## Foreword

The National Standard Reference Data System provides effective access to the quantitative data of physical science, critically evaluated and compiled for convenience, and readily accessible through a variety of distribution channels. The System was established in 1963 by action of the President's Office of Science and Technology and the Federal Council for Science and Technology, with responsibility to administer it assigned to the National Bureau of Standards.

The System now comprises a complex of data centers and other activities, carried on in academic institutions and other laboratories both in and out of government. The independent operational status of existing critical data projects is maintained and encouraged. Data centers that are components of the NSRDS produce compilations of critically evaluated data, critical reviews of the state of quantitative knowledge in specialized areas, and computations of useful functions derived from standard reference data. In addition, the centers and projects establish criteria for evaluation and compilation of data and make recommendations on needed improvements in experimental techniques. They are normally closely associated with active research in the relevant field.

The technical scope of the NSRDS is indicated by the principal categories of data compilation projects now active or being planned: nuclear properties, atomic and molecular properties, solid state properties, thermodynamic and transport properties, chemical kinetics, and colloid and surface properties.

The NSDRS receives advice and planning assistance from the National Research Council of the National Academy of Sciences-National Academy of Engineering. An overall Review Committee considers the program as a whole and makes recommendations on policy, long-term planning, and international collaboration. Advisory Panels, each concerned with a single technical area, meet regularly to examine major portions of the program, assign relative priorities, and identify specific key problems in need of further attention. For selected specific topics, the Advisory Panels sponsor subpanels which make detailed studies of users' needs, the present state of knowledge, and existing data resources as a basis for recommending one or more data compilation activities. This assembly of advisory services contributes greatly to the guidance of NSRDS activities.

The NSRDS-NBS series of publications is intended primarily to include evaluated reference data and critical reviews of long-term interest to the scientific and technical community.

The JANAF Thermochemical Tables Project, sponsored and monitored by agencies of the Defense Department, has been considered an important part of the National Standard Reference Data System. The tables have found wide utility in technical areas far removed from those for which the work was initiated. Consequently, when plans for a Second Edition of the JANAF Thermochemical Tables were under discussion, a suggestion was made that they be incorporated into the NSRDS-NBS publication series. This suggestion was accepted, and the present volume, NSRDS-NBS 37, is the outcome. It is hoped that this publication channel will lead to even wider distribution and greater use of these very valuable tables.

LEWIS M. BRANSCOMB, *Director*

## PREFACE TO THE FIRST EDITION

Beginning in the mid-1950's, when elements other than the conventional carbon, hydrogen, oxygen, nitrogen, chlorine, and fluorine came into consideration as rocket propellant ingredients, formidable difficulties were encountered in conducting rigorous theoretical performance calculations for these new propellants. The first major problem was calculational techniques. The second was the lack of accurate thermodynamic data.

By the end of 1959, the calculational technique problem had been substantially resolved by applying the method of minimization of free energy to large, high-speed digital computers. At this point the calculations became as accurate as the thermodynamic data upon which they were based. However, serious gaps were present in the available data. For propellant ingredients, only the standard heat of formation is required to conduct a performance calculation. However, this must be known to a high degree of accuracy. For combustion products, the enthalpy and entropy must be known, as a function of temperature, in addition to the standard heat of formation.

In order to resolve the problem, a substantial experimental thermodynamic research program was initiated under the sponsorship and technical direction of Project PRINCIPIA of the Advanced Research Projects Agency. Simultaneously, a project was initiated to critically evaluate and compile consistent tables of thermodynamic properties of propellant combustion products for use by the aerospace industry. This project, known as the "JANAF Thermochemical Tables," was undertaken by the Dow Chemical Company. Since the objective of the project was to have one single source of "best available data" prepared for use by the entire industry, the JANAF Thermochemical Panel undertook the task of furnishing a critical review of the Tables prior to their publication and distribution. This approach was designed to insure that the Tables be of the highest possible quality.

## PREFACE TO THE SECOND EDITION

It is appropriate to call attention to some of the reasons for the phenomenal success of the JANAF Thermochemical Tables in achieving, first, the initial limited objective of providing the standard data for the chemical rocket propulsion industry, and later, upon publication, world-wide recognition as thermodynamic reference data of the highest quality and timeliness.

First, and most obvious, there was the selection and continued support of a highly competent evaluation team, themselves engaged in a broad spectrum of thermodynamic research. The personnel of the Thermal Research Laboratory of the Dow Chemical Company, under the direction of Dr. D. R. Stull and Dr. H. Prophet, have filled this role to a degree of excellence not likely to be exceeded anywhere. Moreover, the group has heroically remained productive in spite of many battles to retain continuing support, and the actual sharp reduction of funding over the past two years to a less-than-viable level.

A second important factor is the unusual approach to format, evaluation, and distribution of the Tables, as it has been followed since their inception. The primary distribution is in frequently issued loose-leaf supplements. Each previously issued table may thus be revised as often as necessary to take account of improved data. Each loose-leaf table is accompanied on its reverse side by a complete explanation of the selection of the key data, together with all references.

The third vital distinction of these Tables has been the existence of a continuing cognizant working group composed of technological users of data, thermodynamicists, and government sponsors of both research and development. Independent prepublication review of the Tables has been an important contribution of some of the members of this group; but its annual technical meetings have resulted in even more far-reaching benefits. Together, the users and generators of data have been able to establish realistic priorities for the species to be included in the Tables; at the same time the course of experimental research has been guided by the demonstration of absence or inadequacy of needed data. Although the working group no longer enjoys official recognition, the members and participants have enthusiastically volunteered to continue meeting in this important work.

Special words of appreciation are due to Dr. Charles W. Beckett, who has lined up all the technical presentations at the last six annual meetings of the working group; and to Mr. Curtis C. Selph who has served with wisdom and insight as the Air Force project monitor for the JANAF Thermochemical Tables contracts.

JOSEPH F. MASI  
Air Force Office of Scientific Research

Arlington, Virginia  
October, 1970

Members of the JANAF Thermochemical Panel (1959-1961) and the JANAF Thermochemical Working Group (1961-1964) were:

T. O. Dobbins, Advanced Research Projects Agency (Past Chairman)  
W. H. Jones, Institute for Defense Analysis; Aerospace Corporation (Past Chairman)  
W. G. May, Institute for Defense Analyses; Esso Research and Engineering Company  
(Past Chairman)  
C. W. Beckett, National Bureau of Standards (Vice Chairman)  
G. W. Avery, Chemical Propulsion Information Agency (Past Secretary)  
B. K. Farris, Chemical Propulsion Information Agency (Past Secretary)  
T. L. Reedy, Chemical Propulsion Information Agency (Secretary)  
B. J. Alley, Army Materiel Command  
P. W. Bender, University of Wisconsin  
W. A. Bennett, Bureau of Naval Weapons  
B. Brown, Hercules Powder Company  
C. L. Funk, Jet Propulsion Laboratory  
J. S. Gordon, Thiokol Chemical Corporation  
L. J. Gordon, Aerojet-General Corporation  
S. A. Greene, North American Aviation, Incorporated  
C. B. Henderson, Atlantic Research Corporation  
D. L. Hildenbrand, Philco Corporation  
J. L. Margrave, University of Wisconsin  
J. P. McCullough, U.S. Bureau of Mines  
P. L. Nichols, Jr., Jet Propulsion Laboratory  
C. C. Selph, Air Force Systems Command  
D. R. Stull, Dow Chemical Company

The Thermochemical Working Group of the Interagency Chemical Rocket Propulsion Group (ICRPG) has consisted of the following at various times during its existence (1964-1969).

*Members*

J. F. Masi, Air Force Office of Scientific Research (Chairman)  
C. W. Beckett, National Bureau of Standards (Vice Chairman)  
T. O. Dobbins, Advanced Research Projects Agency  
S. Gordon, National Aeronautics and Space Administration  
R. Jackel, Office of Naval Research  
J. Murrin, Naval Ordnance Systems Command  
R. Odom, Army Materiel Command  
C. E. Selph, Air Force Rocket Propulsion Laboratory  
D. Squire, Army Research Office

*Participants*

G. S. Bahn, Marquardt Corporation  
B. Brown, Hercules, Incorporated  
H. F. Calcote, AeroChem Research Laboratories  
J. P. Coughlin, Aerojet-General Corporation  
J. S. Gordon, Atlantic Research Corporation  
D. R. Douslin, U.S. Bureau of Mines  
M. Farber, Space Sciences, Incorporated  
R. M. Fristrom, Applied Physics Laboratory  
C. B. Henderson, Atlantic Research Corporation  
D. L. Hildenbrand, Douglas Aircraft Company  
J. L. Margrave, Rice University

W. G. May, Esso Research and Engineering Company  
W. Mitchell, Thiokol Chemical Corporation  
C. F. Robillard, Jet Propulsion Laboratory  
L. Schieler, Aerospace Corporation  
C. H. Shomate, Naval Weapons Center  
D. R. Stull, Dow Chemical Company  
M. Zimmer, Naval Ordnance Station

*Secretariat* (Chemical Propulsion Information Agency)

T. Gilliland  
M. McCormack  
T. L. Reedy

## Project Personnel

The Tables began under the direction of Daniel R. Stull in 1959. Major contributions in the first two years were made by Thomas E. Dergazarian, Samuel Levine and Louis A. DuPlessis. In the years from 1961 to 1969 the major contributors were Jing Chao, Harold Prophet, Alan N. Syverud and Andrew T. Hu. In 1969 Harold Prophet succeeded Daniel R. Stull as project director. At present Alan N. Syverud, Andrew T. Hu and Jerry L. Curnutt are the principal contributors.

Special mention must be made of Alan N. Syverud for his help in the technical editing of the Tables. Also G. C. Sinke has aided the project on numerous occasions with criticism, advice and tables.

We also wish to acknowledge the valuable assistance of Norma Dumont 1959-64, Viola E. Harrington 1964-66, Carol S. Scheffler 1966-67, Wildene B. Harris 1967-68 and Mary J. Walter since 1968 in the typing of these Tables. Isabel Carr has provided valuable services to the group in abstracting, searching and ordering documents, and proof reading the Tables.

We also wish to thank the staff of the Computation Research Laboratory for their assistance in the many facets of the production of these Tables.

DANIEL R. STULL  
HAROLD PROPHET

C O N S T A N T S U S E D

The fundamental constants are those recommended by the International Union of Pure and Applied Chemistry as reported by F. D. Rossini, Pure and Applied Chemistry, 9, 453 (1964). The physical scale based on the atomic mass of  $^{12}\text{C} = 12$  reported by A. E. Cameron and E. Wichers, J. Am. Chem. Soc. 84, 4175 (1962) is employed. The temperature scale is nominally the 1948 International Practical Temperature Scale for measured quantities and nominally the thermodynamic temperature scale for calculated gaseous quantities. The probable errors between these scales and the 1968 International Practical Temperature Scale are given by T. B. Douglas, J. Research Natl. Bur. Std. 73A, 451 (1969).

Throughout these tables, the symbols used are defined as follows:

|                 |   |                   |  |
|-----------------|---|-------------------|--|
| amorph.         | Amorphous state   | S                 | Entropy  |
| B               | The rotational constant for diatomic or linear molecules                          | T                 | Temperature in degrees Kelvin ( $T^\circ = t^\circ + 273.15^\circ$ ) |
| $C_p$           | Molar heat capacity at constant pressure  | t                 | Temperature in degrees Celsius                                       |
| c               | Crystalline state   | V                 | Volume   |
| D               | Centrifugal distortion constant   | $V_0$             | Potential barrier  |
| $D_0$           | Dissociation energy required to break a bond at 0°K                               | x                 | First order vibrational anharmonicity constant                       |
| E               | Internal or intrinsic energy  | y                 | Second order vibrational anharmonicity constant                      |
| G or F          | Gibbs energy = $E + PV - TS = H - TS$   | $\alpha$          | Vibrational-rotational interaction constant                          |
| $g_i$           | Quantum weight of electronic states   | $\epsilon$        | Electronic energy level  |
| ( )             | Parentheses following a vibrational frequency are used to indicate the degeneracy | $\mu$             | Reduced mass of the molecule   |
| g               | Gaseous state, or statistical weight  | $\rho$            | Density  |
| GFW             | Gram Formula Mass   | $\sigma$          | Symmetry number  |
| gls             | Glassy state  | $\omega$          | Vibrational frequency  |
| H               | Enthalpy (or heat content) = $E + PV$   | [ ]               | Square brackets enclose estimated quantities                         |
| $I_A, I_B, I_C$ | Principal moments of inertia of a molecule  | <u>Subscripts</u> |  |
| $I_A I_B I_C$   | Product of the principal moments of inertia of a molecule                         | a                 | Atomization  |
| K               | Equilibrium constant  | b                 | Boiling point at one atmosphere pressure                             |
| k               | Hooke's Law force constant  | c                 | Combustion, or critical state  |
| liq. or l       | Liquid state  | d                 | Dissociation   |
| ln              | Logarithm to the base e ( $e = 2.7182818$ )                                       | e                 | Equilibrium position   |
| log             | Logarithm to the base 10  | f                 | Formation from elements in their standard states                     |
| n               | Number of potential maxima in an internal rotation                                | i                 | The i th quantity  |
| P               | Pressure in atmospheres   | m                 | Melting  |
| r               | Internuclear distance   | p                 | Constant pressure  |
|                 |   | r                 | Reaction   |
|                 |   | s                 | Sublimation  |
|                 |   | t                 | Transition   |
|                 |   | v                 | Vaporization   |

In addition to the above symbols, the spectroscopic symbols and terminology employed by G. Herzberg, "Spectra of Diatomic Molecules", 2nd Ed., and "Infrared and Raman Spectra", D. Van Nostrand Company, Inc., New York, are adopted.

Circular superscript, °, indicates the thermodynamic standard state.

Numerical subscript, as  $_{298.15}$ , denotes temperature in Kelvins.

$\Delta$  indicates the increment in a given property for a given process or reaction, taken as the value for the final state (or sum for the products) less that for the initial state (or sum for reactants).

$\Delta H, \Delta G, \Delta S, \Delta C_p$  equal the increment in enthalpy, Gibbs energy, entropy and heat capacity, respectively, for a process or reaction.

$\Delta H_f^\circ$  represents the standard enthalpy of formation, which is the increment in enthalpy associated with the reaction of forming the given compound from its elements, with each substance in its thermodynamic standard state at the given temperature.

$\Delta H_c^\circ$   $_{298.15}$  symbolizes the enthalpy of combustion of a given substance, in gaseous oxygen to completely oxidized products at 25°C. and constant pressure, with all reactants and products in their appropriate standard states.

## S Y M B O L S   A N D   T E R M I N O L O G Y

$\Delta H_{298.15}^{\circ}$  represents the enthalpy change in a given reaction at 25°C and constant pressure with all the reactants and products in their appropriate standard states.

When the reaction or process evolves heat, the sign of the change in enthalpy is negative. Conversely, when the reaction or process absorbs heat, the sign of the change in enthalpy is positive.

$\Delta G_f^{\circ}$  or  $\Delta F_f^{\circ}$  denotes the standard Gibbs energy of formation, which is the increment in Gibbs energy associated with the reaction of forming the given compound from its elements, with each substance in its thermodynamic standard state at the given temperature.

$\log_{10} K_p$  stands for the logarithm (to the base 10) of the thermodynamic equilibrium constant of formation for the reaction of forming the given compound from its elements at the indicated temperature.

$(H_T^{\circ} - H_{298.15}^{\circ})$  indicates the enthalpy (or heat content) in the standard state at the temperature T less the enthalpy in the standard state at 298.15 K.

$(G_T^{\circ} - H_{298.15}^{\circ})/T$  or  $(F_T^{\circ} - H_{298.15}^{\circ})/T$  denotes the Gibbs energy function in the standard state at temperature T, and is defined as  $-S_T^{\circ} + (H_T^{\circ} - H_{298.15}^{\circ})/T$ .

$S_T^{\circ}$  represents the absolute entropy of the thermodynamic standard state at the absolute temperature T, omitting contributions from nuclear spins.

The Standard State is taken as the state at one atmosphere pressure and the temperature under consideration for the solid, liquid, and ideal gas. Only homogeneous substances are considered here.

The Reference State applies to elements in their stable standard state. Consequently the Reference State tables presented here are either single phase or polyphase tables.

### CHANGES IN SYMBOLS ON TABLES DATED 6-30-66 OR LATER

The following symbols are used, without periods, to indicate units as follows:

| <u>Symbol</u> | <u>Unit</u>          | <u>Symbol</u> | <u>Unit</u>              |
|---------------|----------------------|---------------|--------------------------|
| Å             | angstrom             | eu            | calories per degree-mole |
| atm           | atmosphere           | g             | gram                     |
| cal           | calorie              | J             | joule                    |
| deg           | degree (temperature) | kcal          | kilocalorie              |
| °C            | degree Celsius       | mm            | millimeter               |
| °K            | degree Kelvin        | mol           | mole                     |
| eV            | electron volt        | gibbs         | calories per degree      |

Subscripts as defined earlier are used as symbol modifiers but are placed on the same line, thus, heat capacity is abbreviated as  $C_p^{\circ}$ , enthalpy of formation as  $\Delta H_f^{\circ}$ , etc.

### RELATIONSHIP TO SI UNITS

The symbols cal. mole<sup>-1</sup> deg<sup>-1</sup> and gibbs/mol are identical and refer to units of calories per degree-mole. These units can be converted to SI units of joules per degree-mole by multiplying the tabulated values by 4.184. Similarly values in kilocalories per mole can be converted to joules per mole by multiplying with the factor 4184. For further discussions of the SI system and for conversions from other units the reader should consult Pure and Applied Chemistry, 21, 1 (1970).

## EVALUATION OF THERMODYNAMIC DATA

### A. Interconsistency

The basic aim of these thermodynamic property tables is to provide a related and consistent set of enthalpies and Gibbs energies of formation. This allows the prediction of the enthalpy and Gibbs energy changes of any reaction among the constituents of the tables. Since the enthalpy and Gibbs energy of formation are related to each other by the entropy of formation we may choose to make consistent any two of these quantities. The entropy, which is an absolute quantity in thermochemical calculations, is ideal for this purpose. Since the enthalpy of reaction is the most common link between different materials, we adopt it as the other consistent quantity. Unfortunately enthalpies are not absolute quantities and in order to achieve consistency it is necessary to provide a consistent base. This is done by referring all enthalpies of formation to the elements in their reference states. By convention the enthalpy of formation of an element in its reference state is zero at all temperatures.

The reference state may be single phase or multiphase and examples of both kinds are found in this compilation. In these tables we have generally chosen the ideal diatomic gas for the reference state of permanent gases such as  $O_2$ ,  $N_2$ ,  $Cl_2$  etc. For elements which are solid at room temperature we adopt the solid state up to the melting point, then the liquid up to the boiling point, and then the gas phase. These choices are arbitrary and vary in different compilations. Enthalpies or Gibbs energies of formation taken from different sources should be checked to ensure that the reference states are the same.

The choice of reference states is the first step in any scheme for interconsistency, and is the relation of all quantities to comparable bases. The next step in obtaining an interconsistent set of values, ideally, would be to take all the measured values of enthalpies, Gibbs energies and entropies of reaction and, after adjustment to the proper reference states, to solve the whole set simultaneously. This would provide values for enthalpies, Gibbs energies and entropies which when combined would yield the minimum overall deviations from the measured values. We have already taken this approach in a limited sense by treating groups of interrelated fluorides simultaneously. Hopefully with even larger memories in computers we shall be able to move towards the ultimate goal. As an interim solution it is necessary to fix, simultaneously when possible, certain key values for common reactants such as water, hydrochloric acid, etc., these can then be used to help fix smaller groups of interrelated compounds.

Because of the several revisions of these tables we do not claim to maintain perfect interconsistency. However, the consistency of the tables is a prime concern and a cause for revision if the effects are of the same order of magnitude as the stated uncertainties. As an example, over 100 fluoride tables have been revised since a new HF gas table was adopted in December 1968.

Another type of consistency is involved in systems where properties must be estimated. For example the estimation of certain properties of a series of halides must be done so that the proper graduation in properties occurs from fluoride to iodide and from polyhalide to monohalide. Similarly the evaluation of experimental data must be done in a consistent manner, and this is discussed in the next section.

### B. General Evaluation Techniques

#### 1. The Second-Law Method

Starting from the equation  $\Delta G^\circ = -T \ln K$ , by differentiation with respect to  $T$  and substitution of  $d(\Delta G^\circ)/dT = -\Delta S^\circ$ , we obtain  $\Delta H^\circ = RT^2 d(\ln K)/dT$ , the well known van't Hoff equation. By substituting  $dT = -T^2 d(1/T)$  one obtains  $\Delta H^\circ = -R d(\ln K)/d(1/T)$ , thus, the slope of a  $\ln K$  versus  $1/T$  plot is  $-\Delta H^\circ/R$ . If  $\Delta H^\circ$  is constant then the slope is constant and the plot is a straight line. Since the variation of  $\Delta H^\circ$  with temperature is often quite small it is customary to assume a straight line relationship. This method of obtaining heats of reaction from equilibrium measurements is known as a "second-law" calculation. However, it should be noted that for greatest accuracy the equilibrium measurements should extend over a wide range of temperature, and in this case  $\Delta H^\circ$  is probably not constant. Curvature corrections can be applied by assuming a specific form for the variation of  $\Delta H^\circ$  with temperature, however, the effects of such corrections are of significance only with very precise measurements. It should be noted that the second law cannot be applied to a single observation, but the third-law method, which is described below, can be used. The second-law method can be applied when only relative values of the equilibrium constant are available, for example, from mass-spectroscopic intensity measurements.

#### 2. The Third-Law Method

The third-law method is based on a knowledge of the absolute entropy of the reactants and products. It allows the calculation of a reaction enthalpy from each data point when the change in the Gibbs-energy function for the reaction is known. The Gibbs-energy function is defined as  $gef_T = (G_T^\circ - H_{ref}^\circ)/T$  and is easily calculated from the relation

$$S_T^\circ = -(G_T^\circ - H_{ref}^\circ)/T = (H_T^\circ - H_{ref}^\circ)/T - (G_T^\circ - H_{ref}^\circ)/T$$

thus,

$$gef_T = -S_T^\circ + (H_T^\circ - H_{ref}^\circ)/T.$$

From the definition we can write for the change in a reaction

$$\Delta G^\circ/T = \Delta gef_T + \Delta H_{ref}^\circ/T = -R \ln K_p$$

thus,

$$\Delta H_{ref}^\circ/T = -R \ln K_p - \Delta gef_T$$

where  $\Delta$  signifies  $\Sigma$  products  $-\Sigma$  reactants.

In the JANAF Thermochemical Tables, Gibbs-energy functions are based on 298 K and, thus, yield enthalpies at 298 K regardless of the temperature of the reaction. It should be noted that, since most of these tables are single phase tables, the Gibbs-energy functions of liquids are based on liquid at 298 K even though it may not exist at 298 K. This differs from the usual convention of combining all condensed phases into one table; in this case the enthalpy of reaction refers to the state stable at the base temperature. In these tables the functions always refer to the state of the table at 298 K regardless of its stability. For

example, if the vapor pressure over liquid copper is analysed using  $\text{Cu}(l)$  Gibbs-energy functions the enthalpy of vaporization at 298 K will result. To calculate the enthalpy of sublimation of Cu it is necessary to add the heat of melting at 298 K, which is the difference in the heat of formation of  $\text{Cu}(l)$  and  $\text{Cu}(c)$  at 298 K. It should also be noted that Gibbs-energy functions are always negative, thus the function  $-(G_T^0 - H_T^0)/T$  is usually tabulated and the proper sign must be remembered when using these functions.

The analysis of data by the third law is generally considered superior to the second-law analysis. It is definitely superior if the Gibbs-energy functions are measured, because each data point is independent of the others. Thus, third-law analysis will often reveal trends in the equilibrium constants of a set of data that indicate nonequilibrium or erroneous values. We have found a combination of the two methods to be so valuable that a third-law calculation is always accompanied by a second-law treatment of the same data. The calculation is done in ascending temperature order to give  $\Delta H_{298}$  and its deviation from the mean,  $\delta$ , and the calculated  $\log K_p$  and its deviation from the least-squares line. Third-law analyses enables bad points to be seen as deviations from the general trend of the differences; thus the method can be used even when the Gibbs-energy functions are estimated. If these bad points are located on the ends of the data set, the second-law line often fits quite well through them and by itself does not arouse suspicion. Moreover, the dropping of such points can bring widely discordant slopes into agreement with each other and often with the third-law values. The data sets given in Table 1 illustrate these comments. The first set of data contains all the reported points and is in disagreement with earlier values around 54 kcal/mole. The third-law analysis indicates the first two points are poor, and the effect of dropping these two is shown in the second set of data. This latter second-law slope has changed considerably; the heat is in good agreement with the earlier data and with the third law. The size of the third-law deviations in the second set indicates that the data are not very reproducible. A deviation of 0.5 kcal at 1000°K represents an uncertainty of 30% in the measured equilibrium constants.

If measured Gibbs-energy functions are available, third-law analysis is preferred; however, if the data are good, the second-law value should agree. When the Gibbs-energy functions are estimated, the third-law values derived from them must be handled carefully. Values that are constant and that agree with the second-law enthalpy indicate that the Gibbs-energy functions and equilibrium data are mutually consistent. A drift with temperature of the third-law values indicates errors in either the data or the functions. The magnitude of such drifts is often given in the table write-up and represents the entropy change required to bring the second- and third-law values into agreement. If the drift is within the experimental entropy uncertainty then the data are acceptable. Drifts which are much larger than reasonable entropy errors generally indicate failure to attain equilibrium.

Table 1. Analysis of Equilibrium Data

\* Deleted in Analysis II

### 3. Heat Capacities

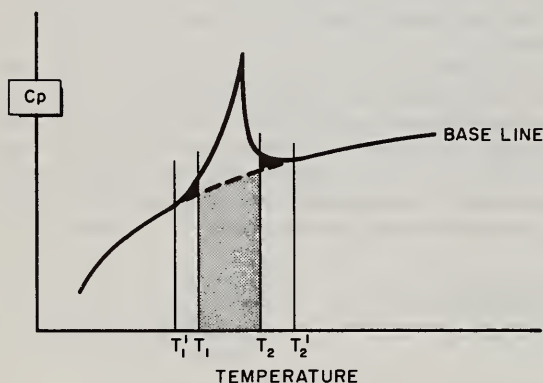

The evaluation of reported values is a relatively subjective procedure, but the analysis should be as objective as possible and therefore certain ground rules must be laid. The first step is the fitting by orthogonal polynomials and the computer-generated plotting of all information so that a general idea of the agreement can be visually obtained. If certain data sets differ from the majority, they are examined for possible causes of the difference. Calibration data, sample purity, and experimental scatter are checked. If the source of error can be located, the data are given appropriately less weight. Otherwise all data of equal reliability are considered equal, even if they disagree. Such data are then smoothed by a weighted orthogonal polynomial curvefit. Enthalpy data are smoothed similarly and heat capacities are derived directly from the differentiated polynomial. The smoothing of enthalpy data requires constraining the fit so that it passes through zero at the reference temperature. Additional constraints are often used to fix the heat capacity at 298 K, or to join enthalpy data smoothly with low-temperature heat capacities.

#### 4. Transitions

The evaluation of solid state transitions involves first the recognition of the type of transition, which may not always be obvious. A first-order transition such as fusion involves a change of enthalpy and entropy at the transition point, whereas second-order transitions involve only discontinuities in heat capacity. Because of impurities and other factors, all first-order transitions do not occur at one temperature; rather, they spread a little on either side and are sometimes difficult to distinguish from  $\lambda$ -type second-order transitions. In order to evaluate the enthalpy of a first-order transition from heat-capacity data, an enthalpy change  $(H_{T_2} - H_{T_1})$  from  $T_1$  to  $T_2$ °K must be reported on either side of the transition. The normal heat-capacity curve is extended forward and backward to the temperature of the transition-heat-capacity maximum to form a base line. If  $T_1'$  and  $T_2'$  are the temperatures at which the transitional heat capacity curve leaves and rejoins the base line, and ubl and obl designate under and over the base line, the heat of transition given by

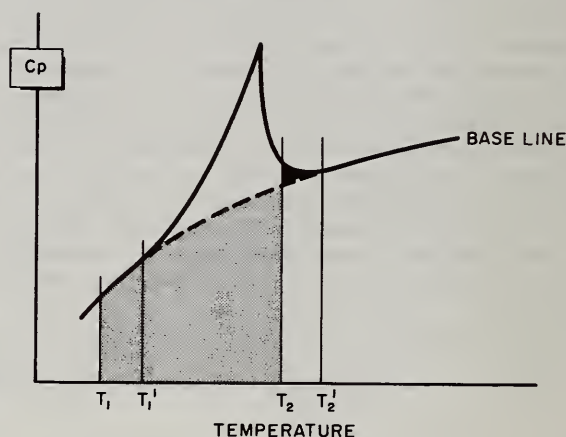

$$\Delta H_t = (H_{T_2} - H_{T_1}) - (H_{T_2} - H_{T_1})_{ubl} + (H_{T_1'} - H_{T_1'})_{obl} + (H_{T_2'} - H_{T_2'})_{obl}$$

Figures 1 and 2 show two possible cases. The shaded areas represent the enthalpy over the base line and cross-hatched areas the enthalpy under the base line.

EVALUATION OF TRANSITIONAL ENTHALPIES

FIGURE 1

EVALUATION OF TRANSITIONAL ENTHALPIES

FIGURE 2

Many enthalpies of fusion and enthalpies of solid-state transitions are obtained from enthalpy measurements and therefore require different treatment. Here the heats are given directly by the difference in enthalpy at the transition temperature. Normally, the enthalpy above and below can be smoothly extended to the temperature of transition, although the transition temperature may not be clearly obtainable from the enthalpy data.

The heats of the remaining transitions, vaporization and sublimation, are evaluated from equilibrium data by the second- and third-law methods just described except when calorimetric measurements are available.

#### 5. Equilibrium

Perhaps the most significant factors to be established in evaluating equilibrium data are that equilibrium was attained and that the process was properly described. For example, in a sublimation process the most accurate measurements are valueless if the vapor phase is not uniquely defined. If polymerization or breakdown might have occurred, the first order of business is to establish the exact reaction. Because mass spectroscopy has shown that vapor phases are often extremely complex, it is almost a requirement that before equilibrium data can be accepted the vapor phases must be examined by a mass spectrometer to ensure their composition. Some methods of measurement are less accurate than others and should be given less weight. For example, equilibria determined in a mass spectrometer are usually quite rough because many approximations and uncertainties are involved in obtaining an absolute pressure measurement. On the other hand, measurements of the electromotive force of reversible cells can have great accuracy. Once the system is defined and equilibrium data are available, the data are analyzed by the second- and third-law methods.

### CONSTRUCTION OF THE TABLES

#### 1. Solid Phase

To produce a final table after all of the data have been evaluated or estimated, the enthalpy of formation, the entropy at 298 K, and the heat capacity at reasonable intervals through the temperature range of interest are needed. The enthalpy is obtained from the heat capacity by evaluating  $\int_{298}^T C_p dT$ . The entropy is similarly obtained from the heat capacity by evaluating  $\int_{298}^T (C_p/T) dT$ . The Gibbs energy function is then obtained from the relation  $(G_T^\circ - H_{ref}^\circ)/T = -S_T^\circ + (H_T^\circ - H_{ref}^\circ)/T$ . Enthalpies of

formation at temperatures other than 298 K require a knowledge of the enthalpies of the reference elements:

$$\Delta H_f^\circ_T = \Delta H_f^\circ_{298} + (H_T - H_{298})_{\text{compd}} - \Sigma(H_T - H_{298})_{\text{elements}}$$

The Gibbs energy of formation is readily calculated from the heat of formation when the entropies of the elements are known. Thus

$$\Delta G_f^\circ_T = \Delta H_f^\circ_T - T[S_T(\text{compd}) - \Sigma S_T(\text{elements})]$$

The logarithm of the equilibrium constant of formation is then found from the relation  $\Delta G_f^\circ_T = -4.5756T \log K_p$ .

Until now, we have only considered the calculation of values above 298 K; however, it is desirable to have data all the way to absolute zero. The temperature 0 K is a natural base for measurements involving gases in their lowest energy state, and values are needed in order to convert to the thermochemical reference temperature of 298 K. There is no basic difference in evaluating low-temperature data, but many more heat-capacity points are needed because of the large curvature. It is also necessary to evaluate the starting entropy at some temperature above 0 K because data rarely extend to below 5 K. In order to evaluate enthalpy it is necessary to start with a value above zero and integrate up to 298 K; then the value at 298 K is subtracted from the intermediate values, giving negative values below 298 K.

The tables extend to well above the normal melting point to facilitate the use of the tables by computers which can then interpolate values accurately right at the melting point. Dotted and solid lines indicate the end of the phase stability and solid-state transitions respectively.

