Marquett, J. Chem. Phys. **37**, 1853 (1962). Second law analysis of ion intensities (635 - 850°K) gave ΔH<sub>f</sub><sup>o</sup> = 50.3 kcal/mol at 727°K, corresponding to ΔH<sub>f</sub><sup>o</sup> = 52.2 kcal/mol at 298.15°K. The absolute pressure at 842°K was calibrated by integrating the ion current during complete volatilization of the sample. Data for (MgBr<sub>2</sub>)<sub>2</sub> indicate that the dimer mole fraction (about 0.04 at 842°K) over the crystal increases with increasing temperature; this behavior is similar to that of the alkali halides.

Heat Capacity and Entropy.

Bond distance and bond angle were taken from the electron diffraction studies of P. A. Aklonis, V. P. Spiridonov, G. A. Sobolev and V. A. Neumov, Zhur. Fiz. Khim. **31**, 461 (1957). Electric deflection experiments of A. Richter, J. L. Stauffer and W. Klumperer, J. Am. Chem. Soc. **86**, 4544 (1964), also suggest a linear structure for MgBr<sub>2</sub> within the sensitivity of the measurements. The antisymmetric stretching vibration ν<sub>3</sub> is that observed in the infrared spectra of the vapor by S. P. Rendell, F. T. Greene and J. L. Margrave, J. Phys. Chem. **63**, 759 (1959). The other frequencies were estimated by L. Brewer, G. R. Somayajulu and E. Brackett, Chem. Rev. **63**, 111 (1963), from a valence force model using K = 1.5 and kδ<sup>2</sup>/12 = 0.15 md/Å.

$\Delta H_f^0 = -111.93 \pm 0.90 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{298.15} = -116.24 \pm 0.90 \text{ kcal. mole}^{-1}$

Heat of Formation.

The temperature dependance of the equilibrium constants (1293-1434°K.) for the reaction (NaBr)<sub>2</sub>(g) ⇌ 2NaBr(g) has been studied by S. Datz, W. T. Smith, Jr. and E. H. Taylor, J. Chem. Phys. **34**, 558 (1961). The dissociation energy (ΔE<sub>300°K.</sub>) was evaluated to be 42.9 ± 1.3 kcal. mole<sup>-1</sup>. The vapor mixture contains 37 to 17% of dimers in the temperature range of 1293 to 1434°K. Hence the vapor pressure data on NaBr(g) reported by the previous investigators were reexamined. In other words, the reported vapor pressure of NaBr(g) is the sum of the partial pressures of both the monomer (NaBr) and the dimer (Na<sub>2</sub>Br<sub>2</sub>). The partial pressures of Na<sub>2</sub>Br<sub>2</sub>(g) thus obtained were used to evaluate the heats of vaporization by both the second and third law methods. The values of ΔH<sub>f</sub>° 298.15 for Na<sub>2</sub>Br<sub>2</sub>(g) were then calculated. The results are presented as follows.

| Investigator                         | Reaction                                       |                  | ΔH <sub>f</sub> ° 298.15 kcal. mole <sup>-1</sup> |
|--------------------------------------|--|------------------|---|

| Bloom et al. <sup>6</sup>            | 2NaBr(l) → Na <sub>2</sub> Br <sub>2</sub> (g) | 45.49            | -116.72**   |

\*\*Based on the average of the second and third law values.

\*\*Only the third law value being used.

- 1 K. Niwa, J. Fac. Sci., Hokkaido Univ., Ser. III, **2**, 201 (1938).
- 2 G. E. Cogin and O. E. Kimball, J. Chem. Phys., **16**, 1035 (1948).
- 3 J. E. Mayer and I. H. Wintner, J. Chem. Phys., **5**, 301 (1938).
- 4 O. Ruff and S. Muggan, Z. anorg. allgem. Chem., **117**, 147 (1921).
- 5 H. von Wartenberg and P. Albrecht, Z. Electrochem., **27**, 162 (1921).
- 6 H. Bloom, J. O.M. Bookria, N. E. Richards and R. O. Taylor, J. Am. Chem. Soc. **80**, 2044 (1958).

The value of ΔH<sub>f</sub>° 298.15 for Na<sub>2</sub>Br<sub>2</sub>(g) adopted is the average of the six ΔH<sub>f</sub>° 298.15 values listed in the above table.

Heat Capacity and Entropy.

Bond distance and angles were calculated based on the related data reported by J. Berkowitz, J. Chem. Phys. **29**, 1386 (1958). The vibrational frequencies were calculated by J. Berkowitz, J. Chem. Phys., **32**, 1519 (1960), from an assumed model. The ground state quantum weight was estimated. The three principal moments of inertia are I<sub>A</sub> = 1.94452 X 10<sup>-38</sup>, I<sub>B</sub> = 1.33619 X 10<sup>-37</sup> and I<sub>C</sub> = 1.53065 X 10<sup>-37</sup> g. cm.<sup>2</sup>

Lead Dibromide (PbBr<sub>2</sub>) (Crystal)

Mol. Wt. = 367.04

ΔH<sub>f</sub><sup>0</sup> 298.15 = -66.07 ± 0.20 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>0</sup> = 38.66 ± 0.5 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

ΔH<sub>f</sub><sup>0</sup> 298.15 = 41.90 ± 0.17 kcal. mole<sup>-1</sup>

T<sub>m</sub> = 640°K.

ΔH<sub>m</sub><sup>0</sup> = 4.96 kcal. mole<sup>-1</sup>

Heat of Formation. Recalculated from the data reported by H. Braune and P. Konef, Z. anorg. Chem., 87, 175 (1914) and C. Kramer, Z. Elektrochem., 26, 97 (1920).

Heat Capacity, Entropy, and Melting Data. C<sub>p</sub> (18.4° to 297.0°K.) reported by W. M. Latimer and H. D. Hoehnel, J. Am. Chem. Soc., 49, 19 (1926). Above 298.15°K., C<sub>p</sub> given by K. K. Kelley, U. S. Bur. Mines Bull. 584 (1960) was used. T<sub>m</sub> and ΔH<sub>m</sub><sup>0</sup> obtained from M. Blanc and G. Petit, Compt. rend., 248, 1305 (1959).

Heat of Sublimation. Calculated from vapor pressure data of H. Bloom, J. O'M. Bockris, R. E. Richards and R. G. Taylor, J. Am. Chem. Soc., 80, 2044 (1958), H. von Wartenberg and O. Boase, Z. Elektrochem., 28, 394 (1922), F. Volmer, Phys. Z., 30, 590 (1929), and B. Greiner and K. Jellinek, Z. physik. Chem., 165, 97 (1933) which are in good agreement.

March 31, 1962

Lead Dibromide (PbBr<sub>2</sub>) (Liquid)

Mol. Wt. = 367.04  
 $\Delta H_f^{\circ} 298.15 = [-63.00 \pm 0.20]$  kcal. mole<sup>-1</sup>  
 $S_{298.15}^{\circ} = [42.699]$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m = 640^{\circ}\text{K.}$   
 $\Delta H_m^{\circ} = 4.96$  kcal. mole<sup>-1</sup>  
 $T_b = 1187^{\circ}\text{K.}$   
 $\Delta H_v^{\circ} = 27.44 \pm 0.17$  kcal. mole<sup>-1</sup>

Heat of Formation. Calculated from that of the crystal.

Heat Capacity, Entropy, and Melting Data. C<sub>p</sub> obtained from K. K. Kelley, U. S. Bur. Mines Bull. 584 (1960). T<sub>m</sub> and ΔH<sub>m</sub> reported by M. Blanc and G. Petit, Compt. rend. 249, 1365-6 (1959). A glass transition temperature of 400°K. is assumed.

Vaporization Phenomena. T<sub>b</sub> and ΔH<sub>v</sub><sup>o</sup> calculated from ΔH<sub>f</sub><sup>o</sup> 298.15 and free energy functions for condensed and gaseous states.

Lead Dibromide (PbBr<sub>2</sub>)

(Ideal Gas) Mol. Wt. = 367.04

ΔH<sub>f</sub><sup>o</sup> = unknown  
 ΔH<sub>f</sub><sup>o</sup><sub>298.15</sub> = -96.9 ± 5.0 kcal/mol  
 ΔH<sub>s</sub><sup>o</sup> = [49.29] kcal/mol

S<sup>o</sup><sub>298.15</sub> = [25.9 ± 2.0] gibbs/molT<sub>s</sub> = [1208.8]°KHeat of Formation

The heat of formation of TiBr<sub>2</sub> crystal is derived from the data of Hall and Blocher (1) for the reaction 2TiBr<sub>3</sub>(c) = TiBr<sub>4</sub>(g) + TiBr<sub>2</sub>(c). Second and third law analyses of these data are not useful because of the formation of solid solutions in the above process. Hall and Blocher obtained a value of ΔH<sub>f</sub><sup>o</sup> of 31.3 kcal/mol for the reaction by integrating the incremental free energy changes over varying compositions of the solid solutions. The corresponding ΔH<sub>f</sub><sup>o</sup><sub>298</sub> and ΔH<sub>f</sub><sup>o</sup> are calculated as 34.6 kcal/mol and -96.9 kcal/mol, respectively, using auxiliary JANAF heats of formation and enthalpy data.

Heat Capacity and Entropy

The heat capacity of TiBr<sub>2</sub>(c) was estimated by Kelley (2). The value of S<sup>o</sup><sub>298.15</sub> is estimated from that of TiCl<sub>2</sub>(c) and the difference between ionic entropy contributions of Cl<sup>-</sup> and Br<sup>-</sup>.

Heat of Sublimation

The heat of sublimation of TiBr<sub>2</sub>(c) is taken as the difference in the heats of formation of TiBr<sub>2</sub>(c) and TiBr<sub>2</sub>(g) at the sublimation temperature. The sublimation temperature is taken as the point at which ΔG<sup>o</sup> = 0 for the reaction TiBr<sub>2</sub>(c) = TiBr<sub>2</sub>(g). The heat of formation of TiBr<sub>2</sub>(g), upon which these quantities depend, is an estimated quantity.

Bond Distance: Ti-Br = [2.4] Å  
 Bond Angle: Br-Ti-Br = [180°]  
 Rotational Constant: B<sub>0</sub> = [0.0183] cm<sup>-1</sup>  
 σ = 2

**Heat of Formation**  
 The heat of formation of TiBr<sub>2</sub>(g) is calculated from the estimated Ti-Br bond energy. The bond energy is estimated as being the same as the average Ti-Cl bond energy of TiCl<sub>2</sub>(g). This estimate is used because the measured average bond energies of TiBr<sub>3</sub>(g) and TiCl<sub>3</sub>(g) and those of TiBr<sub>4</sub>(g) and TiCl<sub>4</sub>(g) are very nearly equal.

**Heat Capacity and Entropy**  
 The interatomic distances are estimated from those of TiCl<sub>2</sub>(g), TiCl<sub>3</sub>(g) and TiBr<sub>4</sub>(g). The vibrational frequencies are estimated from a valence force field model. The force constant k is estimated as 1.2 millidynes Å<sup>-1</sup>, and the constant k<sub>f</sub>/l<sup>2</sup> is assumed to be 0.06 millidynes Å<sup>-1</sup>. These values are derived by a correlation with other dihalides.

The electronic levels are assumed to be the same as TiCl<sub>2</sub>(g). The levels of TiCl<sub>2</sub>(g) are estimated by assuming that they correspond to the inverted states of NiCl<sub>2</sub>(g) (1). The linear configuration is adopted since experimental evidence indicates that other transition metal dihalides are linear (2, 3, 4, 5).

Heat of Formation

The value of  $\Delta H_f^\circ$  (ZrBr<sub>2</sub>, c) = -96.7 kcal/mol is calculated from the estimated  $\Delta H_e^\circ_{298} = 55 \pm 5$  kcal/mol for ZrBr<sub>2</sub>(c) + ZrBr<sub>2</sub>(g), using  $\Delta H_f^\circ_{298}$  (ZrBr<sub>2</sub>, g) = -41.7 kcal/mol (1). The estimated  $\Delta H_e^\circ_{298}$  is obtained as an average of the heats of sublimation at 298°K for CrBr<sub>2</sub>, MnBr<sub>2</sub>, CoBr<sub>2</sub>, NiBr<sub>2</sub>, given by Brewer, Somayajulu and Brackett (2) and TiBr<sub>2</sub> and FeBr<sub>2</sub> listed in JANAF tables (3).

Heat Capacity and Entropy

The heat capacities of ZrBr<sub>2</sub>(c) are estimated from TiBr<sub>2</sub>(c) (3) based on the assumption  $C_p(\text{ZrBr}_2) = C_p(\text{TiBr}_2) + 3/2 R \ln(\text{at. wt. of Zr}/\text{at. wt. of Ti})$ . The entropy,  $S^\circ_{298} = 27.7$  eu, is estimated in a similar manner based on TiCl<sub>2</sub>(c) (4) and TiBr<sub>2</sub>(c) (3).

Melting Data

The heat of fusion is roughly estimated, so that the entropy of vaporization is about 20 eu. The melting point was estimated by Brewer (5).

ZIRCONIUM DIBROMIDE (ZrBr<sub>2</sub>) (LIQUID) GFW = 251.038

$\Delta H_f^\circ_{298.15} = [43.983] \text{ gibbs/mol}$

$\Delta H_f^\circ_{298.15} = [-81.920] \text{ kcal/mol}$

$\Delta H_m^\circ = [15.0 \pm 10] \text{ kcal/mol}$

$\Delta H_v^\circ = [31.5] \text{ kcal/mol}$

$S^\circ_{298.15} = [43.983] \text{ gibbs/mol}$

$T_m = [900]^\circ\text{K}$

$T_b = [1555.1]^\circ\text{K}$

Heat of Formation

The  $\Delta H_f^\circ$  (ZrBr<sub>2</sub>, l) is calculated from  $\Delta H_f^\circ$  (ZrBr<sub>2</sub>, c) by adding  $\Delta H_m^\circ$  and the difference between  $H_{900} - H_{298}$  for crystal and liquid.

Heat Capacity and Entropy

The heat capacity is assumed to be constant at 7.25 gibbs/g-atom. The entropy is calculated in a manner analogous to that of the heat of formation.

Melting Data

See ZrBr<sub>2</sub>(c) table for details.

Vaporization Data

T<sub>b</sub> is the temperature at which the Gibbs energy change approaches zero for the process  $ZrBr_2(l) + ZrBr_2(g)$ . The difference between  $\Delta H_f^\circ$  for ZrBr<sub>2</sub>(l) and ZrBr<sub>2</sub>(g) at T<sub>b</sub> is  $\Delta H_v^\circ$ .

Heat of Formation

The heat of formation,  $\Delta H_f^\circ(\text{ZrBr}_2, g) = -41.7 \text{ kcal/mol}$ , is derived from the estimated  $\Delta H_f^\circ(298) = 243.5 \pm 10 \text{ kcal/mol}$  for  $\text{ZrBr}_2(g) + \text{Zr}(g)$ . The value of  $\Delta H_f^\circ(298)$  is twice the average bond dissociation energy,  $D_{298}^\circ(\text{Zr-Br}_2) = 121.75 \text{ kcal/mol}$ , which is calculated from the relation  $D_{298}^\circ(\text{Zr-Br}_2) = D_{298}^\circ(\text{Zr-Br})/D_{298}^\circ(\text{Ti-Br}_4)$ . The average bond dissociation energies,  $D_{298}^\circ(\text{Zr-Br}_4) = 102.2 \text{ kcal/mol}$ ,  $D_{298}^\circ(\text{Ti-Br}_4) = 87.9 \text{ kcal/mol}$  and  $D_{298}^\circ(\text{Ti-Br}_2) = 104.6 \text{ kcal/mol}$ , are all calculated from JANAF  $\Delta H_f^\circ(298)$  for  $\text{ZrBr}_4(g)$ ,  $\text{TiBr}_4(g)$ ,  $\text{TiBr}_2(g)$ ,  $\text{Zr}(g)$ ,  $\text{Ti}(g)$  and  $\text{Br}(g)$ .

Heat Capacity and Entropy

The molecular configuration is assumed to be linear, since experimental evidence indicates that the transition metal dihalides are generally linear ( $\lambda, \mu, \nu, \xi$ ) even though a few fluorides are bent ( $\zeta$ ). The bond distance is assumed to be the same as that in  $\text{ZrBr}_4(g)$  which was estimated as 2.47 Å by Godnev et al. (7). The moment of inertia is 161.8979 x 10<sup>-39</sup> g cm<sup>2</sup>.

The vibrational frequencies are calculated from a valence force field model. The stretching force constant is estimated to be 1.2 millidyne/Å and the bending force constant 0.06 millidyne/Å. These values are derived from force constants of transition metal dihalides listed by Brewer, Somayajulu and Brackett (8). The electronic levels and quantum weights are estimated to be the same as those of gaseous  $\text{TiCl}_2$  (9).

Bond Distances: P-O = 1.41 ± 0.07 Å P-Br = 2.06 ± 0.03 Å  
 Bond Angle: Br-P-Br = 108° ± 3° σ = 3  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 2.2602 X 10<sup>-112</sup> g. cm.<sup>6</sup>

Heat of Formation:  
 The ΔH<sub>f</sub><sup>0</sup> 298.15 of POBr<sub>3</sub>(g) was calculated from the heat of formation of the crystal and the heat of sublimation. The heat of sublimation was obtained by combining the ΔH<sub>f</sub><sup>0</sup> and an estimated ΔH<sub>m</sub><sup>0</sup>. The heat of formation of the crystal was derived from the heats observed for the reaction: POBr<sub>3</sub>(c) + (n+3)H<sub>2</sub>O(l) → [H<sub>3</sub>PO<sub>4</sub>·3HBr] in nH<sub>2</sub>O(l). The data used in these calculations may be summarized as follows:

Data  
 ΔH<sub>f</sub><sup>0</sup> 298.15 (water solutions) H<sub>3</sub>PO<sub>4</sub>  
 ΔH<sub>f</sub><sup>0</sup> 298.15 (water solutions) HBr  
 ΔH<sub>f</sub><sup>0</sup> 298.15 (liquid) H<sub>2</sub>O = -68.3174 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>0</sup> 298.15 (crystal) POBr<sub>3</sub> = -109.1 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>0</sup> 298.15 = [3.7] kcal. mole<sup>-1</sup>  
 ΔH<sub>v</sub><sup>0</sup> 298.15 = [12.1] kcal. mole<sup>-1</sup>

 Obtained graphically from "Selected Values of Chemical Thermodynamic Properties," Natl. Bur. Stds. Circular 500.  
 "Selected Values of Chemical Thermodynamic Properties," National Bureau of Standards Circular 500.  
 Recalculated from heats observed by T. Charnley and H. A. Skinner, J. Chem. Soc. 450 (1953).  
 Estimated from comparison with POCl<sub>3</sub>.  
 Estimated from the ΔH<sub>f</sub><sup>0</sup> at T<sub>m</sub> (10.6 kcal. mole<sup>-1</sup> at 464.9°K). ΔH<sub>v</sub><sup>0</sup> was calculated from a least squares treatment of the v.p. data of M. Van Driël, Rec. Trav. Chim. 61, 748 (1942).

Heat Capacity and Entropy.  
 The molecular constants used were calculated from electron diffraction measurements by J. H. Searlet and L. O. Brockway, J. Am. Chem. Soc. 55, 1941 (1944). The calculated moments are I<sub>A</sub> = I<sub>B</sub> = 8.66174 X 10<sup>-86</sup> g. cm.<sup>2</sup> and I<sub>C</sub> = 1.474471 X 10<sup>-57</sup> g. cm.<sup>2</sup>

From the Raman spectra of POBr<sub>3</sub> the vibrational frequencies were measured and assigned by H. Garding and M. van Driël, Rec. Trav. Chim. 61, 419 (1942). The Raman spectra was studied end the vibrational frequencies were listed by M. L. Delvaule and P. Francois, Compt. Rend. 220, 817 (1945). The frequencies may also be found in Compt. Rend. 222, 550 (1946) and J. Chim. Phys. 45, 87 (1948) by Delvaule and Francois.

Heat of Formation.

The heat of formation of PBr<sub>3</sub> gas from white (α) phosphorus, -34.9 kcal. mole<sup>-1</sup>, was obtained by T. Charnley and H. A. Skinner, J. Chem. Soc. 450 (1953). This was changed from white (α) to the red (V) phosphorus reference state to give the value used in this table (-30.7 kcal. mole<sup>-1</sup>). To obtain their value (-34.9 kcal. mole<sup>-1</sup>), Charnley and Skinner measured the heat of formation of the liquid, and combined it and their estimate of the liquid enthalpy with the heat of vaporization (9.5 kcal. mole<sup>-1</sup>) calculated by M. Van Driël and H. Oarding, Rec. Trav. Chem. 50, 943 (1941). For the liquid heat of formation Charnley and Skinner observed the  $\Delta H_f^0 = -67.2 \pm 0.6$  kcal. mole<sup>-1</sup> for PBr<sub>3</sub>(l) + (n+3)H<sub>2</sub>O(l) → [H<sub>3</sub>PO<sub>3</sub> + 3nHBr] in nH<sub>2</sub>O(l). Van Driël and Oarding measured the vapor pressure over PBr<sub>3</sub>(l) and calculated the heat of vaporization with the aid of a modified Clapeyron equation. The uncertainties on the heats of formation are estimates.

Heat Capacity and Entropy.

Q. Williams and W. Oordy, Phys. Rev. 79, 225 (1950) have reported moments of inertia from the microwave spectrum of PBr<sub>3</sub>. From this data D. H. Whiffen in "Tables of Interatomic Distances and Configuration in Molecules and Ions", Scientific Editor, L. E. Sutton, Special Publication No. 11, The Chemical Society (London) 1958, has calculated the selected molecular constants. From these constants the principal moments of inertia were calculated as  $I_A = I_B = 8.5214 \times 10^{-38}$  g. cm.<sup>2</sup> and  $I_C = 1.6363 \times 10^{-37}$  g. cm.<sup>2</sup>

M. Lister and L. E. Sutton, Trans. Faraday Soc. 37, 393 (1941) have reported P-Br =  $2.23 \pm 0.04$  Å and the angle P-Br-P =  $100^\circ \pm 2^\circ$ . S. M. Swingle has measured P-Br =  $2.16 \pm 0.03$  Å and the angle P-Br-P =  $101.5^\circ \pm 1.5^\circ$ . The work of Swingle was reported in a private communication from L. Pauling and V. Schomaker, California Institute of Technology to P. W. Allen and L. E. Sutton, Acta. Cryst. 3, 48 (1950). Swingle's data as well as that of Lister and Sutton was obtained by electron diffraction. The  $106^\circ$  angle was selected since  $101.5^\circ$  and  $100^\circ$  give imaginary force constants with the ranges allowed for the type A, 392 cm.<sup>-1</sup> frequency and the form of the potential function assumed by P. W. Davis and R. A. Oetjen, J. Molecular Spec., 2, 253 (1958).

The vibrational frequencies were measured and assigned in the infrared by Davis and Oetjen. Raman measurements and assignments by J. Cabannes and A. Rausset, Ann. Phys. (Paris) 19, 229 (1953) were also listed by M. L. Delawalle, Compt. Rend. 222, 1391 (1946) and Compt. Rend. 224, 389 (1947). The Raman assignments were as follows: type A, 380 cm.<sup>-1</sup> and 162 cm.<sup>-1</sup> and type E, 400 cm.<sup>-1</sup> and 116 cm.<sup>-1</sup>.

Bond Distance: P-Br = 2.13 ± 0.03 Å P-S = 1.89 ± 0.06 Å

Bond Angle: Br-P-Br = 106° ± 3° σ = 3

Product of the Moments of Inertia: I<sub>A</sub><sup>2</sup>I<sub>B</sub>I<sub>C</sub> = 1.8780 × 10<sup>-111</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The ΔH<sub>f</sub><sup>0</sup> 298.15 of PSBr<sub>3</sub>(g) was calculated from the ΔH<sub>f</sub><sup>0</sup> 298.15 of POBr<sub>3</sub>(g) and estimated strengths for P-S and P-O bonds.

The difference in the P-S and P-O bond strengths was assumed to be the same for POBr<sub>3</sub> - PSF<sub>3</sub> and POBr<sub>3</sub> - PSBr<sub>3</sub>. For the P-S bond strength in PSF<sub>3</sub>, C. B. Henderson and R. S. Scheffer, "Survey of Thermochemical Data," January 1960, Atlantic Research Corp., Alexandria, Virginia, estimated 91 kcal., from a consideration of unpublished data. The P-O bond was estimated to be 115 kcal. by E. Neale and L. T. D. Williams, J. Chem. Soc. 2485 (1955) and E. Neale, L. T. D. Williams, and V. T. Moores, J. Chem. Soc., 422 (1956).

The ΔH<sub>f</sub><sup>0</sup> 298.15 of POBr<sub>3</sub>(g) [-93] kcal. mole<sup>-1</sup>, was taken from the March 31, 1963, JANAP Table. The ΔH<sub>f</sub><sup>0</sup> 298.15 of O(g) and S(g) were taken from June 30, 1962, and March 31, 1961, JANAP Table.

Heat Capacity and Entropy.

The molecular constants were determined from electron diffraction data by J. H. Secriest and L. O. Brockway, J. Am. Chem. Soc. 66, 1941 (1944). The principal moments of inertia calculated from these constants were I<sub>A</sub> = 1.105941 × 10<sup>-37</sup> g. cm.<sup>2</sup>, and I<sub>B</sub> = 1.535429 × 10<sup>-37</sup> g. cm.<sup>2</sup>

The vibrational frequencies obtained from the Raman spectra of PSBr<sub>3</sub> were reported by M. L. Delwaille and P. Francois, Compt. Rend. 224, 1422 (1947).

TITANIUM TRIBROMIDE (TiBr<sub>3</sub>) (CRYSTAL)

GFW = 287.627

$\Delta H_f^\circ = -127.0 \pm 2.0$  kcal/mol  
 $\Delta H_f^\circ 298.15 = -131.5 \pm 2.0$  kcal/mol  
 $\Delta H_t^\circ = 0$  kcal/mol  
 $\Delta H_s^\circ = 33.165$  kcal/mol

S<sub>298.15</sub> = 42.2 ± 0.8 gibbs/molT<sub>t</sub> = 179.9°KT<sub>s</sub> = 1067.2°K

## Heat of Formation

The heat of formation of TiBr<sub>3</sub>(c) is based on the vapor pressure data reported by Hall and Blocher (1) for the process 1/2(Hg<sub>2</sub>Br<sub>2</sub>(c) + TiBr<sub>3</sub>(c) = TiBr<sub>4</sub>(g) + Hg(l) over the temperature range 430 to 848°K. Second and third law analyses of these data give values for the heat of reaction of 24.2 ± 0.3 and 24.4 kcal/mol, respectively, for seventy three points, with ten points rejected due to failure of a statistical test. The third law drift in the data is calculated as 0.6 ± 0.6 eu. The third law value of 24.4 kcal/mol is combined with the JANAF heats of formation of TiBr<sub>4</sub>(g) and Hg<sub>2</sub>Br<sub>2</sub>(c) to obtain the adopted heat of formation.

## Heat Capacity and Entropy

The heat capacity and entropy of TiBr<sub>3</sub>(c) have been measured over the temperature range 51° to 800°K by King et al. (2). Heat capacities above 800°K are estimated from graphical extrapolation. The value of S<sub>298</sub> is derived from these data, based on S<sub>51</sub> = 8.60 eu. The value of S<sub>51</sub> is estimated from a Debye-Einstein extrapolation of the measured heat capacities, the equation being  $C_p = D(70.0/T) + E(120/T) + 2E(306/T)$ . It is assumed that all electronic entropy is contained within the measured and extrapolated heat capacities.

## Transition Data

A second order transition at 179.9°K was observed by King et al. (2). The heat capacity at this temperature is in excess of 56.1 gibbs/mol. King et al. measured the value of H<sub>106</sub> - H<sub>160</sub> as 0.773 kcal/mol.

## Heat of Sublimation

The heat of sublimation is calculated from the heats of formation of TiBr<sub>3</sub>(c) and TiBr<sub>3</sub>(g) at the sublimation temperature. The sublimation temperature is taken as the point at which ΔG = 0 for the process TiBr<sub>3</sub>(c) = TiBr<sub>3</sub>(g).

Bond Distance: Ti-Br = [2.4] Å

Bond Angle: Br-Ti-Br = [100]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.70 × 10<sup>-11</sup>] g<sup>3</sup> cm<sup>6</sup>

σ = 3

Heat of Formation

The heat of formation of TiBr<sub>3</sub>(g) is calculated from the heat of sublimation of TiBr<sub>3</sub>(c). A tentative equation for the vapor pressure of TiBr<sub>3</sub>(c) was reported by Hall and Blocher (1). Second and third law analyses of the equation over the temperature range 700° to 900°K give values of ΔH<sub>f</sub><sup>o</sup> of 45.2 and 41.9 kcal/mol, respectively, with a third law drift of -4.2 eu. The chosen value of ΔH<sub>f</sub><sup>o</sup> is based on the third law ΔH<sub>f</sub><sup>o</sup> 298.

Heat Capacity and Entropy

The interatomic distance is estimated from those of TiCl<sub>4</sub>, TiCl<sub>3</sub> and TiBr<sub>4</sub>. The pyramidal bond angle is estimated by assuming that TiBr<sub>3</sub>(g) is similar to the group V trihalides. The principal moments of inertia are I<sub>A</sub> = I<sub>B</sub> = 9.76 × 10<sup>-36</sup> g cm<sup>2</sup> and I<sub>C</sub> = 1.78 cm<sup>2</sup>. The vibrational frequencies are estimated from valence force field predictions and comparisons with group V trihalides. The electronic levels are estimated from the levels of Ti<sup>3+</sup> (2).

Mar. 31, 1962; June 30, 1964

$\Delta H_f^o = [-147] \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{298.15} = [-152] \text{ kcal. mole}^{-1}$   
 $\Delta H_g^{298.15} = [49] \text{ kcal. mole}^{-1}$   
 $S^{298.15} = [41.12] \text{ cal. mole}^{-1} \text{ deg.}^{-1}$   
 $T_g = [1100]^{\circ}\text{K.}$

Heat of Formation.

E. M. Larsen and J. J. Leddy, J. Am. Chem. Soc. 78, 5983 (1956), studied the reaction  $Zr(c) + 3ZrBr_4(g) = 4ZrBr_3(c)$  in the temperature range 473 to 973°K. and pressure range 5 to 15 atm. They present a plot of the fractional reaction, for a series of temperatures, as a function of the reaction time; however, they express doubt concerning the attainment of thermodynamic equilibrium.

The free energy function change for this reaction was calculated at 100° intervals from 500 to 1100°K. At each temperature, the equilibrium constant was assumed to be 1, and  $\Delta H_f^{298}$  accordingly calculated. These values and the heat of formation of  $ZrBr_4(g)$  [see ZrBr<sub>4</sub> table] were used to compute a series of values for the standard heat of formation of  $ZrBr_3(c)$ . The following table gives representative values at four temperatures.

| T(°K.) | K <sub>p</sub> | ΔH <sub>f</sub> <sup>o</sup> 298 | ΔH <sub>f</sub> <sup>o</sup> 298.15 [ZrBr <sub>3</sub> (c)] |
|--------|----------------|----------------------------------|---|
| 500    | 1              | -70.26 kcal. mole <sup>-1</sup>  | -132.9 kcal. mole <sup>-1</sup>                             |
| 700    | 1              | -96.48 kcal. mole <sup>-1</sup>  | -139.3 kcal. mole <sup>-1</sup>                             |
| 900    | 1              | -121.75 kcal. mole <sup>-1</sup> | -145.6 kcal. mole <sup>-1</sup>                             |
| 1100   | 1              | -146.28 kcal. mole <sup>-1</sup> | -151.8 kcal. mole <sup>-1</sup>                             |

If one assumes an initial pressure of from 5 to 10 atm. for  $ZrBr_4$  and stoichiometric amounts of reactants, then, on the basis of zirconium, the reaction must proceed to the extent of 80 to 90% for the pressure of  $ZrBr_4$  to attain a value of 1 atm. and hence an equilibrium constant of 1. The data of Larsen and Leddy indicate about 82% reaction at 973°K. It was assumed that around 1100°K. the equilibrium constant attains a value of 1 giving -152 kcal. mole<sup>-1</sup> for the heat of formation of  $ZrBr_3(c)$  at 298.15°K. The limits of error were taken to be ±16 kcal. mole<sup>-1</sup> which corresponds to a ±500° temperature spread in the above table.

A second law calculation of their data was carried out but the results are of doubtful value in view of the uncertainty in the attainment of equilibrium at the lower temperatures.

Heat Capacity and Entropy.

The heat capacity was estimated in the same manner as for  $ZrBr_4(c)$  [see  $ZrBr_4(c)$  table]. The values for  $\Delta H_f^o$  and  $\Delta G_f^o$  were taken to be the same as those estimated for  $ZrBr_4(c)$ . The internal contribution was obtained from the estimated  $ZrBr_3$  vibrational frequencies and the anharmonicity factor "a" was taken to be  $2.5 \times 10^{-3}$ . The specific heat above 300°K. was obtained by graphical extrapolation.

It was assumed, in the above estimation, that the crystalline lattice is made up of  $ZrBr_3$  molecules. However, E. Holze [see R. P. Rolsten, "Iodide Metals and Metal Iodides", John Wiley & Sons, Inc., New York, 1961, page 46] concluded that crystalline  $Zr_3$  was composed of a chain lattice of  $(Zr_2I_2)$  units. A chain lattice of  $(Zr_2Br_2)_n$  units is probably a better representation of the solid state structure of  $ZrBr_3$ . Until more quantitative data become available, however, it is felt that the above analysis gives a fair approximation to the heat capacity of  $ZrBr_3$ .

Temperature of Disproportionation.

As detailed in the "Heat of Formation" section, this was assumed to be  $1100 \pm 500^{\circ}\text{K.}$

Liquid Phase.

It is assumed that the liquid phase is thermodynamically unstable under ordinary conditions.

Sublimation Data.

The heat of sublimation at 298.15°K. was obtained from the difference in the heats of formation of the gas and solid at 298.15°K. The sublimation point was obtained from the free energy crossover between gas and solid.

Bond Distances: Zr-Br = [2.39] Å  
 Bond Angle: Br-Zr-Br = [98°]  
 Product of the Moments of Inertia:  $I_A I_B I_C = [1.757 \times 10^{-111}]$  gm.<sup>3</sup> cm.<sup>6</sup>  
 $\sigma = [3]$

The heats of formation, from the gaseous atoms, of the gaseous zirconium tetrahalides were computed from data issued in these tables. The zirconium-halide bond energy, taken as 1/4 of this heat of formation, was found to be linear with internuclear separation. From gaseous titanium tri- and tetrachloride, it was found that the bond energy of the trichloride was around 7 kcal. mole<sup>-1</sup> greater than that for titanium tetrachloride. This amount was added to the bond energy of zirconium tetrachloride to get that of zirconium trichloride which, when used with its estimated internuclear distance, was found to lie almost exactly on the bond energy versus internuclear distance curve for the tetrahalides. The bond energy for each of the gaseous trihalides of zirconium was determined from this curve and their estimated bond distances.

For zirconium tribromide, the heat of formation from the gaseous atoms was -329 kcal. mole<sup>-1</sup> and from the elements in their standard state, -103 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.  
 The measured internuclear distances for the tribromides of P, As, and Sb were plotted as a function of the atomic weight of these atoms and a smooth curve was drawn through the points. The internuclear distance for ZrBr<sub>3</sub> was taken from this plot. The bond angle was assumed to be intermediate between the bond angles of AsBr<sub>3</sub> and SbBr<sub>3</sub>; it was taken to be 98°. The individual moments of inertia are  $I_A = I_B = 101.408 \times 10^{-39}$  gm. cm.<sup>2</sup>,  $I_C = 172.669$  gm. cm.<sup>2</sup>.

The measured vibrational frequencies for the tribromides of phosphorus, arsenic, and antimony were plotted as a function of internuclear distance. Smooth curves through these points were obtained for  $\omega_1$ ,  $\omega_2$ , and  $\omega_4$ ; these curves and the estimated ZrBr<sub>3</sub> bond distance were used to obtain correlation values of  $\omega_1$ ,  $\omega_2$ , and  $\omega_4$  for ZrBr<sub>3</sub>. Force constants, assuming a valence force field and a Br-Zr-Br angle of 98°, were derived from the above values for  $\omega_1$  and  $\omega_2$ . These force constants were then used to derive values for  $\omega_3$  and  $\omega_4$ . By a process of successive approximation, a set of force constants was obtained which gave frequencies in good agreement with the three correlation values. The three correlation frequencies and the derived frequency were used in this table.

Bond Distance: Fe-Br = [2.24] Å

Bond Angles: Fe-Br<sub>2</sub>-Fe = [90]°

Br-Fe-Br<sub>2</sub>-bridge = [135]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.4498 x 10<sup>-110</sup>] g<sup>3</sup> cm<sup>6</sup>

Br<sub>2</sub>-bridge - Fe-Br<sub>2</sub>-bridge = [90]°

σ = [4]

Heat of Formation.

The chemical equilibria, 622-665°K, for the reaction Fe<sub>2</sub>Br<sub>4</sub>(g) = 2 FeBr<sub>2</sub>(g) were studied by R. P. Porter and R. C. Schoonmaker, J. Phys. Chem. 63, 626 (1959), using a mass spectrometer. Based on the reported partial pressures for the two species, the enthalpy change (ΔH<sub>f</sub><sup>298.15</sup>) for the reaction was evaluated by both the second and third law methods to be 40.36 ± 2.0 and 40.75 ± 0.2 kcal/mol, respectively. Using the third law ΔH<sub>f</sub><sup>298.15</sup> value and ΔH<sub>f</sub><sup>298.15</sup> (FeBr<sub>2</sub>,g) = -9.9 ± 0.5 kcal/mol, the heat of formation (ΔH<sub>f</sub><sup>298.15</sup>) for Fe<sub>2</sub>Br<sub>4</sub>(g) was calculated as -60.5 ± 2.0 kcal/mol and was adopted.

Heat Capacity and Entropy.

The molecular structure is assumed to be planar. The two Fe atoms are at the two opposite corners of a square. The other two corners of the square are occupied by two Br atoms. The two remaining Br atoms are situated outside the square on a straight line joining the two Fe atoms. The Fe-Br bond distance was estimated to be the same as that in the FeBr<sub>2</sub>(g) molecule. The first six vibrational frequencies were estimated by comparison with those for K<sub>2</sub>Br<sub>2</sub>(g) calculated by J. Berkowitz, J. Chem. Phys. 32, 1519 (1960). The last three degenerate frequencies were assigned arbitrarily in order to give good second and third law agreement for the heats of dissociation of dimer to monomer. The order of the frequencies listed above is arbitrary and not related to their species types.

The electronic levels and quantum weights were estimated by comparison with those for FeBr<sub>2</sub>(g). The three principal moments of inertia are: I<sub>A</sub> = 6.6576 x 10<sup>-36</sup>, I<sub>B</sub> = 4.3456 x 10<sup>-37</sup> and I<sub>C</sub> = 5.0113 x 10<sup>-37</sup> g cm<sup>2</sup>.

Br<sub>4</sub>Ti

GFW = 367.536

(CRYSTAL)

TITANIUM TETRABROMIDE (TiBr<sub>4</sub>)

ΔHf° = -141.7 ± 1.1 kcal/mol  
 ΔHf°<sub>298.15</sub> = -147.7 ± 1.0 kcal/mol  
 ΔHm° = 3.08 kcal/mol

S°<sub>298.15</sub> = 56.2 ± 1.6 kcal/mol  
 Tm = 311.4°K

Heat of Formation

The heat of formation, ΔHf°<sub>298</sub>, of TiBr<sub>4</sub>(c) has been determined calorimetrically by several investigators as follows.

| Investigators                     | Reaction  | ΔHf° <sub>298.15</sub><br>kcal/mol |
|-----------------------------------|---|------------------------------------|
| Nelson, Johnson and Prosen (1)    | Ti(c) + 2Br <sub>2</sub> (g) = TiBr <sub>4</sub> (c)  | -147.3 ± 1.1                       |
| Johnson, Gilliland and Prosen (2) | TiCl <sub>4</sub> (l) + 2Br <sub>2</sub> (l) = TiBr <sub>4</sub> (c) + 2Cl <sub>2</sub> (g) | -147.6 ± 1.3                       |
| Schlafer and Schmidtke (3)        | Ti(c) + 2Br <sub>2</sub> (l) = TiBr <sub>4</sub> (c)  | -147.7 ± 0.3                       |
| Gross, Hayman and Levi (4)        | Ti(c) + 2Br <sub>2</sub> (l) = TiBr <sub>4</sub> (c)  | -146.1 ± 0.3                       |

The chosen value of ΔHf°<sub>298</sub> is the average of these determinations. The value from the work of Nelson et al. (1) is obtained from their heat of reaction and the JANAF value for the heat of vaporization of bromine. The value obtained from Johnson et al. (2) is a combination of their heat of reaction and the JANAF value for the heat of formation of TiCl<sub>4</sub>(l).

Heat Capacity and Entropy

The heat capacity of TiBr<sub>4</sub>(c) has been measured over the temperature range 51° to 298°K by King et al. (5). They reported a value of 42.74 eu for S°<sub>298</sub> - S°<sub>51</sub> based on their measurements. The value of S°<sub>298</sub> is estimated as 15.46 eu. King et al. (5) reported an estimate of 14.75 ± 1.60 for the same quantity. The former estimate is used so that the values of ΔHf°<sub>298</sub> obtained by both second and third law methods are in agreement. See TiBr<sub>4</sub>(g) table for details. The value of H°<sub>51</sub> - H° is estimated as 0.372 kcal/mol. This estimate is based on a Debye-Einstein extrapolation of the measured heat capacity with vibrational contributions removed.

Melting Data

The melting temperature and heat of melting were reported by King et al. (5).

TITANIUM TETRABROMIDE (TiBr<sub>4</sub>) (LIQUID)

GFW = 367.536

S<sup>o</sup><sub>298.15</sub> = 67.918 ± 1.6 gibbs/mol

ΔH<sup>o</sup><sub>f298.15</sub> = -144.681 ± 1.0 kcal/mol

T<sub>m</sub> = 311.4°K

ΔH<sub>m</sub><sup>o</sup> = 3.08 kcal/mol

T<sub>b</sub> = 504.1°K

ΔH<sub>v</sub><sup>o</sup> = 10.80 kcal/mol

Heat of Formation

The heat of formation of TiBr<sub>4</sub>(l) is calculated from the heat of melting, ΔH<sub>m</sub><sup>o</sup><sub>311.4</sub>, the heat of formation of TiBr<sub>4</sub>(c), and the values of H<sub>311.4</sub> - H<sub>298.15</sub> for both crystal and liquid.

Heat Capacity and Entropy

King et al. (1) reported the heat capacity of TiBr<sub>4</sub>(l) between the melting point and normal boiling point. The entropy, S<sup>o</sup><sub>298</sub>, of TiBr<sub>4</sub>(l) is calculated from ΔS<sub>311.4</sub><sup>o</sup>, the values of S<sub>311.4</sub><sup>o</sup> of both crystal and liquid and the value of S<sup>o</sup><sub>298.15</sub> of TiBr<sub>4</sub>(c).

Melting Data

The melting temperature and heat of melting were reported by King et al. (1).

Vaporization Data

The boiling temperature, T<sub>b</sub>, is taken as the point at which K<sub>p</sub> = 1 for the reaction TiBr<sub>4</sub>(l) = TiBr<sub>4</sub>(g). The heat of vaporization is calculated as the difference between ΔH<sup>o</sup><sub>v</sub> of the liquid and gas at the boiling temperature. The vapor pressure data are discussed in the table for TiBr<sub>4</sub>(g).