## 2. Liquid Phase

The construction is identical with that used for the solid phase; however, the required data at 298 K are not usually readily available. The data are obtained by calculating a preliminary table using the chosen heat capacities with zero values for  $\Delta H_f^\circ_{298}$  and  $S^\circ_{298}$ . The correct starting values are then determined by comparing the values from the tables of crystal and liquid, using the following equations:

$$\Delta H_m^\circ = \Delta H_f^\circ_{T_m}(\ell) - \Delta H_f^\circ_{T_m}(c)$$

$$\Delta S_m^\circ = \frac{\Delta H_m^\circ}{T_m} = S^\circ_{T_m}(\ell) - S^\circ_{T_m}(c)$$

The correct values at 298 K may be obtained from the above relations. A typical liquid table is extrapolated both below the melting point and above the boiling point to facilitate interpolation near the phase boundaries.

## 3. Gas Phase

The data required for the various types of molecules are summarized below. The equations used are given in the section on Computational Methods. All molecules require the gram formula mass and enthalpy of formation at 298 K.

Additionally, monatomic species require:  $\epsilon_0, \epsilon_1 \dots \epsilon_n$  and  $g_0, g_1 \dots g_n$

Diatomic species require:  $B_e, \sigma, x_e, \omega_e, \alpha_e, \epsilon_i, g_i$  ( $i = 0, \dots, n$ )

Linear polyatomic species require:  $B_e, \sigma, \omega_i$  ( $i = 1, \dots, 3N-5$ ),  $\epsilon_i, g_i$  ( $i = 0, \dots, n$ )

Nonlinear polyatomic species require:  $\sigma, \log I_A I_B I_C, \omega_i$  ( $i = 1, \dots, 3N-6$ ),  $\epsilon_i, g_i$  ( $i = 0, \dots, n$ )

$\epsilon_i$  is the energy of the  $i$  th electronic level

$g_i$  is the statistical weight of the  $i$  th electronic level

$B_e$  is the rotational constant

$\sigma$  is the symmetry number

$x_e$  is the anharmonicity correction =  $\omega_e x_e / \omega_e$

$\omega_e$  is the fundamental frequency of a diatomic molecule

$\omega_i$  is a fundamental frequency of a polyatomic molecule

$\alpha_e$  is the rotational vibrational interaction constant

$N$  is the number of atoms in the molecule

$I_A I_B I_C$  is the product of the moments of inertia

Monatomic species often have a large number of electronic levels; it is usual to average the higher levels taking account of the individual multiplicities. Diatomic and polyatomic species sometimes have several excited states which are low enough to make appreciable contributions. These states are treated by direct summation over the individual partition functions using anharmonic-oscillator approximations for each state. If vibrational and rotational constants for the higher states are not available the calculations are simplified by assuming the ground state values for each state.

## 4. Multiphase Tables

Tables which show only values for the real phases at one atmosphere pressure are multiphase tables. In this compilation they are generally reference state tables, though some solid phase tables include more than one phase. Multiphase tables can always be recognized by the presence of solid lines, indicating phase transitions, on the table. They are prepared in a manner similar to tables for condensed phases. The functions are evaluated in the same manner as for a solid up to the first transition point; then the heat and entropy of transition are added and the integration is continued using the second-phase heat capacities. At each phase boundary the above process is repeated.

### USE OF TABLES

The rapid proliferation of thermodynamic tabulations in recent years brings with it the possibility of serious abuse of the information in them. First, as we explained earlier, not all tabulations are based on the same reference states. To avoid this pitfall it is helpful to write down the reaction and check the value and state of each component. It is even better to utilize only a single compilation whenever possible, because values from different compilations may not be consistent or compatible. Second, the base temperatures of compilations differ between 0 and 298 K. Only enthalpies and Gibbs-energy functions are affected, but they can result in serious errors if used indiscriminately.

A different type of error is caused by misunderstanding the significance of negative Gibbs-energy changes. For example, many species in the JANAF Thermochemical Tables have large negative Gibbs energies of formation at 6000 K. This does not necessarily imply that the species are stable, but only that the Gibbs-energy change from the elemental reference state is negative. In fact, nearly all the elements are monatomic gases at 6000 K, and the reference states are generally unstable with respect to the atoms. Similarly, a negative Gibbs-energy change does not mean a reaction will occur, but means only that the reaction is favorable as written. For example, at 298 K

However, at normal pressures this reaction would generally be recognized as unlikely in view of

Similarly, in combining free energies of reaction, one should be careful not to combine impossible reactions with possible ones to obtain an over-all favorability:

This equation is impossible because we cannot combine the reactions

and

by simple addition. Both reactions must be written so that they are possible. They then become

Then by simple addition

Although these tables have been continuously revised it is not possible to keep all the tables fully revised with the latest data. Thus, each table indicates the dates of each revision at the foot of the tabular values. The latest date is most important since information generated after that date has not been incorporated. The frequency of revisions often indicates the level of research activity on the compound and may indicate further changes in the future.

CALCULATIONAL METHODS

The presentation of Mayer and Mayer "Statistical Mechanics", John Wiley & Sons, Inc., New York, (1940) forms the basis for the expressions given below for the ideal gas state. The calculations have been carried out by a Burroughs B5500 electronic computer.

I. Ideal Monatomic gas

(a) Translation

$$\begin{aligned} (H^\circ - H_0^\circ)/T &= C_p^\circ = 4.967913 \text{ cal deg}^{-1} \text{ mol}^{-1}. \\ -(G^\circ - H_0^\circ)/T &= 6.863426 \log M + 11.439043 \log T - 7.282868 \text{ cal deg}^{-1} \text{ mol}^{-1}. \\ S^\circ &= 6.863426 \log M + 11.439043 \log T - 2.314954 \text{ cal deg}^{-1} \text{ mol}^{-1}. \end{aligned}$$

(b) Electronic

$$\begin{aligned} C_p^\circ &= \frac{4.113664}{T^2} \left[ \frac{\sum \epsilon_i g_i e^{-\frac{1.438790 \epsilon_i}{T}}}{\sum g_i e^{-\frac{1.438790 \epsilon_i}{T}}} - \left( \frac{\sum \epsilon_i g_i e^{-\frac{1.438790 \epsilon_i}{T}}}{\sum g_i e^{-\frac{1.438790 \epsilon_i}{T}}} \right)^2 \right] \text{ cal deg}^{-1} \text{ mol}^{-1}. \\ (H^\circ - H_0^\circ)/T &= \frac{2.859114}{T} \frac{\sum \epsilon_i g_i e^{-\frac{1.438790 \epsilon_i}{T}}}{\sum g_i e^{-\frac{1.438790 \epsilon_i}{T}}} \text{ cal deg}^{-1} \text{ mol}^{-1}. \\ -(G^\circ - H_0^\circ)/T &= 4.575617 \log \sum g_i e^{-\frac{1.438790 \epsilon_i}{T}} \text{ cal deg}^{-1} \text{ mol}^{-1}. \\ S^\circ &= \frac{2.859114}{T} \frac{\sum \epsilon_i g_i e^{-\frac{1.438790 \epsilon_i}{T}}}{\sum g_i e^{-\frac{1.438790 \epsilon_i}{T}}} + 4.575617 \log \sum g_i e^{-\frac{1.438790 \epsilon_i}{T}} \text{ cal deg}^{-1} \text{ mol}^{-1}. \end{aligned}$$

II. Ideal Diatomic Gas

(a) Translation and Rotation

$$\begin{aligned} C_p^\circ &= 6.955079 + 0.0914148 (B/T)^2 \text{ cal deg}^{-1} \text{ mol}^{-1}. \\ (H^\circ - H_0^\circ)/T &= 6.955079 - 0.953038 (B/T) - 0.0914148 (B/T)^2 \text{ cal deg}^{-1} \text{ mol}^{-1}. \\ -(G^\circ - H_0^\circ)/T &= 6.863426 \log M + 11.439043 \log T - 4.575617 \log (B\sigma/T) + 0.953038 (B/T) \\ &\quad + 0.0457074 (B/T)^2 - 8.005804 \text{ cal deg}^{-1} \text{ mol}^{-1}. \\ S^\circ &= 6.863426 \log M + 11.439043 \log T - 4.575617 \log (B\sigma/T) - 0.0457074 (B/T)^2 - 1.050725 \\ &\quad \text{cal deg}^{-1} \text{ mol}^{-1}. \end{aligned}$$

where  $B = (B_e - \alpha_e/2)$  when spectroscopic constants are available.

$$B = \frac{2.799076 \times 10^{-39}}{I} \text{ when calculated from a molecular model, (I in g cm}^2\text{)}$$

(b) Vibration

$$\begin{aligned} C_p^\circ &= 1.987165 u^2 e^{-u}/(1-e^{-u})^2 \text{ cal deg}^{-1} \text{ mol}^{-1}. \\ (H^\circ - H_0^\circ)/T &= 1.987165 u e^{-u}/(1-e^{-u}) \text{ cal deg}^{-1} \text{ mol}^{-1}. \\ -(G^\circ - H_0^\circ)/T &= -4.575617 \log (1-e^{-u}) \text{ cal deg}^{-1} \text{ mol}^{-1}. \\ S^\circ &= 1.987165 u e^{-u}/(1-e^{-u}) - 4.575617 \log (1-e^{-u}) \text{ cal deg}^{-1} \text{ mol}^{-1}. \end{aligned}$$

where  $u = (1.438790/T) \cdot (\omega_e - 2\omega_e x_e)$  when spectroscopic constants are available.

$$u = (1.438790/T)\omega \text{ where } \omega \text{ is the fundamental wave number of a harmonic oscillator.}$$

## (c) Electronic

Same as I(b) when the  $i$  th-state vibrational partition function,  $Q_v^i$  and the  $i$  th-state rotational partition function,  $Q_r^i$ , are equal to the respective ground state partition functions. In this case the partition function  $Q = Q_t Q_v Q_r \sum_i Q_e^i$ , otherwise all the thermodynamic functions are derived from  $Q = Q_t \sum_i Q_e^i Q_v^i Q_r^i$ , where  $Q_t$  is the translational partition function and  $Q_e^i = g_i \exp(\epsilon_i/kT)$ .

## (d) Anharmonicity Corrections

$$C_p^\circ = 1.987615 \left[ \frac{16\gamma}{u} - \frac{\delta u^2 e^u}{(e^u - 1)^2} + \frac{u^2 e^u (2\delta e^u - 4Xu - 8X)}{(e^u - 1)^3} + \frac{12Xu^3 e^{2u}}{(e^u - 1)^4} \right] \text{ cal deg}^{-1} \text{ mol}^{-1}.$$

$$(H^\circ - H_0^\circ)/T = 1.987165 \left[ \frac{8\gamma}{u} + \frac{u(\delta e^u - 2X)}{(e^u - 1)^2} + \frac{4Xu^2 e^u}{(e^u - 1)^3} \right] \text{ cal deg}^{-1} \text{ mol}^{-1}.$$

$$-(G^\circ - H_0^\circ)/T = 1.987165 \left[ \frac{8\gamma}{u} + \frac{\delta}{(e^u - 1)} + \frac{2Xu}{(e^u - 1)^2} \right] \text{ cal deg}^{-1} \text{ mol}^{-1}.$$

$$S^\circ = 1.987165 \left[ \frac{16\gamma}{u} + \frac{\delta}{(e^u - 1)} + \frac{\delta u e^u}{(e^u - 1)^2} + \frac{4Xu^2 e^u}{(e^u - 1)^3} \right] \text{ cal deg}^{-1} \text{ mol}^{-1}.$$

where  $u$  is  $(\omega_e - 2\omega_e x_e) \cdot 1.438790/T$

$$X = (\omega_e x_e)/\omega_e; \quad \delta = \alpha_e/B_e; \quad \gamma = B_e/\omega_e.$$

## III. Linear Polyatomic Molecule

- (a) Translation and rotation same as for II (a).
- (b) Vibration same as II (b) for  $3N-5$  vibrational degrees of freedom.
- (c) Electronic same as II (c) where levels and quantum weight are known.
- (d) Anharmonic corrections neglected.

## IV. Nonlinear Polyatomic Molecule (Rigid Rotator, Harmonic Oscillator).

## (a) Translation and Rotation

$$C_p^\circ = 7.948662 \text{ cal deg}^{-1} \text{ mol}^{-1}.$$

$$(H^\circ - H_0^\circ)/T = 7.948662 \text{ cal deg}^{-1} \text{ mol}^{-1}.$$

$$-(G^\circ - H_0^\circ)/T = 6.863426 \log M + 18.302469 \log T - 4.575617 \log \sigma + 2.287809 \log I_A I_B I_C \times 10^{117} - 10.297926 \text{ cal deg}^{-1} \text{ mol}^{-1}.$$

$$S^\circ = 6.863426 \log M + 18.302469 \log T - 4.575617 \log \sigma + 2.287809 \log I_A I_B I_C \times 10^{117} - 2.349265 \text{ cal deg}^{-1} \text{ mol}^{-1}$$

- (b) Vibration same as II (b) for  $3N-6$  vibrational degrees of freedom.
- (c) Electronic same as II (c) where levels and quantum weight are known.
- (d) Anharmonic corrections neglected.

## V. Condensed States

Evaluation of thermodynamic data for condensed states rests upon either measured or estimated information. Heat-capacity data are plotted, smoothed, and data for calculations read back at regular temperature intervals. Integration of this smoothed heat capacity data is carried out with the relations

$$H_T^\circ - H_{298.15}^\circ = \int_{298.15}^T C_p^\circ dT \quad S_T^\circ = \int_0^T \frac{C_p^\circ}{T} dT$$

by machine, three points at a time. The computer calculates the constants for a parabolic equation through the three points, and employs the constants to integrate the first temperature interval. The lowest point is discarded; the next higher point is combined with the two retained points; and a new set of parabolic constants calculated and used for integrating the next higher temperature interval. This recurrent procedure is well suited to this type of calculation. At the appropriate temperatures, transition enthalpies are added to the enthalpy total, while the quotient of the transition enthalpy divided by the absolute temperature is added to the entropy total.

## N O T E S

### 1. Indexing

The modified Hill indexing system, J. Am. Chem. Soc. **22**, 478-94 (1900), for Chemical Compounds as used by Chemical Abstracts and the Classification Division of the U. S. Patent Office is used to index the chemical compounds in this data collection. The arrangement of atomic symbols in chemical formulas is alphabetical except for carbon compounds. Thus, the indexing of chemical compounds is as follows: Ac (actinium compounds), Ag (silver compounds), Al (aluminum compounds), Am (americium compounds), Ar (argon), As (arsenic compounds), Au (gold compounds), B (boron compounds), Ba (barium compounds), Be (beryllium compounds), and so on throughout the alphabet. Once the correct order of the elements in the formula is deduced, the location of a compound within the group is easily accomplished. This obviates the need for pagination, and the index page indicates the correct order.

Organic (carbon) compounds represent a gigantic group, so that for convenience this one class of compounds presents the exceptions to the alphabetical rule. In carbon compounds the C always comes first, followed immediately by H if hydrogen is present, and then followed by any other elements present in their normal alphabetical order. The number of atoms of the element indexed first also influences the order of indexing the compound; e.g., all formulas with C (one carbon atom only) come before those with C<sub>2</sub> (two carbon atoms), followed by C<sub>3</sub> compounds, and so on. Thus: CHBF<sub>4</sub>O (formyl fluoride, compound with BF<sub>3</sub>), CHCl<sub>3</sub> (chloroform), CH<sub>2</sub>F<sub>3</sub>P (trifluoromethylphosphine), CH<sub>3</sub>NO<sub>3</sub> (methyl nitrate), CH<sub>4</sub>Cl<sub>2</sub>Si (dichloromethylsilane), CH<sub>10</sub>N<sub>4</sub>O<sub>3</sub> (hydrazine carbonate), CO (carbon monoxide), CO<sub>2</sub> (carbon dioxide), CO<sub>3</sub>Zn (zinc carbonate), CZr (zirconium carbide), C<sub>2</sub>Ba (barium acetylide), C<sub>2</sub>BrClF<sub>2</sub> (bromochlorodifluoroethylene), C<sub>2</sub>Ca (calcium carbide), and so on. See any formula index of Chemical Abstracts for further details and examples.

### 2. Selection of Enthalpy Reference Temperature

Since no enthalpy measurements can be made in the sense of an absolute quantity, and since all enthalpy measurements are made as a difference between an initial and a final state, it is necessary to select the thermodynamic state to which all other thermodynamic states will be referred. For these tables, the thermodynamic state selected is chosen as the state at one atmosphere total pressure tabulated at 298.15 K. Note that the temperature 298 K listed in the table actually refers to 298.15 K, but decimals have been omitted in the temperature column. Usage in theoretical work indicates the selection of the state existing at absolute zero, which is a hypothetical state that is even approached by relatively few measurements. Values of the difference in heat between 298.15 and 0 K will permit theoretical workers to use these tables, so it was decided to tabulate values at 0 K. Modern usage of thermodynamic data sometimes requires application to conditions below ambient, so the decision was made to tabulate values at 0, 100, and 200 K where the information is available.

### 3. Limitations of Calculated Quantities

Calculation of the contributions of rotation and translation involves the use of quantum statistics, but to obtain a numerical solution the quantum statistics are usually replaced by classical statistics at temperatures above about 100 K. Attempts to employ these methods below 100 K lead into a temperature range where the approximation afforded by classical statistics no longer holds. For this reason the equations presented under "Calculational Methods" fail in the vicinity of 0 K. In agreement with the third law concept, C<sub>p</sub><sup>o</sup> and S<sup>o</sup> are zero at 0 K. For a reference element, log K<sub>p</sub> is zero at 0 K, while for compounds the absolute values of the free energy function and log K<sub>p</sub> become infinite at 0 K.

### 4. Reference State of an Element

A related set of thermodynamic property tables requires that there be a reference table of the thermodynamic properties for each element to which all other forms of that element or any compound involving that element may be referred. If the temperature range of interest (6000 K here) can be represented by a single phase for that material (say hydrogen) the tabulated values in the reference table will be smooth and regular. If the temperature range of interest includes more than one phase (say magnesium) there will be a solid phase (from 0 to 922 K, the melting point), a liquid phase (922 to 1378 K, where the vapor pressure reaches one atmosphere), and a gas phase (1378 to 6000 K), the tabulated values in the reference table will be discontinuous at these phase boundaries. Practical usage dictates that in so far as possible the phase most stable at one atmosphere pressure (that is, the form most easily worked with) be selected. This practice is followed in these tables, and does lead to discontinuities in the thermodynamic functions. Attention is called to these discontinuities in the polyphase reference-state tables by insertion of a solid line at the temperature of a phase transition. The phase transitions considered are: first-order solid-state transformations from one crystal type to some other, solid to liquid, and solid or liquid to gas at one atmosphere.

### 5. Single-Phase Table

It is expected that these tables will be employed on various problems solved by automatic machine computation. Such calculations are carried out in numerous ways, and vary from one installation to another. Programs to perform these calculations are simplified if the thermodynamic functions are smooth and extend beyond the actual range of use permitting a wide latitude in iterative procedures. For this reason, most tables other than elemental reference states are tabulated as single-phase tables. Thus, tables for the solid state are extrapolated well past the melting point; those for the liquid state are extrapolated below the melting point (into the supercooled-liquid range to 298.15 K) and well above the atmospheric boiling point, while gas tables are tabulated from 0 K to 6000 K. Care has been taken to preserve the correct free energy relationships between the extrapolated-phase functions and the functions of the real phase. Attention is called to these extrapolations by insertion of a dotted line at the temperature where the indicated phase meets an adjacent more stable phase, but for reasons mentioned above the indicated phase is extrapolated into a temperature range where it is thermodynamically unstable.

## N O T E S

6. Mole

With each table and text there is listed either the atomic, molecular, or gram formula mass. It is generally understood that this mass in grams refers to Avogadro's number of atoms or molecules, and will be referred to simply as a "mole".

7. Point Groups and Ground-State Configurations

Throughout these tables the nomenclature and definition of the ground-state configurations and point groups are those in use by C. E. Moore, U. S. National Bureau of Standards Circular 467, (1949), and G. Herzberg, "Molecular Spectra and Molecular Structure, I. Spectra of Diatomic Molecules", D. Van Nostrand Co., New York, (1950), and "Molecular Spectra and Molecular Structure, II. Infrared and Raman Spectra", D. Van Nostrand Co., New York, (1945).

8. Decimal Places

Three decimal places have been arbitrarily carried in the tables even though in numerous cases the data do not warrant this accuracy. This has been done to preserve the proper relationship of the thermodynamic functions, and to facilitate machine interpolation of these values.

9. Higher Electronic Terms

A single electronic term of  $30,000\text{ cm}^{-1}$  and above contributes a negligible amount to the thermodynamic functions at temperatures of 6000 K and below. On the other hand, a number of such terms cannot be neglected. In these cases, the number of terms and their values have been summed and their contribution included.

10. Estimated Vibrational Frequencies

Some vibrational frequencies have been estimated by analogy with related molecules. Occasionally, more than one frequency has been averaged at the same value. This is not to be confused with a true degeneracy which is indicated by placing the degeneracy value in parentheses following the frequency. However, when the information has been taken from another compilation, the degeneracies indicated by the compiler have been retained.

11. Quantum Weight

The term quantum weight is also referred to as statistical weight by many authors. The quantity is the product of the spin multiplicity and state degeneracy of the electronic level under consideration.

12. Isotope Effects

The functions calculated for gases from molecular constants are, in general, obtained from constants which have been corrected to the natural isotopic abundance.

# INDEX TO TABLES

| Filing Order                      | Table Title                                | Filing Order                                    | Table Title                             |
|-----------------------------------|--|---|---|
| Al                                | Aluminum (ref. st.)                        | AlI <sub>3</sub>                                | Aluminum Triiodide (ℓ)                  |

Heat of Formation.

Zero by definition.

Heat Capacity and Entropy.

The low temperature heat capacity curve is based on the work of N. E. Phillips, Phys. Rev. **114**, 676 (1939) P. F. Meads, J. Am. Chem. Soc. **65**, 1897 (1941). The high temperature enthalpy adopted here is that of R. A. McDonald, private communication, Dow Thermal Research Laboratory, Oct. 1965. This data is in general agreement with the measurements of J. H. Abery and E. Griffiths, Proc. Phys. Soc. (London) **59**, 378 (1926); E. D. Eastman, A. M. Williams and T. F. Young, J. Am. Chem. Soc. **45**, 1178 (1924); M. B. Kanda and R. Hultgren, private communication to D. R. Stull from R. L. Orr Mar. 29, 1960; S. Satoh, Sci. Papers, Inst. Phys. Chem. Res. (Tokyo) **29**, 19 (1936); F. Wast, A. Mauthen and R. Durrer, Forsch. Arb. Ver. deut. Ing. No. 204 (1918). Other investigations have been discussed by R. Hultgren, R. L. Orr, P. D. Anderson and K. K. Kelley "Selected Value of Thermodynamic Properties of Metals and Alloys", John Wiley and Sons, Inc., New York, (1963). These other determinations generally lay below the adopted values.

Melting Data.

The heat of melting was reported by McDonald, loc. cit.. It is in good agreement with the selected value of Hultgren et al, loc. cit. The chosen value also has eliminated uncertainty due to reaction of the liquid aluminum and its vessel by use of BN and TiB<sub>2</sub> containers. The melting point of 933°K. was chosen at the limit of the "well established" 932 ± 1°K., as more likely representing pure aluminum. This choice was based mainly on the work of M. F. Roess and H. T. Wenzel, J. Res. Natl. Bur. Std. **14**, 247 (1935).

Sublimation Data.

See Al(g) for details.

S°<sub>298.15</sub> = 8.42 gibbs/mol

Tm° = 933 K

Tb° = 2766.8°K

ΔHf°<sub>298.15</sub> = 2.072 kcal/mol

ΔHm° = 2.56 ± 0.05 kcal/mol

ΔHv° = 69.497 kcal/mol

Heat of Formation

The heat of formation is calculated from that of the crystal by adding the heat of melting and the difference between H°<sub>298.15</sub> - H°<sub>298</sub> for (c) and (l).

Heat Capacity and Entropy

The heat capacity is adopted from the enthalpy measurements of R. A. McDonald, private communication, Thermal Research Laboratory, The Dow Chemical Company, Midland, Michigan, Oct. 1965. The liquid enthalpies were determined in crucibles of BN and TiB<sub>2</sub> sealed in a platinum-rhodium capsule. The liquid enthalpies are in agreement with the determination of J. W. Averbary and E. Griffiths, Proc. Phys. Soc. (London) 38, 378 (1976) and higher, by as much as 12 percent, than those of F. Wust, A. Meuthen and R. Dorrner, Forsch. Arb. Ver. Deut. Ing. No 204 (1918) and S. Umino, Sci. Repts. Tohoku. Imp. Univ. Ser. 1, 15, 597 (1926). The enthalpy data is adequately represented by a constant heat capacity. The entropy is calculated from that of the crystal in a manner analogous to the heat of formation.

Melting Data

See Al(c) for details.

Vaporization Data

The temperature of boiling and the heat of vaporization are derived from the adopted functions and the heat of sublimation in order to maintain thermodynamic consistency.

| T, °K. | C <sub>p</sub> | S° - (F° - H <sub>298</sub> °)/T | H° - H <sub>298</sub> ° | ΔH <sub>f</sub> ° | ΔF <sub>f</sub> ° | Log K <sub>p</sub> |

Heat of Formation.

The heat of sublimation of aluminum has been derived from a second and third law analysis of the vapor pressure data of several investigators; the results are tabulated below.

| Ref. | Range °K. | Method    | Points | $\Delta H_{298}^{\circ}$ subli. kcal. mole <sup>-1</sup> | Drift cal. deg. <sup>-1</sup> mole <sup>-1</sup> |
|------|-----------|-----------|--------|--|--|
| 1    | 1273-1473 | Knudsen   | 10*    | 76.3 ± 2.3   | 75.32 ± 0.7                                      |
| 2    | 1734-2237 | Boiling   | 4      | 83.1 ± 0.3   | 74.58 ± 1.8                                      |
| 3    | 1395-1468 | Knudsen   | 10     | 89.8 ± 32.9  | 77.29 ± 3.7                                      |
| 4    | 1410-1468 | Knudsen   | 6      | 71.9 ± 19.2  | 78.4 ± 1.3                                       |
| 5    | 1511-1723 | Mass Spec | 11     | 77.2 ± 2   | 70.5   |
| 6    | 2473      | Boiling   | 1      |  | 77.35  |

It is apparent that there is little real agreement in the data; in Ref. 3 some of this is due to diffusion of liquid Al through the TAC crucibles, while Ref. 8 reports surface oxidation of the sample. The data for Ref. 5 have been reworked since they corrected their data using  $\Delta C_p$  obtained from (l) and (g) of -2 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, where our tables give a value of -2.62 cal. deg.<sup>-1</sup> mole<sup>-1</sup>. Ref. 6 has been obtained for the largest number of data points all of which are in good agreement, show no trend and little scatter. Ref. 1 has gone to a great deal of trouble to ensure uniform heating, total collection of effluents and good Knudsen conditions and also has no trend. It is difficult to imagine why these two series differ by a factor of 3 in the pressure. An intermediate value of the heat of sublimation has been adopted at 78 ± 2 kcal. mole<sup>-1</sup>. This choice is also indicated by the decomposition of AlN(c) to Al(l) and 1/2 N<sub>2</sub>(g), which has been well established as 163.7 ± 0.8 kcal. mole<sup>-1</sup>, combined with the heat of formation of AlN(c) = -78 ± 0.3 kcal. mole<sup>-1</sup>, to yield  $\Delta H_{sub}^{\circ} \text{ Al} = 77.7 \pm 0.9 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The electronic ground state configuration and the higher electronic levels are taken from C. E. Moore, Natl. Bur. Stds. Circular 467, "Atomic Energy Levels" Washington 1949.

Heat of Formation.  
 The heat of formation was calculated from the equation:  $\text{Al(g)} - e^- \rightarrow \text{Al}^+(\text{g})$  with the JANAP auxiliary value for  $\text{Al(g)}$  using an I.P. =  $4.627916 \times 10^4 \text{ cm}^{-1}$  (136.047 kcal/mole) obtained from C. E. Moore, "Atomic Energy Levels", Vol. I, Circular of the National Bureau of Standards 467, June 15, 1949.

Heat Capacity and Entropy.  
 The electronic levels and quantum weights were obtained from C. E. Moore loc. cit. The electronic levels above  $1 \times 10^5 \text{ cm}^{-1}$  were omitted because their contribution is negligible below 6000°K. The  $H^{\circ} - H_{298}^{\circ}$  value at 0°K. is -1.481 kcal./mole.

Bond Distances: Al-O = [1.66] Å      O-B = [1.36] Å      B-O = [1.20] Å  
 Bond Angle: Al-O-B = [145]°      O-B-O = [180]°

Product of the Moments of Inertia:  $I_A I_B I_C = [6.65357] \times 10^{-115} \text{ g}^3 \text{ cm}^6$

$\sigma = 1$

Heat of Formation

The heat of formation,  $\Delta H_f^{\circ}(\text{AlBO}_2, g) = -129.4 \pm 4 \text{ kcal/mol}$ , was calculated from the heat of reaction,  $\Delta H_{1500}^{\circ} = -14.7 \pm 3.2 \text{ kcal/mol}$  for  $1/2 \text{ Al}_2\text{O}_3(g) + 1/2 \text{ B}_2\text{O}_3(g) = \text{AlBO}_2(g)$  with all JANAF auxiliary data. The value of  $\Delta H_{1500}^{\circ}$  was obtained from the mass spectrometric determination of ion intensity ratios by A. Büchler, P. E. Blackburn and J. L. Stauffer, "Thermodynamics of Vaporization in the Aluminum Oxide-Boron Oxide System," ARPA Order No 315-62, Arthur D. Little, Inc., Cambridge, Mass.

Heat Capacity and Entropy

The bent molecular structure, the bond distances O-B and B-O, and the bond angle O-B-O were assumed to be the same as those in  $\text{LiBO}_2(g)$ . The bond distance Al-O and the bond angle Al-O-B(O) were estimated to be the same as those in  $\text{Al}_2\text{O}_3(g)$ . The three principal moments of inertia are  $I_A = 0.7255 \times 10^{-39}$ ,  $I_B = 29.9238 \times 10^{-39}$ , and  $I_C = 30.6495 \times 10^{-39} \text{ g cm}^2$ .

The vibrational frequencies were estimated by comparison with those in  $\text{LiBO}_2(g)$ ,  $\text{Al}_2\text{O}_3(g)$ , and  $\text{AlCl}(g)$ .

 $\alpha_e = 0.000849 \text{ cm.}^{-1}$

Heat of Formation.

S. A. Semenkovich, Zh. Fizik, Khim. 50, 933 (1957) measured the vapor pressure of the reaction  $\text{Al}(1) + \text{HBr}(1) \rightarrow \text{Na}(g) + \text{AlBr}(g)$  at 1175°K. By the third law method the heat of reaction ( $\Delta H_f^0 298.15$ ) was evaluated to be 108.31 kcal. mole<sup>-1</sup>. The value of  $\Delta H_f^0 298.15$  for  $\text{AlBr}(g)$  was calculated as  $3.6 \pm 5.0 \text{ kcal. mole}^{-1}$ . Based on this value the dissociation energy ( $D_0^0$ ) was derived to be  $4.3 \pm 0.2 \text{ e.v.}$  which is in excellent agreement with the value,  $D_0^0 = 4.3 \pm 0.2 \text{ e.v.}$ , reported by A. G. Daydon, "Dissociation Energies", Chapman and Hall Ltd., London, 1953. The dissociation energy ( $D_0^0$ ) of  $\text{AlBr}(g)$  was reported to be 2.4 e.v. and 105 kcal. mole<sup>-1</sup> (4.55 e.v.) by G. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Company, Inc., 1950 and R. F. Barrow, Trans. Faraday Soc. 55, 952 (1960), respectively. However, using these  $D_0^0$  values, the corresponding values of  $\Delta H_f^0 298.15$  for  $\text{AlBr}(g)$  were found to be 48.55 and -1.11 kcal. mole<sup>-1</sup>. The adopted value was calculated from the vapor pressure data reported by S. A. Semenkovich, loc. cit.

Heat Capacity and Entropy.

The spectroscopic constants were taken from G. Herzberg, loc. cit. and corrected to the average isotopic species.

Bond Distance: Al-O = [1.66] Å      O-B = [1.36] Å      B-O = [1.20] Å  
Bond Angle: Al-O-B = [145]°      O-B-O = [180]°  
Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [6.65357] X 10<sup>-115</sup> g<sup>3</sup> cm<sup>6</sup>

σ = 1

Heat of Formation.

The heat of formation, ΔHf°<sub>298</sub> (AlBO<sub>2</sub>, g) = -129.4 ± 4 kcal/mol, was calculated from the heat of reaction, ΔHr°<sub>1500</sub> = -14.7 ± 3.2 kcal/mol for 1/2 Al<sub>2</sub>O<sub>3</sub>(g) + 1/2 B<sub>2</sub>O<sub>3</sub>(g) = AlBO<sub>2</sub>(g) with all JANAP auxiliary data. The value of ΔHr°<sub>1500</sub> was obtained from the mass spectrometric determination of ion intensity ratios by A. Büchler, P. E. Blackburn and J. L. Stauffer, "Thermodynamics of Vaporization in the Aluminum Oxide-Boron Oxide System," ARPA Order No 315-62, Arthur D. Little, Inc., Cambridge, Mass.

Heat Capacity and Entropy.

The bent molecular structure, the bond distances O-B and B-O, and the bond angle O-B-O were assumed to be the same as those in LiBO<sub>2</sub>(g). The bond distance Al-O and the bond angle Al-O-(B-O) were estimated to be the same as those in Al<sub>2</sub>O(g). The three principal moments of inertia are I<sub>A</sub> = 0.7255 X 10<sup>-39</sup>, I<sub>B</sub> = 29.9238 X 10<sup>-39</sup>, and I<sub>C</sub> = 30.6493 X 10<sup>-39</sup> g cm<sup>2</sup>.

The vibrational frequencies were estimated by comparison with those in LiBO<sub>2</sub>(g), Al<sub>2</sub>O(g), B<sub>2</sub>O<sub>3</sub>(g), and AlCl(g).

Heat of Formation.

S. A. Semenkovich, Zh. Prikl. Khim. 50, 933 (1957) measured the vapor pressure of the reaction  $\text{Al}(1) + \text{HBr}(1) \rightarrow \text{Na}(g) + \text{AlBr}(g)$  at 1175°K. By the third law method the heat of reaction ( $\Delta H_{f,298.15}^{\circ}$ ) was evaluated to be 108.31 kcal. mole<sup>-1</sup>. The value of  $\Delta H_{f,298.15}^{\circ}$  for AlBr(g) was calculated as  $3.6 \pm 5.0 \text{ kcal. mole}^{-1}$ . Based on this value the dissociation energy ( $D_0^{\circ}$ ) was derived to be  $4.3 \pm 0.2 \text{ e.v.}$  which is in excellent agreement with the value,  $D_0 = 4.3 \pm 0.2 \text{ e.v.}$ , reported by A. O. Gaydon, "Dissociation Energies", Chapman and Hall Ltd., London, 1953. The dissociation energy ( $D_0^{\circ}$ ) of AlBr(g) was reported to be 2.4 e.v. and 105 kcal. mole<sup>-1</sup> (4.55 e.v.) by G. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Company, Inc., 1950 and R. F. Barrow, Trans. Faraday Soc. 56, 952 (1960), respectively. However, using these  $D_0^{\circ}$  values, the corresponding values of  $\Delta H_{f,298.15}^{\circ}$  for AlBr(g) were found to be 48.55 and -1.11 kcal. mole<sup>-1</sup>. The adopted value was calculated from the vapor pressure data reported by S. A. Semenkovich, loc. cit.

Heat Capacity and Entropy.

The spectroscopic constants were taken from O. Herzberg, loc. cit. and corrected to the average isotopic species.

$$\Delta H_f^{\circ} = -121.4 \pm 3 \text{ kcal/mol}$$

$$\Delta H_f^{\circ} = -126.0 \pm 3 \text{ kcal/mol}$$

$$\Delta H_m^{\circ} = 2.69 \text{ kcal/mol}$$

$$S_{298}^{\circ} = 43.08 \pm 0.25 \text{ gibbs/mol}$$

$$T_m = 370.6^{\circ}\text{K}$$

Heat of Formation

The value of  $\Delta H_f^{\circ}$  for AlBr<sub>3</sub>(c) is that selected by the National Bureau of Standards (1). The methods and auxiliary data used to obtain their value are not given. Their result is apparently based on the heats of reaction of aqueous solutions of AlBr<sub>3</sub> measured by Berthelot (2).

Heat Capacity and Entropy

The heat capacity of AlBr<sub>3</sub>(c) has been measured from 11.6° to 308.1°K by Justice (3) and the enthalpy from 337° to 367°K by Fischer (4). The heat capacities used are derived from curve fits of these data. The Cp values above 370.6°K are obtained by graphical extrapolation. Justice (3) reported the value of  $S_{298}^{\circ}$  based on  $S_{12}^{\circ} = 0.951 \text{ eu}$ .

Melting Data

Fischer (4) determined the melting temperature (T<sub>m</sub>) of AlBr<sub>3</sub>(c). The heat of melting (ΔH<sub>m</sub><sup>o</sup>) is calculated from the enthalpies of AlBr<sub>3</sub>(c) and AlBr<sub>3</sub>(l) at the melting temperature. The enthalpy of the crystal at the melting point was determined from the curve used for the heat capacity calculations. The enthalpy of the liquid at the melting point was determined from a linear least squares fit to the enthalpy data for AlBr<sub>3</sub>(l) reported by Fischer (4).

AlBr<sub>3</sub>

Aluminum Tribromide (AlBr<sub>3</sub>)  
(Liquid)    GFW = 266.7085

AlBr<sub>3</sub>

ALUMINUM TRIBROMIDE (AlBr<sub>3</sub>)

(LIQUID)

GFW = 266.7085

$S_{298.16}^{\circ} = 49.352 \text{ gibbs/mol}$

$\Delta H_f^{\circ} = -123.633 \pm 3 \text{ kcal/mol}$

$\Delta H_m^{\circ} = 2.69 \text{ kcal/mol}$

$\Delta H_v^{\circ} = 5.92 \text{ kcal/mol (to dimer gas)}$

The heat of formation ( $\Delta H_f^{\circ}$ ) of AlBr<sub>3</sub>(l) is calculated from  $\Delta H_f^{\circ}$  of AlBr<sub>3</sub>(c) plus the heat of melting ( $\Delta H_m^{\circ}$ ) and the enthalpy differences ( $H_{370.6} - H_{298}$ ) of the crystal and liquid.

Heat Capacity and Entropy

Fischer (1) has measured the enthalpy of AlBr<sub>3</sub>(l) from 371° to 406°K. The heat capacity used is derived from a linear least squares fit to his data. The resulting constant value for the heat capacity is adopted for temperatures above 406°K. The entropy ( $S_{298}^{\circ}$ ) of AlBr<sub>3</sub>(l) was determined in a manner analogous to that for the heat of formation.

Heating Data

See AlBr<sub>3</sub>(c) table for details.

Vaporization Data

The heat of vaporization ( $\Delta H_v^{\circ}$ ) of AlBr<sub>3</sub>(l) is determined from the work of Fischer et al. (2). The boiling temperature (T<sub>b</sub>) was calculated from their vapor pressure data. See Al<sub>2</sub>Br<sub>6</sub>(g) table for details.

Bond Distance: Al-Br = [2.27] Å  
 Bond Angle: Br-Al-Br = [120]°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 2.16 × 10<sup>-111</sup> g<sup>3</sup> cm<sup>6</sup>  
 $\sigma = (6)$

Heat of Formation

Fischer et al. (1) have determined the equilibrium constants for the reaction 2AlBr<sub>3</sub>(g) = Al<sub>2</sub>Br<sub>6</sub>(g) from vapor density measurements. The heats of reaction are calculated from these data using both second law and third law methods. The adopted value of  $\Delta H_{298}^\circ$  is -101.1 ± 4 kcal/mol. The results of the calculations are as follows:

| Range   | No. Pts. | Second Law | Third Law | Drift, cal   | H <sub>f,298</sub> <sup>o</sup> kcal/mol |
|---------|----------|------------|-----------|--------------|--|
| 613-846 | 4        | -29.73     | -29.39    | 0.16 ± 1.33  | -98.4                                    |
| 605-854 | 7        | -29.32     | -29.35    | -0.20 ± 0.67 | -98.5                                    |

\*Calculation based on the third law value of  $\Delta H_{298}^\circ$

Heat Capacity and Entropy

The molecular structure of AlBr<sub>3</sub>(g) is assumed to be the same as that of AlF<sub>3</sub>(g). The bond distance was estimated by Heise and Wieland (2). The vibrational frequencies are estimated from the force constants of BBr<sub>3</sub>(g) (3) and then adjusted so that the values of  $\Delta H_{298}^\circ$  obtained by the second and third law methods are in good agreement. The principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 1.03 × 10<sup>-37</sup>, and I<sub>C</sub> = 2.05 × 10<sup>-37</sup> g cm<sup>2</sup>.

Heat of Formation

D. L. Hildenbrand, E. Murad, L. P. Theard and F. Ju, Aeronutronic Report No. U-3197, July 30, 1965, under contract AF 04(611)-10743, reported an appearance potential of  $9.4 \pm 0.4\text{eV}$  for AlCl<sup>+</sup>. They suggested that the magnitude of the value indicated formation by direct ionization of AlCl(g).

R. F. Porter and E. E. Zeller, J. Chem. Phys. **33**, 858 (1960), obtained an appearance potential of  $19.7 \pm 0.5\text{eV}$  for AlCl<sup>+</sup> which they attributed to formation from AlCl(g). Assuming the process to be AlCl<sub>3</sub>(g) + e<sup>-</sup> → AlCl<sup>+</sup>(g) + 2Cl(g) + 2e<sup>-</sup>  $\Delta H = 454$  kcal, one obtains  $\Delta H_f^{\circ}(\text{AlCl}^+) = 257$  kcal/mol, or an ionization potential of 11.6eV. This would almost certainly represent an upper limit, since the fragments could easily contain excess kinetic energy.

We adopt the ionization potential of  $9.4 \pm 0.4\text{eV}$  obtained by Hildenbrand et al., which yields  $\Delta H_f^{\circ}(\text{AlCl}^+, g) = 205 \pm 10$  kcal/mol.

Heat Capacity and Entropy

AlCl<sup>+</sup> is isoelectronic with MgCl, and the electronic configuration of the ground state and first excited state are estimated to be those for MgCl. The vibrational frequency, anharmonicity constant and bond length are estimated by comparison with those for MgCl and AlCl. The rotational constant is calculated from the bond length and atomic masses, and  $\sigma_e$  is calculated from the other constants assuming a Morse potential function. The enthalpy at 0°K is -2.236 kcal/mol.

Bond Distances: Al-F = [1.63] Å Al-Cl = [2.14] Å

Bond Angle: Cl-Al-F = [120]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.48427 x 10<sup>-114</sup>] g.<sup>3</sup> cm.<sup>6</sup>

σ<sup>-</sup> = 1

Heat of Formation.

The value of  $\Delta H_f^0$  298.15 for AlClF(g) was calculated based on an assumption that  $\Delta H_f^0 = 0$  for the reaction  $AlF_2(g) + AlCl_2(g) = 2AlClF(g)$ . The  $\Delta H_f^0$  298.15 values for  $AlF_2(g)$  and  $AlCl_2(g)$  used for calculation are -185.0 and -75.0 kcal. mole<sup>-1</sup>, respectively.

Heat Capacity and Entropy.

The vibrational frequencies were estimated to be consistent with those for  $AlF_2(g)$  and  $AlCl_2(g)$ . The bond distances of Al-F and Al-Cl were estimated to be the same as those in  $AlF_3(g)$  and  $AlCl_3(g)$ , respectively. The bond angle and ground state quantum weight were estimated to be consistent with those for  $AlF_2(g)$  molecule. The three principal moments of inertia are: I<sub>A</sub> = 2.41078 x 10<sup>-39</sup>, I<sub>B</sub> = 2.3289 x 10<sup>-39</sup> and I<sub>C</sub> = 2.64387 x 10<sup>-39</sup> g. cm.<sup>2</sup>

Bond Distances: Al-F = [1.65] Å Al-Cl = [2.14] Å

Bond Angle: Cl-Al-F = [120]° F-Al-F = [120]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.47245 X 10<sup>-113</sup> g<sup>3</sup> cm<sup>6</sup>

σ<sup>-</sup> = 2

Heat of Formation.

The value of ΔH<sub>f</sub><sup>0</sup> 298.15 was calculated based on an assumption that ΔH<sub>f</sub><sup>0</sup> = 0 for the reaction AlCl<sub>3</sub>(g) + 2AlF<sub>3</sub>(g) = 3AlClF<sub>2</sub>(g). The value of ΔH<sub>f</sub><sup>0</sup> 298.15 for AlF<sub>3</sub>(g) and AlCl<sub>3</sub>(g) used for calculation are -286.5 and -139.7 kcal. mole<sup>-1</sup>, respectively.

Heat Capacity and Entropy.

The vibrational frequencies were estimated by comparison with those for AlF<sub>3</sub>(g) and AlCl<sub>3</sub>(g). The bond distances of Al-F and Al-Cl atoms were assumed to be the same as those in AlF<sub>3</sub>(g) and AlCl<sub>3</sub>(g), respectively. The bond angles and ground state quantum weight were estimated by comparison with those for AlF<sub>3</sub>(g). The three principal moments of inertia are 1.28827 X 10<sup>-38</sup>, 2.79746 X 10<sup>-38</sup> and 4.08573 X 10<sup>-38</sup> g<sup>2</sup> cm<sup>2</sup>.

Heat of Formation.

The heat of formation (ΔH<sub>f</sub><sup>o</sup> 298.15) for AlOCl(c) was calculated from ΔH<sub>f</sub><sup>o</sup> 298 = 21.05 kcal. mole<sup>-1</sup> for the reaction AlOCl(c) + Cl<sub>2</sub>(g) = AlCl<sub>3</sub>(c) + 1/2 O<sub>2</sub>(g) reported by H. Schafer, F. E. Mittag, and W. Wilborn, Z. anorg. allgem. Chem. 297, 48 (1958). This reaction is the overall reaction of the following four separate reactions.

| Chemical Reaction  | ΔH <sub>f</sub> <sup>o</sup> 298, kcal. mole <sup>-1</sup> |
|--|--|
| AlOCl(c) + 2(HCl·299.5 H <sub>2</sub> O) = AlCl <sub>3</sub> ·600 H <sub>2</sub> O(l)        | -46.9  |
| AlCl <sub>3</sub> ·600 H <sub>2</sub> O(l) = AlCl <sub>3</sub> (c) + 600 H <sub>2</sub> O(l) | +79.3  |
| H <sub>2</sub> (g) + Cl <sub>2</sub> (g) = 2(HCl·299.5 H <sub>2</sub> O)                     | -79.67   |
| H <sub>2</sub> O(l) = H <sub>2</sub> (g) + 1/2 O <sub>2</sub> (g)                            | +68.32   |
| AlOCl(c) + Cl <sub>2</sub> (g) = AlCl <sub>3</sub> (c) + 1/2 O <sub>2</sub> (g)              | +21.05   |

Heat Capacity and Entropy.

The heat capacities for AlOCl(c) were estimated based on the assumption that ΔC<sub>p</sub> = 0 for the reaction AlCl<sub>3</sub>(c) + Al<sub>2</sub>O<sub>3</sub>(c) = 3AlOCl(c). S<sub>298.15</sub> was estimated by H. Schafer, F. E. Mittag, and W. Wilborn, loc. cit.

Temperature of Decomposition.

T<sub>p</sub> is estimated as the temperature at which the free energy change of the reaction 6AlOCl(c) → 3Al<sub>2</sub>O<sub>3</sub>(c) + Al<sub>2</sub>Cl<sub>6</sub>(g) approaches zero.

Heat of Formation.

The free energy change of the reaction 1/3 Al<sub>2</sub>O<sub>3</sub>(s) + 1/3 AlCl<sub>3</sub>(g) = AlOCl(g),  $\Delta H_f^0 = 28 \pm 3 \text{ kcal. mole}^{-1}$ , has been determined by M. A. Greenbaum, et al., Marmont Corporation, California, private communication, August 26, 1964. Incorporating appropriate auxiliary data the heat of reaction was derived to be 82.9 kcal. mole<sup>-1</sup>, yielding  $\Delta H_f^{298.15} = -83.2 \pm 5 \text{ kcal. mole}^{-1}$  for AlOCl(g).

Heat Capacity and Entropy.

Point group, ground state quantum weight and vibrational frequencies were obtained from J. Hilsenrath, W. H. Evans and H. M. Woolley, National Bureau of Standards Report 8484, "Preliminary Report on the Thermodynamic Properties of Lithium, Beryllium, Magnesium, Aluminum and Their Compounds with Hydrogen, Oxygen, Nitrogen, Fluorine and Chlorine", July 1, 1959. The bond distances of <sup>16</sup>O-Al and <sup>35</sup>Al-Cl were assumed to be the same as those in AlO(g) and AlCl(g) molecules, respectively. The three principal moments of inertia are I<sub>A</sub> = 0 and I<sub>B</sub> = I<sub>C</sub> = 2.86467 X 10<sup>-38</sup> g. cm.<sup>2</sup>

Heat of Formation.

The value of  $\Delta H_f^0$  298.15 for AlCl<sub>2</sub>(g) was calculated based on an assumption that  $\Delta H_f^0 = 0$  for the reaction AlCl(g) + AlCl<sub>3</sub>(g) = 2AlCl<sub>2</sub>(g). The values of  $\Delta H_f^0$  298.15 for AlCl(g) and AlCl<sub>3</sub>(g) used for calculation are -11.2 and -139.7 kcal. mole<sup>-1</sup>, respectively.

Heat Capacity and Entropies.

The vibrational frequencies were calculated by valence force field method described by O. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Company, Inc., 1950, using force constants,  $k_1 = 2.05 \times 10^6$  and  $k_f/1^2 = 0.25 \times 10^5$  dynes/cm., estimated from those for AlCl(g) and other similar compounds. The bond distance was assumed to be the same as that for AlCl(g). The bond angle and ground state quantum weight were estimated to be consistent with those for AlF<sub>2</sub>(g). The three principal moments of inertia are  $I_A = 4.04243 \times 10^{-38}$ ,  $I_B = 3.7149 \times 10^{-39}$  and  $I_C = 4.41392 \times 10^{-38}$  g. cm.<sup>2</sup>

AlCl<sub>2</sub><sup>+</sup>

ALUMINUM DICHLORIDE UNIPOSITIVE ION (AlCl<sub>2</sub><sup>+</sup>)

(IDEAL GAS)

GFW = 97.887

Point Group [D<sub>2h</sub>]  
 S<sup>298.15</sup> = [63 ± 2] gibbs/mol  
 Ground State Quantum Weight = [1]

ΔHf<sup>o</sup> = [110 ± 40] kcal/mol  
 ΔHf<sup>o</sup><sub>298.15</sub> = [110 ± 40] kcal/mol

Vibrational Frequencies and Degeneracies  
 (590) (1)  
 (180) (2)  
 (380) (1)

σ = 2

Bond Distance: Al-Cl = [2.17] Å  
 Bond Angle: Cl-Al-Cl = [180°]  
 Rotational Constant: B<sub>0</sub> = [0.0505] cm<sup>-1</sup>

Heat of Formation

R. F. Porter and E. E. Zeller, J. Chem. Phys. 33, 858 (1960), reported an appearance potential of 13.4 ± 0.5eV (309 ± 12 kcal) for AlCl<sub>2</sub><sup>+</sup>; they indicated that AlCl<sub>2</sub>(g) was the probable parent molecule. Assuming the formation reaction to be AlCl<sub>3</sub> + e<sup>-</sup> → AlCl<sub>2</sub><sup>+</sup> + Cl + 2e<sup>-</sup>, we obtain ΔHf<sup>o</sup>(AlCl<sub>2</sub><sup>+</sup>, g) = 140 kcal/mol or an ionization potential of 215 kcal or 9.3eV.

Since there is a possibility of the fragments containing excess kinetic energy, the ionization potential represents an upper limit to the true value. A comparison of the ionization potentials of BF<sub>2</sub> and BCl<sub>2</sub> indicates that the chloride is lower by 0.1eV per atom; on this basis we would obtain an ionization potential of 7eV using the value for AlF<sub>2</sub> of 9eV.

The National Bureau of Standards Report No. 8628, Jan. 1, 1965, gives an estimate of 8 ± 1eV (185 ± 25 kcal); we adopt this value as being representative of the probable range of values. The adopted ionization potential yields ΔHf<sup>o</sup><sub>298.15</sub>(AlCl<sub>2</sub><sup>+</sup>, g) = 110 ± 40 kcal/mol in conjunction with ΔHf<sup>o</sup><sub>298</sub>(AlCl<sub>2</sub>, g) = -75 ± 70 kcal/mol.

Heat Capacity and Entropy

AlCl<sub>2</sub><sup>+</sup> is isoelectronic with MgCl<sub>2</sub> and on this basis we assume the ground state to be singlet and linear in accordance with the predictions of A. D. Walsh, J. Chem. Soc. 2768 (1953). The vibrational frequencies are estimated to lie between those for AlCl<sub>2</sub> and MgCl<sub>2</sub>. The bond length is estimated as the sum of the covalent radii of the atoms.

The enthalpy at 0°K is -3.128 kcal/mol.

AlCl<sub>2</sub><sup>+</sup>

Aluminum Dichloride Uninegative Ion (AlCl<sub>2</sub><sup>-</sup>)

Bond Distances: Al-Cl = [2.14] Å  
 Bond Angle: Cl-Al-Cl = [120°]  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [6.634 × 10<sup>-114</sup>] g<sup>3</sup> cm<sup>6</sup>      σ = 2

Heat of Formation

AlCl<sub>2</sub><sup>-</sup> is isoelectronic with SiCl<sub>2</sub> and an estimate of its heat of formation may be obtained by assuming the binding energy to be the same in the two molecules. This leads to ΔH<sub>f</sub><sup>o</sup><sub>298</sub>(AlCl<sub>2</sub><sup>-</sup>, g) = -80 kcal/mol or an electron affinity of 5 kcal. An alternative route assumes that the heat of reaction is identical for the processes AlCl<sub>3</sub>(g) + AlCl<sub>2</sub><sup>-</sup>(g) + Cl<sup>+</sup>(g) and AlCl(g) + Al<sup>-</sup>(g) + Cl<sup>+</sup>(g). Using the electron affinity of Al(g) given in National Bureau of Standards Report No. 6628, Jan. 1, 1965, we obtain ΔH<sub>f</sub><sup>o</sup><sub>298</sub>(AlCl<sub>2</sub><sup>-</sup>, g) = -63 kcal/mol or an electron affinity of -12 kcal. In addition, using the correlation diagrams of A. D. Walsh, J. Chem. Soc. 2266 (1953), the electron must go into a non-bonding orbital; thus the binding energy should be close to that of AlCl<sub>2</sub>. The dissociation energy of AlCl<sub>2</sub> is 211 kcal which leads to ΔH<sub>f</sub><sup>o</sup><sub>298</sub>(AlCl<sub>2</sub><sup>-</sup>, g) = -87 kcal/mol, or an electron affinity of 12 kcal. We adopt an intermediate value for the electron affinity of 5 ± 20 kcal/mol, or ΔH<sub>f</sub><sup>o</sup><sub>298</sub>(AlCl<sub>2</sub><sup>-</sup>, g) = -80 ± 40 kcal/mol using ΔH<sub>f</sub><sup>o</sup><sub>298</sub>(AlCl<sub>2</sub>, g) = -75 ± 20 kcal/mol.

Heat Capacity and Entropy

As noted earlier, AlCl<sub>2</sub><sup>-</sup> is isoelectronic with SiCl<sub>2</sub> and with 18 valence electrons, should be definitely bent according to the correlation scheme of A. D. Walsh, loc. cit. The vibrational frequencies are estimated to lie between those of SiCl<sub>2</sub> and AlCl<sub>2</sub>. The bond length and angle are estimated as equal to those for AlCl<sub>2</sub>(g). By analogy with SiF<sub>2</sub> (see G. Herzberg "Electronic Spectra of Polyatomic Molecules," D. Van Nostrand Company Inc., New York, 1966) we do not expect any low lying electronic levels. The enthalpy at 0°K is -3.006 kcal/mol. The three principal moments of inertia are: I<sub>A</sub> = 3.7155 × 10<sup>-39</sup>, I<sub>B</sub> = 4.0436 × 10<sup>-38</sup>, and I<sub>C</sub> = 4.4154 × 10<sup>-38</sup> g cm<sup>2</sup>.

Heat of Formation.

The value of ΔH<sub>f</sub><sup>o</sup> 298.15 was calculated based on an assumption the ΔH<sub>f</sub><sup>o</sup> = 0 for the reaction AlF<sub>3</sub>(g) + 2AlCl<sub>3</sub>(g) = 3AlCl<sub>2</sub>F(g). The values of ΔH<sub>f</sub><sup>o</sup> 298.15 for AlF<sub>3</sub>(g) and AlCl<sub>3</sub>(g) used for calculation are -286.5 and -139.7 kcal. mole<sup>-1</sup>, respectively.

Heat Capacity and Entropy.

The vibrational frequencies were estimated by comparison with those for AlF<sub>3</sub>(g) and AlCl<sub>3</sub>(g). The bond distances of Al-F and Al-Cl atoms were assumed to be the same as those in AlF<sub>3</sub>(g) and AlCl<sub>3</sub>(g), respectively. The bond angles and ground state quantum weight were estimated by comparison with those for AlF<sub>3</sub>(g). The three principal moments of inertia are 4.04374 X 10<sup>-36</sup>, 1.92508 X 10<sup>-36</sup> and 5.96882 X 10<sup>-36</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation

Gross and Hayman (1) measured the enthalpy of direct combination of "spectrographically pure" aluminum and carefully purified chlorine and derived ΔH<sub>f</sub><sup>o</sup> 298.15 = -168.80 ± 0.16 kcal/mol. Slemmons (2) also reported the enthalpy of direct combination and is in agreement at -167.5 kcal/mol within his relatively large uncertainty interval of ±1.1 kcal/mol.

Coughlin (3) determined the enthalpy of solution of 99.99+ pure Al in 4.360 M HCl and also (4) the enthalpy of solution of anhydrous AlCl<sub>3</sub> in the same solvent. Enthalpies of mixing were measured to close a thermochemical cycle at 303.15°K (adjusted to 1961 at. wts.):

| Reaction  | ΔH <sub>f</sub> <sup>o</sup> 298.15 cal. |
|---|--|
| (1) Al(c) + 3H <sup>+</sup> (sol) = Al <sup>3+</sup> (sol) + 3/2 H <sub>2</sub> (g)   | -127,057 ± 120                           |
| (2) 3(HCl·12.731 H <sub>2</sub> O)(l) = 3H <sup>+</sup> (sol) + 3Cl <sup>-</sup> (sol) + 38.193 H <sub>2</sub> O(sol)       | 0 ± 10                                   |
| (3) AlCl <sub>3</sub> (c) = Al <sup>3+</sup> (sol) + 3Cl <sup>-</sup> (sol)   | -72,504 ± 50                             |
| (4) Al(c) + 3(HCl·12.731 H <sub>2</sub> O)(l) = 38.193 H <sub>2</sub> O(sol)  | -3,050 ± 20                              |
| (5) Al(c) + 3(HCl·12.731 H <sub>2</sub> O)(l) = AlCl <sub>3</sub> (c) + 38.193 H <sub>2</sub> O(l) + 3/2 H <sub>2</sub> (g) | -51,503 ± 140                            |

With heat capacity data for Al, AlCl<sub>3</sub>, and H<sub>2</sub> from the JANAF tables and for HCl(12.731 H<sub>2</sub>O) from Parker et al. (5) reaction 5 at 298.15°K is -51,910 ± 140 cal/mol AlCl<sub>3</sub>. Interpolation of data for ΔH<sub>f</sub><sup>o</sup> 298.15(HCl, aq) selected by Wagman et al. (6) yields ΔH<sub>f</sub><sup>o</sup> 298.15(AlCl<sub>3</sub>, c) = -168.37 kcal/mol. The overall uncertainty is estimated as 300 cal/mol.

Earlier investigations on the enthalpies of solution of Al were adjusted to the conditions of Coughlin's experiments by means of the data of Smith and Bass (7) for the effects of HCl concentration and H<sub>2</sub>O dilution on ΔH<sub>f</sub>(AlCl<sub>3</sub>, aq) and estimates of ΔC<sub>p</sub> of solution of Al of +20 gibbs/mol.

Investigator(s)

| Investigator(s)           | ΔH(soln) as reported kcal/mol Al | ΔH(soln) adjusted kcal/mol Al |
|---------------------------|----------------------------------|-------------------------------|
| Young (8)                 | -126.83                          | -126.79                       |
| Roth and Wolf (9)         | -124.01                          | -127.29                       |
| Canneri and Rossi (10)    | -125.40                          | -126.80                       |
| Sommerer (11)             | -128.36                          | -126.42                       |
| Richards and Burgess (12) | -126.00                          | -124.06                       |

Only Richards and Burgess deviate more than expected; they report a value for Mg in good agreement with modern values and it seems likely their sample of Al was impure.

Several values for the enthalpy of solution of AlCl<sub>3</sub>(c) in water have also been published and are listed here along with Coughlin's value recalculated to solution in pure water at 20°C.

Investigator(s)

| Investigator(s)       | ΔH(soln) in H <sub>2</sub> O at 20°C (kcal/mol AlCl <sub>3</sub> ) |
|-----------------------|--|
| Coughlin (3)          | -78.22 (adjusted)  |
| Thomsen (13)          | -76.85   |
| Berthelot (14)        | -76.3  |
| Saud (15)             | -77.6  |
| Stollé (16)           | -77.9  |
| Roth and Büchner (14) | -77.9  |
| Roth and Bürger (15)  | -79.3  |
| Klemm and Tanke (16)  | -77.7 (adjusted)   |

Klemm and Tanke (16) measured the enthalpy of solution of AlCl<sub>3</sub> in HCl·20 H<sub>2</sub>O at 0°C. A weighted average of the values of Gross and Hayman (1) and of Coughlin (3) is adopted for ΔH<sub>f</sub><sup>o</sup> 298.15(AlCl<sub>3</sub>, c) = -168.65 ± 0.20 kcal/mol.

Heat Capacity and Entropy

Justice (17) reported low temperature heat capacity data (13° to 310°K) and presented smoothed thermodynamic functions, including S<sub>298.15</sub> = 26.12 gibbs/mol, of which 0.086 gibbs/mol is extrapolation below 13°K. Heat content relative to 273.15°K was measured by Fischer (18) from 298°K to 504°K and heat content relative to 298.15°K was measured by Hobnold (19) from 310° to 493°K. The heat content data for the crystal can be fit within about 2% by integration of Cp(c) (gibbs/mol) = 15.52 + 0.021T, which is an extrapolation of Cp data reported by Justice (17).

Melting Data

See table for AlCl<sub>3</sub>(l).

Sublimation Data

See table for Al<sub>2</sub>Cl<sub>6</sub>(g).

AlCl<sub>3</sub>

ALUMINUM TRICHLORIDE (AlCl<sub>3</sub>) (LIQUID)

GFW = 133.341

S<sup>o</sup><sub>298.15</sub> = 41.326 ± 0.5 gibbs/mol

ΔH<sup>o</sup><sub>298.15</sub> = -161.28 ± 0.40 kcal/mol

T<sub>m</sub> = 465.7 ± 0.2°K

ΔH<sub>m</sub> = 8.45 ± 0.20 kcal/mol

Heat of Formation

ΔH<sup>o</sup><sub>298.15</sub>(l) was obtained from ΔH<sup>o</sup><sub>298.15</sub>(c) by adding ΔH<sub>m</sub> and the difference between (H<sub>465.7</sub>-H<sub>298.15</sub>) for crystal and liquid.

Melting Point

Kendall et al. (1) observed AlCl<sub>3</sub> to melt "sharply" at 463.4°K, Foster (2) noted that AlCl<sub>3</sub> began melting and melted completely in the range 465.7 ± 0.2°K, Nisei'son et al. (3) reported T<sub>m</sub> = 467.2°K, and Ostrikova et al. (4) reported T<sub>m</sub> = 466°K. Smits and Meijering (5) and Treadwell and Terabesi (6) derived triple point temperatures of 465.8°K and 466.5°K, respectively, from intersection of vapor pressure curves for crystal and liquid. The value of Foster is adopted as most accurate. The vapor pressure at the triple point is 2.3 atm.

Heat of Fusion and Heat Capacity

Fischer (7) and McDonald (8) measured heat content data for the liquid over a short range (473°-504°K) of temperature. Their data can be represented within ±1 by the heat capacity equation derived for the crystal (see AlCl<sub>3</sub>(c) table), a heat of fusion of 8.45 kcal/mol, and a liquid heat capacity of 30.0 gibbs/mol. Fischer's data are high, while McDonald's points lie below the selected values.