TITANIUM TETRABROMIDE (TiBr<sub>4</sub>)

(IDEAL GAS)

Br<sub>4</sub>Ti

GFW = 367.536

Point Group T<sub>d</sub>S°<sub>298.15</sub> = 95.25 ± 1.0 gibbs/molΔH<sub>f</sub>° = -124.3 ± 1.2 kcal/mol

Ground State Quantum Weight = 1

ΔH<sub>f</sub>°<sub>298.15</sub> = -131.5 ± 1.2 kcal/mol

## Vibrational Frequencies and Degeneracies

| ω, cm <sup>-1</sup> | ω, cm <sup>-1</sup> |
|---------------------|---------------------|
| 229.5 (1)           | 382 (3)             |
| 74 (2)              | 90.5 (3)            |

Bond Distance: Ti-Br = 2.31 Å

Bond Angle: Br-Ti-Br = 109° 28'

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 6.76 × 10<sup>-111</sup> g<sup>3</sup> cm<sup>6</sup>

## Heat of Formation

The heat of formation of TiBr<sub>4</sub>(g) is calculated from those of TiBr<sub>4</sub>(c) and TiBr<sub>4</sub>(l) and the heats of reaction for the processes (A) TiBr<sub>4</sub>(c) = TiBr<sub>4</sub>(g) and (B) TiBr<sub>4</sub>(l) = TiBr<sub>4</sub>(g). Second and third law analyses of the vapor pressure data for these processes yield the following results. The first four investigations employed the spoon gauge method, the last investigation being a manometric determination.

| Source                    | Reaction | No. Pts. | Range T°K | ΔH° <sub>298</sub> , kcal/mol | Drift, kcal/mol |
|---------------------------|----------|----------|-----------|-------------------------------|-----------------|
| Boni, 1966 (1)            | A        | 13       | 275 - 311 | 16.4 ± 0.2                    | 16.19           |
| Funaki et al., 1961 (2)   | B        | 14       | 385 - 493 | 12.2 ± 0.3                    | 12.92           |
| Seki, 1941 (3)            | A        | 12       | 286 - 306 | 15.4 ± 0.5                    | 1.6 ± 0.3       |
| Hall et al., 1958 (4)     | B        | 69*      | 341 - 499 | 13.2 ± 0.1                    | 13.14           |
| Keavney & Smith, 1960 (5) | A        | 14       | 287 - 310 | 16.1 ± 0.3                    | 16.14           |

\* Four points rejected due to failure of a statistical test.

\*\* Calculation based on third law ΔH°<sub>298</sub>.

The adopted value of 131.5 kcal/mol is that obtained from the data of Hall et al. (4), whose third law drift was adjusted to zero by changing the entropy of the crystal within its uncertainty.

## Heat Capacity and Entropy

The interatomic distance was reported by Lister and Sutton (6). The tetrahedral configuration is confirmed by spectroscopic studies (7,8). The individual moments of inertia are I<sub>A</sub> = I<sub>B</sub> = I<sub>C</sub> = 1.69 × 10<sup>-37</sup> g cm<sup>2</sup>.

The vibrational frequencies have been reported by Delvaux and Francois (7) and by Miller and Carlson (8). These values are based primarily on the Raman and infrared spectra of TiBr<sub>4</sub>(l), the value of ν<sub>3</sub> being the only frequency measured for TiBr<sub>4</sub>(g).

The electronic spectra of TiBr<sub>4</sub> in solution have been measured by Dijkgraaf (9). Di Sipio et al. (10) have reported the near ultraviolet spectra of TiBr<sub>4</sub>(g). Both of these studies indicate that TiBr<sub>4</sub> has no low lying electronic levels which would contribute significantly to the entropy.

$\Delta H_f^o = [-1.75.3] \pm 0.8$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^o$  298.15 = -181.6 ± 0.6 kcal. mole<sup>-1</sup>  
 $\Delta H_g^o$  298.15 = 28.0 ± 1.0 kcal. mole<sup>-1</sup>

$S_{298.15}^o = [53.70]$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m = 723^\circ K.$   
 $T_g = 630^\circ K.$

Heat of Formation.

A. G. Turbull, J. Phys. Chem. 65, 1652 (1961), measured the heat effect accompanying the following reactions:

Turbull also measured the chlorine analogue of the above reactions. He used the measured heat of formation of zirconium tetrachloride, reported by Gross, Hyman and Levi [see ZrCl<sub>4</sub> table], to calculate the heats of formation of ZrO<sub>2</sub>(hyd.) and ZrOOH<sup>+</sup>(aq.). The heat of formation of solid zirconium tetrabromide from reaction (1) was -182.2 ± 0.7 kcal. mole<sup>-1</sup> and from reaction (2) was -181.0 ± 0.6 kcal. mole<sup>-1</sup>. An average of the two was taken to represent the heat of formation of the tetrabromide.

Heat Capacity and Entropy.

The heat capacity from 0 to 300°K. was calculated by means of the relationship  $C_p = C_{vib}(e_D = 85^\circ K.) + C_{tr}(e_D = 155^\circ K.) + C_{vr} + a_2 C_{tr}$ , where  $C_{tr}$  represents the hindered translational,  $C_{vr}$  the vibrational, and  $C_{v1}$  the internal vibrational contributions to the heat capacity of the solid.  $C_v = C_{vib} + C_{vr} + C_{v1}$  represents the constant volume heat capacity to which  $a_2 C_{tr}$ , the anharmonic contribution, is added to convert to a heat capacity at constant pressure. The internal contribution,  $C_{v1}$ , was obtained from the estimated vibrational frequencies [see gas table]. The values for  $\theta_D$  and  $\theta_2$  were obtained from an elaborate correlation with the corresponding values for ZrCl<sub>4</sub> [see ZrCl<sub>4</sub> crystal table].  $C_p$  was computed using a number of values for the constant term "a". The value,  $a = 2.5 \times 10^{-3}$ , was chosen from a consideration of the sublimation calculations [see below]. The heat capacity above 300°K. was obtained by a graphical extrapolation.

Melting Point.

This was reported by O. Rehlfis and M. Fischer, Z. anorg. allgem. Chem. 211, 349 (1933).

Sublimation Data.

Vapor pressure measurements have been reported by Rehlfis and Fischer (loc. cit.) and by H. L. Schläfer and H. Skoludek, Z. Elektrochem. 55, 367 (1962). The heat of sublimation results, for two values of "a", are given in the following table.

| Reference | "a"                    | ΔH <sub>s</sub> (298) [3rd Law] | ΔH <sub>s</sub> (298) [2nd Law] |
|-----------|------------------------|---------------------------------|---------------------------------|
|           |                        | A                               | B                               |
| Schläfer  | 3.0 X 10 <sup>-3</sup> | 27.43                           | 28.82                           |
| Schläfer  | 2.5 X 10 <sup>-3</sup> | 27.73                           | 28.68                           |
| Rehlfis   | 3.0 X 10 <sup>-3</sup> | 27.52                           | 28.15                           |
| Rehlfis   | 2.5 X 10 <sup>-3</sup> | 27.85                           | 27.99                           |

All heat values are in kcal. mole<sup>-1</sup>. Two sets of second law heat values are given; set "A" was obtained from the slope reported by the authors and set "B" from a least squares fit performed at The Dow Thermal Laboratory. Various high temperature extrapolations were carried out for a particular value of "a" but only insignificant changes in the heat of sublimation resulted. The data of Schläfer and Skoludek showed a considerable temperature dependent third law heat of sublimation at 298°K. when "a" was taken as 3.0 X 10<sup>-3</sup>, and a moderate temperature dependence when "a" was taken as 2.5 X 10<sup>-3</sup>. The data of Rehlfis and Fischer showed a very slight temperature dependence for  $a = 3.0 \times 10^{-3}$  and no temperature dependence for  $a = 2.5 \times 10^{-3}$ .

In both sets of data there are large differences between 2nd and 3rd law values for  $a = 3.0 \times 10^{-3}$ , good 2nd and 3rd law agreement for the data of Rehlfis and Fischer and  $a = 2.5 \times 10^{-3}$ , and only fair agreement for the data of Schläfer and Skoludek and  $a = 2.5 \times 10^{-3}$ . Extrapolation of the data of Schläfer and Skoludek for  $a = 2.0 \times 10^{-3}$  indicated a continuing temperature dependent third law heat of sublimation and disagreement between 2nd and 3rd law values. The heat of sublimation was taken as the average of the third law and two second law values calculated from the data of Rehlfis and Fischer using "a" = 2.5 X 10<sup>-3</sup>. The results of this analysis should not be considered conclusive since all of the data is estimated.

The sublimation point reported by Rehlfis and Fischer (loc. cit.) was 630°K., that calculated from the data of Schläfer and Skoludek was 624°K. and that obtained from the free energy crossover between solid and gas was 630°K. The sublimation point was taken as 630°K.

Since the sublimation point is lower than the melting point, the liquid phase is thermodynamically unstable under ordinary conditions.

Bond Distance: Zr-Br = [2.45] Å

Bond Angle: Br-Zr-Br = [109° 28']

Product of the Moments of Inertia:  $I_A I_B I_C = [9.5782 \times 10^{-111}] \text{ gm}^3 \text{ cm.}^6$

$\sigma = [12]$

Heat of Formation.

Calculated from the heats of formation and sublimation for the crystal at 298.15°K. (see crystal table for details).

Heat Capacity and Entropy.

The interatomic distance was obtained from an involved correlation of the interatomic distances and covalent radii of the tetrahalides of Pb, Si, Ti, Ge, and Sn. I. N. Odnev, A. M. Aleksandrovskaya, and I. V. Regins, Optics and Spectroscopy 7, 172 (1959), estimated the interatomic distance and report 2.47 Å as the Zr-Br distance. The bond angle was taken to be the tetrahedral angle. The three principal moments of inertia are:  $I_A = I_B = I_C = 2.1237 \times 10^{-37} \text{ gm. cm.}^2$ .

The fundamental vibrational frequencies are all estimated. The product of  $\omega_1$  and intermolecular distance for the tetrabromides of Si, Ti, Ge, Sn, and Pb was found to be nearly constant. Utilizing the estimated Zr-Br distance, a value of 218 cm.<sup>-1</sup> was obtained for  $\omega_1$ . A plot of  $\omega_1$  and  $\omega_2$  versus intermolecular distance for these molecules gave nearly linear smooth curves. Values of  $\omega_1$  and  $\omega_2$  obtained from these plots were 216 cm.<sup>-1</sup> and 58 cm.<sup>-1</sup>, respectively. These values for  $\omega_1$  and  $\omega_2$  were used in a valence force field calculation to derive values for  $\omega_3$  and  $\omega_4$ . Central and valence force field calculations, using estimated force constants were carried out but the results proved to be inconclusive. Therefore,  $\omega_1$  was taken as the average of the two empirically derived values,  $\omega_2$  as its empirically derived value, and  $\omega_3$  and  $\omega_4$  as those derived from the empirical values and the valence force field calculation. Odnev, Aleksandrovskaya, and Regins (loc. cit.) estimated the vibrational frequencies; they obtained  $\omega_1 = 224 \text{ cm.}^{-1}$ ,  $\omega_2 = 65 \text{ cm.}^{-1}$ ,  $\omega_3 = 309 \text{ cm.}^{-1}$ , and  $\omega_4 = 78 \text{ cm.}^{-1}$ .

ΔH<sub>f</sub><sup>o</sup> = unknown

S<sub>298.15</sub> = [65 ± 5] gibbs/mol

T<sub>m</sub> = 559 ± 10°K

ΔH<sub>f</sub><sup>o</sup><sub>298.15</sub> = -74.5 ± 3 kcal/mol

ΔH<sub>m</sub><sup>o</sup> = 4.10 kcal/mol

Heat of Formation

S. A. Shchukarev and G. A. Kokovin (1) have measured calorimetrically the heat of reaction ΔH<sub>r</sub><sup>o</sup> = -187.475 ± 0.9 kcal/mol for WBr<sub>5</sub>(c) + 1/2Br<sub>2</sub>(l) + 8NaOH(77.4H<sub>2</sub>O) + Na<sub>2</sub>WO<sub>4</sub>(c) + 6Habr(c) + 4H<sub>2</sub>O(l). This leads to ΔH<sub>f</sub><sup>o</sup><sub>298</sub>(WBr<sub>5</sub>, c) = -74.5 ± 3 kcal/mol, using ΔH<sub>f</sub><sup>o</sup><sub>298</sub>(NaOH(77.4H<sub>2</sub>O)) = -112.348 kcal/mol (2), ΔH<sub>f</sub><sup>o</sup><sub>298</sub>(NaWO<sub>4</sub>, c) = -389.2 kcal/mol (3), ΔH<sub>f</sub><sup>o</sup><sub>298</sub>(Habr, c) = -86.38 kcal/mol (4) and ΔH<sub>f</sub><sup>o</sup><sub>298</sub>(H<sub>2</sub>O, l) = -68.315 kcal/mol (5).

Heat Capacity and Entropy

C<sub>p</sub>200 = 6.2 gibbs/g-atom and C<sub>p</sub>559 = 7.25 gibbs/g-atom are estimated using the method described by O. Kubaschewski and E. L. Evans (6). Between 300°K and 559°K, which is the melting point, the heat capacity is obtained by linear interpolation.

The entropy, S<sub>298</sub> = 65 eu, is estimated from that of WCl<sub>5</sub>(c) (7) and the entropy difference between bromides and chlorides. The latter is estimated to be 13 eu based on an extrapolation to pentavalent compounds of the entropy values of bromides and chlorides given by W. M. Latimer (8). Both WBr<sub>5</sub> and WCl<sub>5</sub> are paramagnetic with an effective moment of about 1.1 Bohr magnetons as indicated by B. N. Figgis and J. L. Lewis, "Progress in Inorg. Chem.," Vol. 6, page 121, Interscience Publishers, New York, 1964.

Melting Data

S. A. Shchukarev, G. I. Novikov and G. A. Kokovin (9) have found the melting point, 559°K, by the thermographic method and 568°K by the tensimetric method. The value of 559°K is adopted in the tabulation.

The heat of melting is calculated from the difference between the heats of sublimation and vaporization at the melting point. The heats are both calculated from a second law analysis of the vapor pressure data reported by Shchukarev et al. (9), who gave the uncorrected heat of fusion, 5 kcal/mol. This value, when corrected for ΔC<sub>p</sub> of vaporization and sublimation, is in good agreement with the value adopted in the tabulation.

(LIQUID)

TUNGSTEN PENTABROMIDE (WBr<sub>5</sub>)

$$\Delta H_{298,15}^{\circ} = [-71.236] \text{ kcal/mol}$$

$$\Delta H_m^{\circ} = 4.10 \text{ kcal/mol}$$

$$\Delta H_v^{\circ} = 19.48 \text{ kcal/mol}$$

$$S_{298,15}^{\circ} = [70.113] \text{ gibbs/mol}$$

$$T_m = 559^{\circ} \pm 10^{\circ}\text{K}$$

$$T_b = 633.5^{\circ}\text{K}$$

Heat of Formation

The heat of formation,  $\Delta H_{298}^{\circ}(\text{WBr}_5, l) = -71.236 \text{ kcal/mol}$ , is calculated from that of  $\text{WBr}_5(c)$  by adding the heat of melting and the difference between  $H_{559}^{\circ} - H_{298}^{\circ}$  for the crystal and liquid.

Heat Capacity and Entropy

The heat capacity is assumed to be a constant, 7.25 gibbs/g-atom.

The entropy,  $S_{298}^{\circ} = 70.113 \text{ eu}$ , is calculated in a manner analogous to that of the heat of formation.

Melting Data

See  $\text{WBr}_5(c)$  table (June 30, 1967) for details.

Vaporization Data

$T_b$  is calculated as the temperature at which the Gibbs energy of reaction  $\text{WBr}_5(l) \rightarrow \text{WBr}_5(g)$  approaches zero. The differences between the heats of formation for liquid and gas at the boiling point is  $\Delta H_v^{\circ}$ .

S. A. Shchukarev, G. I. Novikov and G. A. Kokovin, Zh. Neorg. Khim. **1**, 2185 (1959), derived the boiling point  $665^{\circ}\text{K}$  and the heat of vaporization  $14.5 \pm 0.5 \text{ kcal/mol}$  from vapor pressure data. Our second law values, corrected for  $\Delta C_p$ , are  $T_b = 666^{\circ}\text{K}$  and  $\Delta H_v^{\circ} = 13.8 \text{ kcal/mol}$ . The adopted values are significantly different because the second law value of  $\Delta S_v$  is not adopted in the table.

Heat of Formation

S. A. Shchukarev, G. I. Novikov and G. A. Kokovin, Zh. Neorg. Khim. 4, 2185 (1959), measured the vapor pressure of WBr<sub>5</sub>(c, l) using a null manometer. Their results are given as below. The adopted heat of formation is -47.6 kcal/mol.

| Reactions                                   | No. of | $\Delta H_f^\circ$ (kcal/mol) | Temp. Range | Drift   |

|   |        |                               |             | -48.04  |

Heat Capacity and Entropy

The molecular configuration is assumed to be a trigonal bipyramid similar to that of MoCl<sub>5</sub> determined by electron diffraction (1). The bond distance is estimated to be the same as that in WBr<sub>5</sub>(g). The three principal moments of inertia are  $I_A = I_B = 267.5 \times 10^{-39}$  and  $I_C = 229.3 \times 10^{-39} \text{ g cm}^2$ .

All vibrational frequencies are estimated from those of MoCl<sub>5</sub>(g) (2), using the average value of  $\nu(\text{WBr}_2)/\nu(\text{MoCl}_2) = 0.62$  for modes which are independent of the central atom and 0.68 for modes involving the central atom. These average values of 0.62 and 0.68 are obtained from the ratios of corresponding vibrational frequencies of ReX<sub>5</sub><sup>+</sup>, SnX<sub>5</sub><sup>+</sup> and PtX<sub>5</sub><sup>+</sup> summarized by H. Siebert (3) and K. Nakamoto (4).

The electronic levels and quantum weights are estimated to be the same as those in MoCl<sub>5</sub>(g) (2).

(CRYSTAL)

TUNGSTEN HEXABROMIDE (WBr<sub>6</sub>)

GFW = 663.304

ΔHf<sup>o</sup> = Unknown

ΔHf<sup>o</sup><sub>298.15</sub> = -82.0 ± 3 kcal/mol

ΔHm<sup>o</sup> = Unknown

S<sup>o</sup><sub>298.15</sub> = [75 ± 6] gibbs/mol

Tm = 582°K

Heat of Formation

S. A. Shchukarev and G. A. Kokovin (1) have measured calorimetrically the heat of reaction ΔHr<sup>o</sup><sub>298</sub> = -180.0 ± 0.8 kcal/mol for WBr<sub>6</sub>(c) + 8NaOH(77.4H<sub>2</sub>O) → Na<sub>2</sub>WO<sub>4</sub>(c) + 6NaBr(c) + 4H<sub>2</sub>O(l). This leads to ΔHf<sup>o</sup><sub>298</sub>(WBr<sub>6</sub>, c) = -82.0 ± 3 kcal/mol, using ΔHf<sup>o</sup><sub>298</sub>(NaOH·77.4H<sub>2</sub>O) = -112.348 kcal/mol (2), ΔHf<sup>o</sup><sub>298</sub>(Na<sub>2</sub>WO<sub>4</sub>, c) = -369.2 kcal/mol (3), ΔHf<sup>o</sup><sub>298</sub>(NaBr, c) = -86.38 kcal/mol (4) and ΔHf<sup>o</sup><sub>298</sub>(H<sub>2</sub>O, l) = -68.315 kcal/mol (5).

Heat Capacity and Entropy

Cp300 = 6.2 gibbs/g-atom and Cp582 = 7.25 gibbs/g-atom are estimated using the method described by O. Kubaschewski and E. L. Evans (6). Between 300° and 582°K, which is the melting point, the heat capacity is obtained by linear interpolation.

The entropy, S<sup>o</sup><sub>298</sub>(WBr<sub>6</sub>, c) = 75 eu, is estimated by assuming S<sup>o</sup><sub>298</sub>(WBr<sub>6</sub>) = S<sup>o</sup><sub>298</sub>(WCl<sub>6</sub>) + 6(S<sup>o</sup><sub>298</sub>(Br<sup>-</sup>) - S<sup>o</sup><sub>298</sub>(Cl<sup>-</sup>)). The value, S<sup>o</sup><sub>298</sub>(WCl<sub>6</sub>, c) = 57 eu, is obtained from the JANAF WCl<sub>6</sub>(c) table (Dec. 31, 1966); and the value, S<sup>o</sup><sub>298</sub>(Br<sup>-</sup>) - S<sup>o</sup><sub>298</sub>(Cl<sup>-</sup>) = 3 gibbs/mol, is obtained from the average entropy values for Br<sup>-</sup> and Cl<sup>-</sup> ions given by W. M. Latimer (7) and K. K. Kelley (8).

Melting Data

S. A. Shchukarev, G. I. Novikov and G. A. Kokovin (9) have found the melting point, 582°K, under 50 atm pressure of Br<sub>2</sub>(g) by the thermographic method. The heat of fusion is unknown.

Bond Distance: W-Br = [2.40] Å

Bond Angle: Br-W-Br = [90°]

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [2.857] × 10<sup>-110</sup> g<sup>3</sup> cm<sup>6</sup>

Heat of Formation

The heat of formation, ΔH<sub>f,298</sub><sup>0</sup>(WBr<sub>6</sub>, g) = -59.1 kcal/mol, is calculated from that of the crystal plus the estimated heat of sublimation ΔH<sub>s,298</sub><sup>0</sup> = 23.9 kcal/mol for WBr<sub>6</sub>(c) + WBr<sub>6</sub>(g). The value of ΔH<sub>s,298</sub><sup>0</sup> is assumed to be the same as that for WCl<sub>6</sub>(c) + WCl<sub>6</sub>(g). See WCl<sub>6</sub> table (Dec. 31, 1968) for details.

Heat Capacity and Entropy

The molecular configuration is assumed to be an octahedron similar to those of WF<sub>6</sub>(g), and WCl<sub>6</sub>(g) determined by electron diffraction. The bond distance is estimated to be 2.40 Å by assuming r<sub>W-Br</sub> = r<sub>W-Cl</sub> + (r<sub>Na-Br</sub> - r<sub>Na-Cl</sub>). The bond distances W-Cl, Na-Br and Na-Cl are given in JANAF WCl(g) and NaBr(g) and NaCl(g) tables, as 2.26 Å, 2.50 Å and 2.36 Å, respectively. The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = I<sub>C</sub> = 303.7 × 10<sup>-39</sup> g cm<sup>2</sup>. All vibrational frequencies are estimated from those of WCl<sub>6</sub>(g) (1), using the average value of ν(WBr<sub>6</sub>)/ν(WCl<sub>6</sub>) = 0.62 for modes which are independent of the central atom and 0.68 for modes involving the central atom. These average values of 0.62 and 0.68 are obtained from the ratios of corresponding vibrational frequencies of ReX<sub>6</sub><sup>+</sup>, SnX<sub>6</sub><sup>+</sup> and PtX<sub>6</sub><sup>+</sup> summarized by H. Siebert (2), and K. Nakamoto (3).

March 31, 1961

ΔH<sub>f</sub><sup>0</sup> = 0ΔH<sub>f</sub><sup>0</sup> = 0ΔS<sub>298.15} = 170.89 ± 0.5 kcal. mole<sup>-1</sup></sub>ΔS<sub>298.15} = 1.359 cal. deg.<sup>-1</sup> mole<sup>-1</sup></sub>

## Heat of Formation

Zero by definition.

## Heat Capacity and Extrapolation

The low temperature C<sub>p</sub> measurements of F. H. Reesom and N. Pearson (1° to 4°K. and 10° to 20°K.), Phys. Rev. 99, 1119 (1955), and of W. Desorbo and G. E. Nichols (1° to 20°K.), The Phys. and Chem. of Solids 6, 352 (1956), were joined smoothly with the C<sub>p</sub> measurements of W. Desorbo and W. W. Tyler (13° to 300°K.), J. Chem. Phys. 21, 1660 (1953). C<sub>p</sub> values above 300°K were taken from National Bureau of Standards Report 6928, "Preliminary Report on the Thermodynamic Properties of Selected Light-Element Compounds", July, 1960. Heat capacity values above 1000°K were adjusted to give smooth results. Above 4000°K. the C<sub>p</sub> values are estimated.

S<sub>298.15} and H<sub>298.15} were calculated to be 0.00265 cal. deg.<sup>-1</sup> mole<sup>-1</sup> and 0.03892 cal. mole<sup>-1</sup> respectively from smooth C<sub>p</sub> values using Meddle's rule.</sub></sub>

Heat of Formation

The ΔH<sub>f</sub><sup>o</sup> is given by the following cycle at 0°K.

For details concerning (I), (II), and (III) see the CO(g) and O<sub>2</sub>(g) sheets. A definitive review of the heat of sublimation of carbon is given by L. Brewer and A. W. Searcy, Ann. Rev. Phys. Chem., 7, 259 (1956).

Heat Capacities and Entropies

The electronic energy levels are those listed by C. E. Moore, Nat. Bur. Standards (U. S.) Circ. 467, (1949). Levels above 60,000 cm.<sup>-1</sup> have been averaged.

Heat of Formation.  
The heat of formation was calculated from the equation: C(g) + e<sup>-</sup> → C<sup>-</sup>(g) with the JANAF auxiliary value for C(g); using an electron affinity = 1.25 e.v. (28.83 kcal/mole) obtained from M. Senan and L. M. Branscomb, Phys. Rev. 125, 1602 (1962). Other values for the electron affinity are: 1.17 e.v. reported by E. Clementi and A. D. McLean, Phys. Rev. 133, A419 (1964); 1.12 e.v. reported by E. Clementi, A. D. McLean, D. L. Raimondi and M. Yoshimine, Phys. Rev. 133, A1274 (1964); and 1.24 e.v. reported by B. Edlen, J. Chem. Phys. 33, 98 (1960).

Heat Capacity and Entropy.

The electronic levels and quantum weights were obtained from C. E. Moore, "Atomic Energy Levels", Vol. 1, U. S. National Bureau of Standards Circular 467, June 15, 1949, by assuming that the extra electron would produce an electronic configuration similar to that of the next higher atomic numbered element, in this case nitrogen. The electronic levels above 1 X 10<sup>5</sup> cm.<sup>-1</sup> were omitted because their contribution is negligible below 6000°K. The H<sub>298</sub> value at 0°K. is -1.481 kcal/mole.

Heat of Formation.  
 $\Delta H_f^o$  was calculated from  $D_0$ , 83.0 kcal. mole<sup>-1</sup>, estimated by J. S. Gordon, AstroSystems International, Livingston, N. J., private communication, June 6, 1963.  $\Delta H_f^o 298.15$  was then calculated. P. Zeeman, Can. J. Phys. 32, 9 (1954) reported a  $D_0 = 1.6 \pm 0.2 \text{ e.v.}$ , 36.9 kcal. mole<sup>-1</sup>, for a molecule that was apparently AlC(g). However, H. Wooley, Nat'l Bur. Std. Report No. 6929, July 1, 1960, surmised that this  $D_0$  and the reported molecular constants were for the Al<sub>2</sub>(g) molecule. His judgment was accepted.

Heat Capacity and Entropy.  
Molecular constants were estimated by J. S. Gordon, loc. cit.

{ Ideal Gas } Mol. Wt. = 22.831

Dec. 31, 1962; June 30, 1963

Ground State Configuration [2Π]  
 $S_{298.15}^{\circ} = [49.822] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^{\circ} = 196 \pm 10 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{\circ} 298.15 = 198 \pm 10 \text{ kcal. mole}^{-1}$   
 $\omega_e x_e = [12.0] \text{ cm.}^{-1}$   
 $\omega_e = [1.350] \text{ cm.}^{-1}$   
 $\omega_e x_e = [0.018] \text{ cm.}^{-1}$   
 $\sigma = 1$

Heat of Formation.

The heat of formation at 298.15°K. was calculated from  $\Delta H_f^{\circ} = 105 \pm 10 \text{ kcal. mole}^{-1}$  for the reaction BC(g) = B(g) + C(g) reported by G. Verhaegen, P. E. Stafford, M. Ackerman, and J. Drowart, Nature, 193, 1280 (1962).

Heat Capacity and Entropy.

All spectroscopic constants were obtained from J. S. Gordon, AstroSystems, International, West Caldwell, New Jersey, private communication, November 2, 1962.

TETRABORON MONOCARBIDE (B<sub>4</sub>C)

(CRYSTAL)

MOL. WT. = 55.25515

$\Delta H_f^{\circ} 0 = -9.2 \pm 2.4$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^{\circ} 298.15 = -9.3 \pm 2.4$  kcal. mole<sup>-1</sup>  
 $\Delta H_m^{\circ} = [25]$  kcal. mole<sup>-1</sup>

$S_{298.15}^{\circ} = 6.483 \pm 0.03$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m = 2743 \pm 20$  °K.

Heat of Formation.

The  $\Delta H_f^{\circ} 298.15$  was calculated from  $\Delta H_f^{\circ} 298.15 = -683.3 \pm 2.2$  kcal. mole<sup>-1</sup> for the reaction  $B_4C(c) + 4O_2(g) \rightarrow 2B_2O_3(\text{amorph}) + CO_2(g)$  measured by D. Smith, A. S. Dworkin and E. R. Van Arsdale, J. Am. Chem. Soc. 71, 2654-6 (1955) and the heat of formation for  $B_2O_3(\text{amorph})$  (Dec. 31, 1964) and for  $CO_2(g)$  (March 31, 1961) in JANAF Tables.

Heat Capacity and Entropy.

The low temperature heat capacities, 54-294°K., were taken from K. K. Kelley, J. Am. Chem. Soc. 63, 1137 (1941). Above 298°K.,  $C_p$  was calculated using the equation  $C_p = 22.89 + 5.40 \times 10^{-5}T - 10.72 \times 10^{-8}T^2$  obtained from the ancalpy data in the range 298 to 1726°K. reported by E. G. King, Ind. Eng. Chem. 41, 1298 (1949). The values from the two sources join smoothly at 298°K. The  $S_{298.15}^{\circ}$  was calculated based on the low temperature heat capacities measured by K. K. Kelley, loc. cit., using  $S_{53.1}^{\circ} = 0.047$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.

$T_m$  was determined by Dolloff, WADD Tech. Rept. 60-143, 1960 and  $\Delta H_m^{\circ}$  was estimated.

$\Delta H_f^{\circ} 298.15 = 16.592 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_m^{\circ} = [25] \text{ kcal. mole}^{-1}$   
 $T_m = 2743 \pm 20^{\circ} \text{K.}$

Heat of Formation.

The  $\Delta H_f^{\circ} 298.15$  was obtained from  $\Delta H_f^{\circ} 298.15(c)$  by adding  $\Delta H_m^{\circ}$  and the difference between  $H_m^{\circ}$  and  $H_{298.15}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy.

A glass transition was assumed at 1750°K. The heat capacity below 1750°K. was obtained from the heat capacity of the crystal. Above 1750°K. the heat capacity was assumed constant and estimated as 32.50 cal. deg.<sup>-1</sup> mole<sup>-1</sup> or 8.5 cal. deg.<sup>-1</sup> per g-atom.

The entropy was obtained in a manner analogous to that of the heat of formation.

Melting Data.

See B<sub>4</sub>C(c) table.

DIBERYLLIUM MONOCARBIDE (Be<sub>2</sub>C)

MOL. WT. = 30.037

(CRYSTAL)

ΔH<sub>f</sub>° = Unknown

ΔH<sub>f</sub>° 298.15 = 21.7 ± 2.5 kcal. mole<sup>-1</sup>

ΔH<sub>f</sub>° = [16] kcal. mole<sup>-1</sup>

S<sub>298.15</sub>° = [3.9 ± 1.0] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>m</sub> = [2400]°K.

Heat of Formation.

The selected ΔH<sub>f</sub>° 298.15 was calculated by the 3rd law method using vapor pressures reported by B. D. Pollock, J. Phys. Chem. 53, 587 (1959). Pressures for the reaction Be<sub>2</sub>C(s) → 2Be(g) + C(graphite) were measured by Pollock in the temperature range 1430-1669°K. by Knudsen technique. Vapor pressure data for this decomposition reaction have also been reported by J. Baboin, French Patents 1.193.790 (1959), J. Quirk, Reactor Handbook 3, 88 (1955) and P. Muratov and A. Novoselova, Dokl. Akad. Nauk SSSR 123, 334 (1959). The calculated ΔH<sub>f</sub>° 298.15 values are summarized as follows:

| Calc. Method | Number of Pressures | T, °K.    | ΔH <sub>f</sub> ° 298.15, kcal. mole <sup>-1</sup> | References   |
|--------------|---------------------|-----------|--|--|
| 3rd law      | 14                  | 1430-1669 | 89.117   | B. D. Pollock  |
| 2nd law      | 14                  | 1430-1669 | 90.8   | Least squares fit of Pollock's v.p. to the equation: log P (atm.) = 6.946-19.593/T |
| 3rd law      | 6                   | 1675-1953 | 71.411   | P. Muratov and A. Novoselova   |
| 3rd law      | 8                   | 1900-2600 | 81.278   | J. Quirk   |
| 3rd law      | 8                   | 1600-2300 | 96.266   | J. Baboin  |

H. L. Schick, D. F. Anthrop, P. L. Hamst, R. E. Dreikorn, and M. B. Panish, "Thermodynamics of Certain Refractory Compounds, Part II", 1 March 1963 to 31 May 1963 have listed the measured vapor pressures. The vapor pressures reported by J. Baboin (loc. cit.) used in the 3rd law calculation were those listed by H. L. Schick, et al.

Heat Capacity and Entropy.

The heat capacity values, from 298.15 to 1200°K., were derived from the mean C<sub>p</sub> data measured by J. J. Neely, E. Teeter, Jr., and J. B. Trice, J. Am. Ceramic Soc. 33, 363 (1950). Neely, et al., estimated an overall error of 1% in their mean heat capacity data. The powdered Be<sub>2</sub>C material which was used analyzed 80 to 74% Be<sub>2</sub>C. The impurities were mainly oxide and nitride of Be. No corrections were made for the effect of these impurities.

From 1200-2400°K. the C<sub>p</sub> was extrapolated so as to approach the value, 22 cal. deg.<sup>-1</sup> mole<sup>-1</sup> calculated from O. H. Krikorian, "Estimation of High-Temperature Heat Capacities of Carbides," University of California, UCLRL 6785, February 6, 1962. The S<sub>298.15</sub>° = 3.9 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, was estimated by Krikorian (loc. cit.).

Melting Data.

H. L. Schick, et al., (loc. cit.) have summarized the available melting data i.e.: Y. Oishi and Y. Hemons, Osaka Kogyo Gijyuu Shikenjo Kaho 8, 89 (1957) have reported decomposition upon heating as low as 1873°K. L. Brewer, L. Bromley, P. Gilles, and M. Lofgren, "The Chemistry and Metallurgy of Miscellaneous Materials," in "Thermodynamics", McGraw-Hill, New York (1950) and I. S. Gev, AEC TR 3036 Transl. from Zh. Neorg. Khim. 1, 196 (1956) reported melting or dissociation between 2373° and 2423°K.

The melting point is assumed to be 2400°K. as estimated by T. B. Douglas and A. C. Victor, National Bureau of Standards Preliminary Report 6645, 1 January 1960 and H. L. Schick, et al. (loc. cit.). From the estimated melting point, 2400°K., and an estimated 2.5 cal. g. atom<sup>-1</sup> deg.<sup>-1</sup> for the entropy of melting, the heat of melting was calculated.

S<sub>298.15</sub> = [11.345] cal. deg.<sup>-1</sup> mole<sup>-1</sup>      ΔH<sub>f</sub>° 298.15 = [3.798 + 10] kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = [2400]\*K.      ΔH<sub>m</sub>° = [18] kcal. mole<sup>-1</sup>

Heat of Formation.

The ΔH<sub>f</sub>° 298.15 was calculated from the heat of formation of the crystal and the estimated heat of melting.

Heat Capacity and Entropy.

The heat capacity was assumed constant and equal to the heat capacity of the solid Be<sub>2</sub>C at the estimated melting point.

Melting Data.

The National Bureau of Standards Report 6645, January, 1960, states that Be<sub>2</sub>C seems to decompose easily only at temperatures above its reported melting point. For this reason they extended their Be<sub>2</sub>C table into the liquid region. For detailed melting data see the Be<sub>2</sub>C (c) table.

CBe<sub>2</sub>

ω<sub>e</sub>X<sub>e</sub> = [736] cm<sup>-1</sup> σ = 1

B<sub>e</sub> = 0.4490 cm<sup>-1</sup> r<sub>e</sub> = 1.8170 Å

Heat of Formation

Dixon and Kroto (1) have observed predissociation of CBr(g) which indicates that the dissociation energy (D<sub>0</sub><sup>0</sup>) is less than 94.7 kcal/mol. They evaluated the kinetic data of Simons and Yarwood (2), obtaining a value of D<sub>0</sub><sup>0</sup> = 97 ± 5 kcal/mol, based on the heat of formation of bromoform and the dissociation energy of HBr, and concluded that the true value of D<sub>0</sub><sup>0</sup> is very close to the upper limit of 94.7 kcal/mol. Comparisons of C-X bond energies of C<sub>2</sub>H<sub>4</sub> and C<sub>2</sub>H<sub>2</sub> compounds, however, indicate that this value is too high to be consistent with other carbon halides. Therefore the value of D<sub>0</sub><sup>0</sup> adopted is 75 ± 15 kcal/mol. The corresponding ΔHf°<sub>298</sub> for CBr(g) is 122 ± 15 kcal/mol.

Heat Capacity and Entropy

The rotational structure of the near UV spectra of CBr(g) has been investigated by Dixon and Kroto (1) in the 3000 Å region. They assigned the above doublet electronic levels to the ground (2Π) and first excited (2Δ) states and reported a value of B<sub>0</sub> = 0.4972 ± 0.0003 cm<sup>-1</sup> for the ground state. An additional electronic level (2Σ) is expected to be close to the first excited state by analogy with Cl(g) and CCl(g).

The fundamental vibrational frequency ω<sub>e</sub> is estimated from Guggenheimer's relation for single bonded molecules (3). The anharmonic vibrational term ω<sub>e</sub>X<sub>e</sub> is estimated by assuming ω<sub>e</sub>X<sub>e</sub> = ω<sub>e</sub><sup>2</sup>/(4D<sub>0</sub> + 2ω<sub>e</sub>). The value of ω<sub>e</sub> is calculated from the Morse potential function. The rotational constant B<sub>e</sub> is calculated from B<sub>e</sub> = B<sub>0</sub> + a<sub>e</sub>/2. The bond distance is calculated from B<sub>e</sub>.

Bond Distances: C-F = 1.328 Å C-Br = 1.909 Å  
 Bond Angle: F-C-F = 108.6 ± 1° F-C-Br = 110.33°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 2.3403 × 10<sup>-113</sup> g<sup>3</sup> cm<sup>6</sup> σ = 3

Heat of Formation

The selected value is obtained from least squares, simultaneous adjustment of the heats of formation of CF<sub>4</sub>, CF<sub>3</sub>X (X = H, Cl, Br, I, F), and C<sub>2</sub>F<sub>4</sub>. Details of the input data and the adjustment are given in (1). Coomber and Whittle (2, 3, 4) have determined equilibrium data for CClF<sub>3</sub>(g) + BrCl(g) = CBrF<sub>3</sub>(g) + Cl<sub>2</sub>(g) and for CF<sub>3</sub>X(g) + Br<sub>2</sub>(g) = CF<sub>3</sub>Br(g) + BrX(g) where X = H, Cl, and CF<sub>3</sub>. Equilibrium data for CF<sub>3</sub>I(g) + BrI(g) = CBrF<sub>3</sub>(g) + I<sub>2</sub>(g) were obtained by Lord et al. (5).

Heat Capacity and Entropy

The molecular structure has been derived from electron-diffraction studies by Sharbaugh et al. (6), Bowen (7), and Anderson (8) and from microwave data by Sheridan and Gordy (9). The adopted parameters are an average of those reported by (6, 7). Infrared spectra of the gas were observed by several investigators (10, 11, 12) and Raman spectra of the liquid were obtained by Edgell and May (12). The vibrational assignments of (11, 12) are in close agreement. These assignments are adopted but preference is given to frequencies observed for the gas. The value for ν<sub>6</sub> is taken as 300 cm<sup>-1</sup> which is between the values of 305 and 297 ± 3 cm<sup>-1</sup> derived from Raman spectra and IR (combination and overtone) spectra, respectively.

The thermodynamic functions of this table are essentially the same as those calculated by (11). Uncertainty in the entropy is estimated to vary from 0.12 to 0.5 gibbs/mol over the range from 300 to 1000°K. Uncertainty in ν<sub>6</sub> and neglect of anharmonicity are the major sources of error. Discussions of the magnitude of anharmonic effects appear on the tables for CClF<sub>3</sub>(g) and CF<sub>4</sub>(g). The principal moments of inertia are I<sub>A</sub> = 14.68 × 10<sup>-39</sup> and I<sub>B</sub> = I<sub>C</sub> = 39.93 × 10<sup>-39</sup> g cm<sup>2</sup>.

Heat of Formation

The heat of formation is calculated from ΔHf°<sub>298</sub>(BrCN, c) = 33.58 kcal/mol (1) and ΔHf°<sub>298</sub> = 10.32 ± 0.1 kcal/mol. This latter is obtained from an analysis of the vapor pressure data of Lord and Woolf (2) and Baxter et al. (3).

The heat of formation of the crystal is calculated from ΔHf°<sub>298</sub> = -56.0 kcal/mol obtained by Lord and Woolf (2) for the reaction BrCN(c) + 2NaOH(56 H<sub>2</sub>O) = NaCBr(2800 H<sub>2</sub>O) + NaBr(2800 H<sub>2</sub>O) + H<sub>2</sub>O(l).

The auxiliary data used were ΔHf°<sub>298</sub>(NaOH·56 H<sub>2</sub>O) = -112.26 kcal/mol (1, 4), ΔHf(NaCBr·2800 H<sub>2</sub>O) = -92.25 kcal/mol (1, 4) and ΔHf°<sub>298</sub>(NaBr·2800 H<sub>2</sub>O) = -70.54 kcal/mol (1, 4). The uncertainty in the final value reflects the uncertainty in ΔHf(NaCBr·2800 H<sub>2</sub>O) which was determined by Lord and Woolf (2) to be -93.6 kcal/mol in excess NaOH·56 H<sub>2</sub>O.

Heat Capacity and Entropy

J. S. Gordon (5) used the constants given above to calculate the adopted table, using the method of Pennington and Kobe (6) for anharmonicity, vibration rotation interaction, and centrifugal stretching corrections.

The bond lengths and angle were reported by Tyler and Sheridan (7).

Heat of Formation.

The heat of formation,  $\Delta H_f^{\circ} 298.15$ , was calculated and reported by F. D. Rossini, D. D. Wagman, W. H. Evans, S. Levine, and I. Jaffe, "Selected Values of Chemical Thermodynamic Properties", National Bureau of Standards Circular 500, 1952.

Heat Capacity and Entropy.

The molecular constants, bond distance, and bond angle were determined by electron diffraction by C. Finbak, O. Haase, and B. Ottar, Arch. Math. Naturv B44, No. 13 (1941) and C. Finbak, O. Haase, and O. Olafsson, Vidensk. Kjemi Bergr. 3, 13 (1943). The constants reported by C. Finbak, et al., in 1943 were selected. These constants are listed in "Tables of Intraatomic Distances and Configuration in Molecules and Ions," Special Publication No. 11, The Chemical Society (London), 1958. The principal moments of inertia calculated from these constants were  $I_A = I_B = I_C = 1.5343 \times 10^{-37} \text{ g. cm.}^2$

The vibrational frequencies used were assigned by A. O. Meister, S. E. Rosser, and F. F. Cleveland, J. Chem. Phys. 18, 346 (1950). They measured the infrared and Raman spectrum, considered the previous literature, calculated force constants and made most probable value assignments for the frequencies. A more recent paper by B. Mozynska and J. P. Mathieu, Compt. Rend 255, 2820 (1963) made assignments from Raman and Infrared spectra which agreed with all of Meister, et al.'s assignments except  $\nu_2$  which they found was 126  $\text{cm.}^{-1}$  rather than 122  $\text{cm.}^{-1}$ .