AlCl<sub>3</sub>

Point Group D<sub>3h</sub>  
S<sup>0</sup><sub>289.15</sub> = 76.118 ± 1.0 gibbs/mol  
Ground State Quantum Weight = 1.11

GFW = 133.341

ΔH<sub>f</sub><sup>0</sup> = -139.27 ± 0.70 kcal/mol  
ΔH<sub>f</sub><sup>298.15</sup> = -139.70 ± 0.70 kcal/mol

Vibrational Frequencies and Degeneracies  
ω<sub>v</sub>, cm<sup>-1</sup>      g<sub>v</sub>, cm<sup>-1</sup>  
371 (1)      148 (2)  
[106] (1)      810 (2)

Bond Distances: Al-Cl = 2.06 Å  
Bond Angle: Cl-Al-Cl = 120°  
Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.0618 × 10<sup>-112</sup> g cm<sup>6</sup>      σ = 8

Heat of Formation  
The heat of formation is calculated from the value adopted for Al<sub>2</sub>Cl<sub>6</sub>(g) and the heat of dissociation of Al<sub>2</sub>Cl<sub>6</sub>, derived from equilibrium P-v-T data on aluminum chloride vapor as listed below.

| Investigator(g)         | Temp. Range °K | Number of Data Points |
|-------------------------|----------------|-----------------------|
| Smits and Meijering (1) | 869-916        | 6                     |
| Fischer et al. (2)      | 847-869        | 16 <sup>a</sup>       |
| Vreeland and Stull (3)  | 669-825        | 16 <sup>b</sup>       |

Twenty six points reported, points at 836, 881, 944, 734, 605, 605, and 688°K rejected by statistical test.  
The three investigations are in reasonable agreement. Giving consideration also to equilibrium data on the reaction of AlCl<sub>3</sub>(g) and Al(l) to form AlCl(g) [see AlCl(g) table], there is selected as a best value ΔH<sub>f</sub><sup>298.15</sup> = 30.24 kcal/mol Al<sub>2</sub>Cl<sub>6</sub>, which yields ΔH<sub>f</sub><sup>298.15</sup>(AlCl<sub>3</sub>, g) = -139.70 kcal/mol.

Heat Capacity and Entropy

Zaorin and Rambidi (4) carried out electron diffraction experiments on aluminum chloride vapor at 800°K where the monomer should predominate. They found a planar symmetrical structure with Al-Cl = 2.06 ± 0.01 Å and Cl-Al-Cl angles of 120°. The individual moments of inertia are I<sub>A</sub> = I<sub>B</sub> = 3.7468 × 10<sup>-38</sup> g cm<sup>2</sup> and I<sub>C</sub> = 7.4932 × 10<sup>-38</sup> g cm<sup>2</sup>. For aluminum chloride vapor at high temperatures (monomer predominant), Klempner (5) observed a band at 810 cm<sup>-1</sup> in the infrared spectrum and Beattie and Horder (6) reported Raman bands at 371 cm<sup>-1</sup> and 146 cm<sup>-1</sup>. The remaining frequency should be infrared active but presumably was beyond the range of Klempner's measurements. Zaorin and Rambidi (7) give 96 ± 15 cm<sup>-1</sup> based on amplitudes of vibration observed in electron diffraction measurements. However, this frequency gives thermodynamic functions clearly not compatible with the equilibrium P-v-T data. Force constant ratios in the boron halides also suggest a higher wavenumber. An estimate of 185 cm<sup>-1</sup> was therefore adopted as an optimum value for fitting both the Al<sub>2</sub>Cl<sub>6</sub> dissociation data and the equilibrium data for AlCl<sub>3</sub>(g) + 2Al(l) + 3AlCl(g) [see AlCl(g) table].

ΔH<sub>f</sub><sup>o</sup> = Unknown  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -286.0 ± 2.5 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = Unknown

S<sub>298.15</sub><sup>o</sup> = [47 ± 2] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 529°K.

Heat of Formation.

The heat of reaction of aluminum chloride and potassium chloride was measured by E. Baud, Ann. Chim. Phys. 1, 8 (1904). From ΔH<sub>f</sub><sup>o</sup> = -26.38 kcal. mole<sup>-1</sup> for the reaction: Al<sub>2</sub>Cl<sub>6</sub>(c) + 2KCl(c) = 2KAlCl<sub>4</sub>(c), the value of ΔH<sub>f</sub><sup>o</sup> 298.15 for KAlCl<sub>4</sub>(c) was calculated to be -286 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

Heat capacities were estimated by comparison with those for KAlCl<sub>3</sub>(c), reported by K. K. Kelley, U. S. Bur. Mines Bull. 584 (1960). S<sub>298.15</sub> was estimated according to the method suggested by O. Kubaschewski and E. L. Evans, "Metallurgical Thermochemistry," Pergamon Press, 1958 and K. K. Kelley, private communication, June, 1960.

Temperature of Melting.

T<sub>m</sub> was reported by W. Flacher and A.-L. Simon, Z. anorg. allgem. Chem. 305, 1 (1960).

ΔH<sub>f</sub>° = Unknown

ΔH<sub>f</sub>° 298.15 = -273 ± 1 kcal. mole<sup>-1</sup>

ΔH<sub>m</sub>° = Unknown

S° 298.15 = [45 ± 2] cal. deg<sup>-1</sup> mole<sup>-1</sup>

T<sub>m</sub> = 424° K.

Heat of Formation.

The heat of formation at 298.15° K. was calculated from ΔH<sub>f</sub>° = -11.9 kcal. mole<sup>-1</sup> for the reaction Al<sub>2</sub>Cl<sub>6</sub>(c) + 2NaCl(c) = 2NaAlCl<sub>4</sub>(c) measured by E. Baud, Ann. chim. phys., 1, 8 (1904).

Heat Capacity and Entropy.

Heat capacities were estimated by comparison with those of KAlCl<sub>4</sub>(c). S° 298.15 was estimated according to the method suggested by O. Kubaschewski and E. L. Evans, "Metallurgical Thermochemistry," Pergamon Press, 1958 and K. K. Kelley, private communication, June, 1960.

Temperature of Melting.

T<sub>m</sub> was reported by H. Fischer and A.-I. Simon, Z. anorg. allgem. Chem. 302, 1 (1960).

ΔH<sub>f</sub>° = Unknown  
 ΔH<sub>f</sub>° 298.15 = -500 ± 1 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub>° = Unknown

S<sub>298.15</sub>° = [90 ± 2] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = [800]°K.

Heat of Formation.

The heat of formation at 298.15°K. was recalculated from the same quantity given in National Bureau of Standards (U. S.) Circular 500, "Selected Values of Chemical Thermodynamic Properties," 1952. The latter value was derived from the enthalpy change for the reaction Al2Cl6(c) + 6KCl(c) = 2K3AlCl6(c) measured by E. Baud, Ann. chim. phys. **3**, 6 (1904).

Heat Capacity and Entropy.

Both C<sub>p</sub> and S<sub>298.15</sub> were estimated by comparison with the corresponding values of the sum of the constituent halides for Na3AlF6(c).

Temperature of Melting.

T<sub>m</sub> was estimated by comparison with that for K3AlF6(c).

K3AlCl6

Trisodium Hexachloroaluminate (Na<sub>3</sub>AlCl<sub>6</sub>)

## Heat of Formation

There have been several studies of the interaction of Al with AlF<sub>3</sub> to produce AlF(g) and the results of 2nd and 3rd law analyses are given below.

| Ref. | Range, °K  | Reaction | Points | ΔH <sub>f</sub> <sup>0</sup> 298.15 kcal/mol | ΔH <sub>f</sub> <sup>0</sup> 298.15 (AlF, g) kcal/mol | Drift eu     |

| 5.   | 1198-1348  | C        | 10     | 100.8 ± 1.8                                  | 98.02 ± 0.5   | -2.2 ± 1.4   |

\* 1 point rejected due to statistical test. \*\* Value given by original author.

A) AlF<sub>3</sub>(c) + 2 Al(c) = 3 AlF(g)      B) AlF<sub>3</sub>(c) + 2 Al(l) = 3 AlF(g)      C) AlF<sub>3</sub>(g) + 2 Al(l) = 3 AlF(g)

It is apparent that the runs with least drift are in close agreement at -63.4 kcal/mol and we adopt this value. This value is confirmed by Gross et al. (g) who report the heat of reaction A as 172.9 kcal/mol or ΔH<sub>f</sub><sup>0</sup>298 (AlF, g) = -62.96 kcal/mol. Also the data of Hildenbrand et al. (7) on the reaction BeF<sub>2</sub>(g) + Al(c) = Be(c) + 2 AlF(g) yield ΔH<sub>f</sub><sup>0</sup>298 = 59.25 ± 0.5 kcal/mol which gives ΔH<sub>f</sub><sup>0</sup>298 (AlF, g) = -64.12 ± 1.7 kcal/mol. The highest observed levels in the A<sup>11</sup> state of AlF correspond to an absolute minimum of 156.4 kcal for the dissociation energy of AlF. Barrow et al. (g) indicate that normal extrapolation of the levels would yield a dissociation energy of 167.0 kcal. The dissociation energy corresponding to the adopted heat of formation is 159.2 kcal which may indicate a potential hump in the A<sup>11</sup> state.

## Heat Capacity and Entropy

The rotational, vibrational constants and electronic levels are from the analyses of Maude and Hugo (g), Barrow et al. (g) and Lide (10).

Heat Capacity and Entropy  
 AlF<sup>+</sup> is isoelectronic with MgF, and the electronic configuration of the ground and excited states we estimate to be those for MgF(g). The vibrational frequency, anharmonicity constant and bond length we estimate by comparison with those for MgF and AlF. The rotational constant is calculated from the bond length and atomic masses, and  $\alpha_e$  is calculated from the other constants assuming a Morse potential function. The enthalpy at 0°K is -2.139 kcal.

T. C. Ehlert, G. D. Blue, J. W. Green, and J. L. Margrave, J. Chem. Phys. 41, 2250 (1964) reported the ionization potential of AlF as  $9.7 \pm 0.5 \text{ eV}$  ( $224 \pm 12 \text{ kcal}$ ). The magnitude of the value has been confirmed by R. F. Porter, J. Chem. Phys. 33, 951 (1960) who found it between 9 and 10 eV. Using the above value in conjunction with  $\Delta H_f^{\circ}(AlF, g) = -62.5 \text{ kcal/mol}$ , and the equation  $AlF(g) + AlF^+(g) + e^- \text{ yields } \Delta H_f^{\circ}(AlF^+, g) = 161 \pm 12 \text{ kcal/mol}$ .

Bond Distance: O-Al = [1.62] Å  
 Bond Angle: O-Al-F = [180]°  
 Rotational Constant: P<sub>0</sub> = [0.180806] cm.<sup>-1</sup>  
 σ = 1

Heat of Formation.  
 The equilibrium constants (2200-2225°K.) of the chemical reaction Al<sub>2</sub>O<sub>3</sub>(c) + AlF<sub>3</sub>(g) = 3AlOF(g) were measured by M. Farber and H. L. Petersen, Trans. Faraday Soc. 59, 856 (1963). Using this data, the heat of reaction at 298.15°K. was calculated by the third law method to be 266.2 ± 1.7 kcal. mole<sup>-1</sup>. The value of ΔH<sub>f</sub><sup>o</sup> 298.15 for AlOF(g) was then derived.

Heat Capacity and Entropy.  
 The bond distances of Al-O and Al-F were estimated to be the same as those for AlO(g) and AlF(g), respectively. The point group, ground state quantum weight and vibrational frequencies were obtained from W. H. Evans, J. Hilsenrath and H. W. Woolley, "Preliminary Report on the Thermodynamic Properties of Selected Light-Element Compounds," National Bureau of Standards Report 6928, July 1, 1960. The moment of inertia is 1.54800 x 10<sup>-38</sup> g. cm.<sup>2</sup>

Bond Distances: Al-F = [1.65] Å  
 Bond Angles: F-Al-F = [120°]  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [3.367903 X 10<sup>-115</sup>] g.<sup>3</sup> cm.<sup>6</sup>  
 $\sigma = 2$

Heat of Formation.

The selected heat of formation, -165 ± 20 kcal. mole<sup>-1</sup> is the weighted average of two estimates (a) [-163 ± 20 kcal. mole<sup>-1</sup>] and (b) [-175 ± 30 kcal. mole<sup>-1</sup>]. The first estimate (a) is based upon appearance potentials reported by T. C. Ehlert and J. L. Margrave, J. Am. Chem. Soc. 86, 3901 (1964).

- (1) AlF<sub>2</sub>(g) → AlF<sub>2</sub><sup>+</sup>(ion) + F(g) 15.2 ± 0.3 e.v.
- (2) AlF<sub>2</sub><sup>+</sup>(ion) → AlF<sub>2</sub>(g) -9 ± 1 e.v.
- (3) (1) + (2) or AlF<sub>2</sub><sup>+</sup>(g) → AlF<sub>2</sub>(g) + F(g) 6.2 ± 1.3 e.v.

The second estimate (b) is based upon the average Al-F bond strength of AlF<sub>3</sub>(g) and AlF(g), i.e.  
 (4) AlF<sub>3</sub>(g) + AlF(g) → 2 AlF<sub>2</sub>(g) ΔH<sub>f</sub> 298 = 0

Heat Capacity and Entropy.

The bond distance, 1.65 Å, was estimated from a consideration of the Al-F distance 1.65 and 1.655 Å in AlF<sub>3</sub>(g) and AlF(g). The bond configuration and bond angle estimates were based on the correlations of A. D. Walsh, J. Chem. Soc., 2266, (1953). From the molecular constants the principal moments of inertia were found to be I<sub>A</sub> = 1.7829 X 10<sup>-39</sup>, I<sub>B</sub> = 12.8617 X 10<sup>-39</sup>, and I<sub>C</sub> = 14.6646 X 10<sup>-39</sup> g. cm.<sup>2</sup>. The vibrational frequencies were calculated assuming valence forces, (G. Herzberg, "Molecular Spectra and Molecular Structure II", D. Van Nostrand Co., 1945) and using force constants calculated from AlF<sub>3</sub>(g).

June 30, 1968

ALUMINUM DIFLUORIDE UNIPOSITIVE ION (AlF<sub>2</sub><sup>+</sup>)

(IDEAL GAS)

GFW = 64.9778

Point Group [D<sub>2h</sub><sup>+</sup>]

ΔH<sub>f</sub><sup>o</sup> = [42.3 ± 10] kcal/mol

S<sub>298.15</sub><sup>o</sup> = [57.6 ± 2.0] gibbs/mol

ΔH<sub>f</sub><sup>o</sup> = [42.3 ± 10] kcal/mol

Ground State Quantum Weight = [1]

ΔH<sub>f</sub><sup>o</sup> = [42.3 ± 10] kcal/mol

Vibrational Frequencies and Degeneracies

| ω, cm <sup>-1</sup> |
|---------------------|
| [850] (1)           |
| [240] (2)           |
| [500] (1)           |

Bond Distance: Al-F = [1.77] Å

Bond Angle: F-Al-F = [180°]

Rotational Constant: B<sub>0</sub> = [0.1535] cm<sup>-1</sup>

σ = 2

Heat of Formation

T. C. Ehlert, G. D. Blue, J. W. Green and J. L. Margrave, J. Chem. Phys. 41, 2250 (1964) report the appearance potential of AlF<sub>2</sub><sup>+</sup> from AlF<sub>3</sub> as 15.2 ± 0.3eV. Assuming the reaction to be AlF<sub>3</sub>(g) + e<sup>-</sup> → AlF<sub>2</sub><sup>+</sup> + F + 2e<sup>-</sup> ΔH = 350.5 ± 7 kcal we calculate ΔH<sub>f</sub><sup>o</sup>(AlF<sub>2</sub><sup>+</sup>, g) = 42 ± 10 kcal/mol, or an ionization potential for AlF<sub>2</sub><sup>+</sup> of 9eV. Due to the neglect of any kinetic energy of the fragments this probably is an upper limit.

Heat Capacity and Entropy

The linear configuration is estimated from the correlation diagrams of A. D. Walsh, J. Chem. Soc. 2266 (1953), however, it should be noted that the isoelectronic MgF<sub>2</sub> is considered to be bent. The vibrational frequencies are estimated to lie between those for AlF<sub>2</sub> and MgF<sub>2</sub>. The bond distance is estimated by comparison with AlF and AlF<sub>3</sub>. The enthalpy at 0°K is -2.883 kcal/mol.

AlF<sub>2</sub><sup>+</sup>

Aluminum Difluoride Uninegative Ion (AlF<sub>2</sub><sup>-</sup>)

ALUMINUM DIFLUORIDE UNINEGATIVE ION (AlF<sub>2</sub><sup>-</sup>) (IDEAL GAS)

Point Group [C<sub>2v</sub>]

S<sup>298,15</sup> = [61.4 ± 0.5] gibbs/mol

Ground State Quantum Weight = [1]

Vibrational Frequencies and Degeneracies

ω, cm<sup>-1</sup>

[820] (1)

[320] (1)

[900] (1)

Bond Distance: [1.85] Å

Bond Angle: F-Al-F = [120°]

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [3.366 × 10<sup>-41.5</sup>] g<sup>3</sup> cm<sup>6</sup> σ = 2

Heat of Formation

AlF<sub>2</sub><sup>-</sup> is isolectronic with SiF<sub>2</sub> and an estimate of its heat of formation may be obtained by assuming the binding energy to be the same; this yields ΔH<sub>f298</sub><sup>o</sup>(AlF<sub>2</sub><sup>-</sup>, g) = -191 kcal/mol, or an electron affinity for AlF<sub>2</sub> of 26 kcal/mol.

The binding energy should be close to that of AlF<sub>2</sub> since the extra electron should go into a non-bonding orbital according to the correlation diagrams of A. D. Walsh, J. Chem. Soc. 2266 (1953); using this approach yields ΔH<sub>f298</sub><sup>o</sup>(AlF<sub>2</sub><sup>-</sup>, g) = -177 kcal/mol or an electron affinity for AlF<sub>2</sub> of 12 kcal. Another method of estimation assumes that the heats are identical for the two reactions AlF<sub>3</sub> = AlF<sub>2</sub><sup>-</sup> + F<sup>+</sup> and AlF + Al<sup>+</sup> + F<sup>+</sup>, which yields ΔH<sub>f298</sub><sup>o</sup>(AlF<sub>2</sub><sup>-</sup>, g) = -161 kcal/mol or an electron affinity for AlF<sub>2</sub> of -4 kcal.

We adopt a median value for the electron affinity for AlF<sub>2</sub> of 10 ± 20 kcal, which leads to ΔH<sub>f298</sub><sup>o</sup>(AlF<sub>2</sub><sup>-</sup>, g) = -175 ± 40 kcal/mol when combined with ΔH<sub>f298</sub><sup>o</sup>(AlF<sub>2</sub>, g) = -165 ± 20 kcal/mol.

Heat Capacity and Entropy

According to the predictions of A. D. Walsh, loc. cit., there is no doubt that the molecule is bent; the bond length is assumed to lie between those of AlF and AlF<sub>3</sub>, the angle is that in AlF<sub>3</sub>. The vibrational frequencies are estimated between those for SiF<sub>2</sub> and AlF<sub>2</sub>. By analogy with SiF<sub>2</sub>, no low electronic levels are expected (G. Herzberg, "Electronic Spectra of Polyatomic Molecules," D. Van Nostrand Co., Inc., New York 1966).

The enthalpy at 0°K is -2.698 kcal/mol.

The individual principal moments of inertia are I<sub>A</sub> = 1.783 × 10<sup>-39</sup> g cm<sup>2</sup>, I<sub>B</sub> = 12.882 × 10<sup>-39</sup> g cm<sup>2</sup> and I<sub>C</sub> = 14.665 × 10<sup>-39</sup> g cm<sup>2</sup>.

AlF<sub>2</sub><sup>-</sup>

GFW = 64.9788

ΔH<sub>f0</sub><sup>o</sup> = [-174.5 ± 40] kcal/mol

ΔH<sub>f298,15</sub><sup>o</sup> = [-175 ± 40] kcal/mol

AlF<sub>2</sub><sup>-</sup>

Aluminum Trifluoride (AlF<sub>3</sub>)

(Crystal) GFW = 83.9767

AlF<sub>3</sub>

ALUMINUM TRIFLUORIDE (AlF<sub>3</sub>)

ΔH<sub>0</sub><sup>c</sup> = -359.5 ± 0.3 kcal/mol  
 ΔH<sub>298.15</sub><sup>c</sup> = -361.0 ± 0.3 kcal/mol  
 ΔH<sup>c</sup> = 0.1346 kcal/mol  
 ΔH<sub>298.15</sub><sup>c</sup> = 71.865 ± 0.5 kcal/mol monomer  
 ΔH<sub>298.15</sub><sup>c</sup> = 92.55 ± 4 kcal/mol dimer

S<sub>298.15</sub><sup>c</sup> = 15.89 ± 0.1 gibbs/mol  
 Tt = 728°K  
 Ts = [15491]°K

**Heat of Formation**  
 The adopted value is from separate calorimetric studies of combustion in fluorine of aluminum (1) and aluminum-Teflon mixtures (2). More extensive auxiliary data (2) for Teflon being the aluminum-Teflon study into exact agreement with the aluminum study (1). Calorimetric data relating AlF<sub>3</sub> to POF<sub>2</sub> (1, 2) tend to confirm this value, but POF<sub>2</sub> is probably more uncertain than is AlF<sub>3</sub>.

Solid-state emf data (4) relating AlF<sub>3</sub> to HgF<sub>2</sub> via TmF<sub>6</sub> gave ΔG<sup>c</sup> = -305.7 kcal/mol for AlF<sub>3</sub>(c) at 600°C. The adopted ΔH<sup>c</sup> yields ΔG<sup>c</sup> = -306.5 kcal/mol; this is more negative by 0.8 kcal/mol. The adopted ΔH<sup>c</sup> is also 2.4 kcal/mol more negative than indicated by entrainment data (5) for 2/3 AlF<sub>3</sub>(c) + H<sub>2</sub>O(g) + 1/3 Al<sub>2</sub>O<sub>3</sub>(g, c) + 2HF(g) in the range from 849° to 1312°K. Analysis of the equilibrium constants yields ΔH<sub>298.15</sub><sup>c</sup> = 33.11 ± 0.2 kcal/mol (3rd law) and 33.33 ± 0.22 kcal/mol (2nd law) with an insignificant entropy difference, ΔS<sub>298.15</sub><sup>c</sup> (2nd law) = 0.2 ± 0.2 gibbs/mol. It has been suggested (1) that interaction of the condensed phases caused the equilibria to deviate from the standard-state reaction assumed above. An alternative may be that the reaction with water vapor produced Al<sub>2</sub>O<sub>3</sub> in a metastable form; such forms require ignition temperatures greater than 1400°K for complete conversion to α-Al<sub>2</sub>O<sub>3</sub> (g).

**Heat Capacity and Entropy**  
 Cp<sup>a</sup> and S<sub>298</sub><sup>b</sup> are taken from Douglas and Dittmars (7), whose tables are based on heat capacity measurements from 54° to 288°K (g) and relative enthalpy measurements from 323° to 1173°K (l). The enthalpy data confirm earlier data (401°-1401°K) of O'Brien and Kelley (9) rather than the adjusted values proposed by Frank (10). Douglas and Dittmars (7) gave a detailed comparison with other data. The entropy is derived from Cp<sup>a</sup> using the extrapolation S<sub>0</sub><sup>b</sup> = 0.53 ± 0.06 gibbs/mol.

**Transition Data**

Tt and ΔH<sup>c</sup> are from Douglas and Dittmars (7). The values were obtained from extensive enthalpy data for the transition region assuming the presence of a very small amount of impurity in solid solution.

**Sublimation Data**

Ts is the temperature at which the calculated total pressure (monomer plus dimer) reaches one atm; the mole fraction of dimer is calculated as 0.109 at Ts. Sublimation temperatures of 1533° and 1566°K were obtained in two sublimation-pressure studies (11, 12) at the Technische Hochschule, Breslau. The selected enthalpies of sublimation to AlF<sub>3</sub>(g) and Al<sub>2</sub>F<sub>6</sub>(g) reproduce closely the entrapment data of Krause and Douglas (13). Selection of these values of ΔH<sub>s</sub><sup>c</sup> and comparisons with other vapor-pressure data are discussed on the gas-phase tables.

Heat of Formation  
ΔH<sup>o</sup>f is calculated from that of the crystal by use of ΔH<sup>o</sup>f, 298.15 = 71.965 ± 0.5 kcal/mol. Sublimation studies by mass-spectrometric and entrainment techniques suggest the presence of a small amount of dimer in the saturated vapor. These studies are reviewed on the table for Al<sub>2</sub>F<sub>6</sub>(g). ΔH<sup>o</sup>s(monomer) and ΔH<sup>o</sup>s(dimer) are selected by adopting (a) the JANAF entropies for crystal, monomer and dimer, (b) the mass spectrometric value of 2 ΔH<sup>o</sup>s(monomer) = ΔH<sup>o</sup>s(dimer) = -49 kcal/mol at 1000°K, and (c) the entrainment data of Krause and Douglas (1). The resulting calculated pressures deviate by <0.5% from the entrainment data (1), by <1.0% from the mass-spectrometric equation (3) and by <3% from the mass-effusion equation (4). Further comparisons with experimental data are given below. The adopted values favor the later (11) of two sublimation-point studies (11, 12), both show considerable scatter and smaller deviations from the calculated dp/dT. Torison-effusion data suggest the possibility of more serious discrepancy. Although data of Witt and Barrow (3) are consistent with the JANAF pressures, Hildenbrand et al. (2, g), noted a trend toward increasing pressure with decreasing orifice area. They concluded (7) that the condensation coefficient <0.06, based on eightfold variation in the product of Clausius factor x orifice area, JANAF predictions for the pressure are 60 to 80% of the adjusted torsion values (2) and the discrepancy corresponds roughly to the ratios used in the adjustment. In contrast, the JANAF predictions agree closely with mass-effusion data of Ko et al. (4), who reported no significant affect from a twelvefold variation in orifice area.

Comparison of Calculated and Observed Total Pressures over AlF<sub>3</sub>(s)

Table with columns: T, °K; Range; Calc. Range; P<sub>calc</sub>/P<sub>obs</sub> Range; Difference<sup>a</sup> in dp/dT. Rows include Entrainment, Mass Spec., Mass Effusion, Torsion Effusion for various sources like Krause (1968), Naryshkin (1939), Erokhin (1967), Ko (1965), Blackburn (1965), Evasav (1959), Hildenbrand (1963), Witt (1959), Vetyukov (1959), Ruff (1934), Olbrich (1928), Hildenbrand (1961).

Heat Capacity and Entropy  
The molecular structure is that derived from electron-diffraction data by Akshin et al. (12). Observed vibrational frequencies are those reported by Büchler at al. (14) from infrared spectra of the vapor at 1000-1200°K. These frequencies are estimated by infrared spectra of AlF<sub>3</sub> isolated in matrices of neon, argon and krypton (15). The Raman-active fundamental ν<sub>1</sub> is confirmed as 650 ± 50 cm<sup>-1</sup> by three methods: (a) calculation of the force constant k<sub>1</sub> from ν<sub>3</sub> and ν<sub>4</sub>; (b) comparison of k<sub>1</sub>(XY<sub>2</sub>)/k(XY) for X = B, Al and V = F, Cl and Br; and (c) extrapolation of ν<sub>1</sub>(BY<sub>2</sub>)/ν<sub>1</sub>(AlY<sub>3</sub>) to Y = F from Y = Cl, Br and I, using recent gas-phase Raman data (16) for AlY<sub>3</sub>. Principal moments of inertia are I<sub>A</sub>=12.572x10<sup>-39</sup> and I<sub>B</sub>=25.14x10<sup>-39</sup> g cm<sup>2</sup>.

Heat of Formation

$\Delta H_f^\circ$  is based on  $\Delta H_f^\circ(298.15) = 69.36$  kcal/mol for the reaction  $Na_3AlF_6(c) + 2NaAlF_4(g) + 2NaF(c) + 2Na_2O(l) = 3NaAlF_4(g)$ .  $\Delta H_f^\circ$  is calculated by third law analysis of the pressure equation reported for this reaction by Sidorov and Kolesov (2). The second law  $\Delta H_f^\circ = 70.5$  kcal/mol and the entropy deviation is 1.1 gibbs/mol. Sidorov and Kolesov obtained their pressure equation by combination of the temperature variation of ion intensities with integration of intensities during total sublimation at 931°K (2). Sidorov et al. (2) concluded that the pressure of the dimer (NaAlF<sub>4</sub>)<sub>2</sub> at 931°K is almost half of the monomer pressure over the two-phase system Na<sub>3</sub>Al<sub>2</sub>F<sub>7</sub>-AlF<sub>3</sub>. In contrast, Büchler et al. (3) reported the approximate vapor composition of 97% monomer, 1% dimer, and 1% AlF<sub>3</sub> over the same condensed phases at 931°K. The latter composition was obtained from e mass spectrometric study by the twin crucible method. Vapor pressures over melts in the NaF-AlF<sub>3</sub> system have been measured by the entrainment and boiling point techniques (4,5). We have made no attempt to establish the liquid phase activities necessary for use of these data.

Heat Capacity and Entropy

The adopted structure (C<sub>3v</sub> symmetry) consists of tetrahedral AlF<sub>4</sub> combined with Na to form a planar ring, AlF<sub>2</sub>Na, through coordination with two fluorines. Experimental evidence available for NaAlF<sub>4</sub> and LiAlF<sub>4</sub> does not distinguish conclusively between this structure and the alternatives which have been seriously considered. Alternatives include a C<sub>s</sub> structure, in which the ring is non-planar, and two C<sub>2v</sub> structures, in which Na (or Li) is coordinated to one or three fluorines instead of two. Electron diffraction data (6) for the vapor gave the adopted bond distances and showed that the AlF<sub>4</sub> group is essentially tetrahedral. Wave error at small scattering angles precluded the calculation of accurate non-bonded distances for Na. Snelson (3) observed the infrared spectra of LiAlF<sub>4</sub> and NaAlF<sub>4</sub> isolated in matrices of neon and argon. Eight fundamentals were found above 200 cm<sup>-1</sup> for LiAlF<sub>4</sub> and six for NaAlF<sub>4</sub>. Snelson chose a C<sub>3v</sub> structure for LiAlF<sub>4</sub> on the basis of Redlich-Teller product-rule calculations for isotopic shifts due to Li.

Neither the infrared data nor the electron-diffraction data are conclusive so we apply these qualitative arguments. Coordination of Na to three fluorines seems less likely, since there are no known examples of this behavior. The C<sub>3v</sub> structure, as suggested by Büchler and Berkowitz-Mattuck (3), is likely because it is a hybrid between the accepted structures of Na<sub>2</sub>F<sub>2</sub> and Al<sub>2</sub>F<sub>6</sub>. C<sub>2v</sub> symmetry (σ = 2) is a compromise which has an entropy effect intermediate between the other alternatives. The principal moments of inertia of the C<sub>3v</sub> structure are I<sub>A</sub> = 24.025 × 10<sup>-39</sup> and I<sub>B</sub> = I<sub>C</sub> = 44.559 × 10<sup>-39</sup> g cm<sup>2</sup>. The fundamental vibrations of 800 and 890 cm<sup>-1</sup> are average values from gas phase (1D) and matrix (3) spectra. Four other observed values are from the matrix data. Six fundamentals are estimated by comparisons similar to those used for LiAlF<sub>4</sub> (g).

$\Delta H_f^o =$  Unknown

$\Delta H_f^o 298.15 = [-795 \pm 5] \text{ kcal. mole}^{-1}$

$\Delta H_m^o =$  Unknown

$S_{298.15}^o = [68.0 \pm 1.0] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

$T_m = 1293^\circ\text{K.}$

Heat of Formation.

The value of  $\Delta H_f^o 298.15$  adopted was calculated based upon  $\Delta H_m^o = -30.2 \text{ kcal. mole}^{-1}$  for the reaction,  $AlF_3(c) + 3KF(c) = K_3AlF_6(c)$ , which was estimated by comparison with the values of  $\Delta H_m^o$  of the similar reactions for  $Na_3AlF_6(c)$ ,  $Na_3AlCl_6(c)$  and  $K_3AlCl_6(c)$ .

Heat Capacity and Entropy.

Both  $C_p$  and  $S_{298.15}^o$  were estimated by the addition of a correction term,  $3(M_{K,F} - M_{Na,F})$ , to the corresponding values for  $Na_3AlF_6(c)$ , where M denotes either  $C_p$  or  $S_{298.15}^o$ .

Temperature of Melting.

$T_m$  was obtained from P. F. Hall and H. Inaley, J. Am. Ceram. Soc. 21, 113 (1938).

$S_{298.15}^{\circ} = 44.907 \pm 0.05$  gibbs/mol  
 $S_{298.15}^{\circ} = -805.6 \pm 1.1$  kcal/mol  
 $\Delta H_{298.15}^{\circ} = -808.7 \pm 1.1$  kcal/mol  
 $\Delta H_{T_1}^{\circ} = [0.5]$  kcal/mol  
 $\Delta H_{T_2}^{\circ} = [0.3]$  kcal/mol  
 $\Delta H_{T_3}^{\circ} = [0.1]$  kcal/mol  
 $\Delta H_m^{\circ} = 20.6 \pm 1.0$  kcal/mol

Heat of Formation

$\Delta H_f^{\circ}$  is derived from  $\Delta H_m^{\circ} = -5.4 \pm 0.5$  kcal/mol at 298.15 K for the reaction  $3 \text{LiF}(c) + \text{AlF}_3(c) + \text{Li}_2\text{AlF}_6(c, \beta \text{ mixture})$ .  
 Greens et al. (1) obtained this result by heating the fluorides under standardized conditions in a small electrical furnace contained in their calorimeter at 25°C.  $\Delta H_f^{\circ}$  includes a small endothermic effect observed during heating of the reaction product. The authors suggest that the enthalpy of conversion between the  $\alpha$ - and  $\beta$ -forms is small and thus their result should apply to both forms.

Heat Capacity and Entropy

Furukawa et al. (2) measured Cp (15-370 K) using a sample prepared by fusion of stoichiometric proportions of LiF and AlF<sub>3</sub> in graphite. X-ray diffraction and petrographic examination of separate portions of the sample indicated a single phase identified as  $\beta$ -Li<sub>3</sub>AlF<sub>6</sub>. The authors tabulated values of Cp\* and S\* based on their data and the extrapolation S<sub>15</sub><sup>0</sup> = 0.042 gibbs/mol. These values are adopted.

Douglas and Neuffer (3) reported relative enthalpy data (323-973 K) for part of the same sample used in measurement of Cp\* (2). Their study was made prior to discovery of the five crystalline phases, and their drop-calorimetric data reveal the transition near 748 K. Reinterpretation of the data above 748 K is complicated by the proximity of the furnace temperatures to the transition temperatures and by the tendency of high-temperature forms to revert to both  $\alpha$ - and  $\beta$ -forms under different conditions of cooling. Björge and Jensen (4) and Rolin et al. (5) also reported crystalline enthalpy data, but these are relatively imprecise and include similar uncertainties in the final data after the drop. These difficulties preclude the derivation of accurate heat capacities for the high-temperature forms.

Cp\* for the  $\beta$ -form is adopted from (2), since the two methods are in good agreement. The curve is extrapolated linearly above 748 K to obtain Cp\* for the high-temperature forms. Obvious differences in Cp\* are not apparent in the observed data for the different forms, so this should be an adequate approximation.

Transition Data

Existence of five polymorphic forms was shown by high-temperature X-ray diffraction (1, 2, 7) and differential thermal analysis (6, 7). Both  $\alpha$ - and  $\beta$ -forms persisted at room temperature, but the  $\alpha$ -form appeared only on quenching of high-temperature forms (1). The  $\alpha$ -form transformed to  $\beta$  near 490 K (1, 6), but the reverse transformation was not observed. Single-crystal X-ray diffraction showed the  $\alpha$ -form to be orthorhombic (6).

The adopted values of Tt are the lowest temperatures at which the high-temperature form was observed growing at the expense of the low-temperature form (1). DTA data (6, 7) were higher by roughly 30° for Tt<sub>1</sub> and 25° for Tt<sub>2</sub>. Combination of the observed enthalpies (3) with the adopted Cp\* yields  $\Delta H_{T_1}^{\circ} = 0.76$  and  $\Delta H_{T_2}^{\circ} = 0.03$  or 0.15 kcal/mol; however, we prefer to adopt  $\Delta H_{T_1}^{\circ}$  values (0.5 and 0.3 kcal/mol) which are more consistent with the areas of peaks in the DTA curve (7). Evidence suggests that  $\Delta H_{T_2}^{\circ}$  is small, so we estimate 0.1 kcal/mol.

Melting Data

See the table for the liquid.

AlF<sub>6</sub>Li<sub>3</sub>

(LIQUID)

GFW = 161.7889

ΔH<sub>f</sub><sup>298.15</sup> = -792.935 kcal/mol

ΔHm° = 20.6 ± 1.0 kcal/mol

S<sub>298.15</sub><sup>o</sup> = 58.758 gibbs/mol

T<sub>m</sub> = 1058 ± 3 K

**Heat of Formation**  
 ΔH<sub>f</sub><sup>298.15</sup> is calculated from that of the crystal by addition of ΔHm° and the difference of (H<sub>1058</sub><sup>o</sup>-H<sub>298.15</sub><sup>o</sup>) for the crystal and liquid.

**Heat Capacity and Entropy**

Relative enthalpy data were measured by Björge and Jensen (1) from 1065 to 1088 K and by Rolin et al. (2) from about 1075 to 1145 K. The data are consistent with liquid heat capacities in the range from roughly 82 to 92 gibbs/mol. We adopt the mean value of 86 gibbs/mol and extrapolate this to higher and lower temperatures. A glass transition is assumed at 700 K and Cp° at lower temperatures is taken to be the same as that of β-Li<sub>3</sub>AlF<sub>6</sub>. S<sub>298</sub><sup>o</sup> is calculated in a manner analogous to that of the heat of formation.

**Melting Data**

T<sub>m</sub> was observed at 780°C (3), 782°C (2, 4), 783°C (5, 8) and 785°C (1). The last and highest value is adopted for this table. Combination of the observed liquid enthalpies with the adopted crystal enthalpies yields values for ΔHm° of 19.7 kcal/mol (1), authors gave 20.2 ± 1.0 and 21.5 ± 0.3 kcal/mol (2, authors gave 21.5). We adopt the mean value of 20.6 kcal/mol which is confirmed by values of 20.7 (8), 20.8 (4), 22.2 (4), 20.1 (4) and 22.0 (2) derived from crystal-liquid phase data for binary systems. The agreement among values for ΔHm° seemingly excludes the possibility of large discrepancies in the enthalpies due to formation of the α-phase instead of β during drop-calorimetry from high temperatures.

**Vaporization Data**

Li<sub>3</sub>AlF<sub>6</sub> vaporizes mainly to LiAlF<sub>4</sub>(g) with small contributions from species such as Li<sub>2</sub>AlF<sub>5</sub>(g), Li<sub>2</sub>F<sub>2</sub>(g) and LiF(g) (5, 7).

The heats of solution of Al(c), NaCl(c), and Na<sub>3</sub>AlF<sub>6</sub>(c) in 4.36 M HCl acid solution were determined at 303.15°K by Coughlin (1). The enthalpy change for the reaction Al(c) + 2.96 NaCl(c) + 5.96 (HF·5.716 H<sub>2</sub>O) + 3.617 H<sub>2</sub>O(l) = Na<sub>2</sub>9AlF<sub>6</sub>96(c) + 2.96 (HCl·12.731 H<sub>2</sub>O) + 3/2 H<sub>2</sub>(g) was derived as ΔH<sub>298.15</sub> = -153.22 ± 0.14 kcal/mol. Using the ΔH<sub>298.15</sub> data on H<sub>2</sub>O(l), HCl and HF solution from (2, 3) and NaCl from JANAF Table (12), we calculate the value ΔH<sub>298.15</sub> = -791.2 ± 0.7 kcal/mol for Na<sub>3</sub>AlF<sub>6</sub>(c).

Baud (5) reported ΔH<sub>f</sub><sup>o</sup> = -40.7 kcal/mol for the reaction 2AlF<sub>3</sub>(c) + 6NaF(c) = 2Na<sub>3</sub>AlF<sub>6</sub>(c). Based on JANAF ΔH<sub>f</sub><sup>o</sup>298 values for AlF<sub>3</sub>(c) and NaF(c), we obtain ΔH<sub>f</sub><sup>o</sup>298(Na<sub>3</sub>AlF<sub>6</sub>, c) = -793.7 ± 2 kcal/mol.

Hoshovets and Yudin (6) determined the equilibrium constants in the temperature range 1101-1298°K for the reaction 2/3 Na<sub>3</sub>AlF<sub>6</sub>(c) + H<sub>2</sub>O(g) = 1/3 Al<sub>2</sub>O<sub>3</sub>(c) + 2HF(g) + 2NaF(c), using the transpiration method. Based on the reported Kp values, we evaluate ΔH<sub>298.15</sub> = 48.1 ± 0.8 and 46.6 kcal/mol by the second and third law methods, respectively. From the third law ΔH<sub>298.15</sub> value, we calculate ΔH<sub>f</sub><sup>o</sup>298(Na<sub>3</sub>AlF<sub>6</sub>, c) = -791.3 kcal/mol.

The equilibrium pressures of sodium vapor in the reaction 2NaF(c) + 1/3 Al(c) = Na(g) + 1/3 Na<sub>3</sub>AlF<sub>6</sub>(c) at temperatures 1020 - 1150°K were determined by Ono et al. (7), employing differential thermal analysis and X-ray analysis. Since the reported vapor pressures are the total pressures of Na(g) and Na<sub>2</sub>(g), we calculate the partial pressures of Na(g) by use of the equilibrium constants for the reaction Na<sub>2</sub>(g) = 2Na(g) derived from JANAF functions for Na<sub>2</sub>(g) and Na(g). Based on the calculated Na(g) pressures we evaluate the enthalpy change of the above reaction by the third law method to be 109.2 kcal/mol, yielding ΔH<sub>f</sub><sup>o</sup>298(Na<sub>3</sub>AlF<sub>6</sub>, c) = -791.1 kcal/mol.

The amounts of sodium over the mixtures of cryolite and aluminum were measured in the temperature range 1023 - 1373°K by the ultraviolet absorption method by Stokes and Frank (8). The enthalpy change for the reaction 6NaF(l) + Al(l) = 3Na(g) + Na<sub>3</sub>AlF<sub>6</sub>(l) is not evaluated due to lack of appropriate data on the activities of NaF(l) and Na<sub>3</sub>AlF<sub>6</sub>(l).

The heat of formation (298°K) for cryolite(c) is adopted as -791 ± 1 kcal/mol.

The low temperature heat capacities, 53.66 - 296.00°K, were measured by King (9). The values of Cp below 53.66°K are extrapolated using the Cp equation given by King. S<sub>298</sub> is derived based on the adopted low temperature heat capacities.

The high temperature enthalpies, 401.3 - 1370.5°K, determined by O'Brien and Kelley (10), are adopted to derive the heat capacities which join smoothly at 298°K with the low temperature Cp's. The heat capacity of Na<sub>3</sub>AlF<sub>6</sub>(l) is estimated such that the calculated enthalpy at 1200.5°K is consistent with the measured value reported by O'Brien and Kelley. The heat capacity above the melting point is obtained by linear extrapolation.

Frank (21) commented that the enthalpies reported by O'Brien and Kelley were incorrect due to an apparent error in temperature measurement. However, his reported corrected enthalpy values are not used here (see NaF(c) table for details). The high temperature enthalpies have also been measured by the following investigators: Joly, 284.5 - 373.3°K (11); Baud, 289 - 328°K (12); Roth and Bertram, 369 - 1371°K (13); Krestovnikov and Karetnikov, 573 - 1273°K (14); Lyshenko, 290 - 1217°K (15); and Albright, 350.0 - 1311.8°K (16). Their data are not used for evaluation due to inconsistencies among the reported values.

Transition Data  
Landon and Ubbelohde (17) determined the electrical conductance (σ) of crystals and melt of cryolite, and observed two transition temperatures from a plot of log σ vs 1/T, i.e. Tt(α + β) = 838°K and Tt(β + γ) = 1153°K, which are adopted here. Other values of Tt(α + β) reported are (°K): 823 (18), 833 (19), 834 (20), 835 (20), and 838 (13).

The values of ΔH<sup>o</sup>(α + β) and ΔH<sup>o</sup>(β + γ) are calculated as the difference between the adopted enthalpies for α and β at 838°K and β and γ at 1153°K, respectively. The value of ΔH<sup>o</sup>(α + β) has also been reported as (kcal/mol): 1.24 (13), 2.16 (10), 2.24 (20), and 2.38 (18). Landon and Ubbelohde (17) estimated that ΔH<sup>o</sup>(β + γ) = 0.01 x ΔHm = 0.2 kcal/mol.

The cause of the discrepancies among the reported values for Tt, ΔH<sup>o</sup> and the high temperature enthalpies may be due to differences in the sample composition.

Melting Data  
See the Na<sub>3</sub>AlF<sub>6</sub>(l) table for details.

**Heat of Formation**  
The ΔH<sub>f</sub><sup>298.15</sup>(l) is obtained from ΔH<sub>f</sub><sup>298.15</sup>(c) by adding ΔH<sub>m</sub><sup>0</sup> and the difference between H<sub>298.15</sub><sup>0</sup> - H<sub>298</sub><sup>0</sup> for crystal and liquid. Yudin and Mashovets (1) studied the dissociation of cryolite and reported K<sub>1300</sub> = 2.33x10<sup>-5</sup> for the reaction Na<sub>3</sub>AlF<sub>6</sub>(l) = 3NaF(l) + AlF<sub>3</sub>(c). Based on this K<sub>1300</sub> value, we evaluated the enthalpy change by the third law method as 24.3 kcal/mol. Using ΔH<sub>f</sub><sup>298</sup> = -360.8 and -130.6 kcal/mol for AlF<sub>3</sub>(c) and NaF(l), respectively, we obtain ΔH<sub>f</sub><sup>298</sup> = -776.7 ± 3 kcal/mol for Na<sub>3</sub>AlF<sub>6</sub>(l).

**Heat Capacity and Entropy**  
The high temperature enthalpies, 1285.5 - 1370.5°K, were measured by O'Brien and Kelley (2). Using their data we derive a constant Cp, 94.7 gibbs/mol, for Na<sub>3</sub>AlF<sub>6</sub>(l). A glass transition temperature is assumed at 800°K., and the heat capacities below 800°K are taken to be the same as those of the Na<sub>3</sub>AlF<sub>6</sub>(c). The Cp values above 1370.5°K are obtained by linear extrapolation. The entropy, S<sub>298</sub>, is calculated in a manner analogous to that of the heat of formation.

Albright (3) measured the high temperature enthalpies of Na<sub>3</sub>AlF<sub>6</sub>(l) in the temperature range 1298.1 - 1311.8°K. However, his data are systematically higher (about 4.9%) than the values determined by O'Brien and Kelley (2), which is also true for the other sets of enthalpy data measured using this calorimeter. Therefore Albright's enthalpy data is not used for evaluation.

**Melting Data**  
The melting point of cryolite has been reported as (°K): 1273 (4), 1279 (3), 1281 (5), 1282 (6, 7), 1293 (9), and 1300 (2). The value of T<sub>m</sub> adopted is that determined by Landon and Ubbelohde (8). This value is corrected from the original measured value 1286°K, due to the thermocouple standardization against the freezing points of assay gold giving a gold point of 1064.2 ± 0.15°K compared with the fixed value of 1063.0°K.

The value of ΔH<sub>m</sub><sup>0</sup> is calculated as the difference between the enthalpies at T<sub>m</sub> for crystal and liquid. Other reported values of ΔH<sub>m</sub><sup>0</sup> are (in kcal/mol): 16.64 (4), 26.6 (10), 27.64 (2), and 27.91 (3).

Heat of Formation

A. G. Gaydon, "Dissociation Energies", 2nd Ed., Chapman Hall, Ltd., London (1953), extrapolated the available  $X^2\Sigma$  vibrational levels and also considered predissociation in the  $A^1\Pi$  state and concluded that the best value of  $D_0^\circ$  was  $2.9 \pm 0.2$  e.v. The linear Birge-Sponer extrapolation gave a value of 3.05 e.v. while the predissociation limit was 3.07 e.v. Gaydon's recommended value is adopted here and leads to a value of  $\Delta H_f^\circ = 62.16 \pm 5.0$  kcal mole $^{-1}$  using JANAF auxiliary data.

Heat Capacity and Entropy

P. B. Zeeman and G. J. Ritter, Can. J. Phys. **32**, 555 (1954) examined the UV band system of AIH under high resolution and reported the molecular constants adopted above.

Heat of Formation.

The heat of formation was estimated by summing the constituent bond energies. The Al-O was taken as that in AlO(g) and the Al-H bond was taken as that in AlH(g), this gave a heat of atomization of 182 kcal.

Heat Capacity and Entropy.

Vibrational frequencies, bond lengths and angles and point group were taken from National Bureau of Standards Report 6297, Jan. 1, 1959, "Preliminary Report on the Thermodynamic Properties of Lithium, Beryllium, Magnesium, Aluminum, and Their Compounds with Oxygen, Hydrogen, Fluorine, and Chlorine".

Heat of Formation

From a mass-spectrometric investigation of the equilibrium

M. Farber et al. (1) report second law heats of reaction of 56.7 ± 0.6 kcal at 1900°K, 57.1 ± 2.8 kcal at 2060°K and 62.7 ± 1.4 kcal at 2000°K. Using JANAF auxiliary data, assuming AlOD to be AlOH, we obtain ΔHf°<sub>298</sub>(AlOD, g) = -44.6 ± 1, -44.0 ± 3.2 and -38.6 ± 1.8 kcal/mol. A second equilibrium in the same investigation was

Al<sub>2</sub>O(g) + D<sub>2</sub>O(g) = 2AlOD(g)

for which second law heats of reaction of 6.3 ± 2.1 kcal at 2060°K and 5.7 ± 0.8 kcal at 2000°K were reported. Farber et al. also measured the heat of reaction

at the same temperatures as -10.7 ± 2.8 kcal at 2060° and -10.3 ± 10.2 kcal at 2000°K. Combining these reactions and eliminating Al<sub>2</sub>O(g) yields ΔHr°<sub>2060</sub> = -4.4 ± 5.0 kcal and ΔHr°<sub>2000</sub> = -5 ± 11 kcal for the reaction

Using auxiliary JANAF values for Al<sub>2</sub>O<sub>3</sub>(c) and Al(g), ΔHf°<sub>298</sub>(D<sub>2</sub>O, g) = -69.56 kcal/mol (2), and functions for D<sub>2</sub>O(g) from Friedman and Haar (3) we obtain ΔHf°<sub>298</sub>(AlOD, g) = -43.9 ± 6 kcal/mol and -43.4 ± 3 kcal/mol. From all the above results we adopt a value of ΔHf°<sub>298</sub>(AlOD, g) = -44 ± 3 kcal/mol, assuming that AlOH is less stable than AlOD by 1 kcal/mol as is the case for H<sub>2</sub>O, HDO and D<sub>2</sub>O. We obtain ΔHf°<sub>298</sub>(AlOH, g) = -43 ± 3 kcal/mol.

Farber et al. (1) also performed weight loss experiments under molecular flow conditions by allowing hydrogen to flow over Al<sub>2</sub>O<sub>3</sub>(c). The products assumed were AlOH(g), Al(g), Al<sub>2</sub>O(g), H(g) and H<sub>2</sub>O(g) and the equilibrium amounts of H(g), Al(g) and Al<sub>2</sub>O(g) were assumed to be those predicted by the free energies from the JANAF tables. A 3rd law analysis of the equilibrium constants given by Farber for the reaction 2H<sub>2</sub>(g) + Al<sub>2</sub>O<sub>3</sub>(c) = 2AlOH(g) + H<sub>2</sub>O(g) yields ΔHr°<sub>298</sub> = 238 ± 12 kcal/mol and ΔHf°<sub>298</sub>(AlOH, g) = -52 ± 6 kcal/mol. However, the assumed equilibria involving Al<sub>2</sub>O(g) and Al(g) may be significantly in error and thus the ΔHf°<sub>298</sub> should be considered as simply confirming the magnitude determined mass-spectrometrically.

Heat Capacity and Entropy

The vibrational frequencies are estimated by using the AlO(g) fundamental as approximately the Al-O stretch; the O-H stretch is that in H<sub>2</sub>O(g); and the bending frequency is approximately the OH bend in CD<sub>3</sub>OH(g) reported by T. Shimanouchi, U. S. Natl. Bur. Std. NBS-RS-NBS 6, 1967.

The AlO bond length was taken from U. S. Natl. Bur. Std. Report No. 6297, Jan. 1, 1959, and the OH bond length is assumed to be that in H<sub>2</sub>O(g). The bond angle is assumed to be 180° using the prediction of A. D. Walsh, J. Chem. Soc. 1953, 2288 (1953), for "HAB" molecules with less than 11 valence electrons. Confirmation of this prediction is scanty for molecules having A more electronegative than B; however, R. L. Kuczkowski, D. R. Lide, Jr., and L. C. Krisher, J. Chem. Phys. 44, 3131 (1966), have confirmed the linearity of KOH and CaOH which have 8 valence electrons.

Heat of Formation  
The heat of formation is obtained from ΔHf°<sub>298</sub>(AlOH, g) and its ionization potential, which is estimated to be 7.5 ± 1 eV (173 ± 23 kcal). The ionization potential is estimated from a reported value of 7.5 eV for the appearance potential of AlOH<sup>+</sup>, presumably from the parent AlOH, by M. Farber, M. A. Frisch, G. Grenier, and H. C. Ko, Space Sciences, Inc., Final Report under USAF contract F04611-67-C-0010, AFRPL-TR-67-244, November, 1967.

Heat Capacity and Entropy  
According to the correlation diagram given by A. D. Walsh, J. Chem. Soc. 1953, 2286 (1953), for "HAg" molecules, a compound with 9 valence electrons would have the three outermost electrons in an unfilled π orbital. Thus, it would be a <sup>2</sup>Π state since the molecule ought to be linear if it has less than 11 valence electrons. The outermost orbital is a bonding orbital and thus the loss of an electron from it would weaken the bonding. The vibrational frequencies are estimated from those for AlOH(g) with somewhat lower frequencies due to the weaker bonding. Similarly, the Al-O bond length is slightly increased over that in AlOH(g). The enthalpy at 0°K is -2.138 kcal/mol.

Heat of Formation

The heat of formation is obtained from  $\Delta H_f^{\circ}(\text{AlOH}, g)$  and its electron affinity, which is estimated to be  $0.5 \pm 0.9 \text{ eV}$  ( $12 \pm 20 \text{ kcal}$ ). The electron affinity is estimated to be small, or even negative, since the additional electron must go into an antibonding orbital, according to the correlation diagram of A. D. Walsh, J. Chem. Soc. 1953, 2288 (1953).

Heat Capacity and Entropy

Since the molecule now has 11 valence electrons, the Walsh correlation diagram predicts a bent molecule. The extra electron is antibonding thus making the bonds weaker than in AlOH(g). Thus the vibrational frequencies and bond lengths are taken to be the same as in AlOH<sup>-</sup>(g), which is also less strongly bound than AlOH(g). The bond angle is arbitrarily chosen as 120°. The principal moments of inertia are  $I_A = 6.536 \times 10^{-39} \text{ g cm}^2$ ,  $I_B = 0.105 \times 10^{-39} \text{ g cm}^2$  and  $I_C = 6.641 \times 10^{-39} \text{ g cm}^2$ . The enthalpy at 0 K is -2.419 kcal/mol.

Dec. 31, 1967

GFW = 59.98827

(IDEAL GAS)

ALUMINUM DIOXYHYDRIDE (AlO<sub>2</sub>H)

Point Group [C<sub>s</sub>]

S<sub>298.15</sub> [60.6 ± 1.5] gibbs/mol

Ground State Quantum Weight = 1

Aluminum Dioxide (AlO<sub>2</sub>)

GFW = 59.98827

(Ideal Gas)

Bond Distances: Al-O = [1.62] Å Al-O = [1.87] Å O-H = [0.94] Å  
 Bond Angles: O-Al-O = [180°] Al-O-H = [105°]  $\sigma = 1$   
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [37.349 × 10<sup>-117</sup>] g<sup>3</sup> cm<sup>6</sup>

Heat of Formation

The hydroxyl group can often be considered as intermediate between F and Cl as is illustrated by the following examples of bond energies from these tables.  
 D(F-H) = 136 kcal, D(Cl-H) = 103 kcal and D(HO-H) = 119 kcal; also  
 D(F-BO) = 163 kcal, D(Cl-BO) = 105 kcal and D(HO-BO) = 143 kcal. Thus from  
 D(F-AlO) = 181 kcal and D(Cl-AlO) = 134 kcal we estimate D(HO-AlO) = 158 ± 20 kcal. This yields ΔH<sub>f,298</sub><sup>o</sup>(HOAlO, g) = -127 ± 20 kcal/mol.

Consider also D(FB-O) = 175 kcal and D(ClB-O) = 169 kcal; and D(FAl-O) = 138 kcal and D(ClAl-O) = 132 kcal; it is evident that the substituent F or Cl has little effect on the B-O and Al-O bonds. Thus, we assume that D(HOAl-O) = 135 ± 10 kcal/mol which leads to ΔH<sub>f,298</sub><sup>o</sup>(HOAlO, g) = -119 ± 10 kcal/mol.  
 M. Farber, M. A. Frisch, G. Grenier, and H. C. Ko, "Investigation of the Thermodynamic Properties of Rocket Combustion Products," AFRLP-TR-67-244, Nov. 1967, found no evidence for the ion DOAlO<sup>+</sup> when reacting D<sub>2</sub>O(g) + Al<sub>2</sub>O<sub>3</sub>(c). From estimates of the pressure needed to ensure detection of DOAlO and a knowledge of the D<sub>2</sub>O pressure, they calculated the most negative value of ΔH<sub>f,298</sub><sup>o</sup>(HOAlO, g) = -104 ± 10 kcal/mol. The absence of DOAlO<sup>+</sup> may be caused by fragmentation by the ionizing electrons and thus the value quoted may not be a real limit.  
 We adopt ΔH<sub>f,298</sub><sup>o</sup>(HOAlO, g) = -110 ± 15 kcal/mol which encompasses all the values.

Heat Capacity and Entropy

Vibrational frequencies, bond distances, bond angles, and the product of the moments of inertia were taken from "Preliminary Report on the Thermodynamic Properties of Lithium, Beryllium, Magnesium, Aluminum, and Their Compounds with Oxygen, Hydrogen, Fluorine, and Chlorine," National Bureau of Standards Report No. 6297, January 1, 1959. The individual moments of inertia are: I<sub>A</sub> = 0.13 × 10<sup>-39</sup> g cm<sup>2</sup>, I<sub>B</sub> = 16.9 × 10<sup>-39</sup> g cm<sup>2</sup>, and I<sub>C</sub> = 17.0 × 10<sup>-39</sup> g cm<sup>2</sup>.

LITHIUM TETRAHYDROALUMINATE (LiAlH<sub>4</sub>) (CRYSTAL)

MOL. WT. = 37.952

ΔF°<sub>0</sub> = Unknown

ΔH°<sub>f</sub> 298.15 = -28.0 ± 2.0 kcal. mole<sup>-1</sup>

S°<sub>298.15</sub> = [21.0 ± 2.0]

T<sub>d</sub> = [410 ± 10]\*K.

**Heat of Formation.**

The heats of solution of LiAlH<sub>4</sub>(c) in HCl(aq.) were measured calorimetrically by the following investigators: W. D. Davis, L. S. Mason and G. Stegeman, J. Am. Chem. Soc. 71, 4775 (1949), L. G. Fiesolini, et al., "Heat of Formation of Lithium Aluminum Hydride," Special Report, National Research Corporation, Md., April 26, 1963, and M. B. Smith and G. E. Bess, Jr., J. Chem. Eng. Data, 6, 342 (1963). The results are given in the following table.

- Investigator
- Chemical Reaction
- Davis, et al.
- (1) LiAlH<sub>4</sub>(c) + 10(HCl·50H<sub>2</sub>O) → (LiCl + AlCl<sub>3</sub> + 6HCl)·500H<sub>2</sub>O + 4H<sub>2</sub>(g) -165.87
  - (2) (AlCl<sub>3</sub> + LiCl + 6HCl)·500 H<sub>2</sub>O + 41020 H<sub>2</sub>O(l) → (AlCl<sub>3</sub> + LiCl + 6HCl)·41520 H<sub>2</sub>O -4.43
  - (3) (AlCl<sub>3</sub> + LiCl + 6HCl)·41520 H<sub>2</sub>O → AlCl<sub>3</sub>·5130 H<sub>2</sub>O + LiCl·5130 H<sub>2</sub>O + 6(HCl·5130 H<sub>2</sub>O) 0.00(assumed)

- Fiesolini, et al.
- (4) Al + 60(HCl·1.4H<sub>2</sub>O) → (AlCl<sub>3</sub> + 57 HCl)·840 H<sub>2</sub>O + 3/2 H<sub>2</sub> -128.14
  - (5) Li + 80(HCl·1.4H<sub>2</sub>O) → (LiCl + 59 HCl)·840 H<sub>2</sub>O + 1/2 H<sub>2</sub> -87.05
  - (6) LiAlH<sub>4</sub> + 60(HCl·1.4 H<sub>2</sub>O) → (LiCl + AlCl<sub>3</sub> + 56 HCl)·840 H<sub>2</sub>O + 4H<sub>2</sub> -170.52
  - (4) + (5) - (6) -24.67

- Smith and Bess
- (7) LiAlH<sub>4</sub>(c) + 39.715(HCl·11.624 H<sub>2</sub>O) → [LiCl + AlCl<sub>3</sub> + 35.715 (HCl·12.926 H<sub>2</sub>O)] + 4H<sub>2</sub>(g) -164.6
  - (8) LiCl(c) + [AlCl<sub>3</sub> + 35.715(HCl·12.926 H<sub>2</sub>O)] → [LiCl + AlCl<sub>3</sub> + 35.715 (HCl·12.926 H<sub>2</sub>O)] -6.75
  - (7) - (8) -157.85

Incorporating appropriate auxiliary thermal data, the heats of formation (ΔH°<sub>f</sub> 298.15) for LiAlH<sub>4</sub>(c) were derived as -28.51 (recalculated value, by Smith and Bess, loc. cit.), -24.67 ± 1.31 and -28.4 ± 1.5 kcal. mole<sup>-1</sup>, resp. The adopted value, -28.0 ± 2.0 kcal. mole<sup>-1</sup>, is the weighted average of the above three values.

**Heat Capacity and Entropy.**

Heat capacities were estimated by comparison with those for LiBH<sub>4</sub>(c), LiBO<sub>2</sub>(c) and LiAlO<sub>2</sub>(c). The entropy value (S°<sub>298.15</sub>) was calculated from that for LiBH<sub>4</sub>(c) by the substitution of the entropy contribution of B atom by that of Al atom in the LiAlH<sub>4</sub>(c) molecule. The entropy values of the constituent B and Al atoms in crystalline compounds were taken from O. Kubaschewski and E. L. Evans, "Metallurgical Thermochemistry," Pergamon Press, New York, 1958.

**Temperature of Decomposition.**

T<sub>d</sub> was reported by A. E. Finholt, A. C. Bond, Jr. and H. I. Schlesinger, J. Am. Chem. Soc. 69, 1199 (1947). The decomposition products are aluminum, hydrogen, and lithium hydride. This reaction is apparently kinetically controlled since the free energy for the decomposition is negative even at room temperature.

MOL. WT. = 153.89

(IDEAL GAS)

ALUMINUM MONIODOIDE (AlI)

Ground State Configuration  $1\Sigma^+$

$S^{\circ}_{298.15} = [59.243] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$

$S^{\circ}_{298.15} = 14.6 \pm 2.0 \text{ kcal. mole}^{-1}$

Electronic Levels and Quantum Weight

$$\frac{\sum g_i}{0} \frac{e_i}{1}$$

$\omega_e x_e = 1.0 \text{ cm.}^{-1}$

$\alpha_e = [0.1156] \text{ cm.}^{-1}$

$r_e = [2.56] \text{ \AA}$

$\sigma = 1$

Heat of Formation.

The dissociation energy ( $D_0$ ) of AlI( $\Sigma$ ) was reported by A. G. Gaydon<sup>1</sup>, R. F. Barrow<sup>2</sup>, and G. Herzberg<sup>3</sup>, respectively. Hence the corresponding values of  $\Delta H^{\circ}_{298.15}$  for AlI( $\Sigma$ ) were derived. The results are given as follows.

| Investigator          | e.v. | $D_0$ | $\Delta H^{\circ}_{298.15}$ |
|-----------------------|------|-------|-----------------------------|
| Gaydon <sup>1</sup>   | 3.92 | 90.4  | 12.7                        |
| Barrow <sup>2</sup>   | —    | 87.0  | 16.0                        |
| Herzberg <sup>3</sup> | 2.9  | 66.9  | 36.2                        |

<sup>1</sup> A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules", Chapman and Hall Ltd., London, 1953.

<sup>2</sup> R. F. Barrow, Trans. Faraday Soc. 56, 952 (1960).

<sup>3</sup> G. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Company, Inc., New York, 1950.