 $\omega_e \times r_e = 6.15 \text{ cm}^{-1}$

Heat of Formation

The data of Miller and Palmer (1) provide a value of  $D_0(\text{C}-\text{Cl}) = 80 \pm 5$  kcal/mol, which appears to be reasonably substantiated. They studied the chemiluminescence from flames of  $\text{CHCl}_3$  and  $\text{CCl}_4$  burning in potassium vapor. These flames exhibit C<sub>2</sub> Swan band radiation with major departures from vibrational and rotational equilibrium. The spectra are interpreted as due to the reaction  $\text{C} + \text{CCl} + \text{C}_2^* + \text{Cl}$  where the carbon atom is either <sup>3</sup>D ground state or <sup>1</sup>D first excited state. The separation between the ground and first excited state of the carbon atom is matched closely by the difference in preferential population of the excited C<sub>2</sub> levels. The assumption is made that all the exothermicity of the reaction is retained as vibrational excitation of the C<sub>2</sub>, thus the populated levels are measures of the heat of reaction. In this manner we obtain a heat of reaction of  $67 \pm 2.5$  kcal for the reaction  $\text{C} + \text{CCl} + \text{Cl}$  which, using JANAF auxiliary data, gives  $\Delta H_f^\circ(\text{CCl}, g) = 124 \pm 2.5$  kcal/mol; however, this represents the initial state of the CCl which in the flame is presumed to have about 4 kcal of vibrational energy at roughly 2000°K. Thus, we obtain  $\Delta H_f^\circ_{298}(\text{CCl}, g) = 120 \pm 5$  kcal/mol, which is adopted.

The heat of formation can also be estimated from the dissociation energy calculated from the linear Birge-Sponer extrapolation of the ground state vibrational constants. This yields  $D_0 = 89$  kcal or  $\Delta H_f^\circ = 111$  kcal/mol. There are several indications that this dissociation energy is probably a maximum value, for example, Hildenbrand (2) has applied an ionic-covalent correction to the linear extrapolation which gives  $D_0 = 72$  kcal. We would expect this heat of formation to be a minimum value. A real minimum for the dissociation energy can be obtained from the knowledge that the first vibrational level of the <sup>2</sup>Δ state is occupied and so the dissociation energy of this state must be greater than  $850 \text{ cm}^{-1}$ . This yields a minimum dissociation energy of the ground state of 76 kcal, assuming the dissociation products are C(-Δ) and Cl(<sup>2</sup>P), and  $\Delta H_f^\circ_{298}(\text{CCl}, g) = 124$  kcal/mol which is the maximum value of the heat of formation.

Heat Capacity and Entropy

The rotational and electronic constants are those of Verma and Mulliken (2). The vibrational constants are those derived by Ovcharenko et al. (3) from the data of Gordon and King (4). The anharmonicity constants listed by Verma and Mulliken are not used, since these are based only on the 0,0 and 0,1 transitions. The  $\omega_e$  level is estimated by analogy with CF(g). The value for  $\alpha_e$  was obtained from the other constants assuming a Morse potential function.

$\sigma = 1$

Heat of Formation  
 The heats of formation of COCl<sub>2</sub> and COF<sub>2</sub> have been averaged to obtain that of COClF.

Heat Capacity and Entropy

The molecular constants are from R. J. Lovall, C. V. Stephenson, and E. A. Jonas, J. Chem. Phys. 22, 1953 (1954).

Heat of Formation

The selected value is obtained from least squares, simultaneous adjustment of the heats of formation of CF<sub>3</sub>, CF<sub>3</sub>X (X = H, Cl, Br, I, CF<sub>3</sub>) and C<sub>2</sub>F<sub>4</sub>. Details of the input data and the adjustment are given in (1). Coomber and Whittle (2) have determined equilibrium data for CClF<sub>3</sub>(g) + BrX(g) + CBrF<sub>3</sub>(g) + ClX(g) where X = Cl and Br. Lord et al. (3) studied the analogous equilibrium CF<sub>3</sub>I(g) + ClI(g) + CClF<sub>3</sub>(g) + I<sub>2</sub>(g). These data link CClF<sub>3</sub> with CBrF<sub>3</sub> and CF<sub>3</sub>I. Other data which were omitted from the adjustment include those of Baibuz (4, 5), Mears (6), Kolesov (7), Kiribride (8), and von Wartenberg (9). Baibuz (4, 5) derived ΔHf° = -166.2 ± 2.2 kcal/mol by applying the method of estimation in a spherical bomb to mixtures of H<sub>2</sub>, O<sub>2</sub> and CClF<sub>3</sub>. By comparison with similar data for CF<sub>4</sub> and CCl<sub>4</sub>, we estimate the bias in Baibuz' value to be about +2 kcal/mol. Mears (6) gave a preliminary report of values of ΔHr at 300°C for reactions involving HF, HCl and CCl<sub>3</sub>F<sub>n</sub> (n = 1, 2, 3, 4). We derive ΔHf° = -177 and -173 kcal/mol from two different combinations of reactions; however, no detailed account of the data has been published. The other authors (7, 8, 9) measured ΔHr for reaction of CClF<sub>3</sub> with an alkali metal (Na or K) to form amorphous carbon and mixtures of the fluoride and chloride. Discrepancies of many kcal/mol exist in these studies, presumably due to inadequate characterization of the thermochemical reactions.

Heat Capacity and Entropy

The molecular structure has been derived from electron-diffraction studies by Bowen (10) and Bartell (11). Results from Bartell are adopted. These parameters are consistent with the microwave data of Coles (12). Principal moments of inertia are I<sub>A</sub> = 14.68 × 10<sup>-39</sup> and I<sub>B</sub> = I<sub>C</sub> = 23.37 × 10<sup>-39</sup> g cm<sup>2</sup>. Vibrational assignments are based on the work of Claassen (13) and the gas-phase Raman spectra observed by Holzer and Moser (14). The largest uncertainty in Cp and S° probably results from the neglect of anharmonicity. Barbo (15) and Albright (16) have given estimates for the anharmonic contributions. These vary from 0.1 to 0.3 gibbs/mol in both Cp° and S° over the range from 300 to 1000°K, respectively. Somewhat larger contributions are possible based on the anharmonic functions calculated by McBride (17) for CF<sub>4</sub>(g). We estimate the overall uncertainty in the entropy of this JANAF table to be 0.1 eu at 300°K and 0.4 eu at 1000°K. Cp° is consistent with Cv° measured at 300°K by the wire-ribbon method (18).

Bond Distances: Cl-C = 1.631 Å C-N = 1.162 Å  
Bond Angle: Cl-C-N = 180°  
Rotational constants: B<sub>0</sub> = 0.19817 cm<sup>-1</sup> D<sub>0</sub> = 5.503 X 10<sup>-8</sup> cm<sup>-1</sup>

Spectroscopic constants used in calculating corrections to rigid rotator-harmonic oscillator approximation (cm<sup>-1</sup>):  
α<sub>1</sub> = 8.25 X 10<sup>-4</sup> x<sub>11</sub> = [-4] ε<sub>22</sub> = 0.95  
α<sub>2</sub> = 5.46 X 10<sup>-4</sup> x<sub>22</sub> = -0.85 ε<sub>23</sub> = -7.236  
α<sub>3</sub> = 1.06 X 10<sup>-3</sup> x<sub>33</sub> = [-7] x<sub>13</sub> = -2.8

C = 1

Heat of Formation.

The heat of formation was taken from D. D. Wagman, W. H. Evans, I. Helow, V. B. Parker, S. M. Bailey, and R. H. Schumm, "Selected Values of Chemical Thermodynamic Properties" NBS Technical Note 270-1, Washington, 1965.

Heat Capacity and Entropy.

J. S. Gordon, AstroSystems International Inc., Fairfield, N. J., (private communication, Feb., 1966), has used the constants listed above to calculate C from 298.15 to 6000°K using the method of R. E. Pennington and K. A. Kobe, J. Chem. Phys. 22, 1442 (1954), which takes anharmonicity, vibration-rotation interaction, and centrifugal stretching into account. The constants B<sub>0</sub> and D<sub>0</sub> were taken from C. A. Burrus and W. Gordy, Phys. Rev. 101, 599 (1956); ω<sub>1</sub>, α<sub>1</sub>, α<sub>2</sub>, x<sub>23</sub>, x<sub>13</sub> and ε<sub>22</sub> were obtained from W. J. Lafferty, D. R. Lide and R. A. Toth, J. Chem. Phys. 43, 2083 (1965); α<sub>3</sub> has been taken from C. H. Townes, A. N. Holden and P. R. Merritt, Phys. Rev. 74, 1113 (1948) and x<sub>11</sub>, x<sub>33</sub> and x<sub>12</sub> were estimated by Gordon, loc. cit. The bond distances and bond angle were taken from Lafferty et al., loc. cit.

Carbonyl Monochloride (COCl)

CC10

MOL. WT. = 63.46355

(IDEAL GAS)

CARBONYL MONOCHLORIDE (COCl)

Point Group C<sub>2v</sub>

S<sub>298.15</sub> = [64] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Ground State Quantum Weight = 2

ΔH<sub>f,0</sub> = [-15 ± 10] kcal. mole<sup>-1</sup>

ΔH<sub>f</sub><sup>0</sup> 298.15 = [-15 ± 10] kcal. mole<sup>-1</sup>

Vibrational Frequencies and Degeneracies

(ν<sub>v</sub>, cm.<sup>-1</sup>)

570 (1)

281 (1)

1860 (1)

Bond Distance: C-Cl = [1.75] Å

Bond Angle: Cl-C-O = [120] °

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.27603 × 10<sup>-115</sup>] g.<sup>3</sup> cm.<sup>6</sup>

σ = 1

Heat of Formation.

The enthalpy change (ΔH<sub>f</sub><sup>0</sup>) for the reaction COCl<sub>2</sub>(g) = CO(g) + 2Cl(g) is calculated to be 82 kcal. mole<sup>-1</sup>, which is the sum of two bond energies, i.e. D(Cl-CO) + D(Cl-Cl). By comparison with the values, D(H<sub>3</sub>C-COCH<sub>3</sub>)/D(H<sub>3</sub>C-CO) = 72/18 = 4.0 for CH<sub>3</sub>COCl(g) and D(H<sub>3</sub>C-COCl)/D(Cl-CO) = 4.3 for CH<sub>3</sub>COCl(g), the ratio of D(Cl-COCl)/D(Cl-CO) is estimated to be 4.0 for COCl<sub>2</sub>(g). Hence the enthalpy change for the reaction COCl<sub>2</sub>(g) = COCl(g) + Cl(g) is calculated as 82 × (4/5) = 65.6 kcal. mole<sup>-1</sup>. Using the ΔH<sub>f</sub><sup>0</sup> value obtained, the heat of formation for COCl(g) is derived to be -15 ± 10 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The vibrational frequencies were reported by M. E. Jécox and D. E. Milligan, J. Chem. Phys. 43, 866 (1965). The bond distances and angle were estimated by Jécox and Milligan, loc. cit. Due to the presence of one unpaired electron on C atom, the ground state quantum weight is calculated to be 2. The three principal moments of inertia are: I<sub>A</sub> = 1.29987 × 10<sup>-36</sup>, I<sub>B</sub> = 7.1580 × 10<sup>-40</sup>, and I<sub>C</sub> = 1.37145 × 10<sup>-36</sup> g. cm.<sup>2</sup>

Bond Distance: C-Cl =  $[1.76 \pm 0.05]$  Å  
Bond Angle: Cl-C-Cl =  $[100 \pm 10]^\circ$   
σ = 2

Product of Moments of Inertia:  $I_{A}I_{B}I_{C} = [1.1017 \times 10^{-11}] \text{ g}^3 \text{cm}^6$

Heat of Formation

Shapiro and Jaccoc (2) have measured mass-spectrometrically the appearance potentials 12.2 and 14.7 eV for the processes  $\text{CHCl}_3(g) + e^- \rightarrow \text{CCl}_2(g) + \text{HCl}(g) + 2e^-$  and  $\text{C}_2\text{Cl}_4(g) + e^- \rightarrow \text{CCl}_2(g) + \text{CCl}_2(g) + 2e^-$ , respectively. The difference in these two processes gives  $\Delta H_f^\circ = 2.5 \text{ eV}$  (57.65 kcal/mol) for the reaction  $\text{C}_2\text{Cl}_4(g) + \text{HCl}(g) \rightarrow \text{CCl}_2(g) + \text{CHCl}_3(g)$  which leads to  $\Delta H_f^\circ(\text{CCl}_2, g) = 57.32 \text{ kcal/mol}$ , using JANAF  $\Delta H_f^\circ(298) = -2.97, -22.063$  and  $-24.7 \text{ kcal/mol}$  for  $\text{C}_2\text{Cl}_4(g), \text{HCl}(g)$  and  $\text{CHCl}_3(g)$ , respectively. Since the authors claimed that the experimental error was probably 5 kcal/mol, the value,  $57 \pm 5 \text{ kcal/mol}$ , is adopted for the heat of formation.

Heat Capacity and Entropy

Milligan and Jaccoc (2) have found two stretching fundamentals (721 and 748  $\text{cm}^{-1}$ ) for the  $\text{CCl}_2$  radical in the infrared and ultraviolet spectra by matrix-isolation, and proposed a bent molecular structure (the valence angle =  $100 \pm 10^\circ$ ) with a ground singlet state which was based on the analogy with the electronic absorption spectrum of  $\text{CF}_2$ . L. Andrews (3) has confirmed all these observations in his infrared spectrometric studies of dichlorocarbene in solid argon, and made vibrational assignment to the fundamentals and also eliminated the possibility of a linear molecular structure for  $\text{CCl}_2$ . The bending frequency (350  $\text{cm}^{-1}$ ) is estimated by the valence force method (4), using the same ratio of bending over stretching force constants from  $\text{CF}_2(g)$  (5). The bond distance is estimated to be the same as that of  $\text{CCl}_4(g)$  measured by Bartell et al. (6). The three principal moments of inertia are  $I_A = 2.1028 \times 10^{-39}, I_B = 21.4013 \times 10^{-39}$ , and  $I_C = 23.5840 \times 10^{-39} \text{ g}^2 \text{cm}^2$ .

The triplet low lying electronic level of 4000  $\text{cm}^{-1}$  is estimated by analogy with that of  $\text{CF}_2(g)$ . The other level of 17,500  $\text{cm}^{-1}$  is also estimated based on a weak band appearing between 4400 and 5600 Å in the spectra of  $\text{CCl}_2$  observed by Milligan and Jaccoc (2).

Heat of Formation

Mears and Stahl (1) investigated several heats of reaction involving CF<sub>4</sub>, CF<sub>2</sub>Cl<sub>2</sub>, CF<sub>2</sub>Cl, CF<sub>2</sub>Cl<sub>2</sub>, CFCI<sub>3</sub>, CCl<sub>4</sub>, HF and HCl.

Using JANAF values for all compounds except CF<sub>2</sub>Cl<sub>2</sub> and CFCI<sub>3</sub> we obtain the following observations:

1.  $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -70.12 \pm 1.1$  kcal/mol
2.  $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = -116.53 \pm 1.5$  kcal/mol
3.  $\Delta H_f^{298}(\text{CCl}_2\text{F}, g) = -89.39 \pm 1.0$  kcal/mol
4.  $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -20.34 \pm 1.0$  kcal/mol
5.  $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = -165.47 \pm 1.0$  kcal/mol

The sum of the squares of the deviations is smallest when  $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = -117.5$  kcal/mol and  $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -69$  kcal/mol, and all the values are within their uncertainty ranges.

Petersen and Pitzer (2) obtained an approximate equilibrium constant for the reaction  $2\text{CCl}_3\text{F}(g) + \text{CCl}_4(g) = 3\text{CCl}_2\text{F}_2(g)$  of  $\log K_{400} = -3.0$ . This on 3rd law reduction gives  $\Delta H_r^{298} = 7.64$  kcal and with  $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = -117.9$  kcal/mol.

Kirkbride and Davidson (3) investigated the reaction of potassium with the chlorofluoromethanes and obtained  $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = -115.1 \pm 2$  kcal/mol and  $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -72.9 \pm 4$  kcal/mol after correction with JANAF auxiliary data. Wartenberg and Schiefer (3) investigated the same reaction and we obtain, after correction with JANAF auxiliary data,  $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = -112.7$  kcal/mol and  $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -63.1$  kcal/mol. Kolesov et al. (4) have reported analogous data for the reaction with sodium which, after correction with JANAF auxiliary data, yields  $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = -114.4 \pm 3.5$  kcal/mol.

We adopt the values calculated above from Mears and Stahl (1), since they have a high degree of internal consistency and also lead to a realistic progression in the heats of atomization in going from CF<sub>4</sub> to CCl<sub>4</sub>. With the adopted heats of formation, the successive replacement of F by Cl changes the atomization heats by 43.8, 41.6, 38.5 and 36.0 kcal.

Heat Capacity and Entropy

Clausen (5) chose the frequencies given above from his own gas-phase Raman measurements and the infrared values of earlier investigators. The values are in good agreement with the assignment of Plyler and Benedict (6). Masi (7) has measured the gas phase heat capacities at 243, 273, 318 and 363°K, within this range our adopted heat capacities are from .3 to .7% high. The entropies agree to within 0.05% and further adjustment to obtain better fits was not considered necessary. The molecular structure was determined from the microwave measurements of Long et al. (7). The individual moments of inertia were:  $I_A = 31.928 \times 10^{-39}$  g cm<sup>2</sup>,  $I_B = 21.216 \times 10^{-39}$  g cm<sup>2</sup>, and  $I_C = 38.148 \times 10^{-39}$  g cm<sup>2</sup>.

Interatomic distances: C-O 1.166 ± 0.002 Å  
C1-O 2.589 ± 0.001  
C1-Cl 2.884 ± 0.001  
C-Cl 1.746 ± 0.004  
Cl-C-Cl angle 111.3 ± 0.1°

Moments of inertia: I<sub>A</sub> = 1.0690 X 10<sup>-38</sup> g. cm.<sup>2</sup> I<sub>B</sub> = 2.4489 X 10<sup>-38</sup> I<sub>C</sub> = 3.5291 X 10<sup>-38</sup> σ = 2

Heat of Formation

J. Thomsen, Thermochemische Untersuchungen, Barth, Leipzig, 1882, Vol. 2, p. 361, reports the heat of alkali line hydrolysis of COCl<sub>2</sub>, from which ΔH<sub>f</sub><sup>o</sup> 298.15 is calculated to be -54.4 ± 0.3 kcal. mole<sup>-1</sup>. From the heat of combustion of COCl<sub>2</sub> in O<sub>2</sub> and H<sub>2</sub>, reported by Thomsen, op. cit., p. 363, ΔH<sub>f</sub><sup>o</sup> 298.15 is calculated to be -51.73 ± 0.43 kcal. mole<sup>-1</sup>. M. Bodenstein and H. Plaut, Z. Phys. Chem. 110, 399 (1924), J. A. Christiansen, ibid. 103, 99 (1923), and M. Bodenstein and O. Dunant, ibid. 61, 437 (1908), report 10 values of K<sub>p</sub> from 647° to 876°K for the reaction CO + Cl<sub>2</sub> ⇌ COCl<sub>2</sub>. These yield -25.91 ± 0.04 kcal. for ΔH<sub>f</sub><sup>o</sup> 298.15, whence ΔH<sub>f</sub><sup>o</sup> 298.15 for COCl<sub>2</sub> is -52.33 ± 0.62 kcal. mole<sup>-1</sup>. The average of the 5 foregoing values of ΔH<sub>f</sub><sup>o</sup> 298.15, weighted for the uncertainties, is adopted here. Values calculated from the degrees of dissociation of COCl<sub>2</sub> from 374° to 778°K, reported by R. H. Atkinson, C. T. Heycock, and W. J. Pope, J. Chem. Soc. 117, 1410 (1920), range from -47.06 to -53.11 kcal. mole<sup>-1</sup> and are ignored.

Heat Capacity and Entropy

The vibrational frequencies were assigned by E. Catalano and K. S. Pitzer, J. Am. Chem. Soc. 80, 1054 (1958), on the basis of their own infra-red spectra and other data. The molecular dimensions listed above were deduced from microwave spectra by G. W. Robinson, J. Chem. Phys. 21, 1741 (1953), and are confirmed by electron-diffraction values compiled by P. W. Allen and L. E. Sutton, Acta Cryst. 2, 46 (1950). The moments of inertia are weighted for the isotopes and were calculated from Robinson's dimensions by W. F. Giauqua and J. B. Ott, J. Am. Chem. Soc., 82, 2689 (1960). Diaque and Ott, loc. cit., determined S<sub>298.15</sub> experimentally to be 67.81 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, with which the value calculated here agrees.

Point Group C<sub>3v</sub>  
 $\Delta H_f^0 = -68.24 \pm 1.5$  kcal/mol  
 $\Delta H_f^{298.15} = -69.0 \pm 1.5$  kcal/mol

$S_{298.15}^0 = 74.00 \pm 0.05$  gibbs/mol  
 Ground State Quantum Weight = 1

Heat of Formation

Wears and Stahl (1) investigated several heats of reaction involving CF<sub>4</sub>, CF<sub>3</sub>Cl, CF<sub>2</sub>Cl<sub>2</sub>, CFCI<sub>3</sub>, CCl<sub>4</sub>, HF and HCl. Using JANAF values for all compounds except CF<sub>2</sub>Cl<sub>2</sub> and CFCI<sub>3</sub>, we obtain the following observations:

- $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -70.12 \pm 1.1$  kcal/mol
- $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = -116.53 \pm 1.5$  kcal/mol
- $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) - \Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -49.39 \pm 1.0$  kcal/mol
- $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) - 2\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = 20.34 \pm 1.0$  kcal/mol
- $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) - 2\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = 165.47 \pm 1.0$  kcal/mol

The sum of the squares of the deviations is smallest when  $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = -117.5$  kcal/mol and  $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -69$  kcal/mol, and all the values are within their uncertainty ranges.

Petersen and Pitzer (2) obtained an approximate equilibrium constant for the reaction  $\text{CCl}_3\text{F}(g) + 2\text{CCl}_4(g) = 3\text{CCl}_3\text{F}_2(g)$  of  $\log K_{p, \text{CCl}_4} = -4.5$ . This on 3rd law reduction gives  $\Delta H_f^{298} = 10.56$  kcal and with  $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -169.2$  kcal/mol and  $\Delta H_f^{298}(\text{CCl}_4, g) = -22.94$  kcal/mol this yields  $\Delta H_f^{298}(\text{CCl}_3\text{F}_2, g) = -68.2$  kcal/mol.