The adopted value of  $\Delta H^{\circ}_{298.15}$  for AlI( $\Sigma$ ) is the average of the first two  $\Delta H^{\circ}_{298.15}$  values listed in the above table.

Heat Capacity and Entropy.

The spectroscopic constants,  $\omega_e$  and  $\omega_e x_e$ , and ground state configuration were taken from G. Herzberg, loc. cit. The values of  $B_e$  and  $\alpha_e$  were estimated. The bond length ( $r_e$ ) was estimated by comparison with those for Al<sub>2</sub>I<sub>6</sub>(g) reported by K. J. Palmer and N. Elliott, J. Am. Chem. Soc. 50, 1852 (1938).

Dec. 31, 1961; June 30, 1964

ALUMINUM TRIIODIDE (AlI<sub>3</sub>) (CRYSTAL) MOL. WT. = 407.71

ΔH<sub>f</sub><sup>o</sup> = Unknown  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -73.9 ± 1.5 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = 3.8 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 (to dimer) = 28.8 ± 1.8 kcal. mole<sup>-1</sup>

S<sup>o</sup> 298.15 = [45.3 ± 2.0] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 484.15°K.

Heat of Formation.

J. D. Corbett and N. W. Gregory, J. Am. Chem. Soc. 76, 1446 (1954) reported the free energy change, ΔF<sub>f</sub><sup>o</sup> 298.15 = -8.7 ± 0.2 kcal. mole<sup>-1</sup>, for the reaction AlI<sub>3</sub>(c) + 3HCl(g) → AlCl<sub>3</sub>(c) + 3HI(g). By the relationship ΔH = ΔF + TΔS the value of ΔH<sub>f</sub><sup>o</sup> 298.15 was derived as -10.1 ± 0.2 kcal. mole<sup>-1</sup>. The heat of formation (ΔH<sub>f</sub><sup>o</sup> 298.15) for AlI<sub>3</sub>(c) was evaluated to be -73.86 ± 0.30 kcal. mole<sup>-1</sup>. The heat of solution of AlI<sub>3</sub>(c) in water was measured by D. J. A. Dear and D. D. Eley, J. Chem. Soc., 4684 (1954). From the value, ΔH<sub>f</sub><sup>o</sup> 298.15 = -91.4 ± 1.5 kcal. mole<sup>-1</sup> for the reaction AlI<sub>3</sub>(c) → Al<sup>3+</sup>(aq.) + 3I<sup>-</sup>(aq.), the heat of formation for AlI<sub>3</sub>(c) was calculated to be -74.1 ± 1.5 kcal. mole<sup>-1</sup>. The adopted value of ΔH<sub>f</sub><sup>o</sup> 298.15 for AlI<sub>3</sub>(c) is the average of the above two values.

Heat Capacity and Entropy.

The heat capacities, 298.15-464°K., were taken from K. K. Kelley, U. S. Bur. Mines Bull. 584 (1960). They were derived from the enthalpy data measured by W. Fischer, Z. anorg. Chem. 200, 332 (1931). Above 464°K. the C<sub>p</sub> values were obtained by graphical extrapolation. The entropy, S<sub>298.15</sub><sup>o</sup> for AlI<sub>3</sub>(c) was calculated from S<sub>298.15</sub><sup>o</sup> for AlI<sub>3</sub>(l) by subtracting ΔS<sub>m</sub><sup>o</sup> and the difference between S<sub>298.15</sub><sup>o</sup> for crystal and liquid.

Melting Data.

Temperature and heat of melting were reported by W. Fischer, loc. cit.

Heat of Sublimation.

Heat of sublimation was calculated from vapor pressure data reported by W. Fischer, O. Rahlfs, and B. Benze, Z. anorg. allgem. Chemie, 205, 1 (1932), by both the second and third law methods. See Al<sub>2</sub>I<sub>6</sub>(g) table for details.

Aluminum Triiodide (AlI<sub>3</sub>)

ALUMINUM TRIIODIDE (AlI<sub>3</sub>)

(LIQUID)

MOL. WT. = 407.71

$$S_{298.15}^o = [52.45] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$\Delta H_f^o 298.15 = -70.777 \pm 1.5 \text{ kcal. mole}^{-1}$$

$$\Delta H_m^o = 3.8 \text{ kcal. mole}^{-1}$$

$$T_m = 464.15^\circ \text{K.}$$

Heat of Formation.

$\Delta H_f^o 298.15(1)$  was obtained from  $\Delta H_f^o 298.15(c)$  by adding  $\Delta H_m^o$  and the difference between  $H_{464.15}^o$  and  $H_{298.15}^o$  for crystal and liquid.

Heat Capacity and Entropy.

The heat capacity, 464-500°K., was obtained from K. K. Kelley, U. S. Bur. Mines Bull. 584 (1960). It was derived based on the enthalpy data measured by W. Fischer, Z. anorg. Chem. 200, 332 (1931). The  $C_p$  values above 500°K. were assumed to be the same as that at 500°K. The entropy,  $S_{298.15}^o$ , was estimated so that the value of  $\Delta H_f^o$  calculated from vapor pressure data by the second and third law methods were in reasonable agreement.

Melting Data.

$T_m$  and  $\Delta H_m^o$  were reported by W. Fischer, loc. cit.

Bond Distance: Al-I = 2.44 ± 0.02 Å  
 Bond Angle: I-Al-I = [120]°K.

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.33213 X 10<sup>-110</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The equilibrium pressures of the reaction Al<sub>2</sub>I<sub>6</sub>(g) → 2AlI<sub>3</sub>(g) at several temperatures were determined by H. Fischer, O. Rehlfis and B. Benz, Z. anorg. allgem. Chem. 205, 1 (1932). The heats of dissociation of Al<sub>2</sub>I<sub>6</sub>(g) were calculated by both second and third law methods. The heats of vaporization, i.e. AlI<sub>3</sub>(l) → AlI<sub>3</sub>(g), were also evaluated using the calculated partial pressure of AlI<sub>3</sub>(g) over AlI<sub>3</sub>(l). See AlI<sub>3</sub>(g) table for detail. The results obtained are summarized as follows:

| Chemical Reaction or Process                               | Temperature Range (°K.) | Second Law Value | Third Law Value | ΔH <sub>f</sub> <sup>0</sup> 298.15 (AlI <sub>3</sub> , g) Kcal. Mole <sup>-1</sup> |
|--|-------------------------|------------------|-----------------|---|
| Al <sub>2</sub> I <sub>6</sub> (g) → 2AlI <sub>3</sub> (g) | 614 - 744               | 25.18            | 23.34           | -47.9   |
| Al <sub>2</sub> I <sub>6</sub> (l) → 2AlI <sub>3</sub> (g) | 482.8 - 578.0           | 23.07            | 23.34           | -49.0   |
| AlI <sub>3</sub> (l) → AlI <sub>3</sub> (g)                | 493.8 - 645.2           | 21.45            | 22.69           | -49.2   |

The three ΔH<sub>f</sub><sup>0</sup> 298.15 (AlI<sub>3</sub>, g) values were calculated using the respective second law values of ΔH<sub>f</sub><sup>0</sup> 298.15. The adopted value, ΔH<sub>f</sub><sup>0</sup> 298.15 = -49.0 ± 1.6 kcal. mole<sup>-1</sup>, is the weighted average of the above three values.

Heat Capacity and Entropy.

The molecular structure, bond distances and angle were obtained from P. A. Akhshin, N. G. Rambidi, and E. L. Zheorin, Kristallografiya, 4, 166 (1959). The vibrational frequencies were estimated such that the value of ΔH<sub>f</sub><sup>0</sup> obtained by the third law method are in reasonable agreement with the corresponding values calculated by the second law method. The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 1.8815 X 10<sup>-37</sup> and I<sub>C</sub> = 3.7630 X 10<sup>-37</sup> g. cm.<sup>2</sup>.

ΔH<sub>f</sub>° = -282.78 kcal. mole<sup>-1</sup>  
S<sub>298.15</sub>° = 12.75 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
ΔH<sub>m</sub>° = [6000] cal. mole<sup>-1</sup>

ΔH<sub>f</sub>° = -282.78 kcal. mole<sup>-1</sup>  
T<sub>m</sub> = 1663°K

Heat of Formation.

ΔH<sub>f</sub> 298.15 was measured by J. P. Coughlin, J. Am. Chem. Soc. **79**, 2397 (1957).

Heat Capacity and Extrapolation.

Thermodynamic functions are based on the low temperature heat capacity data of E. O. King, J. Am. Chem. Soc. **77**, 3189 (1955), and on the high temperature heat content results of A. O. Christensen, K. O. Conway, and K. K. Kelley, U. S. Bur. Mines Rept. Invest. **5565** (1960).

Melting.

R. Ballo and E. Dittler, Z. anorg. u. allgem. Chem. **76**, 39 (1912), list the melting point as between 1900° to 2000°K. More recently, K. H. Kim and P. A. Hummel, J. Am. Ceram. Soc. **43**, 611 (1960), determined the melting point as 1883° ± 15°K. by rapidly heating a small sample on a Pt-Rh strip furnace. The value, which was used in this report, was derived from an average of ten measurements by Kim and Hummel.

H. Prophet, The Dow Chemical Company, private communication March 9, 1961, using an arc-omega furnace reports the melting point to be about 1875°K. After seven successive runs on the same sample the melting point approached that of Al<sub>2</sub>O<sub>3</sub> at 2308°K. This sample, therefore, is decomposed upon fusion to Li<sub>2</sub>O vapor and Al<sub>2</sub>O<sub>3</sub>(c). See O. N. Salmon and L. Marcus J. Am. Ceram. Soc. **43**, 549 (1960), and P. A. Hummel, B. S. R. Sastri and D. Wstring, *Ibid.*, **41**, 88 (1958).

ΔH<sub>f</sub><sup>0</sup> = -74.8 ± 0.3 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>0</sup> 298.15 = -76.0 ± 0.3 kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub><sup>0</sup> = 4.816 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>D</sub> = [2790°K]

Heat of Formation.

The selected heat of formation is the average of two independent calorimetric determinations. The heat of formation was reported to be -76.5 ± 0.2 kcal. mole<sup>-1</sup> and -75.6 ± 0.4 kcal. mole<sup>-1</sup>. The former value was reported by C. A. Neugebauer and J. L. Margrave, Z. Anorg. Allgem. Chem. 230, 82 (1957). The latter value was reported by A. D. Mah, E. G. King, W. W. Weller, and A. V. Christensen, U. S. Bureau of Mines Report of Investigations 5716 (1961).

Vapor pressure measurements agree with the selected heat of formation. For instance ΔH<sub>f</sub><sup>0</sup> 298.15 = -75.5 kcal. mole<sup>-1</sup> for AlN(c) was calculated from the heat for the reaction 2AlN(c) → 2Al(g) + N<sub>2</sub>(g) and the heat of sublimation, 78.0 kcal. mole<sup>-1</sup>, for Al(c). This heat of reaction was obtained from a third law calculation using JANAF values for the free energy functions and torsion effusion pressures measured by D. L. Hildenbrand and L. P. Theard, Aeronutronic Technical Report U-1497 (1961). Vapor pressure measurements with a microbalance in a vacuum system by L. H. Dreger, V. V. Dedape, and J. L. Margrave, J. Phys. Chem. 66, 1556 (1962) agree with the selected ΔH<sub>f</sub><sup>0</sup> 298.15. When recalculated with the sublimation coefficient (G = 2.2 × 10<sup>-5</sup>) reported by Hildenbrand and Theard, some of the Knudsen cell measurements by M. Hoch and D. White, "The Vaporization of Boron Nitride and Aluminum Nitride," ASTIA Unclassified Report 142616, October 29, 1956, agree with the selected heat of formation.

Earlier determinations of the heat of formation which apparently are in error are summarized by C. A. Neugebauer and J. L. Margrave (loc. cit.) and by L. H. Dreger et al. (loc. cit.).

Heat Capacity and Entropy.

The heat capacity and entropy were reported by A. D. Mah et al. (loc. cit.). They measured the low temperature (51-298.15°K) and high temperature (298.15-1800°K) heat capacities and extrapolated the heat capacity from 0 to 51°K using the T<sup>3</sup> law. A smooth extrapolation of the heat capacity was made from 1800° to 3000°K. The heat content of AlN(c) was recently determined from 300 to 1200°K by R. Mezaki, "Heat Contents of Inorganic Substances at High Temperatures," M. S. Thesis, University of Wisconsin (1961). The enthalpies reported by Mezaki are about 1% greater than those of Mah et al.

Decomposition Data.

P. O. Schissel and W. S. Williams, Bull. Am. Phys. Soc. II, 4, 139 (1959) studied the vaporization of AlN with the mass spectrometer and detected only the gaseous species Al and N<sub>2</sub>. The temperature at which the ΔH<sub>f</sub><sup>0</sup> of AlN(c) and Al(g) were equal, 2788.9°K, was taken as the temperature of decomposition.

| T, °K | Cp°   | S° - (Cp° - H° <sub>298</sub> )/T | H° - H° <sub>298</sub> | ΔHf°    | Log Kp   |

$$\frac{e^{-\epsilon_i / kT}}{\sum_j e^{-\epsilon_j / kT}} \frac{g_i}{g_j}$$

$$w_e X_e = [6.9] \text{ cm}^{-1} \quad \sigma = 1$$

$$B_e = [0.6748] \text{ cm}^{-1} \quad \alpha_e = [0.0064] \text{ cm}^{-1} \quad r_e = [1.65] \text{ \AA}$$

Heat of Formation

The heat of formation is calculated from the estimated  $w_e$  and  $w_{X_e}$ , using  $D_0 = w_e^2 / w_{X_e}$ , as 89 kcal/mol. J. L. Margrave and P. Stephenson, J. Phys. Chem., 59, 1231 (1955) estimated values of the bond length as 1.23 - 1.65 Å and calculated from an ionic model  $D_0$  values of 137 - 82 kcal/mol. Using an estimated bond length of 1.65 Å and a  $D_0 = 87$  kcal/mol leads to  $\Delta H_f^{\circ} = 104$  kcal/mol.

Heat Capacity and Entropy

The bond length is estimated as 1.65 Å from a comparison with the bond lengths of SO, PO, SiO, AlO, MgO, S<sub>2</sub>, SIS, AlS, PN, SiN, and the sums of covalent radii. This bond length is then used with Guggenheim's Relation [K. M. Guggenheim, Proc. Phys. Soc. (London), 59, 456 (1946)] to calculate a value for  $w_e$ . By analogy with SiN(g) it is taken to closely approach the multiple bonding case, which gives  $w_e = 960 \text{ cm}^{-1}$ . The anharmonicity correction  $X_e$  is calculated by assuming the product  $X_e \mu_e^{1/2}$  equal to that for AlO(g). The value of  $\alpha_e$  is calculated using the relation:

$$\alpha_e = 6[(w_e X_e B_e^3)^{1/2} - B_e^2] / w_e$$

 T<sub>m</sub> = above 1923°K.

Heat of Formation.

ΔH<sub>f</sub><sup>0</sup> 298.15 was reported by J. P. Coughlin, J. Am. Chem. Soc. 79, 2397 (1957). The value was calculated from the measured heat of solution of NaAlO<sub>2</sub>(c) at 303.15°K. in 4.36M hydrochloric acid solution.

Heat Capacity and Entropy.

The low temperature heat capacities, below 350°K., were measured by E. F. Westrum, University of Michigan, Ann Arbor, Michigan, private communication, May 19, 1960. Heat capacities above 350°K., 399.4 - 1698.6°K., were measured by A. U. Christensen, K. C. Conway, and K. K. Kelley, U. S. Bur. Mines Rept. Invest. 5565 (1960). These two sets of C<sub>p</sub> data were plotted graphically and joined smoothly at 350°K. Low temperature heat capacities S<sub>1</sub><sup>0</sup>-298°K., were also determined by E. G. King, J. Am. Chem. Soc. 77, 3189 (1955), which agree very well with those reported by E. F. Westrum, loc. cit. S<sub>298.15</sub> was reported by E. F. Westrum, loc. cit., using S<sub>1</sub><sup>0</sup>(extrap.) = 0.01 cal. deg<sup>-1</sup> mole<sup>-1</sup>.

Transition Data.

T<sub>m</sub> and ΔH<sub>f</sub><sup>0</sup> were obtained from A. U. Christensen, K. C. Conway, and K. K. Kelley, loc. cit.

Temperature of Melting.

T<sub>m</sub> was taken from K. Kammermeyer and A. B. Peck, J. Am. Ceram. Soc. 16, 363 (1933).

ΔHf° = 20 ± 4 kcal/mol

Heat of Formation

The vibrational quanta of the ground and first excited states can be linearly extrapolated to obtain approximate dissociation energies of 98.3 and 106.5 kcal/mol. Both these states can correlate with ground state atoms and we assume, with a high degree of confidence, that these are the products of the dissociation. Hildenbrand (1) has shown that improved values from ground state extrapolations can be obtained by correcting the extrapolation for the ionicity of the state. The corrected value is obtained from D<sub>0</sub> = D(linear extrapolation)(0.365(r<sub>e</sub><sup>2</sup>/r<sub>e</sub><sup>0.448</sup>) eV where r<sub>e</sub> = 1.44/(IP-EA) and IP-EA is the difference, in eV, between the ionization potential of the electropositive element and EA is the electron affinity of the more electronegative element. This approach yields a corrected value of 114.7 kcal for the ground state dissociation energy. The second and higher excited states all have extrapolations of the same magnitude as the ground state but involve excited products, thus, they do not add materially to the knowledge of the dissociation energy.

Drowart et al. (2) have determined the partial pressures of Al(g), O(g) and AlO(g) over Al<sub>2</sub>O<sub>3</sub> by mass-spectrometry in the temperature range 2000-2300°K. A similar experiment has also been reported by Efimko (3) over a mixture of Be and Al<sub>2</sub>O<sub>3</sub>. An analysis of this data for the reaction AlO(g) + Al(g) + O(g) by the 2nd and 3rd law methods is given below.

| Reference  | Points | Range °K  | ΔHf <sub>298</sub> , kcal/mol | 2nd law     | 3rd law     | Drift      | ΔHf <sub>298</sub> (AlO, g) |
|------------|--------|-----------|-------------------------------|-------------|-------------|------------|-----------------------------|
| 2. Mo cell | 15     | 2036-2466 | 114.7 ± 7.0                   | 114.7 ± 7.0 | 116.0 ± 2.6 | 0.4 ± 3.1  | 21.6                        |
| 2. W cell  | 15*    | 2188-2514 | 122.1 ± 5.0                   | 122.1 ± 5.0 | 114.7 ± 1.9 | -3.2 ± 2.2 | 22.9                        |
| 3. W cell  | 10*    | 1511-1743 | 68.4 ± 7.3                    | 68.4 ± 7.3  | 75.2 ± 1.9  | 3.7 ± 4.4  | 62.4                        |

\* 2 or 3 points rejected due to failure of a statistical test.

In addition Tyte (4) has obtained a value for the onset of continuous absorption, which he interprets as the dissociation of AlO, of 36630 cm<sup>-1</sup> or 104.73 kcal. However, McDonald and Innes (5) conclude that Tyte was seeing continuous absorption from the A<sup>2</sup>Π state, since bands of two systems terminating in this state were seen by Tyte. On this basis they conclude that the best value of the dissociation energy should be 41912 cm<sup>-1</sup> or 119.83 kcal/mol, which corresponds to ΔHf<sub>298</sub>(AlO, g) = 16.57 kcal/mol. Many other values have been reported for ΔHf<sub>298</sub>(AlO, g), including 9.3 kcal/mol (6), -0.7 kcal/mol (7), 48.7 kcal/mol (8) and 20.3 ± 3 kcal/mol (9).

The situation is not clearly resolved, and so a median value of D<sub>0</sub> = 116.3 ± 4 kcal is adopted which corresponds to ΔHf<sub>298</sub>(AlO, g) = 20 ± 4 kcal/mol.

Heat Capacity and Entropy

The thermodynamic functions were calculated by summing over the individual partition functions for the separate states. The ground and B state constants were obtained from Lagerqvist et al. (10), the A and E state constants from McDonald and Innes (5), quantities are obtained by comparison with other states and from combination of references (5) and (11) for ω<sub>e</sub> of the E state. Several other sets of data exist but are no longer considered significant to the analysis. References to them may be found in the adopted studies.

Heat of Formation

The ionization potential of AlO has been reported as  $9.5 \pm 0.5$  eV (219 kcal) by J. Drowart, G. DeMaria, R. P. Burns, and M. G. Inghram, J. Chem. Phys. **32**, 1366 (1960), and by G. DeMaria, J. Drowart and M. G. Inghram, J. Chem. Phys. **30**, 318 (1959). Using this value in conjunction with  $\Delta H_f^\circ(\text{AlO}, g) = 20 \pm 4$  kcal/mol, we obtain  $\Delta H_f^\circ(\text{AlO}^+, g) = 238 \pm 15$  kcal/mol.

Heat Capacity and Entropy

AlO<sup>+</sup> is isoelectronic with MgO and we estimated the electronic ground state and excited states by comparison with those for MgO as reported by H. G. Richards, G. Verhaegen and C. H. Moser, J. Chem. Phys. **45**, 3226 (1966). The bond length is estimated to be longer than that in AlO, since the dissociation energy of AlO<sup>+</sup> is less than that of AlO. The vibrational frequency and anharmonicity are estimated between those for MgO and AlO and the rotational constant,  $\alpha_e$ , is derived from the above quantities assuming a Morse potential function. The enthalpy at 0°K is  $-2.118$  kcal/mol.

Bond Distance: Al-O = [1.86] Å  
 Bond Angle: O-Al-O = [180]°  
 Rotational Constant: B<sub>0</sub> = [0.1912] cm<sup>-1</sup>

Heat of Formation

The OH bond strength in H<sub>2</sub>O is 119 kcal and in H<sub>2</sub>O<sub>2</sub> it is 118 kcal. Thus, it appears very reasonable to assume 118 kcal for the value in HOAlO. This assumption leads to ΔH<sub>f,298</sub><sup>o</sup>(AlO<sub>2</sub>, g) = -44 ± 20 kcal/mol, using the JANAF ΔH<sub>f,298</sub><sup>o</sup>(HOAlO, g) = -110 kcal/mol. This value is consistent with the independently estimated ΔH<sub>f,298</sub><sup>o</sup>(AlO<sub>2</sub>, g) = -130 ± 15 kcal/mol, since it yields an electron affinity for AlO<sub>2</sub> of 66 kcal in good agreement with the value 98 kcal for BO<sub>2</sub>.

Heat Capacity and Entropy

The electronic ground and excited states and molecular configuration are estimated to be similar to those for BO<sub>2</sub>. The AlO bond length is assumed to be equal to that in Al<sub>2</sub>O<sub>3</sub>. The vibrational frequencies are estimated from a valence force field treatment using k<sub>1</sub> from BO<sub>2</sub> modified by the ratio K(AlO)/K(BO) and using the same ratio of bending to stretch force constants as in BO<sub>2</sub>.

The adopted molecular configuration and electronic ground state are in accord with the predictions of A. D. Walsh, J. Chem. Soc. 1953, 2266 (1953).

GFW = 58.9809

Point Group [D<sub>2h</sub>]  
 S<sup>o</sup><sub>298,15</sub> = [55.5 + 2] Gibbs/mol  
 Ground State Quantum Weight = [1]

ΔH<sup>o</sup><sub>f</sub> = [-144.5 ± 15] kcal/mol  
 ΔH<sup>o</sup><sub>f,298,15</sub> = [-145 ± 15] kcal/mol

Vibrational Frequencies and Degeneracies  
 w<sub>i</sub>, cm<sup>-1</sup>  
 [800] (1)  
 [320] (2)  
 [1200] (1)

Bond Distance: Al-O = [1.66] Å  
 Bond Angle: O-Al-O = [180°]  
 Rotational Constant: B<sub>0</sub> = [0.1912] cm<sup>-1</sup>  
 σ = 2

Heat of Formation  
 The heat of formation of AlO<sub>2</sub><sup>-</sup> is estimated from the following considerations. The heats of the following reactions are calculated from the tables:

BO<sub>2</sub> + B<sup>-</sup> + 2O  
 CO<sub>2</sub> + C + 2O  
 BO<sub>2</sub> + B + O + O<sup>-</sup>  
 BOF + B + O + F  
 ΔH = 411 kcal  
 ΔH = 384 kcal  
 ΔH = 382 kcal  
 ΔH = 355 kcal

It is apparent that the heat of dissociation of BO<sub>2</sub><sup>-</sup> is closely predicted by use of the corresponding isoelectronic decomposition. Thus using

SiO<sub>2</sub> + Si + 2O  
 we predict AlO<sub>2</sub><sup>-</sup> + Al<sup>-</sup> + 2O  
 and using AlO<sub>2</sub><sup>-</sup> + Al + O + F  
 we predict AlO<sub>2</sub><sup>-</sup> + Al + O + O<sup>-</sup>

From these two reactions we estimate ΔH<sup>o</sup>(AlO<sub>2</sub><sup>-</sup>, g) = -158 and -135 kcal/mol and we adopt the value -145 ± 15 kcal/mol. From the value adopted for AlO<sub>2</sub>(g) we obtain an electron affinity of 4.38 eV (101 kcal) which is comparable to that for BO<sub>2</sub>(g).

Heat Capacity and Entropy  
 The configuration of the molecule is assumed to be linear using the correlations of Walsh, (1) for 16 electron XY<sub>2</sub> molecules; the ground state is assumed to be <sup>1</sup>Σ<sup>+</sup> from the same correlation diagrams. The bond length is taken to be that in Al<sub>2</sub>O and the vibrational frequencies are estimated between those for AlO<sub>2</sub> and SiO<sub>2</sub>.

The enthalpy at 0°K is -2.630 kcal/mol.

Dec. 31, 1960; Mar. 31, 1964

Round State Configuration  $\sum^+$   
 $\Delta H_f^0 = 48 \pm 20$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^0 = 55.09$  cal. deg. mole<sup>-1</sup>  
 $S_{298.15}^0 = 48 \pm 20$  kcal. mole<sup>-1</sup>

Electronic Levels and Quantum Weights

$$\frac{E_i, \text{ cm.}^{-1}}{0} \frac{g_i}{2}$$

$$\omega_e x_e = 3.33 \text{ cm.}^{-1} \quad \sigma = 1$$

$$E_e = 0.2799 \text{ cm.}^{-1} \quad r_e = 2.05 \text{ \AA}$$

Heat of Formation.

The dissociation energy of 4.1 e.v. was calculated by adding 1.7% to the dissociation energy obtained from a linear extrapolation of the vibrational levels, 3.5 e.v. This was done by analogy with the molecule AlO(g) whose observed  $D_0$  is 1.7% larger than the linear extrapolation. The adopted value of 4.1 e.v. corresponds to a heat of formation of 48 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The vibrational and rotational constants were reported by C. N. McKimney and K. K. Innes, J. Mol. Spect., 3, 235 (1959) from an analysis of 6 bands of the  $A_1^2 \Sigma^+ - X_2^2 \Sigma^+$  system.

ΔH<sub>f</sub><sup>°</sup> O = -541 ± 5 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>°</sup> 298.15 = -545 ± 5 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>°</sup> = [42] kcal. mole<sup>-1</sup>  
 S<sub>298.15</sub><sup>°</sup> = 15.84 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub><sup>°</sup> = 2143°K.

Heat of Formation.

W. A. Young, J. Phys. Chem. **64**, 1003 (1960) studied the equilibria

from his results one obtains ΔH<sub>f</sub><sup>°</sup> 1673 = -379 kcal. mole<sup>-1</sup>, which corresponds to ΔH<sub>f</sub><sup>°</sup> 298 = -545 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

G. T. Furawaka and W. O. Saba, and T. B. Douglas and W. H. Payne, National Bureau of Standards Report 8186, Jan. 1964 have measured the low temperature heat capacities and the high temperature enthalpy in the range 15 - 1173°K.

Melting Data.

The temperature of melting was taken from National Bureau of Standards Circular 500, Washington (1952).  
 The heat of melting was estimated as the sum of the ΔH<sub>f</sub><sup>°</sup> of the constituent oxides at 2100°K.

Point Group D<sub>2h</sub>

$\Delta H_f^\circ = -221.0 \pm 7 \text{ kcal/mol}$

$S_{298}^{298} = 130.8 \text{ gibbs/mol}$

$\Delta H_f^{298} = -231.5 \pm 7 \text{ kcal/mol}$

Ground State Quantum Weight = [1]

Bond Distances: Al-Br =  $2.21 \pm 0.4 \text{ \AA}$   
Al-Br<sub>2</sub>bridge =  $2.33 \pm 0.4 \text{ \AA}$

Bond Angles: Br-Al-Br =  $114^\circ 38'$   
Br-bridge-Al-Br<sub>2</sub>bridge =  $88^\circ 44'$

$\sigma = 4$

Product of the Moments of Inertia:  $I_A I_B I_C = 8.80123 \times 10^{-110} \text{ g}^3 \text{ cm}^6$

Heat of Formation

The vapor pressures of AlBr<sub>3</sub>(c) and AlBr<sub>3</sub>(l) have been measured by Dunne and Gregory (1) and Fischer et al. (2), respectively. Using these data, the heats of vaporization were calculated by both second and third law methods. The adopted value of  $\Delta H_f^{298}$  for Al<sub>2</sub>Br<sub>6</sub>(g) is  $-231.5 \pm 7 \text{ kcal/mol}$ . The results of these calculations are as follows with reaction (A) corresponding to  $2\text{AlBr}_3(\text{c}) = \text{Al}_2\text{Br}_6(\text{c})$  and reaction (B) corresponding to  $2\text{AlBr}_3(\text{l}) = \text{Al}_2\text{Br}_6(\text{g})$ :

\*\*Calculation based on third law  $\Delta H_f^{298}$

\*\*One point rejected due to failure of a statistical test.

Heat Capacity and Entropy

The molecular structure, bond distances and angles were obtained from the electron diffraction work of Palmer and Elliott (3). The bond distances and angles have also been reported by Akishin et al. (4), and these values are in good agreement with those given by Palmer and Elliott (3). The principal moments of inertia are  $I_A = 6.38492 \times 10^{-37}$ ,  $I_B = 2.51547 \times 10^{-37}$ , and  $I_C = 6.52171 \times 10^{-37} \text{ g cm}^2$ . It has been established that the condensed phases of AlBr<sub>3</sub> are dimeric (5), (6), thus spectroscopic studies of the crystal and liquid pertain to the structure of Al<sub>2</sub>Br<sub>6</sub>(g). Gerding and Smit (7) have studied the Raman spectra of Al<sub>2</sub>Br<sub>6</sub>(l). The eighteen fundamental vibrational frequencies of Al<sub>2</sub>Br<sub>6</sub>(g) have been predicted by Miller (8) based on seven of the frequencies reported by Gerding and Smit (7). Webb (9) has measured the infrared spectra of Al<sub>2</sub>Br<sub>6</sub>(c) in the 40-800 cm<sup>-1</sup> region, the results being in general accord with the predictions of Miller (8). The vibrational frequencies used are adjusted so that the values of  $\Delta H_f^{298}$  obtained by the third law method are in agreement with the corresponding second law values. These adjustments are based on the assumption that vibrations with a wave number below 300 cm<sup>-1</sup> have a lower wave number in the gas phase than they have in the condensed phases.

Values include 501, 438, 625, 610, 420, 77, 484, 116, 217, 186, 1300, 19, 1790, 99.

Bond Lengths: Al-Cl = 2.05 Å, Al-Cl-bridge = 2.23 Å  
Bond Angles: Cl-Al-Cl = 120°, Cl-bridge-Al-Cl-bridge = 83°  
Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 3.988 × 10<sup>-111</sup> g cm<sup>6</sup>  
σ = 4

Heat of Formation

The heat of formation is calculated from the value adopted for AlCl<sub>3</sub>(g) and the heat of sublimation as derived from vapor pressure data. Vapor pressures were corrected for vapor non-ideality by means of the equation ΔG°/T = -RlnP - BP/T. The Berthelot equation of state and critical constants T<sub>c</sub> = 625.7°K and P<sub>c</sub> = 26.1 atm reported by Denisova and Baskova (1) were used to calculate B. Boston et al. (2) and Nisei and Sokolova (3) confirm T<sub>c</sub> within ±2%. The corrected vapor pressures were used to derive ΔHf°298.15 by both second law and third law methods.

Number of ΔHf°298.15(Kcal/mol) Al<sub>2</sub>Cl<sub>6</sub>(g)

Table with 3 columns: Investigator(s), Data Points, Drift. Includes entries for Smits and Meijering (4), Smits and Meijering (4), Trethewell and Terbesi (5), Trethewell and Terbesi (5), Fischer et al. (6), Nisei and Sokolova (3), Friedel and Crafts (8), Friedel and Crafts (8), Maier (9), Dunne and Gregory (10), Denisova and Baskova (1).

Nine points reported, points at 420.8° and 433.5°K rejected by statistical test.  
Fourteen points reported, points at 385.2° and 441.3°K rejected by statistical test.  
Thirteen points reported, point at 472.2°K rejected by statistical test.  
Eleven points reported, point at 342.0°K rejected by statistical test.  
Six points not reported; their vapor pressure equation was used to calculate 2 points at extremes of temperature range covered.

The first seven data sets show good agreement between second and third law values and an average of ΔHf298.15 = 27.66 ± 0.55 kcal/mol Al<sub>2</sub>Cl<sub>6</sub> is adopted. The remaining data sets show serious discrepancies between second and third law values, indicating temperature dependent errors in measurement, and are given no weight.

Heat Capacity and Entropy

Electron diffraction data by Palmer and Elliott (11) and by Akishin et al. (12) are in agreement within experimental error and average values for bond angles and distances as given above are selected. The principal moments of inertia are: I<sub>A</sub> = 2.2172 × 10<sup>-37</sup>, I<sub>B</sub> = 9.991 × 10<sup>-38</sup>, and I<sub>C</sub> = 2.7023 × 10<sup>-37</sup> g cm<sup>2</sup>. Klemperer (13) observed three frequencies in the infrared spectrum of Al<sub>2</sub>Cl<sub>6</sub> vapor, Beattie and Horder (14) and Maroni et al. (15) reported gas phase Raman spectra, and Gerding and Smit (16) and Pershina and Raskin (17) measured liquid phase Raman frequencies. With previous vibrational assignments and normal coordinate calculations by Onishi and Shimanouchi (18), Miller (19), and Maroni et al. (15) as a starting point, a new assignment was made (see above) which incorporates additional frequencies observed by Beattie and Horder (14) and Pershina and Raskin (17).

Raman and infrared spectra of Al<sub>2</sub>Br<sub>6</sub> and Al<sub>2</sub>I<sub>6</sub> determined by Beattie, et al. (20) were very helpful. The new assignment differs with earlier calculations primarily in the assumption that the frequencies at 36 cm<sup>-1</sup> and 19 cm<sup>-1</sup> observed by Pershina and Raskin in the liquid can be assigned to modes not ordinarily Raman active. This assumption is supported by the compatibility of thermodynamic functions based on the new assignment with vapor pressure data as listed above. Use of the frequencies 89 cm<sup>-1</sup> and 56 cm<sup>-1</sup> of Miller (19) gives 3rd law heats of sublimation nearly 2 kcal/mol Al<sub>2</sub>Cl<sub>6</sub> higher than the average of 2nd law values.

ΔH<sub>f</sub>° 298.15 = -683.6 ± 3 kcal. mole<sup>-1</sup>

ΔH<sub>m</sub>° = Unknown

S° 298.15 = [112] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>m</sub> = Unknown

Heat of Formation.

The value of ΔH<sub>f</sub>° 298.15 for K<sub>3</sub>Al<sub>2</sub>Cl<sub>9</sub>(c) was calculated from the heat of solution, ΔH<sub>f</sub>° = -112.07 kcal. mole<sup>-1</sup>, of K<sub>3</sub>Al<sub>2</sub>Cl<sub>9</sub>(c) in water (one mole of solute in 36 l. of water) determined by E. Baud, Ann. chim. phys. 1, 6 (1904).

Heat Capacity and Entropy.

Heat capacities and S° 298.15 were estimated based on an assumption that the property of the mixed chloride (2AlCl<sub>3</sub> · 3KCl) is the sum of the corresponding values for its component chlorides, i.e. AlCl<sub>3</sub>(c) and KCl(c).

Point Group {D<sub>2h</sub>}

Bond Distance: Al-I = 2.53 Å Al-I-bridge = 2.58 Å

Bond Angle: I-Al-I = 112 ± 1° I-bridge-Al-I-bridge = 68 ± 1°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 5.2175 × 10<sup>-109</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

W. Fischer, O. Rahlfs and B. Benze, Z. anorg. allgem. Chem. 205, 1 (1932) measured the vapor pressure of AlI<sub>3</sub>(l). The vapor consists of both Al<sub>2</sub>I<sub>6</sub>(g) and AlI<sub>3</sub>(g) species. The partial pressures of Al<sub>2</sub>I<sub>6</sub>(g) and AlI<sub>3</sub>(g) at different temperatures for the equilibrium Al<sub>2</sub>I<sub>6</sub>(g) = 2AlI<sub>3</sub>(g) were determined by W. Fischer, O. Rahlfs and B. Benze, loc. cit. From these partial pressures the mole ratios of Al<sub>2</sub>I<sub>6</sub>(g) and AlI<sub>3</sub>(g) at other temperatures were estimated. The partial pressures of Al<sub>2</sub>I<sub>6</sub>(g) over AlI<sub>3</sub>(l) were calculated from the total pressure using the estimated mole ratio values. The heat of vaporization, ΔH<sub>v</sub> 298.15 = 20.5 ± 1.0 kcal. mole<sup>-1</sup>, was evaluated employing the vapor pressures obtained by second law method. The corresponding third law value is 22.4 kcal. mole<sup>-1</sup>. It was not used due to the uncertainties involved in the estimation of the vibrational frequencies. The heat of formation for Al<sub>2</sub>I<sub>6</sub>(g) was calculated from ΔH<sub>f</sub>°(l) and ΔH<sub>v</sub>° obtained.

Heat Capacity and Entropy.

Molecular structure, bond distances and angles were reported by K. J. Palmer and N. Elliott, J. Am. Chem. Soc. 60, 1852 (1938). Five vibrational frequencies (344, 146, 94, 53 and 410 cm.<sup>-1</sup>) were adopted from the Raman spectrum of Al<sub>2</sub>I<sub>6</sub>(l) measured by H. Gerding and E. Smit, Z. physik. Chem. 50B, 171 (1941). The remaining ones were estimated by comparison with those for Al<sub>2</sub>O<sub>6</sub>(g) and Al<sub>2</sub>Br<sub>6</sub>(g) and adjusted so that the value of ΔH<sub>f</sub>° 298.15 obtained by the third law method is in reasonable agreement with the corresponding second law value. The three principal moments of inertia are: I<sub>A</sub> = 9.32506 × 10<sup>-37</sup>, I<sub>B</sub> = 4.60265 × 10<sup>-37</sup>, and I<sub>C</sub> = 1.21558 × 10<sup>-36</sup> g. cm.<sup>2</sup>.

MOL. WT. = 142.28

ΔH<sub>f</sub><sup>o</sup> = -547.3 ± 1.9 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -551.2 ± 1.9 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = Unknown

S<sub>298.15</sub> = 19.27 ± 0.10 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 2408°K.

Heat of Formation.

The value of ΔH<sub>f</sub><sup>o</sup> 298.15 was calculated from ΔH<sub>f</sub><sup>o</sup> 298.15 = 124.6 ± 1.5 kcal. mole<sup>-1</sup> for the reaction:  
 4MgO(c) + 2Al(l) = MgAl<sub>2</sub>O<sub>4</sub>(c) + 3Mg(g). The value of ΔH<sub>f</sub><sup>o</sup> 298.15 was obtained by the third-law method, using  
 vapor pressure data reported by K. Grjotheim, O. Herstad, and J. M. Toguri, Can. J. Chem. **39**, 443 (1961). From  
 the Knudsen experiments with MgAl<sub>2</sub>O<sub>4</sub>(c), R. L. Altman, J. Phys. Chem., **57**, 366 (1953) calculated the value of  
 ΔH<sub>f</sub><sup>o</sup> 298.15 as -552 kcal. mole<sup>-1</sup> which agrees with the value used.

Heat Capacity and Entropy.

The low temperature heat capacity, 53-296°K., was measured by E. G. King, J. Phys. Chem. **59**, 218 (1955).  
 The high temperature heat capacity, 400°-1800°K., was reported by K. R. Bómiclson, J. Phys. Chem. **59**, 220 (1955).  
 These two sets of data were joined smoothly and extrapolated to 3000°K. S<sub>298.15</sub> was reported by E. G. King, loc.  
 cit., based on S<sub>1</sub><sup>o</sup> (extrap.) = 0.32 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Temperature of Melting.

T<sub>m</sub> was taken from "Data on Chemicals for Ceramic Use," U. S. National Research Council Bulletin 118, 1949.

Bond Distances: Al-O = 1.66 Å  
 Bond Angle: Al-O-Al = 145°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 263.2477 X 10<sup>-117</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The value of  $\Delta H_f^o(298) = -31.4 \pm 7$  kcal. mole<sup>-1</sup> for Al<sub>2</sub>O(g) was calculated from  $\Delta H_f^o(298) = 247 + 7$  kcal. mole<sup>-1</sup> for the reaction Al<sub>2</sub>O(g) = 2Al(g) + O(g) and  $\Delta H_f^o(298) = 131 \pm 7$  kcal. mole<sup>-1</sup> for the reaction Al<sub>2</sub>O(g) = AlO(g) + Al(g). The values of  $\Delta H_f^o(298)$  were obtained by the third law method, using the partial pressure data reported by J. Drowart, G. Delmaris, R. Burns and M. Ingraham, *J. Chem. Phys.* **32**, 1368 (1960). (The second law values which are in poor agreement with the third law values, are  $\Delta H_f^o(298) = 271 \pm 10$  kcal. mole<sup>-1</sup> and  $\Delta H_f^o(298) = 154 \pm 10$  kcal. mole<sup>-1</sup>, respectively.) L. Brewer and A. Searcy, *J. Am. Chem. Soc.*, **75**, 5508 (1953), reported that under reducing condition, Al<sub>2</sub>O<sub>3</sub> vaporizes mostly to Al<sub>2</sub>O(g), but under neutral condition Al<sub>2</sub>O(g) and O(g) are the major products. Brewer and Searcy also measured the vapor pressures of the Al-Al<sub>2</sub>O<sub>3</sub> system by Knudsen effusion method, and obtained the heat of formation of Al<sub>2</sub>O(g) from gaseous atoms as  $\Delta H_f^o(298) = -249$  kcal. mole<sup>-1</sup>. This value leads the heat of formation for Al<sub>2</sub>O(g),  $\Delta H_f^o(298) = -32.4 \pm 7$ , which agrees with the value selected.

Heat Capacity and Entropy.

The matrix isolation of high temperature vapors for the investigation of the infrared spectrum of Al<sub>2</sub>O has been used to determine the bond distance, angle and vibrational frequencies by M. Linevsky, D. White and D. Mann, *J. Chem. Phys.*, **41**, 542 (1964). These reported data have been adopted in this table. The symmetric structure Al-O-Al instead of Al-Al-O for Al<sub>2</sub>O(g) was chosen for two reasons: (1) The dissociation energy of Al<sub>2</sub>O(g), D<sub>298</sub><sup>o</sup> = 247 ± 7 kcal/mole, is approximately twice the dissociation energy of AlO(g), D<sub>298</sub><sup>o</sup> = 115 ± 5 kcal. mole<sup>-1</sup>, which implies that the symmetric structure is more reasonable. (2) The dissociation energy of Al<sub>2</sub>O(g) has been estimated to be only 39 kcal. mole<sup>-1</sup> by J. Drowart and R. Honig, *J. Phys. Chem.*, **61**, 980 (1957). This implies that the Al-O bond energy in "Al-Al-O" structure would be as large as 208 kcal. mole<sup>-1</sup> if D<sup>o</sup>Al-Al = 39 kcal. mole<sup>-1</sup>. Therefore Al<sub>2</sub>O(g) must have a symmetric structure. Linevsky et al., loc. cit., have also included the bent symmetric structure (instead of a linear one) and the calculated  $\omega_2$  from the observed infrared spectra and the re-analysis of the ultraviolet spectra. The three principal moments of inertia are I<sub>A</sub> = 0.5105 X 10<sup>-39</sup>, I<sub>B</sub> = 22.4539 X 10<sup>-39</sup> and I<sub>C</sub> = 22.9644 X 10<sup>-39</sup> g. cm.<sup>2</sup>

Drowart, et al. (loc. cit.), also postulated a bent symmetric molecule for Al<sub>2</sub>O(g), and estimated the bond distance Al-O = [1.07-1.76] Å and angle Al-O-Al = [110]° and the vibrational frequencies as [1079] cm.<sup>-1</sup>, [351] cm.<sup>-1</sup> and [921] cm.<sup>-1</sup>

The National Bureau of Standards Report No. 6494 "Preliminary Report on the Thermodynamic Properties of Li, Be, Mg, Al and Their Compounds with Hydrogen, Oxygen, Nitrogen, Fluorine and Chlorine" July, 1959, has proposed a trigonal structure for Al<sub>2</sub>O(g) with bond distance Al-O = [1.87] Å, and Al-Al = [2.0] Å. Its vibration frequencies were estimated as [450] cm.<sup>-1</sup>, [1000] cm.<sup>-1</sup> and [1000] cm.<sup>-1</sup>.

Dialuminum Monoxide Unipositive Ion (Al<sub>2</sub>O<sup>+</sup>)

Bond Distance: Al-O = [1.66] Å  
 Bond Angle: Al-O-Al = [155°]  
 $\sigma = 2$   
 Product of the Moments of Inertia:  $I_A I_B I_C = [1.481 \times 10^{-115}] \text{ g}^3 \text{ cm}^6$

Heat of Formation

The ionization potential of Al<sub>2</sub>O has been reported as  $7.7 \pm 0.2$  eV (177.6 kcal) by R. F. Porter, P. Schissel, and M. G. Inghram, J. Chem. Phys. **23**, 339 (1955), and has been confirmed as  $7.7 \pm 0.5$  eV by G. DeMaria, J. Drowart, M. G. Inghram, J. Chem. Phys. **30**, 318 (1959). Using this value with  $\Delta H_f^\circ(\text{Al}_2\text{O}, g) = -31.4$  kcal/mol, we obtain  $\Delta H_f^\circ(\text{Al}_2\text{O}^+, g) = 146 \pm 10$  kcal/mol.

Heat Capacity and Entropy

The molecule is assumed to be bent by analogy with Al<sub>2</sub>O, although both these molecules are predicted to be linear according to A. D. Walsh, J. Chem. Soc. 2266 (1953). The electronic ground state is doublet, since there is an odd number of electrons. The bond length is estimated to be the same as that in Al<sub>2</sub>O and the vibrational frequencies are also assumed to be close to those for Al<sub>2</sub>O. Since normally the molecule Al<sub>2</sub>O ought to be linear, the bending must occur due to the occupancy of an outermost orbital with strong angular variation. Presumably this orbital is occupied by a pair of electrons, one of which will be removed in Al<sub>2</sub>O<sup>+</sup>, thus causing an opening of the bond angle. On this basis the angle is estimated to be greater than that in Al<sub>2</sub>O. The individual moments of inertia are:  $I_A = 2.645 \times 10^{-40} \text{ g cm}^2$ ,  $I_B = 2.353 \times 10^{-38} \text{ g cm}^2$  and  $I_C = 2.380 \times 10^{-38} \text{ g cm}^2$ . The enthalpy at 0°K is -2.769 kcal/mol.

Bond Distance: Al-O = [1.60] Å  
 Bond Angles: Al-O-Al = [90]°, O-Al-O = [90]°  
 Products of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.4246 × 10<sup>-114</sup>] g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.  
 The value of ΔH<sub>f</sub>° 298 = -97 ± 7 kcal. mole<sup>-1</sup> for Al<sub>2</sub>O<sub>2</sub>(g) was calculated from ΔH<sub>f</sub>° 298 = 372 ± 7 kcal. mole<sup>-1</sup> for the reaction Al<sub>2</sub>O<sub>2</sub>(g) = 2Al(g) + O<sub>2</sub>(g). The value of ΔH<sub>f</sub>° 298 was obtained by the third law method, using the partial pressure data reported by J. Drowart, G. Defmaris, R. Burna and M. Inghram, J. Chem. Phys., 32, 1366 (1960). (The second law value for ΔH<sub>f</sub>° which is in poor agreement with the third law value, is 451 ± 25 kcal. mole<sup>-1</sup>.)

Heat Capacity and Entropy.  
 The molecular structure (plane cyclic model) and vibrational frequencies of Al<sub>2</sub>O<sub>2</sub>(g) were obtained from Drowart, et al., J. Chem. Phys., 32, 1366 (1960). The bond distance Al-O in Al<sub>2</sub>O<sub>2</sub> was assumed to be the same as that in AlO (g). The three principal moments of inertia are I<sub>A</sub> = 6.8005 × 10<sup>-35</sup>, I<sub>B</sub> = 11.4674 × 10<sup>-35</sup> and I<sub>C</sub> = 19.2679 × 10<sup>-35</sup> g. cm.<sup>2</sup>

The configuration was proposed by Drowart, et al., instead of the alternate linear structure OAl-AlO for the reason discussed below. The O-B-O bond angle compares to the B<sub>2</sub> dissociation energy<sup>3,4</sup> in the same way as the N-C-O bond compares to the C-O angle bond. However, for Al<sub>2</sub>O<sub>2</sub>(g), the relationship between OAl-AlO and Al<sub>2</sub> would be quite different.

Bond Distance: Al-O = [1.66] Å

Bond Angle: O-Al-O = [90°] Al-O-Al = [90°] σ = [4]

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.777 x 10<sup>-114</sup>] g<sup>3</sup> cm<sup>6</sup>

Heat of Formation

G. DeMaria, J. Drowart, and M. G. Inghram, J. Chem. Phys. 30, 118 (1959), have reported an ionization potential for Al<sub>2</sub>O<sub>2</sub><sup>+</sup> of 9.9 ± 0.5eV (228 kcal). Using this value in conjunction with ΔHf°<sub>298</sub>(Al<sub>2</sub>O<sub>2</sub>, g) = -97 kcal/mol, we obtain ΔHf°<sub>298</sub>(Al<sub>2</sub>O<sub>2</sub><sup>+</sup>, g) = 131 ± 20 kcal/mol.

Heat Capacity and Entropy

The molecular configuration is assumed to be the same as that used for Al<sub>2</sub>O<sub>2</sub>. The bond length is assumed to be longer than that in Al<sub>2</sub>O<sub>2</sub> and is made equal to that reported for Al<sub>2</sub>O. The bond angle is arbitrarily estimated to be the same as that in Al<sub>2</sub>O<sub>2</sub>. The vibrational frequencies are estimated to be slightly lower than those for Al<sub>2</sub>O<sub>2</sub> since the Al<sub>2</sub>O<sub>2</sub><sup>+</sup> molecule should be less rigidly bound. The ground state is assumed to be doublet, since there is an odd number of electrons. The individual moments of inertia are I<sub>A</sub> = 7.32 x 10<sup>-39</sup> g cm<sup>2</sup>, I<sub>B</sub> = 1.234 x 10<sup>-38</sup> g cm<sup>2</sup>, and I<sub>C</sub> = 1.966 x 10<sup>-38</sup> g cm<sup>2</sup>. The enthalpy at 0°K is -3.010 kcal/mole.

Aluminum Oxide (alpha Al<sub>2</sub>O<sub>3</sub>)  
(Crystal) Mol. Wt. = 101.960

ALUMINUM OXIDE (ALPHA Al<sub>2</sub>O<sub>3</sub>) (CRYSTAL)

MOL. WT. = 101.960

$\Delta H_f^0 = -397.5 \pm 0.3 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{298.15} = -400.4 \pm 0.3 \text{ kcal. mole}^{-1}$   
 $\Delta H_m = 28.30 \pm 0.55 \text{ kcal. mole}^{-1}$

$S_{298.15}^0 = 12.174 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\eta_m = 2315^\circ \text{K.}$

**Heat of Formation.**

The value of  $\Delta H_f$  derived from the direct combustion of pure aluminum in oxygen was taken from A. D. Mah, J. Phys. Chem. 61, 1572 (1957). Other values for  $\Delta H_f$  obtained in the same way are:  $-399.04 \pm .24 \text{ kcal. mole}^{-1}$  reported by P. E. Snyder and H. Seitz, J. Am. Chem. Soc. 81, 683 (1945);  $-400.4 \pm .3 \text{ kcal. mole}^{-1}$  reported by C. E. Holley, Jr., and E. J. Huber, Jr., J. Am. Chem. Soc. 72, 5577 (1951); and  $-402 \pm 2 \text{ kcal. mole}^{-1}$  reported by A. Schneider and O. Götow, Z. anorg. u. allgem. Chem. 217, 41 (1954).

**Heat Capacity and Entropy.**

The heat capacity measurements reported by G. T. Furukawa, T. B. Douglas, R. E. McConkey, and D. C. Ginnings, (15° to 1200°K.), J. Research Natl. Bur. Standards 57, 67 (1956), were employed in this table. Low temperature measurements were also made by P. Simon and R. C. Swain (30-280°K.), Z. Physik. Chem. 20B, 189 (1935); E. C. Kerr, H. L. Johnston, and N. C. Hallett (20° to 295°K.), J. Am. Chem. Soc. 72, 4740 (1950); J. W. Edwards and G. L. Kingdon (53-291°K.), Trans. Faraday Soc. 59, 1313-22 (1962); E. N. Rodigna and K. Z. Gornel'akii, (100-900°K.), Zhur. Fiz. Khim. 32, 1859-62 (1956); B. E. Walker, J. A. Grand, and R. R. Miller (300-900°K.), J. Phys. Chem. 60, 231-3 (1956); R. Dawson, E. B. Brackett, and T. E. Brackett (700-1400°K.), J. Phys. Chem. 67, 1689 (1963), and L. Terrebasi (0-1300°K.), Helv. Chim. Acta. 17, 804 (1934). All of the above low temperature data are in good agreement with Furukawa's work.

The heat capacities above 1200°K. (1200-2500°K.) were taken from the enthalpy measurements of P. B. Kantor, L. S. Lazareva, V. V. Kandyba, and E. M. Pomichov, Ukr. Fiz. Zh. 7, 205-10 (1962). The heat capacity values above 2500°K. were extrapolated. High temperature measurements were also made by the following investigators: V. Ya. Chekhovskoi (500-2000°K.), Inzh. Fiz. Zh., Akad. Nauk. Belorussk SSR 5, 62-5 (1962); A. Perrier and M. Olette (1100-2300°K.), Compt. Rend. 254, 4293-95 (1962); C. H. Shomate and B. P. Naylor (500-1800°K.), J. Am. Chem. Soc. 67, 72 (1945) and H. L. Johnston and M. Hoch (1000-2000°K.), J. Phys. Chem. 65, 1184-5 (1961); and V. A. Kirillin, A. E. Sheidin, and V. Ya. Chekhovskii (500-2000°K.), Doklady Akad. Nauk. SSSR 135, 125-8 (1960). Numerical values were not available from Kirillin, et al., but graphical values were in close agreement with an extrapolation of Furukawa's data. The entropy at 298.15 was reported by T. Furukawa, et al., loc. cit., using  $S_{15}^0 = 0.0105 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$ .

**Melting Data.**

The melting data were obtained from the measurements of P. B. Kantor, L. S. Lazareva, V. V. Kandyba, and E. M. Pomichov, loc. cit. S. J. Schneider "Compilation of the Melting Points of the Metal Oxides," NBS Monograph 69, p. 6, Oct. 10, 1963, gives a review of the melting points that range from 2287 to 2345°K.

$T_m = 2323^\circ\text{K.}$

Heat of Formation.

The enthalpy change ( $\Delta H_f^*$ ) for the transition  $Al_2O_3(\beta, c) \rightarrow Al_2O_3(\alpha', c)$  has been determined by (1) V. Kostomarov and M. Rey, *Silicates Ind.*, 28, 9 (1963); and (2) T. Yokokawa and O. J. Kleppa, *J. Phys. Chem.*, 68, 3246 (1964). The results obtained are presented in the table. The enthalpies of solution for  $Al_2O_3(\beta, c)$  and  $Al_2O_3(\alpha', c)$  in 2N KOH(aq.) have been measured by (3) K. K. Kelley, C. H. Shonster, F. E. Young, B. F. Naylor, A. E. Salo and E. H. Ruffman, *U. S. Bur. Mines Tech. Rept.*, 688 (1946). Based on their reported values,  $-16.13 \pm 1.0$  and  $-196.02 \pm 0.25 \text{ kcal. mole}^{-1}$ , respectively, the heat of formation ( $\Delta H_f^* 298.15$ ) for  $Al_2O_3(\beta, c)$  was evaluated to be  $-384.84 \pm 1.1 \text{ kcal. mole}^{-1}$ . Hence, the enthalpy of transition ( $\Delta H_m^*$ ) was calculated as  $-15.6 \pm 1.1 \text{ kcal. mole}^{-1}$ , using  $\Delta H_f^* 298.15 (Al_2O_3, \alpha', c) = -400.4 \text{ kcal. mole}^{-1}$ .

| Source | Method                        | Temperature, °K. | $\Delta H_m^*$ , kcal. mole <sup>-1</sup> | $\Delta H_f^*$ , kcal. mole <sup>-1</sup> |
|--------|-------------------------------|------------------|---|---|
| (2)    | solution calorimetry          | 978              | -5.3                                      | -4.4                                      |
| (1)    | differential thermal analysis | 1473             | -11.0                                     | -9.4                                      |
| (3)    | solution calorimetry          | 298.15           | -15.6                                     | -15.6                                     |

The heat of formation for  $Al_2O_3(\beta, c)$  was calculated from that for  $Al_2O_3(\alpha', c)$  and the  $\Delta H_m^*$  value reported by Yokokawa and Kleppa, loc. cit., which was arbitrarily selected.

Heat Capacity and Entropy.

The heat capacities were assumed to be larger than those for  $Al_2O_3(\alpha', c)$  by 5% at each temperature. The value of  $S_{298.15}^*$  was estimated such that at  $T_m$ ,  $\Delta F_m^* (Al_2O_3, \beta, c) > \Delta F_m^* (Al_2O_3, \alpha', c)$ .

Melting Data.

$T_m$  was reported by H. Plummer, *J. Appl. Chem.*, 9, 35 (1959). The difference between  $\Delta H_m^*$  for  $Al_2O_3(\beta, c)$  and  $Al_2O_3(\alpha', c)$  at  $T_m$  is  $\Delta H_m^*$ .

ALUMINUM OXIDE (Al<sub>2</sub>O<sub>3</sub>) (LIQUID) MOL. WT. = 101.96

$$\Delta H_f^{298.15} = [23.728] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$\Delta H_m^{298.15} = [373.356] \text{ kcal. mole}^{-1}$$

$$\Delta H_m^{298.15} = 28.30 \pm 0.55 \text{ kcal. mole}^{-1}$$

$$T_m = 2315^\circ\text{K.}$$

Heat of Formation.  
The heat of formation for the liquid was obtained from  $\Delta H_f^{298.15}$  for a crystal by adding on  $\Delta H_m$  plus the difference between  $H_{2315} - H_{298.15}$  for crystal and liquid.

Heat Capacity and Entropy.

The heat capacities of the liquid alpha-Al<sub>2</sub>O<sub>3</sub> was taken from the crystal heat capacities up to 1600°K. where a glass transition was assumed. From 1600°K. to 3500°K. the heat capacities were assumed to be the constant value of 34.623 measured by P. B. Kantor, L. S. Lazareva, V. V. Kandyba and E. M. Fomichov (2300-2500°K.) Ukr. Fiz. Zh. 7, 205-10 (1962).

The entropy at 298.15°K. was obtained in a manner analogous to the heat of formation.

Melting Data.

The melting data was taken from the measurements of P. B. Kantor, et al., loc. cit. S. J. Schneider, "Compilation of the Melting Points of the Metal Oxides," NBS Monograph 68 p. 6, Oct. 10, 1963, gives a review of the melting points that range from 2267 to 2345°K.

SILLIMANITE (Al<sub>2</sub>SiO<sub>5</sub>)

(CRYSTAL)

GFW = 162.046

Al<sub>2</sub>O<sub>5</sub>Si

ΔHf° = -614.83 ± 0.5 kcal/mol

ΔHf°<sub>298,15</sub> = -618.81 ± 0.5 kcal/mol

S°<sub>298,15</sub> = 22.987 ± 0.1 gibbs/mol

Heat of Formation

The heat of the reaction Al<sub>2</sub>O<sub>3</sub>(c) + SiO<sub>2</sub> (quartz) + Al<sub>2</sub>SiO<sub>5</sub> (sillimanite) has been determined at 968°K by J. L. Holm and O. J. Kleppa, J. Phys. Chem. 70, 1690 (1966) and Am. Mineralogist 51, 1808 (1966), to be -1.51 ± 0.15 kcal/mol. This value was obtained from heat of solution measurements in a high temperature oxide melt calorimeter. Using the JANAF functions, this reduces to ΔHr° = -0.71 kcal/mol, which is used to calculate the adopted value.

The above value is in serious disagreement with the solution data of F. Neumann, Z. Anorg. Allgem. Chem. 145, 193 (1925); this work, however, has recently been questioned by several workers. H. Flood and W. J. Knapp, J. Am. Ceram. Soc. 40, 206 (1957) suggested that ΔHr° was between 0 and -10 kcal/mol. L. B. Pankratz and K. K. Kelley, U. S. Bur. Mines RI 6370, 1964, conclude that ΔHr° should lie between 0 and -6 kcal/mol. C. R. Waldbaum, Am. Mineralogist 50, 186 (1965), calculated ΔHr° = -0.356 kcal/mol from high temperature - high pressure equilibria. These later values are all in good agreement with the adopted calorimetric value.

Heat Capacity and Entropy

The low temperature heat capacity has been measured from 54.4° to 286.5°K by S. S. Todd, J. Am. Chem. Soc. 72, 4742 (1950). The entropy is based on S°<sub>21</sub> = 0.73 gibbs/mol. The high temperature enthalpy has been measured to 1500°K by L. B. Pankratz and K. K. Kelley, U. S. Bur. Mines RI 6370, 1964. The low and high temperature data were joined smoothly together by means of a Shomate function plot (C. H. Shomate, J. Phys. Chem. 58, 368 (1954)). The crystal structure of sillimanite, L. Bragg and S. F. Claringbull, "Crystal Structure of Minerals," Vol. IV, G. Bell and Sons Ltd., London, 1965, indicates that there is no mixing of the tetra-coordinated aluminum and silicon atoms. Thus there should be no residual entropy at 0°K.

Al<sub>2</sub>O<sub>5</sub>Si

$\Delta H_f^\circ = -615.46 \pm 0.5$  kcal/mol  
 $\Delta H_f^\circ_{298.15} = -619.52 \pm 0.5$  kcal/mol

$S^\circ_{298.15} = 22.28 \pm 0.1$  gibbs/mol

Heat of Formation  
 The heat of the reaction  $Al_2O_3(c) + SiO_2(quantz) + Al_2SiO_5(andalusite)$  has been determined at 968°K by J. L. Holm and O. J. Kleppa, J. Phys. Chem. **70**, 1690 (1966) and Am. Mineralogist **51**, 1608 (1966), to be  $-1.99 \pm 0.17$  kcal/mol. This value was obtained from heat of solution measurements in a high temperature oxide melt calorimeter. Using the JANAF functions, this reduces to  $\Delta H_f^\circ_{298} = -1.42$  kcal/mol, which is used to calculate the adopted value.

The above value is in serious disagreement with the solution data of F. Neumann, Z. Anorg. Allgem. Chem. **115**, 193 (1925); this work, however, has recently been questioned by several workers. H. Flood and W. J. Knapp, J. Am. Ceram. Soc. **40**, 206 (1957), suggested that  $\Delta H_f^\circ$  was between 0 and  $-10$  kcal/mol. L. B. Pankratz and K. K. Kelley, U. S. Bur. Mines RI 6370, 1964, conclude that  $\Delta H_f^\circ$  should lie between 0 and  $-6$  kcal/mol. C. R. Waldbaum, Am. Mineralogist **50**, 186 (1965), calculated  $\Delta H_f^\circ = -1.108$  kcal/mol from high pressure equilibrium. These latter values are all in good agreement with the adopted calorimetric value.

Heat Capacity and Entropy

The low temperature heat capacity has been measured from 54.9° to 296.2°K by S. S. Todd, J. Am. Chem. Soc. **72**, 4742 (1950). The entropy is based on  $S^\circ_{298} = 0.62$  gibbs/mol. The high temperature enthalpy has been measured to 1600°K by L. B. Pankratz and K. K. Kelley, U. S. Bur. Mines RI 6370, 1964. The low and high temperature data were joined smoothly together by means of a Shomate function plot [C. H. Shomate, J. Phys. Chem. **58**, 368 (1954)]. Since all the aluminum and silicon atoms occupy differently coordinated sites, there is no possibility of any residual entropy of mixing in this polymorph.