Kirkbride and Davidson (3) investigated the reaction of potassium with the chlorofluoromethanes and obtained  $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -115.1 \pm 2$  kcal/mol and  $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = -72.9 \pm 4$  kcal/mol after correction with JANAF auxiliary data. Wartenberg and Schiefer (4) investigated the same reaction and we obtain, after correction with JANAF auxiliary data,  $\Delta H_f^{298}(\text{CCl}_2\text{F}_2, g) = -112.7$  kcal/mol and  $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -63.1$  kcal/mol. Baibuz (5) has reported  $\Delta H_f^{298}(\text{CCl}_3\text{F}, g) = -66.4 \pm 2.1$  from heat of explosion measurements. A correlation of his other results would indicate that this value is not negative enough, possibly by as much as 3 kcal.

We adopt the values calculated above from Wears and Stahl (1), since they have a high degree of internal consistency and also lead to a realistic progression in the heats of atomization in going from CF<sub>4</sub> to CCl<sub>4</sub>. With the adopted heats of formation, the successive replacement of F by Cl changes the atomization heats by 43.8, 41.6, 38.5 and 36.0 kcal.

Heat Capacity and Entropy

Claassen (6) chose the frequencies given above from his own gas phase Raman measurements and the infrared values of earlier investigators. The values are in good agreement with the assignment of Plyler and Benedict (8), and the matrix studies of King (7). The molecular structure was determined from the microwave measurements of Long et al. (9). The individual moments of inertia were:  $I_A = I_C = 34.301 \times 10^{-39}$  g cm<sup>2</sup> and  $I_B = 40.744 \times 10^{-39}$  g cm<sup>2</sup>.

Bond Distance: C-Cl = 1.760 Å

Bond Angle: Cl-C-Cl = 109.47°

$\sigma = 12$

Product of the Moments of Inertia:  $I_A I_B I_C = 1.14972 \times 10^{-112}$  g<sup>2</sup>cm<sup>6</sup>

Heat of Formation

Hu and Sinke (1) have measured the heat of combustion of CCl<sub>4</sub>(l) in the rotating platinum bomb calorimeter, using As<sub>2</sub>O<sub>3</sub> solution as the reducing agent. They reported  $\Delta H_c^\circ = -86.02$  kcal/mol for CCl<sub>4</sub>(l) + 2H<sub>2</sub>O(l) + CO<sub>2</sub>(g) + 4HCl(600H<sub>2</sub>O, aq), which leads to  $\Delta H_f^\circ(\text{CCl}_4, l) = -30.69$  kcal/mol, using  $\Delta H_f^\circ = -94.051, -39.823$  and  $-89.315$  kcal/mol for CO<sub>2</sub>(g), HCl(600H<sub>2</sub>O, aq) and H<sub>2</sub>O(l), respectively (2). The standard deviation of five combustion runs was  $\pm 0.074$  kcal/mol. Employing the heat of vaporization of CCl<sub>4</sub>(l) at 298°K as 7.75 kcal/mol (3), we obtain  $\Delta H_f^\circ(\text{CCl}_4, g) = -22.94$  kcal/mol which is adopted in the tabulation.

L. Smith et al. (5), based on the combustion data of E. Efring (1), re-evaluated the heat of combustion of carbon tetrachloride at 18.7°C as  $\Delta H_c^\circ(M) = -87.5$  cal/g for CCl<sub>4</sub>(l) + 2H<sub>2</sub>O(l) + CO<sub>2</sub>(g) + 4HCl(600H<sub>2</sub>O). This value needs to be further corrected for a change in the heat of oxidation of As<sub>2</sub>O<sub>3</sub>(s) (6) and calculated to 25°C to give  $\Delta H_c^\circ = -88.105$  kcal/mol,  $\Delta H_c^\circ = -87.513$  kcal/mol,  $\Delta H_f^\circ(\text{CCl}_4, l) = -29.20$  kcal/mol and  $\Delta H_f^\circ(\text{CCl}_4, g) = -21.45$  kcal/mol.

C. A. Neugebauer (7) has measured the heat of reaction of CCl<sub>4</sub> with Hg in presence of hydrogen in the stationary bomb calorimeter and then derived the heat of formation,  $\Delta H_f^\circ(\text{CCl}_4, l) = -32.3 \pm 2$  kcal/mol which yields  $\Delta H_f^\circ(\text{CCl}_4, g) = -24.55 \pm 2$  kcal/mol. V. F. Baibuz (8), using an explosion technique, obtained  $\Delta H_f^\circ(\text{CCl}_4, g) = -24.6 \pm 1.9$  kcal/mol. Bodenstern and Gunther (9) have measured calorimetrically  $\Delta H_f^\circ = -62.57 \pm 0.35$  kcal/mole for CCl<sub>4</sub>(g) + 2H<sub>2</sub>(g) + C(s) + 4HCl(g). They calibrated their calorimeter by means of the reaction H<sub>2</sub>(g) + Cl<sub>2</sub>(g) + 2HCl(g) for which they took  $\Delta H_f^\circ = -44$  kcal/mol. Their data have been re-evaluated to give  $\Delta H_f^\circ(\text{CCl}_4, g) = -25.68$  kcal/mol, but no correction is applied for the heat of formation of carbon which was not the reference state "graphite" formed in the reaction. Bomalski and Armstrong (10) reviewed several cases of active carbon formed in similar reactions and quoted a heat of formation of carbon from 1.9 to 3.95 kcal/mol. If this correction is applied to the data of Bodenstern, their heat of formation of CCl<sub>4</sub>(g) should be 2 to 4 kcal/mol less negative than  $-25.68$  kcal/mol.

Heat Capacity and Entropy

Barcell, Brockway and Schwendeman (11) have measured the bond distance as  $1.760 \pm 0.004$  Å by the electron diffraction measurement. The assigned fundamental vibrational frequencies are obtained from Shinouchi's selection (12) in which they are essentially the same as those frequencies determined from Raman and infrared spectra by Classen (13). The three principal moments of inertia are  $I_A = I_B = I_C = 48.627 \times 10^{-39}$  gm<sup>2</sup>.

 $r_g = 1.2667 \text{ \AA}$   
 $\sigma = 1$

Heat of Formation

M. Farber et al. (1) have studied the weight change of graphite in  $\text{CF}_4$  at high temperatures. Our reanalysis of their data uses the equilibrium constants for  $\text{CF}_4$ ,  $\text{CF}_3$  and  $\text{CF}_2$  from the JANAF Tables (2); the only other C-F species considered is assumed to be CF. This treatment yields negative values for the CF pressure except at the highest temperature, where 3rd law analysis of the equilibrium constant yields  $\Delta H_{298}^\circ(\text{CF}, g) = 59.4 \text{ kcal/mol}$ . Farber et al. also investigated mass-spectrometrically the vapor species present at equilibrium and followed the intensities of  $\text{CF}^+$  and  $\text{F}^+$ . From a second law treatment of the intensities they report  $\Delta H_{298}^\circ(\text{CF}, g) = 62.0 \text{ kcal/mol}$ , or  $\Delta H_{298}^\circ(\text{CF}, g) = 64 \text{ kcal/mol}$ . Porter et al. (3) have investigated the A-X band system under high dispersion. From an analytical extrapolation of the 10 observed levels they reported a dissociation energy of  $126.9 \pm 2.9 \text{ kcal/mol}$ , which yields  $\Delta H_{298}^\circ(\text{CF}, g) = 61.9 \pm 2.9 \text{ kcal/mol}$ . The predissociation limit of  $\text{CF}(g)$  has been reported by Thrush and Zwolenik (4) as  $\leq 132 \text{ kcal/mol}$ ; Kuzakov and Tatischevsky (5) determined the same quantity as  $\leq 133 \text{ kcal/mol}$ . These results yield  $\Delta H_{298}^\circ(\text{CF}, g) \geq 65 \text{ kcal/mol}$ . Thrush and Zwolenik (4) also report a predissociation limit for the reaction  $\text{CF}_2 \rightarrow \text{CF} + \text{F}$  which is  $\leq 120 \text{ kcal/mol}$ . This value has now been shown to be erroneous (see the  $\text{CF}_2(g)$  table for details).

Modica (6) has studied the equilibrium  $\text{CF}_2 \rightarrow \text{CF} + \text{F}$  in a shock tube in the range  $2880^\circ$  to  $3400^\circ\text{K}$ . Since functions for  $\text{CF}_2$ , CF and F are well established, the data were analyzed using 2nd and 3rd law treatments. The 2nd law analysis gives  $\Delta H_{298}^\circ = 107.2 \pm 7.6 \text{ kcal/mol}$ , in agreement with the value reported by Modica. The 3rd law analysis yields  $\Delta H_{298}^\circ = 134.9 \pm 7.2 \text{ kcal/mol}$  and a drift of  $9.7 \pm 2.5 \text{ au}$ . The excessive drift indicates that the reported equilibrium constants do not represent the stated reaction.

Andrews and Barrow (7) report a dissociation energy of  $114 \text{ kcal}$  from an extrapolation of four B state levels. This extrapolation is considered unreliable by Porter et al. (3) since this state is formed from an avoided crossing and is likely to be perturbed.

The adopted value of  $\Delta H_{298}^\circ(\text{CF}, g)$  is  $61 \pm 2 \text{ kcal/mol}$ , which is within the uncertainties and ranges of the acceptable investigations.

Heat Capacity and Entropy

The vibrational and rotational constants are from Porter et al. (3); the higher electronic levels are those reported by Andrews and Barrow (7), except that the B state is now considered to be  $^2\Sigma$ . The estimated level at  $25000 \text{ cm}^{-1}$  is proposed in order to explain the low bond dissociation energy of  $\text{C}_2\text{F}_2$ , by analogy with the reasoning used by Simons (8) for  $\text{C}_2\text{F}_4$ . This level would be a  $^3\Sigma$  level and could correlate with the ground state atoms.

$\sigma = 1$

Bond Distances: C-F = 1.262 Å C-N = 1.159 Å

Bond Angle: F-C-N = 180°

Rotational Constants:  $B_0 = 0.3531$   $cm^{-1}$

Heat of Formation

Davis and Okabe (1) have determined the dissociation energy of FCN to F(g) and CN(g) by measuring the threshold energies of incident photon radiation to produce  $B^2\Sigma^+$  CN which is monitored by its fluorescence. The dissociation energy determined by this technique is  $\leq 111$  kcal/mol with an uncertainty of about 1 kcal in the determination of the limit.

Dibeler and Liston (2) have reported a dissociation energy of  $\leq 115.6$  kcal/mol from the threshold of the CN<sup>+</sup> ion as determined by photoionization.

We adopt a median value of  $113.1 \pm 2.5$  kcal/mol which leads to  $\Delta H_f^{\circ}(\text{FCN}, g) = 0.6 \pm 4$  kcal/mol with auxiliary JANAF values for F(g) and CN(g).

Heat Capacity and Entropy

The molecular structure and bond lengths and angle were determined using microwave spectroscopy by Tyler and Sheridan (3). The vibrational frequencies were reported by Aynsley et. al. (4) from the infra-red spectrum, except for the bending frequency which is estimated from the values for ClCN, BrCN and ICN, by comparison of bending force constants. The reasonable limits for this value as calculated from generous limits on the bending force constant are 405-450  $cm^{-1}$ .

Bond Distance: C-F = [1.34] Å  
 Bond Angle: F-C-O = [135] °  
 Product of the Moments of Inertia:  $I_A I_B I_C = [2.1986 \times 10^{-116}] \text{ g.}^3 \text{ cm.}^6$   
 $\sigma^- = 1$

Heat of Formation.  
 The enthalpy change ( $\Delta H_f^{\circ}$ ) for the reaction  $\text{COF}_2(\text{g}) = \text{CO}(\text{g}) + 2\text{F}(\text{g})$  was calculated as 160.5 kcal. mole<sup>-1</sup>.  
 By analogy with  $\text{D}(\text{Cl-COCl})/\text{D}(\text{Cl-CO})$ , the value of  $\text{D}(\text{F-COF})/\text{D}(\text{F-CO})$  was taken to be 4. Based on  $\Delta H_f^{\circ} = 160.5 \times (4/5) = 128.4 \text{ kcal. mole}^{-1}$  for the reaction  $\text{COF}_2(\text{g}) = \text{CO}(\text{g}) + \text{F}(\text{g})$ , the heat of formation for  $\text{COF}(\text{g})$  was derived as  $-41 \pm 15 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.  
 The vibrational frequencies were reported by D. E. Milligen, M. E. Jacox, A. M. Bass, J. J. Comerford and D. E. Mann, J. Chem. Phys. 42, 3187 (1965). The bond distances and angle were estimated by comparison with those for HFCO (g). Due to the presence of one unpaired electron on C atom, the ground state quantum weight is calculated to be 2. The three principal moments of inertia are:  $I_A = 7.8757 \times 10^{-39}$ ,  $I_B = 3.3880 \times 10^{-40}$ , and  $I_C = 8.2155 \times 10^{-39} \text{ g. cm.}^2$

Heat of Formation

Through and Zwolenik (1) reported a predissociation limit for CF2 + CF + F; however, Marsigny et al. (2) have since observed in emission the assumed predissociated level, and others above it, which invalidates the reported limit.
Walter et al. (3) have obtained the photoionization threshold at 0 K for onset of the reaction C2F4 + e- -> CF2+ + CF2 + 2e-, as 14.63 ± 0.04 eV (337.37 Kcal). The ionization potential of CF2 has been reported as 11.7 eV (4), 11.8 ± 0.3 eV (5) and 11.86 ± 0.1 eV (6). Since these values were obtained by electron impact methods, there may be excess energy involved. Thus, adopting the lowest value as 11.7 ± 0.2 eV, we obtain ΔHf298(CF2, g) = -44.4 ± 2.5 kcal/mol (7). All previous electron impact methods are considered superseded by this photoionization result.

Modica and LaGraff (8) determined equilibrium constants for the reaction (A) C2F6 + 2CF2 by use of a shock tube to achieve high temperatures and ultra violet absorption to detect the CF2 concentration. Carlson (9) has studied the same reaction using a similar technique, and also Zmbov et al. (5) have investigated this equilibrium in a mass spectrometer. A 2nd and 3rd law analysis of all three sets of data is given below along with our recalculated equilibrium data of Farber et al. (10) for the reaction (B) C + 2F + CF2 from weight loss experiments in the system C + CF2.

Kinetic methods were used by Edwards and Small (11) to study the equilibrium (C) CHF2Cl(g) ⇌ CF2(g) + HCl(g). They analysed their data by assuming that the only other equilibrium occurring was 2CF2(g) ⇌ C2F4(g), and fit their kinetic data by 6.21 ± 3.0 kcal, thus ΔE = 49.6 ± 3.0 and ΔH300 = 51.4 ± 3 kcal, which yields ΔHf298(CF2, g) = -42 ± 4 kcal/mol (7). They also obtained the activation energy of reaction (A) as 70.36 ± 1.3 kcal. Dalby (12) has reported the activation energy of the reverse of (A) as 1.2 ± 0.2 kcal, thus, ΔEa = 69.2 ± 1.3 and ΔH300 = 71.0 ± 1.3 kcal, which yields ΔHf298(CF2, g) = -42.6 ± 1.0 kcal/mol (7). Gozzo and Patrick (13) also investigated the kinetics of reaction C and obtained activation energies of 51.4 ± 2.5 and 14.4 ± 5 kcal, the latter value being corrected for the activation energy of CF2 recombination (12). Thus, we obtain ΔEa = 37 ± 7 and ΔH1000 = 39 ± 7 kcal, which yields ΔHf298(CF2, g) = -54 ± 9 kcal/mol (7).

Modica and LaGraff (14) investigated the kinetics of CHF3 decomposition by a mass spectrometer coupled to a shock tube. They investigated the pressure dependence of the rate and concluded that at the high pressure limit E0 = 58.4 ± 2.2 kcal. Taking this value as ΔHf° for the reaction (D) CHF3(g) ⇌ CF2(g) + HF(g), we obtain ΔHf298(CF2, g) = -41.3 ± 2.5 kcal/mol (7). However, any activation energy of the reverse reaction (D) will make this value more negative. Since values of the reverse activation energy of analogous reaction (C) range from 6.2 to 14.4 kcal, it appears likely that reverse reaction (D) will have a significant activation energy; thus, ΔHf298(CF2, g) < -41.3 ± 2.5 kcal. Tschukow-Roux (15) has investigated the same reaction in a shock tube, but was unable to obtain sufficient variation of rate with pressure to calculate the high pressure limit.

Heat Capacity and Entropy

The structure of CF2 has been reported by Powell and Lide (16) from microwave measurements and has been confirmed by Mathews (17) from the fine structure of the 2500Å absorption band. Mathews also reported ω2 and Herz and Pimentel (18) reported ω3, both from gas phase studies. Milligan et al. (19) have observed all three vibrations in matrix-isolated CF2 as 1222, 666 and 1102 cm-1. The electronic levels are from Mathews (17) with the triplet level estimated by Simons (20) to explain the low c-c bond energy of 70 kcal in C2F4. The individual moments of inertia are IA = 0.9512 x 10-39 g cm2, IB = 6.7020 x 10-39 g cm2, and IC = 7.6532 x 10-39 g cm2.

Heat of Formation  
 Ruff and Li (1) measured equilibrium constants for the reaction  
 2COF<sub>2</sub>(g) ⇌ CO<sub>2</sub>(g) + CF<sub>4</sub>(g)

in the temperature range 573-1273°K. These equilibrium data were recently analyzed by Stull, Westrum, and Sinke (2). Their third law analysis of the data clearly indicates that the three low temperature points are in error and should not be used in calculating ΔH<sub>f</sub><sup>298</sup>. They reported, ΔH<sub>f</sub><sup>298</sup> = -12 ± 3 kcal/mol, based upon an average of the five high temperature points. Combining this result with the heat of formation of carbon dioxide and carbon tetrafluoride (3), we derive,  
 ΔH<sub>f</sub><sup>298</sup>(COF<sub>2</sub>, g) = -152.5 ± 3.3 kcal/mol.  
 Wartenberg and Ritaric (4) measured the heat of hydrolysis of CF<sub>2</sub>O. They reported, ΔH<sub>r</sub> = -26.7 ± 0.2 kcal/mol, for the reaction  
 COF<sub>2</sub>(g) + H<sub>2</sub>O(l) ⇌ CO<sub>2</sub>(g) + 2HF·300 H<sub>2</sub>O.  
 Combining this result with heat of formation data for carbon dioxide and HF(ΔH<sub>f</sub><sup>298</sup>(HF·300 H<sub>2</sub>O) = -76.84 kcal/mol (5)), we derive,  
 ΔH<sub>f</sub><sup>298</sup>(COF<sub>2</sub>, g) = -152.7 ± 0.4 kcal/mol.

Amstrong, Coyle, and Krieger (6) measured the heats of combustion of CH<sub>4</sub> in O<sub>2</sub>-F<sub>2</sub> mixtures and found ΔH<sub>f</sub><sup>298</sup>(CF<sub>2</sub>O, g) = -154.8 kcal/mol. The value calculated from Wartenberg's data is adopted here.  
 Heat Capacity and Entropy  
 The vibrational frequencies are from the infrared studies of Hopper et al. (7) and are in good agreement with the results of Lovall et al. (8) and Nielsen et al. (9). The molecular constants are from the microwave studies of Laurie et al. (10) and are in reasonable agreement with the electron-diffraction work of Brown and Livingston (11). Individual moments of inertia calculated from the rotational constants of Laurie et al. (10) are I<sub>A</sub> = 7.105 × 10<sup>-39</sup> g cm<sup>2</sup>, I<sub>B</sub> = 7.144 × 10<sup>-39</sup> g cm<sup>2</sup>, and I<sub>C</sub> = 14.27 × 10<sup>-39</sup> g cm<sup>2</sup>.

Bond Distance: C-F = 1.332 Å C-I = 2.130 Å  
 Bond Angle: F-C-F = 108.3 ± 1° F-C-I = 110.62°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 4.4095 × 10<sup>-113</sup> g<sup>3</sup> cm<sup>6</sup> σ = 3

Heat of Formation  
 The selected value is obtained from least squares, simultaneous adjustment of the heats of formation of CF<sub>3</sub>, CF<sub>3</sub>X (X = H, Cl, Br, I, CF<sub>3</sub>) and C<sub>2</sub>F<sub>6</sub>. Details of the input data and the adjustment are given in (1). Lord, Goy and Fritchard (2, 3) report equilibrium data for the reactions CF<sub>3</sub>X(g) + I<sub>2</sub>(g) = CF<sub>3</sub>I(g) + XI(g) where X = H, Cl, and Br. In addition to these prime links, there is a weak link to CF<sub>3</sub> through kinetic studies of CF<sub>3</sub>I(g) + I(g) = CF<sub>3</sub>(g) + I<sub>2</sub>(g). Data for this reaction (3, 12) yield the average value ΔH<sub>f</sub><sup>0</sup> = 17.1 ± 2 kcal/mol at 298.15°K.

Heat Capacity and Entropy  
 The molecular structure has been derived from electron-diffraction studies by Bowen (4), Anderson (5), and Wong and Schomaker (6). Differences among the data are small. The results of Anderson are adopted since they are intermediate between the others. Microwave data (7) are consistent with the adopted parameters. Infrared spectra of the gas were observed by several investigators (8, 9, 10) and Raman spectra of the liquid were obtained by Edgell and May (10). The vibrational assignments of (9, 10) are in close agreement. These assignments are adopted but preference is given to frequencies observed for the gas. In particular, ν<sub>6</sub> is taken as 260 cm<sup>-1</sup> (from overtone and combination bands of the gas) rather than 285 cm<sup>-1</sup> (from the Raman spectra of the liquid). The approximate values of ν<sub>2</sub>, ν<sub>3</sub> and ν<sub>6</sub> have been confirmed by analysis (11) of absorption spectra in the UV.

The thermodynamic functions of this table are essentially the same as those calculated by (9). Uncertainty in ν<sub>6</sub> and neglect of anharmonicity are the major sources of error. Discussions of the magnitude of anharmonic effects appear on the tables for CCl<sub>3</sub>(g) and CF<sub>4</sub>(g). The principal moments of inertia are I<sub>A</sub> = 14.71 × 10<sup>-39</sup> and I<sub>B</sub> = I<sub>C</sub> = 54.75 × 10<sup>-39</sup> g cm<sup>2</sup>.

Bond Distances: C-F = [1.33] Å F-O = [1.42] Å C-O = [1.43] Å  
 Bond Angles: C-O-F = [103.2]° F-C-F = [109.5]°  
 Product of Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.138 × 10<sup>-113</sup> g<sup>3</sup>cm<sup>6</sup>

Heat of Formation

Porter and Cady (1) measured equilibrium constants for the reaction  
 CF<sub>3</sub>OF(g) + COF<sub>2</sub>(g) + F<sub>2</sub>(g)  
 in the temperature range 630-750°K. Equilibrium constants were also determined with excess fluorine added to the system.

Second and third law analyses of these data yield the following heats of reaction:

| Set                | $\Delta H_{298}^\circ$ 2nd law | $\Delta H_{298}^\circ$ 3rd law | Drift     |
|--------------------|--------------------------------|--------------------------------|-----------|
| Set 1              | 27.65 ± 0.2                    | 30.10                          | 3.6 ± 0.3 |
| Set added fluorine | 25.11 ± 0.3                    | 30.09                          | 7.2 ± 0.5 |

The third law analyses indicate significant trends within each set of equilibrium data. If the entire error is assigned to the free energy functions, then the drifts in the third law analysis imply that the free energy functions for CF<sub>3</sub>OF should be increased by 3.6 or 7.2 gibbs/mol. However, the real error in these free energy functions is probably no larger than 1 gibbs/mol in the temperature range of the experimental data. Apparently, the equilibrium reaction investigated by Porter and Cady (1) was affected by side reactions possibly involving perfluorodimethyl peroxide. However, since the only other approach to the heat of formation of CF<sub>3</sub>OF involves bond energies, we adopt the third law value,  $\Delta H_f^\circ = 30.1 \text{ kcal/mol}$ , and derive  $\Delta H_f^\circ(\text{CF}_3\text{OF}, g) = -182.8 \pm 3 \text{ kcal/mol}$  with  $\Delta H_f^\circ(\text{COF}_2, g) = -152.7 \pm 0.4 \text{ kcal/mol}$  (2).

Czarnowski et al. (3) recently determined the O-F bond energy in CF<sub>3</sub>OF from kinetic studies on the thermal decomposition of CF<sub>3</sub>OF in the presence of SO<sub>2</sub>. They reported the value D(O-F) = 43.5 ± 0.5 kcal/mol. Combining this result with the following data,

|   |   |
|---|---|
| $\Delta H_f^\circ(\text{SO}_2, g) = 170.89 \pm 0.45 \text{ kcal/mol}$ (4) | $\Delta H_f^\circ(\text{SO}_2, g) = 18.96 \pm 0.40 \text{ kcal/mol}$ (5)  |
| $\Delta H_f^\circ(\text{SO}_3, g) = 59.559 \pm 0.03 \text{ kcal/mol}$ (6) | $\Delta H_f^\circ(\text{SO}_3, g) = 117.4 \text{ kcal/mol}$ (from $\Delta H_f^\circ(\text{CF}_3\text{OF}, g) = -223.04 \pm 0.3 \text{ kcal/mol}$ (2)) |
| $\Delta H_f^\circ(\text{CO}_2, g) = 84 \text{ kcal/mol}$ (8)              | $\Delta H_f^\circ(\text{CO}_2, g) = 173.8 \text{ kcal/mol}$   |

We derive  $\Delta H_f^\circ(\text{CF}_3\text{OF}, g) = -173.8 \text{ kcal/mol}$ .  
 The value determined from Porter and Cady's equilibrium data is adopted here.  $\Delta H_f^\circ$  is determined to be -4.086 kcal/mol.

Heat Capacity and Entropy

The vibrational frequencies are from the infrared and Raman studies of Wilt and Jones (9) and are in reasonable agreement with nine of the twelve expected fundamentals observed by Lagemann et al. (10). Bond lengths and angles are estimated quantities chosen by Wilt and Jones (9). Individual moments of inertia calculated from these estimated molecular constants are I<sub>A</sub> = 14.723 × 10<sup>-39</sup> g cm<sup>2</sup>, I<sub>B</sub> = 27.796 × 10<sup>-39</sup> g cm<sup>2</sup>, and I<sub>C</sub> = 27.801 × 10<sup>-39</sup> g cm<sup>2</sup>. The contributions of hindered internal rotation to the thermodynamic properties of CF<sub>3</sub>OF are from the tables of Pitzer and Swain (11). The reduced moment of inertia, I<sub>r</sub>, and the potential barrier, V<sub>0</sub>, are from the work of Wilt and Jones (9) and are:

$I_r = 2.939 \times 10^{-39} \text{ g cm}^2$   
 $V_0 = 1130 \text{ cal/mol}$  (V<sub>12</sub> = 56 cm<sup>-1</sup>)

Heat of Formation

G. Herzberg, "Spectra of Diatomic Molecules," D. Van Nostrand Co., Inc., New York, 1950, reanalyzed the rotational predissociation reported by T. Shidei, Japan J. Phys., 11, 23 (1936), and concluded that D<sub>0</sub><sup>o</sup> = 80.0 kcal/mol (3.47 eV). This yields ΔH<sub>f</sub><sup>o</sup>(CH, g) = 142.0 kcal/mol and is the adopted value.

R. G. Brewer and F. L. Kester, J. Chem. Phys., 20, 812 (1954), have confirmed the value as 142 ± 5 kcal/mol, from an equilibrium study of the temperature variation of the intensity of the <sup>2</sup>Δ<sub>g</sub>,<sup>2</sup>Π emission band.

M. Linevsky, J. Chem. Phys., 47, 1495 (1967), determined the concentration of CH radicals in equilibrium with 1 atm. of hydrogen gas, by application of a high resolution spectro-photographic technique to three electronic transitions in absorption.

A third law analysis, using the present functions, of 27 determinations in the temperature range 3065 - 3155°K yielded ΔH<sub>f</sub><sup>o</sup>(CH, g) = 142.01 ± 1.28 kcal/mol with a negligible drift. This value is in excellent agreement with the spectroscopic predissociation value.

Heat Capacity and Entropy

The vibrational and rotational constants and electronic levels are from Herzberg, loc. cit., with the exception of the estimated <sup>4</sup>Σ level. All the constants have been adjusted to the normal isotopic abundances for both carbon and hydrogen. The <sup>4</sup>Σ level is estimated from the ab initio calculations of A. C. Hurley, Proc. Roy. Soc. (London), 219A, 402 (1959), which include electron correlation effects. Earlier LCAO calculations had predicted the <sup>4</sup>Σ level to be the ground state, but J. Higuchi, J. Chem. Phys., 22, 1339 (1954), used LCAO-SCF calculations and obtained the <sup>4</sup>Σ level at 800 cm<sup>-1</sup>. M. Krauss and J. F. Wehrer, J. Chem. Phys., 29, 1287 (1958), using essentially the same technique as Hurley, obtained <sup>4</sup>Σ at 3000 cm<sup>-1</sup>.

Bond Distance: C-H = 1.12 Å C-Cl = 1.689 Å

Bond Angle: H-C-Cl = 103.4°

σ = 1

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 3.9877 × 10<sup>-117</sup> g<sup>3</sup> cm<sup>6</sup>

Heat of Formation

The heat of formation can be estimated as the average of those of the CH<sub>2</sub> and CCl<sub>2</sub> radicals, which gives ΔH<sub>f</sub><sup>0</sup><sub>298</sub>(CHCl, g) = 74.5 ± 15 kcal/mol. A better value for the heat of formation can be obtained by considering the reactions CHCl + CH + Cl and CHCl + CCl + H. When ΔH<sub>f</sub><sup>0</sup><sub>298</sub>(CCl, g) = 74.5 kcal/mol is substituted into the above equations it gives D<sub>C-Cl</sub> = 98 kcal and D<sub>C-H</sub> = 98 kcal. Although these values are not unreasonable the D<sub>C-H</sub> value appears to be too high compared to that in CFH. Thus, we adopt ΔH<sub>f</sub><sup>0</sup><sub>298</sub>(CHCl, g) = 80 kcal/mol which gives D<sub>C-Cl</sub> = 91 kcal and D<sub>C-H</sub> = 92 kcal.

Heat Capacity and Entropy

The structure and electronic levels of the molecule have been established by Merer and Travis (1) from an analysis of the rotational structure of the visible absorption bands. The estimated triplet state is based on the electronic levels of CCl<sub>2</sub> and CH<sub>2</sub> as given in these tables. The vibrational levels are from Jacox and Milligan (2) who investigated the infrared spectrum of matrix-isolated CHCl, and also estimated the missing frequency. The individual moments of inertia are I<sub>A</sub> = 4.6455 × 10<sup>-39</sup> g cm<sup>2</sup>, I<sub>B</sub> = 1.780 × 10<sup>-40</sup> g cm<sup>2</sup>, and I<sub>C</sub> = 4.8235 × 10<sup>-39</sup> g cm<sup>2</sup>.

Vibrational Frequencies and Degeneracies

| ω, cm <sup>-1</sup> | ω, cm <sup>-1</sup> | ω, cm <sup>-1</sup> |
|---------------------|---------------------|---------------------|
| 3024 (1)            | 812 (1)             | 1350 (1)            |
| 1312 (1)            | 598 (1)             | 1108 (1)            |
| 836 (1)             | 417 (1)             | 400 (1)             |

Bond Distance: C-H = 1.09 Å    C-Cl = 1.74 Å    C-F = 1.35 Å

Bond Angle: H-C-Cl = 107°    Cl-C-F = 110.5°    F-C-F = 107°    σ = 1

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 3.43433 × 10<sup>-114</sup> g<sup>3</sup> cm<sup>6</sup>.

Heat of Formation

Edwards and Small (1) determined a single equilibrium constant at 600°C for the reaction 2CHClF<sub>2</sub>(g) + C<sub>2</sub>F<sub>4</sub>(g) + 2HCl(g). The value was not obtained directly but was obtained by extrapolation to eliminate the effects of side reactions. The equilibrium constant was used with JANAF free energy functions (2) to obtain ΔHf°<sub>298</sub> = 28.75 kcal, which yields ΔHf°<sub>298</sub> (CHClF<sub>2</sub>, g) = -115.1 kcal/mol. An uncertainty of ±3 kcal/mol corresponds to an uncertainty of about ±50% in the equilibrium constant.

Heat Capacity and Entropy

The gas phase vibrational frequencies have been observed in the Raman by Holzer and Moser (3); they do not see anything in the 1350 cm<sup>-1</sup> region as reported in the liquid by Glockler and Edgell (4). Plyler and Benedict (5) in their assignment replaced an 831 cm<sup>-1</sup> frequency by 1178 cm<sup>-1</sup>. We essentially adopt Glockler and Edgell's assignment with updated gas phase values for the observed frequencies. The microwave spectrum has been analysed by McLay and Mann (6) and Beeson et al. (7), who derive bond lengths and angles in excellent agreement with each other. The values given by Beeson et al. are adopted here.

McLay and White (8) have measured the low temperature heat capacity and heat of vaporization and have reported an entropy in the gas phase at 232.5°K of 63.919 ± 0.28 gibbs/mol. This compares with 63.959 gibbs/mol calculated from our adopted functions.

The individual moments of inertia are I<sub>A</sub> = 8.203 × 10<sup>-39</sup> g cm<sup>2</sup>, I<sub>B</sub> = 17.402 × 10<sup>-39</sup> g cm<sup>2</sup> and I<sub>C</sub> = 24.060 × 10<sup>-39</sup> g cm<sup>2</sup>.

Bond Distances: C-H = 1.09 Å C-Cl = 1.75 Å C-F = 1.367 Å  
 Bond Angle: Cl-C-Cl = 112°12' F-C-Cl = 109° H-C-Cl = 109°45'  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.11593 × 10<sup>-113</sup> g<sup>3</sup> cm<sup>6</sup>

Heat of Formation

The change in heat of atomization by successive replacement of F by Cl in the CF<sub>4</sub> to CCl<sub>4</sub> series follows a regular pattern (see CCl<sub>2</sub>F<sub>2</sub> table). A similar pattern is to be expected in the CHCl<sub>3</sub> series. The first replacement of the series is, in fact, 4 kcal higher than the mean versus 3.8 kcal higher in the CF<sub>3</sub>-CCl<sub>4</sub> series. Thus, we have selected the atomization energy of the second and third replacements to continue this pattern. In this manner we have selected the atomization energy of CHCl<sub>2</sub>F as 367.4 kcal which corresponds to ΔH<sub>f,298</sub><sup>0</sup>(CHCl<sub>2</sub>F, g) = -67.7 kcal/mol. With this adopted value, the successive replacement of F by Cl changes the heat of atomization by 41.4, 37.3 and 33.0 kcal.

Heat Capacity and Entropy

Holzer (1) has reported the gas phase Raman spectrum which is in excellent agreement with the assignments of Plyler and Benedict (2). The only discrepancy is in ν<sub>7</sub>, which Plyler and Benedict assign at 1242 cm<sup>-1</sup>, and Holzer (1) does not report a band in this region. Holzer does, however, report a band at 728 cm<sup>-1</sup> which has not been reported in the earlier liquid studies. There is strong evidence from correlations with CHCl<sub>3</sub> and CHF<sub>3</sub> that two frequencies should occur between 1220 and 1376 cm<sup>-1</sup>. On this basis we adopt the assignment of Plyler and Benedict for ν<sub>7</sub>, while accepting the gas phase values of Holzer for the other frequencies. The extra band at 728 cm<sup>-1</sup> is not used. It is probable that the bands at 741 and 728 cm<sup>-1</sup> are due to Fermi resonance of ν<sub>4</sub> with 2ν<sub>9</sub>; the unperturbed level would lie at 735 cm<sup>-1</sup>. The symmetry classes of ν<sub>4</sub> and 2ν<sub>9</sub> are identical and thus Fermi resonance is allowed.

Nclay (3) has reported the molecular structure from his microwave investigations. The individual principal moments of inertia are I<sub>A</sub> = 12.053 × 10<sup>-39</sup> g cm<sup>2</sup>, I<sub>B</sub> = 25.684 × 10<sup>-39</sup> g cm<sup>2</sup> and I<sub>C</sub> = 36.047 × 10<sup>-39</sup> g cm<sup>2</sup>.

Bond Distances: C-H = 1.100 Å C-Cl = 1.758 Å

Bond Angles: Cl-C-Cl = 111°10', H-C-Cl = 107°34', σ = 3

Product of the Moments of Inertia:  $I_A I_B I_C = 3.2811 \times 10^{-113} \text{ g}^3 \text{ cm}^6$

Heat of Formation

Hu and Sinke (1) have measured the heat of combustion of CHCl<sub>3</sub>(l) in the rotating bomb calorimeter, using As<sub>2</sub>O<sub>3</sub> solution as the reducing agent. The reported ΔH<sub>c298</sub> = -113.10 kcal/mol for CHCl<sub>3</sub>(l) + 0.5O<sub>2</sub> + H<sub>2</sub>O(l) + CO<sub>2</sub>(g) + 3HCl(600H<sub>2</sub>O, aq) which leads to ΔH<sub>f298</sub>(CHCl<sub>3</sub>, l) = -32.10 kcal/mol, using ΔH<sub>f298</sub> = -94,051, -39,823, -68,315 kcal/mol for CO<sub>2</sub>(g), HCl(600H<sub>2</sub>O, aq) and H<sub>2</sub>O(l), respectively (2). The standard deviation of six combustion runs was 0.09 kcal/mol. Employing the heat of vaporization of chloroform at 298°K as 7.44 kcal/mol (3), we obtain ΔH<sub>f298</sub>(CHCl<sub>3</sub>, g) = -24.66 kcal/mol which is adopted in the tabulation.

L. Smith et al. (4), based on the combustion data of E. Efring (5), re-evaluated the heat of combustion of chloroform at 18.7°C as ΔH<sub>c</sub>°/M = -847.7 cal/g for CHCl<sub>3</sub>(l) + 0.5O<sub>2</sub>(g) + H<sub>2</sub>O(l) + CO<sub>2</sub>(g) + 3HCl(600H<sub>2</sub>O, aq). This value needs to be further corrected for a change in the heat of oxidation of As<sub>2</sub>O<sub>3</sub>(s) and calculated to 25°C to give ΔH<sub>f298</sub> = -113.44 kcal/mol, ΔH<sub>f298</sub>(CHCl<sub>3</sub>, l) = -31.76 kcal/mol and ΔH<sub>f298</sub>(CHCl<sub>3</sub>, g) = -24.32 kcal/mol.

Heat Capacity and Entropy

The assigned fundamental vibrational frequencies are obtained from Shimanouchi's selection (7), based on infrared and Raman spectra measured by Nielsen and Ward (8), Madigan and Cleveland (9), Gibian and McKinney (10) and Stanevich and Yaroslavskii (11).

The bond distances and angles were obtained from the microwave spectra by Jen and Lide (12). The three principal moments of inertia are  $I_A = I_B = 25.719 \times 10^{-39}$  and  $I_C = 49.603 \times 10^{-39} \text{ g cm}^2$ .

| 1182 (1)                | 1     |

Bond Distance: C-H = 1.121 Å C-F = 1.314 Å  
 Bond Angle: H-C-F = 101.6°  
 Product of the Moments of Inertia:  $I_A I_B I_C = 1.0217 \times 10^{-117} \text{ g}^3 \text{ cm}^6$   
 $\sigma = 1$

Heat of Formation

The heat of formation can be estimated as the average of those of the  $\text{CH}_2$  and  $\text{CF}_2$  radicals, which gives  $\Delta H_f^\circ(\text{CHF}, g) = 25 \pm 20 \text{ kcal/mol}$ . A better value for the heat of formation can be obtained by considering the bond energies  $\text{CHF} \rightarrow \text{CH} + \text{F}$  and  $\text{CHF} \rightarrow \text{CF} + \text{H}$ . When  $\Delta H_f^\circ(\text{CHF}, g) = 25 \text{ kcal/mol}$  is substituted into the above equations it gives  $\text{D}_{\text{C-F}} = 136 \text{ kcal}$  and  $\text{D}_{\text{C-H}} = 86 \text{ kcal}$ . These are not unreasonable values but are probably close to the upper and lower limits respectively. A value of  $\Delta H_f^\circ(\text{CHF}, g) = 30 \text{ kcal/mol}$  gives  $\text{D}_{\text{C-F}} = 131 \text{ kcal}$  and  $\text{D}_{\text{C-H}} = 81 \text{ kcal}$  which are more probable since both fall within the bounds of normal bond strengths. The strongest established C-F bond is 135 kcal in  $\text{CF}_3$  and the weakest established C-H bond is 80 kcal in  $\text{CH}_4$ . We adopt  $\Delta H_f^\circ(\text{CHF}, g) = 30 \pm 7 \text{ kcal/mol}$ .

Heat Capacity and Entropy

The structure and electronic levels of the molecule have been established by Merer and Travis (1) from an analysis of the rotational structure of the visible absorption bands. The estimated triplet state is based on the electronic levels of  $\text{CF}_2$  and  $\text{CH}_2$  as given in these tables. The vibrational levels are from Merer and Travis (1) and Jacox and Milligan (2), the latter investigated the infrared spectrum of matrix-isolated HCF and also estimated the missing frequency. The individual moments of inertia are  $I_A = 2.2979 \times 10^{-39} \text{ g cm}^2$ ,  $I_B = 1.795 \times 10^{-40} \text{ g cm}^2$ , and  $I_C = 2.4774 \times 10^{-39} \text{ g cm}^2$ .

Heat of Formation

$\Delta H_f$  for III was estimated to be the average of the  $\Delta H_f$ 's of I and II.  
 (I)  $CH_2O(g) = CO(g) + 2H(g)$  106 kcal.  
 (II)  $CF_2O(g) = CO(g) + 2F(g)$  162 kcal.  
 (III)  $CHFO(g) = CO(g) + F(g) + H(g)$  [134] kcal.

The auxiliary  $\Delta H_f$  288.15 of  $CH_2O = -28$ ,  $H = 52$ ,  $F = 19$ ,  $CO = -25$ ,  $CF_2O = -150$  kcal. mole<sup>-1</sup> was used. See the respective sheets for details. The estimated heat of formation is consistent with the instability of  $CHFO(g)$  at room temperature.

Heat Capacities and Entropies

The molecular structural parameters were obtained by O. H. LeBlanc, V. W. Laurie and W. D. Gwinn, J. Chem. Phys. 35, 598 (1960), from combining the results of microwave measurements with those of electron diffraction determined by M. E. Jones, K. Hedberg, and V. Schomaker, J. Am. Chem. Soc. 77, 5278 (1955). Agreement within the assigned uncertainties was obtained by R. F. Stratton and A. H. Nielsen, J. Mol. Spect. 4, 373 (1960), on the basis of infrared measurements.

Five of the fundamentals were observed by Stratton and Nielsen, loc. cit. in agreement with those obtained by H. W. Morgan, P. A. Staats and J. H. Goldstein, J. Chem. Phys. 25, 357 (1956). The estimated frequency was based upon the observed value of 857.4 cm.<sup>-1</sup> for the fundamental in the infrared spectrum of the deuterated compound and the application of the Teller-Ridlich isotope rule.

Bond Distances: C-F = 1.333 Å C-H = 1.098 Å  
 Bond Angle: F-C-F = 108.6 ± 0.5° F-C-H = 110.33°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 9.7204 × 10<sup>-115</sup> g<sup>3</sup> cm<sup>6</sup> σ = 3

Heat of Formation

The selected value is obtained from least squares, simultaneous adjustment of the heats of formation of CF<sub>3</sub>, CF<sub>3</sub>X (X = H, Cl, Br, I, CF<sub>3</sub>), details of the input data and the adjustment are given in (1). Trifluoromethane is linked to HF(21.5 H<sub>2</sub>O) by calorimetric data, to CHF<sub>3</sub>(g) and CF<sub>3</sub>I(g) by equilibrium data, and to CF<sub>3</sub>(g) by kinetic data. Neugebauer (2) reported calorimetric data for CHF<sub>3</sub>(g) + 0.5 O<sub>2</sub>(g) + H<sub>2</sub>O(l) + 3 HF(21.5 H<sub>2</sub>O), where CF<sub>3</sub>(g) was also formed in a competing reaction. Recalculation of the original data with ΔH<sub>f</sub>°<sub>298.15</sub>(CF<sub>4</sub>, g) = -223.0 kcal/mol yields the mean value of ΔH<sub>f</sub>°<sub>298.15</sub> = -90.35 ± 0.7 kcal/mol, but the individual values of ΔH<sub>f</sub>° show a disturbing trend with the amount of competing reaction. Possible causes for the trend include corrosion and error in the analysis of the reaction products. Calibration was done in the presence of HF in an attempt to eliminate the heat due to corrosion. Because of this unexplained trend, we increase the uncertainty to ± 1.0 kcal/mol. Goy (3) and Coomber (4) determined equilibrium data for CHF<sub>3</sub>(g) + X<sub>2</sub>(g) = CF<sub>3</sub>X(g) + HX(g) where X = I and Br. Kinetic data pertinent to CHF<sub>3</sub> are noted on the table for CF<sub>3</sub>(g).

Heat Capacity and Entropy

The molecular structure has been derived from electron-diffraction data by Thornton (5) and from microwave data by Gosh (6). The results are in close agreement and average values are adopted. Vibrational frequencies are from the assignment of Long (7) who reviewed the spectral data and gave force-constant calculations. Preference has been given to the gas-phase spectra, particularly the Raman data of Claassen (8). Shimanouchi (9) assigned ν<sub>2</sub> = 1117 rather than 1137 cm<sup>-1</sup>, but he apparently did not consider the gas-phase data of (8, 10). Principal moments of inertia are I<sub>A</sub> = 14.786 × 10<sup>-33</sup> and I<sub>B</sub> = I<sub>C</sub> = 8.108 × 10<sup>-33</sup> g cm<sup>2</sup>.

Valentine (11) used low-temperature calorimetric data to derive the ideal gas entropy at the normal boiling point of 190.97°K. The experimental value of 57.18 gibbs/mol is in good agreement with 57.216 gibbs/mol obtained from this table. Schwing (12) measured C<sub>p</sub> for CHF<sub>3</sub> vapor (25-100°C) and confirmed that the vibrational assignment is adequate. Uncertainty in C<sub>p</sub> and S° increases at higher temperatures due to neglect of anharmonicity in the calculations. Discussions of anharmonic contributions are given on the tables for CF<sub>4</sub>(g) and CClF<sub>3</sub>(g). The error probably does not exceed 0.3 gibbs/mol in S° at 1000°K. C<sub>p</sub> is consistent with C<sub>p</sub>° measured at 300°K by the wire-ribbon method (13).

Bond Distances: C-H = 1.066 Å C-N = 1.153 Å  
 Bond Angle: H-C-N = 180°  
 Rotational Constant:  $B_0 = 1.4782 \text{ cm}^{-1}$   
 $\sigma = 1$

Spectroscopic constants used in calculating corrections to the rigid-rotator harmonic oscillator approximation ( $\text{cm}^{-1}$ ):

|                                   |                   |                   |
|-----------------------------------|-------------------|-------------------|
| $\alpha_1 = 10.10 \times 10^{-3}$ | $-x_{11} = 7.07$  | $-x_{12} = 2.53$  |
| $\alpha_2 = -3.61 \times 10^{-3}$ | $-x_{22} = 2.65$  | $-x_{23} = 19.01$ |
| $\alpha_3 = 10.42 \times 10^{-3}$ | $-x_{33} = 52.49$ | $-x_{13} = 10.44$ |
| $\delta_{22} = 5.16$              |                   |                   |

Heat of Formation

The value adopted is from reference 1. The data of Thomsen (2) who measured both  $C_2N_2$  and HCN and Berthelot (3) were used in conjunction with the well established value for  $C_2N_2$  to derive the adopted value (4).

Badger (5) studied the equilibrium  $NH_3(g) + C(c) = HCN(g) + H_2(g)$  from both sides; we obtain a 3rd law  $\Delta H_f^\circ = 46 \pm 0.9 \text{ kcal}$  and a 2nd law  $\Delta H_f^\circ(298) = 34.5 \pm 1.9 \text{ kcal}$ , the 3rd law drift is  $14 \pm 24 \text{ eu}$ . The 3rd law value leads to  $\Delta H_f^\circ(\text{HCN}, g) = 35 \pm 1 \text{ kcal/mol}$ .

Horiuchi et al. (6) studied the equilibrium  $2 \text{ CO}(g) + \text{NH}_3(g) = \text{HCN}(g) + \text{CO}_2(g) + \text{H}_2(g)$ . We obtain  $\Delta H_f^\circ = 1.1 \pm 0.5 \text{ kcal}$  from a 3rd law analysis with a drift of  $-2 \pm 3 \text{ eu}$ , and a 2nd law value of  $2.9 \pm 2.6 \text{ kcal}$ . The 3rd law value leads to  $\Delta H_f^\circ(\text{HCN}, g) = 31.35 \pm 0.6 \text{ kcal/mol}$ . The two sets of equilibrium data are self-consistent but disagree with each other and the direct combustions. We adopt an uncertainty of  $2.0 \text{ kcal/mol}$  to draw attention to this unsatisfactory situation.

Heat Capacity and Entropy

McBride et al. (7) used the constants listed above to calculate the adopted table which includes first and second corrections for anharmonicity, vibration-rotation interaction and centrifugal stretching. The bond lengths and molecular constants are those listed by Rank et al. (8). A more extensive set of anharmonic constants has recently been determined by Nakagawa and Morino (9), they are in generally good agreement with the values used.

March 31, 1961

ΔH<sub>f</sub><sup>0</sup> = -3.0 ± 3 kcal. mole<sup>-1</sup>  
 Point Group C<sub>2v</sub>  
 Ground State Multiplicity = [2]

ΔH<sub>f</sub><sup>0</sup> 298.15 = -2.9 ± 3 kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub> = [53.683] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Vibrational Levels and Multiplicities

|                        |
|------------------------|
| (0), cm. <sup>-1</sup> |
| [3000] (1)             |
| 1860 (1)               |
| 1085 (1)               |

HC bond length = [1.08] Å CO bond length = 1.198 ± 0.005 Å HCO angle = 119°30' ± 1°

Product of Moments of Inertia = I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 4.73 × 10<sup>-118</sup> g.<sup>3</sup> cm.<sup>6</sup> σ = 1

Heat of Formation

Calculated from ΔH<sub>f</sub><sup>0</sup> = 75.1 ± 2.3 kcal. for the reaction H<sub>2</sub>CO(g) → HCO(g) + H(g), reported by J. C. D. Brand and R. T. Reed, J. Chem. Soc. 2386 (1957).

Heat Capacity and Entropy

The vibrational levels and multiplicities are from G. E. Ewing, W. E. Thompson, and G. C. Fimentel, J. Chem. Phys. 32, 927 (1960), while the ground state multiplicity and structural data are from G. Herzberg and D. A. Ramsay, Proc. Roy. Soc. A233, 34 (1955).

Point Group [C<sub>2v</sub>]  
S<sub>298.15</sub> = [48.3] gibbs/mol  
Ground State Quantum Weight = [1]

ΔHf<sub>0</sub><sup>0</sup> = 203.0 ± 10 kcal/mol  
ΔHf<sub>298.15</sub><sup>0</sup> = 204.4 ± 10 kcal/mol

Heat of Formation, ΔHf<sub>0</sub><sup>0</sup> (HCO<sup>+</sup>, g) = 203 kcal/mol was obtained from electron impact studies on cis- and trans-HCOOH by F. M. Field and J. L. Franklin, "Electron Impact Phenomena," Academic Press, New York, 1957. A higher value, ΔHf<sub>0</sub><sup>0</sup> = 220 kcal/mol, has also been reported from appearance potential measurements on CH<sub>3</sub>CHO by J. R. Majer, C. R. Patrick and J. C. Robb, Trans-Paraday Soc. 57, 14 (1961). Generally, errors in the heat of formation derived from electron impact studies are such as to cause the quantities to be high because of unaccounted excitations or residual kinetic energy in the fragments; therefore, the value of 203 kcal/mol is preferable, assuming the same reliability of the experiments.

Heat Capacity and Entropy.

Since the molecule HCO<sup>+</sup>(g) has the same number of valence electrons as HCN(g), a linear molecular configuration is assumed for HCO<sup>+</sup>(g) in the tabulation. The bond distances H-C and C-O were estimated by comparison with those in similar molecules by D. G. Clifton, J. Chem. Phys. 41, 3656 (1964). The vibrational frequencies were calculated by the valence force method from the estimated stretching and bending force constants of Clifton. The principal moment of inertia is 1.7941 X 10<sup>-39</sup> g cm<sup>2</sup>.

Bond Distances: C-H = [1.029] Å C-O = [1.090] Å  
Bond Angle: H-C-O = [180°]  
Rotational Constant: B<sub>0</sub> = [1.56015] cm<sup>-1</sup>  
σ = [1]

Heat of Formation.

The selected heat of formation, ΔHf<sub>0</sub><sup>0</sup> (HCO<sup>+</sup>, g) = 203 kcal/mol was obtained from electron impact studies on cis- and trans-HCOOH by F. M. Field and J. L. Franklin, "Electron Impact Phenomena," Academic Press, New York, 1957. A higher value, ΔHf<sub>0</sub><sup>0</sup> = 220 kcal/mol, has also been reported from appearance potential measurements on CH<sub>3</sub>CHO by J. R. Majer, C. R. Patrick and J. C. Robb, Trans-Paraday Soc. 57, 14 (1961). Generally, errors in the heat of formation derived from electron impact studies are such as to cause the quantities to be high because of unaccounted excitations or residual kinetic energy in the fragments; therefore, the value of 203 kcal/mol is preferable, assuming the same reliability of the experiments.

Heat Capacity and Entropy.

Since the molecule HCO<sup>+</sup>(g) has the same number of valence electrons as HCN(g), a linear molecular configuration is assumed for HCO<sup>+</sup>(g) in the tabulation. The bond distances H-C and C-O were estimated by comparison with those in similar molecules by D. G. Clifton, J. Chem. Phys. 41, 3656 (1964). The vibrational frequencies were calculated by the valence force method from the estimated stretching and bending force constants of Clifton. The principal moment of inertia is 1.7941 X 10<sup>-39</sup> g cm<sup>2</sup>.

Point Group  $C_{2v}$  CHF  
 $\Delta H_f^\circ = [39.9 \pm 15] \text{ kcal/mol}$   
 $\Delta H_f^\circ_{298.15} = [40 \pm 15] \text{ kcal/mol}$

$S^\circ_{298.15} = 51.37 \pm 0.01 \text{ gibbs/mol}$

Spectroscopic constants used in calculating corrections to the rigid-rotor harmonic oscillator model (cm<sup>-1</sup>):

$\alpha_1 = 3.4 \times 10^{-3}$   $-X_{11} = [3.7]$   
 $\alpha_2 = -3.4 \times 10^{-4}$   $-X_{22} = [2.4]$   
 $\alpha_3 = 3.1 \times 10^{-3}$   $-X_{23} = [18.0]$   
 $-X_{13} = [6.0]$

Bond Distances: C-H = 1.0667 Å C-P = 1.5421 Å  
 Bond Angle: H-C-P = 180°  
 Rotational Constant: B<sub>0</sub> = 0.56633 cm<sup>-1</sup>  
 $\sigma = 1$

Heat of Formation

The bonding in HCP and HCN is very similar, as evidenced by the bond lengths and vibrational frequencies. We assume that the C-H bond strength is thus the same in these two molecules. For the reaction HCN → H + CN we derive ΔHr = 123.8 kcal from ΔHf<sup>0</sup>(HCN) = 32.3, ΔHf<sup>0</sup>(H) = 52.1 and ΔHf<sup>0</sup>(CN) = 104 kcal/mol. Applying this to the reaction HCP → H + CP, we obtain ΔHf<sup>0</sup>(HCP, g) = 40 ± 15 kcal/mol, from ΔHf<sup>0</sup>(CP) = 111.7 kcal/mol.

Heat Capacity and Entropy

The molecular configuration was first reported by Gier (1), and later the bond lengths were determined by Tyler (2) using microwave spectroscopy. The vibrational frequencies and electronic levels were obtained from an analysis of the ultraviolet spectrum by Johns et al. (3). Since the first excited state is above 24000 cm<sup>-1</sup> and the first nonlinear state at 34,000 cm<sup>-1</sup>, there is negligible error introduced by assuming ground state molecular constants for all excited states. The anharmonic constants were estimated from those of HCN by Gordon (4) and the adopted table includes these corrections and the electronic contributions.

Heat of Formation

Chupka and Livshitz (1) have recently obtained the photoionization threshold for the production of CH<sub>2</sub><sup>+</sup> from CH<sub>3</sub> as 15.09 ± 0.03 eV. In conjunction with the spectroscopic ionization potential determined by Herzberg (2), they report D<sub>0</sub>(CH<sub>3</sub>-H) = 4.694 ± 0.033 eV (108.25 ± 0.77 kcal). Use of ΔHf<sup>0</sup>(CH<sub>3</sub>, g) = 35.62 kcal/mol from these tables yields ΔHf<sup>0</sup>(CH<sub>2</sub>, g) = 92.25 ± 1.0 kcal/mol, which is adopted.

Chupka (3) and Dibeler et al. (4) have determined the photoionization threshold for the production of CH<sub>2</sub><sup>+</sup> from CH<sub>4</sub>. If the latter value is corrected for rotational energy effects as suggested by Chupka the two values are identical and yield ΔHf<sup>0</sup>(CH<sub>2</sub>, g) = 94.6 kcal/mol. However, Chupka indicates that this is a maximum value since the process of H<sub>2</sub> elimination is likely to occur with excess energy in the products at the threshold. Chupka et al. (11) have obtained the appearance threshold of CH<sub>2</sub><sup>+</sup> from C<sub>2</sub>H<sub>4</sub>(g) by photoionization and obtain a maximum value of ΔHf<sup>0</sup>(CH<sub>2</sub>, g) = 95.5 kcal/mol.

Dibeler and Liston (5) have also reported the photoionization threshold for the process CH<sub>3</sub>CH + CH<sub>2</sub><sup>+</sup> + HCN as 14.94 eV (344.55 kcal). Using auxiliary data from (2) and (13) we obtain ΔHf<sup>0</sup>(CH<sub>2</sub>, g) = 95 kcal/mol, however the above process is also likely to occur with excess energy and so this is a maximum value.

The older electron impact data of Langer et al. (6) contained several inconsistencies with presently accepted values and was reanalyzed by Prophet (7) to give ΔHf<sup>0</sup>(CH<sub>2</sub>, g) = 95 ± 5 kcal/mol. Chupka et al. (8) have also reported a heat of formation, from chemical equilibria measured in a mass spectrometer, as 86.8 ± 6 kcal/mol.

Heat Capacity and Entropy

The ground state configuration, bond length and angle are from Herzberg (9). The excited electronic states are from the calculations of Goldberg and Riter (10) who have tried to allow for correlation energy effects in the different states. The separation between the a<sub>1</sub> and b<sub>1</sub> states is established as 7100 cm<sup>-1</sup>. The degenerate bending frequency was listed as a possible fundamental of CH<sub>2</sub> by Milligan and Pimentel (11). There is considerable uncertainty that it is in fact the ground state bending frequency, excited state bending frequencies of 1353 and 557 cm<sup>-1</sup> have been reported. The symmetric stretch was estimated to be that listed by Herzberg (12) for a bent molecule. The asymmetric stretch was estimated using the valence force field approximation.

The uncertainty in the entropy reflects the possible errors in the vibrational frequencies and the uncertain position of the low lying electronic levels and their varying geometries.

Bond Distance: C-H = 1.078 Å C-Cl = 1.759 Å C-F = 1.378 Å

Bond Angle: H-C-H = 111°54' F-C-Cl = 110° H-C-Cl = 109°06'

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 4.8154 × 10<sup>-115</sup> g<sup>3</sup> cm<sup>6</sup> σ = 1

Heat of Formation

The change in heat of atomization by successive replacement of F by Cl, in the CF<sub>4</sub> to CCl<sub>4</sub> series and CHF<sub>3</sub> to CHCl<sub>3</sub> series, follows a regular pattern (see CCl<sub>2</sub>F<sub>2</sub> and CHCl<sub>2</sub>F Tables). We make the assumption that this same regular variation occurs also in the CH<sub>2</sub>F<sub>2</sub> to CH<sub>2</sub>Cl<sub>2</sub> series. Thus, the difference between the atomization energies of CH<sub>2</sub>F<sub>2</sub> and CH<sub>2</sub>Cl<sub>2</sub> is divided into two unequal parts which fall into the pattern established in the CF<sub>4</sub> and CHF<sub>3</sub> sequences. We adopt a heat of atomization of 385.5 kcal which corresponds to a ΔH<sub>f</sub><sup>o</sup>(CH<sub>2</sub>ClF, g) = -62.6 kcal/mol. The changes, in kcal, in the heat of atomization by successive replacement of F by Cl are tabulated, below for all three series.

|                                 |                                 |
|---------------------------------|---------------------------------|

Heat Capacity and Entropy

Plyler and Benedict (1) assigned the vibrational frequencies from the infrared and Raman data for the liquid. The molecular structure was obtained from the microwave measurements of Muller (2). The individual moments of inertia are I<sub>A</sub> = 2.008 × 10<sup>-39</sup> g cm<sup>2</sup>, I<sub>B</sub> = 16.241 × 10<sup>-39</sup> g cm<sup>2</sup>, and I<sub>C</sub> = 14.766 × 10<sup>-39</sup> g cm<sup>2</sup>.

Heat of Formation  
Hu and Sinks (1) have measured the heat of combustion of CH<sub>2</sub>Cl<sub>2</sub>(l) in the rotating bomb calorimeter, using As<sub>2</sub>O<sub>3</sub> solution as the reducing agent. They reported ΔHc°<sub>298</sub> = -144.00 kcal/mole for CH<sub>2</sub>Cl<sub>2</sub>(l) + O<sub>2</sub>(g) → CO<sub>2</sub>(g) + 2HCl(600H<sub>2</sub>O, aq) which leads to ΔHf°<sub>298</sub>(CH<sub>2</sub>Cl<sub>2</sub>, l) = -29.70 kcal/mol, using ΔHf°<sub>298</sub> = -94.051 and -39.823 kcal/mol for CO<sub>2</sub>(g) and HCl(600H<sub>2</sub>O, aq), respectively (2). The standard deviation of five combustion runs was 0.12 kcal/mol. Employing the heat of vaporization of CH<sub>2</sub>Cl<sub>2</sub>(l) at 298°K as 6.87 kcal/mol (3), we obtain ΔHf°<sub>298</sub>(CH<sub>2</sub>Cl<sub>2</sub>, g) = -22.83 kcal/mol which is adopted in the tabulation.

L. Smith et al. (4), based on the combustion data of E. Efring (5), re-evaluated the heat of combustion of dichloromethane at 18.7°K as ΔH°<sub>c</sub> = -1701.4 cal/g for CH<sub>2</sub>Cl<sub>2</sub>(l) + O<sub>2</sub>(g) + 2HCl(600H<sub>2</sub>O, aq). This value needs to be further corrected for a change in the heat of oxidation of As<sub>2</sub>O<sub>3</sub>(s) and calculated to 25°K to give ΔHc°<sub>298</sub> = ΔHc°<sub>18.7</sub> - 144.89 kcal/mol, ΔHf°<sub>298</sub>(CH<sub>2</sub>Cl<sub>2</sub>, l) = -28.80 kcal/mol and ΔHf°<sub>298</sub>(CH<sub>2</sub>Cl<sub>2</sub>, g) = -21.93 kcal/mol.

J. Lacher et al. (Z) have measured the heat of hydrogenation of dichloromethane to methane and hydrogen chloride at 250°K as -40.07 kcal/mol. Connection to 298°K gives ΔHf°<sub>298</sub>(CH<sub>2</sub>Cl<sub>2</sub>, g) = -23.05 kcal/mol which is in good agreement with the value adopted.

Heat Capacity and Entropy  
The bond distances and angles have been determined from the microwave spectra by R. J. Myers and W. D. Gwinn (6). The three principal moments of inertia are I<sub>A</sub> = 2.630 × 10<sup>-39</sup>, I<sub>B</sub> = 2.5623 × 10<sup>-38</sup> and I<sub>C</sub> = 2.7727 × 10<sup>-38</sup> g cm<sup>2</sup>.

The assigned fundamental vibrational frequencies are obtained from Shimanouchi's selection (9), based on infrared and Raman spectra by Shimanouchi and Syzuki (10), Palma et al. (11), and Welsh et al. (12).

Bond Distances: C-F = 1.358 ± 0.001 Å C-H = 1.092 ± 0.003 Å

Bond Angles: F-C-F = 108° 17' ± 6' H-C-H = 111° 52' ± 25'

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.2272 × 10<sup>-115</sup> g<sup>3</sup> cm<sup>6</sup>

Heat of Formation

Neugebauer and Margrave (1) measured the enthalpy of combustion of CH<sub>2</sub>F<sub>2</sub>. Their result for the combustion reaction was ΔH<sub>298</sub><sup>o</sup> = -139.84 ± 0.22 kcal/mole. Using ΔH<sub>f</sub><sup>o</sup><sub>298</sub><sup>o</sup>(HF·21.5 H<sub>2</sub>O) = -76.75 ± 0.1 kcal/mol (2), obtained with dilution data compiled by Parker (3), we derive,

ΔH<sub>f</sub><sup>o</sup><sub>298</sub><sup>o</sup>(CH<sub>2</sub>F<sub>2</sub>, g) = -107.7 ± 0.4 kcal/mol,

from Margrave's data.

Heat Capacity and Entropy

The vibrational frequencies are average values from the infrared studies of Stewart and Nielsen (4) and Plyler and Benedict (5). Individual moments of inertia are calculated from the rotational constants reported by Lide (6) with the result I<sub>A</sub> = 1.7082 × 10<sup>-39</sup> g cm<sup>2</sup>, I<sub>B</sub> = 7.9160 × 10<sup>-39</sup> g cm<sup>2</sup>, and I<sub>C</sub> = 9.0794 × 10<sup>-39</sup> g cm<sup>2</sup>. The molecular structure data are from the microwave studies of Lide (6) and are in excellent agreement with electron-diffraction studies of Brockway, Thornton, and Bartell whose results are reported in the Annual Review of Physical Chemistry (7).