(CRYSTAL)

KYANITE (Al<sub>2</sub>SiO<sub>5</sub>)

GFW = 162.046

Al<sub>2</sub>O<sub>5</sub>Si

ΔHf° = -615.75 ± 0.5 kcal/mol

ΔHf°<sub>298.15</sub> = -620.06 ± 0.5 kcal/mol

S°<sub>298.15</sub> = 20.032 ± 0.1 gibbs/mol

Heat of Formation

The heat of the reaction Al<sub>2</sub>O<sub>3</sub>(s) + SiO<sub>2</sub>(quartz) → Al<sub>2</sub>SiO<sub>5</sub>(kyanite) has been determined at 968° by J. L. Holm and O. J. Kleppa, *J. Phys. Chem.* **70**, 1690 (1966) and *Am. Mineralogist* **51**, 1608 (1966), to be -2.37 ± 0.15 kcal/mol. This value was obtained from heat of solution measurements in a high temperature oxide melt calorimeter. Using the JANAF functions, this reduces to ΔHf°<sub>298</sub> = -1.95 kcal/mol, which is used to calculate the adopted value.

The above value is in serious disagreement with the solution data of F. Neumann, *Z. Anorg. Allgem. Chem.* **145**, 183 (1925); this work, however, has recently been questioned by several workers. H. Flood and W. J. Knapp, *J. Am. Ceram. Soc.* **40**, 206 (1957), suggested that ΔHf° was between 0 and -10 kcal/mol. L. B. Pankratz and K. K. Kelley, *U. S. Bur. Mines RI 6370*, 1964, conclude that ΔHf° should lie between 0 and -6 kcal/mol. R. W. Haskell and R. C. DeVries, *J. Am. Ceram. Soc.* **47**, 202 (1964), from phase equilibria obtained ΔHf° = -2 ± 7 kcal/mol. C. R. Waldbaum, *Am. Mineralogist* **50**, 186 (1965), calculated ΔHf° = -0.622 kcal/mol from high temperature - high pressure equilibria. These latter values are all in good agreement with the adopted calorimetric value.

Heat Capacity and Entropy

The low temperature heat capacity has been measured from 54.8° to 296.3° by S. S. Todd, *J. Am. Chem. Soc.* **72**, 4742 (1950). The entropy is based on S°<sub>298</sub> = 0.33 gibbs/mol. The high temperature enthalpy has been measured to 1500°K by L. B. Pankratz and K. K. Kelley, *U. S. Bur. Mines RI 6370*, 1964. The low and high temperature data were joined smoothly together by means of a Shomate function plot [C. H. Shomate, *J. Phys. Chem.* **58**, 368 (1954)]. The high temperature heat capacity has been measured between 100° and 1200°C by V. Ya. Leonidov, Yu. P. Barskii and N. I. Khatarov, *Geochemistry (English Transl.)* **1964**, 409 (1964). The values reported are in excellent agreement with the adopted functions. Since the aluminum atoms and the silicon atoms occupy different types of sites there is no possibility of any residual entropy of mixing in this polymorph.

MULLITE (Al<sub>6</sub>Si<sub>2</sub>O<sub>13</sub>) (CRYSTAL)

GFW = 426.053

$\Delta H_f^\circ = -1619.25 \pm 1.5$  kcal/mol  
 $\Delta H_f^\circ 298.15 = -1629.83 \pm 1.5$  kcal/mol

$S_{298.15}^\circ = 65.7 \pm 3$  gibbs/mol  
 $T_m = 2023^\circ K$

Heat of Formation

The heat of the reaction  $3Al_2O_3(s) + 2SiO_2(quantz) + Al_6Si_2O_{13}$  has been determined at 968°K by J. L. Holm and O. J. Kleppa, J. Phys. Chem. 70, 1690 (1966) and Am. Mineralogist 51, 1608 (1966), to be  $+5.44 \pm 0.35$  kcal/mol. This value was obtained from heat of solution measurements in a high temperature oxide melt calorimeter. Using the JANAF functions, this reduces to  $\Delta H_f^\circ 298 = +4.11$  kcal/mol, which is used to calculate the adopted value.

Heat Capacity and Entropy

The low temperature heat capacity and high temperature enthalpy of mullite have been measured by L. B. Pankratz, W. W. Waller and K. K. Kelley, U. S. Bur. Mines RI 6287, 1963. The low temperature investigations extended from 53.5°K to 295.4°K; the Debye-Einstein equation  $3D(182/T) + 15E(350/T) + 10E(502/T) + 15E(897/T)$  represented the data from 53.5° to 114.6°K within 1.4 percent and gave a smooth extrapolation to zero. From this equation the entropy at 51°K was found to be 2.17 gibbs/mol as opposed to the value 1.96 gibbs/mol found by Pankratz et al. However, since it is known that mullite has some of its Al atoms on Si sites, there will be configurational entropy remaining at 0°K. This is borne out by the free energy determinations of R. H. Rein and J. Chipman, Trans. Met. Soc. AIME 233, 415 (1965), and D. A. R. Kay and J. Taylor, Trans. Faraday Soc. 56, 1372 (1960), who obtain  $\Delta G_f^\circ 1823 = -5.7 \pm 0.1$  kcal/mol for the formation from oxide. If the entropies and enthalpies reported by Pankratz et al. are used with the heat of formation, they yield  $\Delta G_f^\circ 1823 = +2.9$  kcal/mol. Holm and Kleppa, loc. cit., calculate that random mixing of tetra-coordinated aluminum and silicon atoms could produce 7 eu residual entropy. We have added 4.7 eu in order to match the measured  $\Delta G_f^\circ 1823$ .

A review of the enthalpy determination indicated that the values might easily be 2 percent low if as little as 4 percent of kyanite remained unchanged in the sample used for measurement. Since X-ray could not detect this amount, it is not an unreasonable assumption. Accordingly we have checked the effect of increasing the heat capacity above 298°K by 2 percent; this then gives  $\Delta G_f^\circ 1823 = -2.10$  kcal/mol. In order to bring this within reasonable agreement with the observations a residual configurational entropy of 2 gibbs/mol would be needed. Thus the uncertainty in the residual entropy is of the order of 2 eu due to possible uncertainty in the high temperature heat capacity.

Melting Data

The congruent melting point of mullite was reported by S. Aramaki and R. Roy, Nature 184, 631 (1959).

Dec. 31, 1960; Dec. 31, 1964

$$\Delta H^{\circ}_f 0 = 0 \text{ kcal. mole}^{-1}$$

$$\Delta H^{\circ}_f 298.15 = 0 \text{ kcal. mole}^{-1}$$

$$\Delta H^{\circ}_m = [5.39] \text{ kcal. mole}^{-1}$$

$$\Delta H^{\circ}_s 298.15 = 132.8 \pm 4.0 \text{ kcal. mole}^{-1}$$

$$S^{\circ}_{298.15} = 1.403 \pm 0.01 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$T_m = 2450 \pm 20 \text{ }^{\circ}\text{K.}$$

Heat of Formation.

Zero by definition.

Heat Capacity and Entropy.

Low temperature heat capacities, 16.90 - 303.71°K., were measured by H. L. Johnston, H. N. Hersh and E. C. Kerr, J. Am. Chem. Soc. 73, 1112 (1951). The high temperature heat capacities, 282.8 - 1667.8°K., were measured by R. A. McDonald and D. R. Stull, J. Chem. Eng. Data, 7, 84 (1962). These two sets of data were joined smoothly at 298.15°K. by graphical method. The heat capacity values above 1667.8°K. were estimated by graphical extrapolation. The high temperature Cp, 530 - 800°K., were also determined by S. S. Wise, J. L. Margrave and R. L. Altman, J. Phys. Chem., 64, 915 (1960). The other principal investigators are: (1) J. A. Robertson, Ph. D. Thesis, Cornell University, 1944; (2) A. Magnus and H. Danz, Ann. Phys. [4] 81, 407 (1926); (3) H. Moleson and H. Gautier, Compt. rend. 116, 924 (1893); (4) H. F. Weber, Ann. Phys. [2] 154, 367, 553 (1875); (5) H. Kopp, Trans. Roy. Soc. [London] 155, 71 (1865); and (6) V. Regnault, Ann. chim. et phys. [3] 63, 5 (1861) and Phil. Mag. [4] 23, 103 (1862). The value of S°<sub>298.15</sub> was obtained from H. L. Johnston, H. N. Hersh and E. C. Kerr, loc. cit., based on S°<sub>7</sub> = 0.00139 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Melting Data.

The melting point (T<sub>m</sub>) of B(c) has been measured by many investigators. The values of T<sub>m</sub> reported are in the range 2273 - 2673°K. Based on the relationship between the values of T<sub>m</sub> determined and the purities of the boron sample used, the value T<sub>m</sub> = 2450 ± 20°K. was estimated. The data employed for estimation are those reported by C. F. Oline, J. Electrochem. Soc. 106 (4), 332 (1959), and A. W. Searcy and C. E. Myers, J. Phys. Chem. 61, 957 (1957). The estimated value for T<sub>m</sub> is in agreement with the value taken by H. L. Schick, et al., "Thermodynamics of Certain Refractory Compounds", ASD-RR-61-260, Part I, Vol. 1, May 1962, in which the reported melting points of boron were reviewed. The heat of melting was calculated assuming entropy of melting is 2.2 cal. deg.<sup>-1</sup> mole<sup>-1</sup> at 2450°K.

Heat of Sublimation.

The adopted value of ΔH°<sub>g</sub> 298.15 is the weighted average of eight ΔH°<sub>g</sub> 298.15 values derived from vapor pressure data. See B(g) table for details.

Boron (B)

(Liquid) At. Wt. = 10.82

| T, °K. | C <sub>p</sub> | S°     | $-(F^{\circ} - H_{298}^{\circ})/T$ | $H^{\circ} - H_{298}^{\circ}$ | $\Delta H_f^{\circ}$ | $\Delta F_f^{\circ}$ | Log K <sub>p</sub> |

(LIQUID)

BORON (B)

B

AT. WT. = 10.82

$$\Delta H_f^{\circ} 298.15 = [5.260] \text{ kcal. mole}^{-1}$$

$$\Delta H_m^{\circ} = [5.39] \text{ kcal. mole}^{-1}$$

$$\Delta H_v^{\circ} = [121.3 \pm 4] \text{ kcal. mole}^{-1}$$

$$S_{298.15}^{\circ} = [3.533] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$T_m = [2450 \pm 20]^{\circ}\text{K.}$$

$$T_b = [3931]^{\circ}\text{K.}$$

Heat of Formation.

$\Delta H_f^{\circ} 298.15$  for B(l) was obtained from  $\Delta H_f^{\circ} 298.15$  for B(c) by adding  $\Delta H_m^{\circ}$  and the difference between  $H_{Tm}^{\circ}$  and  $H_{298.15}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy.

The heat capacity of liquid was estimated by comparison with the heat capacity of solid at the melting temperature. The value of  $S_{298.15}^{\circ}$  was obtained in a manner analogous to that of the heat of formation. A glass transition temperature at 1600°K. is assumed.

Melting Data.

See B(c) table for details.

Vaporization Data.

The boiling point was calculated as the temperature at which the free energies of formation ( $\Delta F_g^{\circ}$ ) for both B(l) and B(g) are equal. The difference in heat of formation ( $\Delta H_f^{\circ}$ ) of B(l) and B(g) at the boiling point is the heat of vaporization ( $\Delta H_v^{\circ}$ ).

Ground State Configuration  $2P_{1/2}$

$\Delta H_f^0 = 131.6 \pm 4$  kcal. mole $^{-1}$

$\Delta H_f^{298.15} = 132.6 \pm 4$  kcal. mole $^{-1}$

$S_{298.15}^0 = 36.649$  cal. deg. $^{-1}$  mole $^{-1}$

Dec. 31, 1960

The vapor pressures of B(g) over condensed phases B(c) and B<sub>2</sub>(c), respectively, were determined by many investigators. Using the vapor pressure data reported, the corresponding heats of sublimation and decomposition were evaluated by both the third and second law methods. The values of  $\Delta H_f^0$ ,  $\Delta H_f^{298.15}$  for B(g) were then calculated. The results obtained are listed as follows (all calculations were made employing JANAF Functions).

| Investigator                        | Process or Reaction                       |                  | $\Delta H_f^0$ , 298.15° kcal. mole $^{-1}$ |                  | $\Delta H_f^0$ , 298.15° kcal. mole $^{-1}$ |

- 1 D. L. Hildenbrand and W. F. Hall, J. Phys. Chem. **69**, 989 (1964) - torsion-effusion.
- 2 C. L. Hildenbrand, "Thermodynamic Properties of Propellant Combustion Products", QLR-64-10, Philco Corporation, California, 1950-2140°K., torsion-Langmuir method. Listed  $\Delta H_f^0$ , 298.15 value is the average of three reported values.
- 3 R. O. Paule and J. L. Margrave, J. Phys. Chem. **67**, 1368 (1963) - 1761-2152°K. - free-evaporation.
- 4 H. E. Robson and P. W. Olliges, J. Phys. Chem. **69**, 983 (1964) - 2184-2522°K. - Knudsen-effusion.
- 5 A. W. Searcy and C. E. Myers, J. Phys. Chem. **51**, 957 (1957) - 2115-2413°K. - Knudsen-effusion.
- 6 P. O. Schissel and W. S. Williams, Bull. Am. Phys. Soc. **4**, 139 (1959). The quoted value of  $\Delta H_f^0$  was derived from vapor pressure data determined by the mass spectrometer-effusion method.
- 7 The third and second law values of  $\Delta H_f^0$ , 298.15 were calculated from the respective values of  $\Delta H_f^0$  quoted by O. Verhaegen and J. Drowart, J. Chem. Phys. **37**, 1367 (1962). Vapor pressure data obtained by mass spectrometer-effusion method.
- 8 P. A. Alkshin, D. O. Hikitin and L. N. Ozerkhov, Proc. Acad. Sci., USSR, **129**, 1075 (1959). The vapor pressure data (2024 - 2231°K.) were determined by the mass spectrometric method.
- 9 The two second law values were recalculated from  $\Delta H_f^0$ , 2060 = 127.4 and  $\Delta H_f^0$ , 2080 = 133.1 kcal. mole $^{-1}$  for the first and second reactions in the above table, respectively. The data were reported by O. Verhaegen and J. Drowart, J. Phys. Chem. **51**, 1361 (1952), which were derived from vapor pressures determined by the mass spectrometric method.
- 10 M. J. Linevsky, O. M. Kibler, T. F. Lyon and V. J. Desantis, "Refractory materials Research", WADD-TR-60-646, Part IV, August 1964, General Electric Co., Ohio.
- 11 P. O. Schissel and O. C. Trulsson, J. Phys. Chem. **66**, 1492 (1962).

The adopted value of  $\Delta H_f^0$ , 298.15 for B(g) is the weighted average of the 12  $\Delta H_f^0$ , 298.15 values given in the above table.

Heat Capacity and Entropy.

The electronic levels and quantum weights used were obtained from C. E. Moore, "Atomic Energy Levels", Vol. I, National Bureau of Standards Circular 467, 1949.

Heat of Formation

We calculate the heat of formation at 0°K from the reaction B(g) + e<sup>-</sup>(g) + B<sup>+</sup>(g) using the JANAF auxiliary value for B(g) and an ionization potential of 191.34 kcal/mol from C. E. Moore, U. S. Natl. Bur. Std. Circ. 467, Vol. I, 1949.

Heat Capacity and Entropy

We obtain the electronic levels and quantum weights from C. E. Moore, loc. cit. H° - H°<sub>298</sub> = -1.481 kcal/mol at 0°K.

Bond Distance: Be-O = [1.40] Å    O-B = [1.36] Å    B-O = [1.20] Å

Bond Angle: Be-O-B = [120]°    O-B-O = [180]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [2.450656] X 10<sup>-115</sup> g<sup>3</sup> cm<sup>6</sup>

σ = [1]

Heat of Formation.

Since P. E. Blackburn and A. Bichler, J. Phys. Chem. 69, 4250 (1965), have postulated that the B<sub>2</sub>O<sub>2</sub> group has the pseudochloride character in bond strength, the heat of formation of BeB<sub>2</sub>O<sub>2</sub>(g) is estimated by adding the difference of the heats of formation of BeCl(g) and AlCl(g) to the heat of formation of AlB<sub>2</sub>O<sub>2</sub>(g), using all JANAF values ΔH<sub>f</sub><sup>o</sup>298 (BeCl, g) = 3.0, ΔH<sub>f</sub><sup>o</sup>298 (AlCl, g) = -11.2 and ΔH<sub>f</sub><sup>o</sup>298 (AlB<sub>2</sub>O<sub>2</sub>, g) = -129.4 kcal/mol.

Heat Capacity and Entropy.

All molecular constants are estimated by comparison with those in LiBO<sub>2</sub>(g), AlBO<sub>2</sub>(g), B<sub>2</sub>O<sub>1</sub>(g) and BeCl(g). The three principal moments of inertia are I<sub>A</sub> = 1.1015 X 10<sup>-39</sup>, I<sub>B</sub> = 14.3751 X 10<sup>-39</sup> and I<sub>C</sub> = 15.4766 X 10<sup>-39</sup> g cm<sup>2</sup>.

(Ideal Gas) Mol. Wt. = 90.736

BORON MONOBROMIDE (BBr) (IDEAL GAS)

MOL. WT. = 90.736

Ground State Configuration  $1s^2 +$   
 $5^2S_{1/2} 1.5 = 53.750 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^{\circ} 0 = 57 \pm 10 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{\circ} 298.15 = 56 \pm 10 \text{ kcal. mole}^{-1}$

Electronic Levels and Quantum Weight

$$\frac{\sum \epsilon_i}{0} \text{ cm.}^{-1} \quad \frac{\epsilon_i}{1}$$

$$\omega_e x_e = 3.57 \text{ cm.}^{-1} \quad \sigma = 1$$

$$\omega_e = 669.04 \text{ cm.}^{-1} \quad r_e = 1.887 \text{ \AA}$$

$$B_e = 0.497 \text{ cm.}^{-1} \quad \alpha_e = 0.0036 \text{ cm.}^{-1}$$

Heat of Formation.

G. Herzberg, "Spectra of Diatomic Molecules" D. Van Nostrand Co. New York 1950 reports a  $D_0$  of 4.1 e.v. which corresponds to a heat of formation of 64 kcal. mole<sup>-1</sup>. A. G. Gaydon "Dissociation Energies and Spectra of Diatomic Molecules", Chapman and Hall, London 1953, gives essentially the same value, with a rider that the value is unreliable due to the ionic nature of the bonding. R. F. Barrow, Trans. Farad. Soc. 56, 952 (1960) made a critical evaluation of the bond dissociation energies of the Group III halides and concluded  $D_0 \text{ BBr} = 103.5$  which gives  $\Delta H_f^{\circ} = 56 \text{ kcal. mole}^{-1}$ . An estimate of the dissociation energy by taking the ratio  $D(\text{BF})/(\Delta H_f(\text{BF}_3)/3) = 1.177$  and applying this to  $\text{BBr}_3$  yields  $D(\text{BBr}) = 103 \text{ kcal. mole}^{-1}$ , this was the value adopted.

Heat Capacity and Entropy.

The vibrational and rotational constants were all taken from National Bureau Standards Report 7083, Jan. 1, 1962.

Bond Distances: B-Cl = [1.75] Å B-Br = [1.87] Å  
 Bond Angle: Cl-B-Br = [120°]  
 Product of the Moments of Inertia:  $I_A I_B I_C = [2.192176] \times 10^{-114}$  g.<sup>3</sup> cm.<sup>6</sup>  
 $\sigma = 1$

Heat of Formation

The heat of formation was estimated by assuming  $\Delta H_f^\circ = 0$  for the reaction  $BBr_2 + BBr_2 \rightarrow 2BBrCl$ .

Heat Capacity and Entropy

The vibrational frequencies were estimated by comparison with those for  $BBr_2$  and  $BCl_2$ . The bond distances, angles, and quantum weight were assumed the same as in the dihalides. The individual moments of inertia were  $I_A = 1.2997 \times 10^{-39}$  g. cm.<sup>2</sup>,  $I_B = 40.4239 \times 10^{-39}$  g. cm.<sup>2</sup> and  $I_C = 41.7236 \times 10^{-39}$  g. cm.<sup>2</sup>

Bond Distances: B-Cl = 1.73 Å     B-Br = 1.87 Å  
 Bond Angle: Cl-B-Cl = [120°]     Br-B-Cl = [120°]  
 Product of the Moments of Inertia:  $I_A I_B I_C = 9.19303 \times 10^{-113} \text{ g.}^3 \text{ cm.}^6$   
 $\sigma = 2$

Heat of Formation  
 The heat of formation was estimated by assuming  $\Delta H_f^{\circ} = 0$  for the reaction  
 $\text{BBr}_3 + 2\text{BCl}_3 \rightarrow 3\text{BBrCl}_2$

Heat Capacity and Entropy  
 Vibrational frequencies were obtained from L. P. Lindeman and M. K. Wilson, J. Chem. Phys. 24, 242 (1956). The  $\nu_1$  mode was the only unobserved frequency and was calculated from a normal coordinate treatment. Bond distances were reported by T. Wentink and V. H. Tiensau, J. Chem. Phys. 28, 826 (1958). Bond angles were estimated by analogy with the other trihalides of boron. The individual moments of inertia were  $I_A = 26.4242 \times 10^{-39} \text{ g. cm.}^2$ ,  $I_B = 47.2327 \times 10^{-39} \text{ g. cm.}^2$  and  $I_C = 73.6569 \times 10^{-39} \text{ g. cm.}^2$

Heat of Formation:  $\Delta H_f^\circ = 0$  for the reaction  $2BF_3 + BBr_3 \rightarrow 3BBrF_2$ .  
The heat of formation was estimated by assuming  $\Delta H_f^\circ = 0$  for the reaction  $2BF_3 + BBr_3 \rightarrow 3BBrF_2$ .  
Heat Capacity and Entropy.  
All but two of the vibrational frequencies have been observed and assigned by L. P. Lindeman and M. K. Wilson J. Chem. Phys. 24, 242 (1956), the two remaining frequencies were calculated by a normal coordinate treatment. The bond distances were reported by T. Wentink and V. H. Tiemann, J. Chem. Phys. 29, 826 (1958). The bond angles were estimated by analogy with the other boron trihalides. The individual moments of inertia were  $I_A = 7.9349 \times 10^{-39}$  g. cm.<sup>2</sup>,  $I_B = 28.9426 \times 10^{-29}$  g. cm.<sup>2</sup> and  $I_C = 36.8775 \times 10^{-39}$  g. cm.<sup>2</sup>.

Heat of Formation.

The value of  $\Delta H_f^0$  for BOBr (g) was calculated based on an assumption that  $D(\text{BO-Br}) = 92.5 \text{ kcal. mole}^{-1}$  which was estimated by comparison with the following related bond energy values:  $D(\text{BF}_2\text{-F}) = 159$ ,  $D(\text{BO-F}) = 169$ ,  $D(\text{BCl}_2\text{-Cl}) = 105$ ,  $D(\text{BO-Cl}) = 110$  and  $D(\text{BBr}_2\text{-Br}) = 90.5 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The molecular structure was assumed to be linear. The vibrational frequencies ( $\omega$ ) were estimated from the  $\omega$  values calculated by the valence force method described by G. Herzberg, "Infrared and Raman Spectra", D. Van Nostrand Company, Inc., 1945, using estimated force constants,  $k_1 = 4.2 \times 10^5$ ,  $k_2 = 16.9 \times 10^5 \text{ dynes cm.}^{-1}$  and  $k_3 = 0.37 \times 10^{11} \text{ dynes cm. rad.}^{-1}$ . The B-O and B-Br bond distances were assumed to be the same as those in BO(g) and BBr<sub>3</sub>(g), respectively. The moment of inertia is  $2.36357 \times 10^{-36} \text{ g. cm.}^2$ .

Bond Distance: [1.87] Å  
 Bond Angle: [120]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 7.26584 X 10<sup>-114</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The heat of formation was estimated by analogy with BF<sub>3</sub>, specifically the ratio

$$\Delta H_f^o(\text{BX}_3) \approx \text{BX}_2 + X / \Delta H_f^o(\text{BX}_3) \approx B + 3X$$

was taken as 0.337.

Heat Capacity and Entropy.

The vibrational frequencies were obtained from force constants transferred from the trihalide given by G. Herzberg "Infrared and Raman Spectra of Polyatomic Molecules", D. Van Nostrand, Inc., (1945). The bond length was taken between those of the mono and trihalide and the angle was estimated to be the same as that in the trihalides. The ground state quantum weight was taken as two on account of the one unpaired electron.

The individual moments of inertia were I<sub>B</sub> = 1.4708 X 10<sup>-39</sup> g. cm.<sup>2</sup>, I<sub>A</sub> = 69.5532 X 10<sup>-39</sup> g. cm.<sup>2</sup> and I<sub>C</sub> = 71.0640 X 10<sup>-39</sup> g. cm.<sup>2</sup>

Bond Distance: B-Br = 1.87 Å B-Cl = 1.75 Å  
 Bond Angle: Br-B-Br = [120°] Cl-B-Br = [120°]  
 Product of the Moments of Inertia:  $I_A I_B I_C = 2.55478 \times 10^{-112} \text{ g.}^3 \text{ cm.}^2$

Heat of Formation.  
 The heat of formation was estimated by assuming  $\Delta H_f^0 = 0$  for the reaction  
 $2\text{BBr}_3 + \text{BCl}_3 \rightarrow 3\text{BBr}_2\text{Cl}$

Heat Capacity and Entropy.  
 The vibrational frequencies have all been observed and assigned by L. P. Lindeman and M. K. Wilson, J. Chem. Phys., 24, 242 (1956). The bond lengths were reported by T. Wentink and V. H. Tienau, J. Chem. Phys., 26, 826 (1958). Bond angles were estimated by analogy with the other trihalides of boron. Individual moments of inertia are  $I_B = 35.0754 \times 10^{-39} \text{ g. cm.}^2$ ,  $I_A = 69.5934 \times 10^{-39} \text{ g. cm.}^2$  and  $I_C = 104.6668 \times 10^{-39} \text{ g. cm.}^2$ .

Bond Distances: B-Br = 1.87 Å B-Cl = 1.285 Å  
 Bond Angle: Br-B-Br = [120°] Br-B-F = [120°] σ = 2

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 8.72359 X 10<sup>-113</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The heat of formation was estimated by assuming ΔH<sub>f</sub> = 0 for the reaction 2BBr<sub>3</sub> + BF<sub>3</sub> → 3BBr<sub>2</sub>F.

Heat Capacity and Entropy.

Two of the vibrational frequencies were observed and assigned by L. P. Lindeman and M. K. Wilson, J. Chem. Phys. 24, 242 (1956), the remaining frequencies were calculated by a normal coordinate treatment using force constants obtained by comparison with the other mixed trihalides. The bond distances were reported by T. Wentink and V. H. Rieneau, J. Chem. Phys. 28, 826 (1958). The bond angles were estimated by analogy with the other trihalides. The individual moments of inertia were I<sub>B</sub> = 14.8452 X 10<sup>-59</sup> g.<sup>2</sup> cm.<sup>2</sup>, I<sub>A</sub> = 69.5934 X 10<sup>-59</sup> g.<sup>2</sup> cm.<sup>2</sup> and I<sub>C</sub> = 84.4386 X 10<sup>-59</sup> g.<sup>2</sup> cm.<sup>2</sup>

Bond Distance : B-H = 1.20 Å B-Br = [1.87] Å  
 Bond Angle : Br-B-Br = 119.3 ± 2° Br-B-H = 120.3 ± 1°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.08645 X 10<sup>-113</sup> g.<sup>3</sup> cm.<sup>6</sup>  
 σ = 2

Heat of Formation.

The value of ΔH<sub>f</sub><sup>o</sup> 298.15 (BBr<sub>2</sub>H, g) was derived by assuming the B-H bond strength to be 92 kcal. mole<sup>-1</sup>, the same as that in BCl<sub>2</sub>H(g).

Heat Capacity and Entropy.

The molecular structure, B-H bond distance and bond angle were obtained from L. Lynds and C. D. Bass, J. Chem. Phys. 41, 3165 (1964). The B-Br bond distance was taken from that in BBr<sub>3</sub>(g) molecule. The vibrational frequencies adopted and corrected to the average isotopic species were assigned by O. Brioux de Mendivola and J. F. Westerkamp, Spectrochim. Acta, 21, 1101 (1965), from infrared spectrum. The values in brackets are calculated by the Wilson's FG-method. Infrared spectrum of BBr<sub>2</sub>H(g) was also reported by S. K. Mason and R. F. Porter, J. Phys. Chem. 69, 2461 (1965), and three frequencies, ν<sub>1</sub>, ν<sub>4</sub> and ν<sub>5</sub>, were assigned. The three principal moments of inertia are: I<sub>A</sub> = 6.8742 X 10<sup>-38</sup>, I<sub>B</sub> = 2.2244 X 10<sup>-39</sup> and I<sub>C</sub> = 7.10086 X 10<sup>-38</sup> g. cm.<sup>2</sup>

BORON TRIBROMIDE (BBr<sub>3</sub>) (LIQUID) MOL. WT. = 250.568

S<sub>298,15</sub><sup>o</sup> = 54.7 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>f,298,15</sub><sup>o</sup> = -57.0 ± 0.2 kcal. mole<sup>-1</sup>  
 ΔH<sub>f,m</sub><sup>o</sup> = Unknown  
 ΔH<sub>v</sub><sup>o</sup> = 7.30 kcal. mole<sup>-1</sup>

Heat of Formation.

The heat of formation of boron tribromide liquid has been determined by H. A. Skinner and N. B. Smith, Trans. Farad. Soc. 51, 19 (1955) by hydrolysis to H<sub>2</sub>O<sub>3</sub> and HBr. The adopted heat of formation was calculated from Skinner's hydrolysis data using ΔH<sub>f</sub><sup>o</sup> H<sub>2</sub>O<sub>3</sub>(c) from these tables, ΔH<sub>soln</sub> H<sub>2</sub>O<sub>3</sub> from L. G. Fraillino, National Research Corporation Special Report NMR-3608 (OO) June 2, 1964, with the dilution data of J. Smisko and L. S. Mason, J. Am. Chem. Soc. 72, 3679 (1950). The ΔH<sub>f</sub><sup>o</sup> HBr(aq) was taken from W. H. Evans, Appendix III, Natl. Bureau of Standards Report 8504, 1 July 1964.

Heat Capacity and Entropy.

The heat capacity was estimated from that of the gas by K. K. Kelley USRM Bulletin 383. The entropy was back calculated from that of the gas by adjusting the free energy functions to give the best fit of the vapor pressure data.

Melting Data.

The temperature of melting was reported by J. Goubeau and H. Keller, Z. anorg. allgem. Chem. 267, 1 (1951) and A. Stock and E. Kuss, Ber. 47, 3113 (1914). This value was recently confirmed by the triple point measurement of 227.31°K by W. F. Barber, C. F. Boynton and P. E. Gallagher J. Chem. Eng. Data 9, 137 (1964).

Boiling Data.

The boiling point is from the data of Stock and Kuss, loc. cit. A second and third law analysis of the vapor pressure data of Stock and Kusa (1) and Barber et. al. (2) loc. cit. indicated that the data of Stock gave the best agreement as indicated below.

|   | Second Law              | Third Law                |
|---|-------------------------|--------------------------|
| ΔH <sub>v</sub> 298,15 kcal. mole <sup>-1</sup> | S <sub>298</sub> = 54.7 | S <sub>298</sub> = 54.26 |
| Ref. 1.   | 8.175 ± 0.03            | 8.222 (-0.02)            |
| Ref. 2.   | 8.229 ± 0.03            | 8.203 (-0.44)            |

Ref. 1. had the first eight data points rejected due to a statistical test on the third law values. The values in parentheses are values of the third law drift measured as Δ(ΔH) / ΔT. The second law entropy also confirmed the choice of the data of ref. 1 and an entropy of 54.7 cal. deg.<sup>-1</sup> mole<sup>-1</sup>.

Bond Distance: B-Br =  $1.87 \pm 0.02 \text{ \AA}$   
 Bond Angle: Br-B-Br =  $120 \pm 6^{\circ}$   
 Product of the Moments of Inertia:  $I_A I_B I_C = 6.74115 \times 10^{-112} \text{ g.}^3 \text{ cm.}^6$   
 $\sigma = 8$

Heat of Formation.

$\Delta H_f^{\circ} 298$  was obtained from the heat of formation of the liquid plus the heat of vaporization at 298°K, taken as 8.20 kcal. mole<sup>-1</sup> as the average second end third law value derived from the vapor pressures of A. Stock and E. Kluas, Ber. 47, 3113 (1914). See BBr<sub>3</sub>(1) for details.

Heat Capacity and Entropy.

Vibrational frequencies were obtained from T. Wentink, Jr., and V. H. Tiemann, J. Chem. Phys., 25, 825 (1958) modified for the natural isotopic abundances (p10 16.83%, p11 81.17%) given by J. R. Bredford, "Handbook of Chemistry and Physics", Chemical Rubber Publishing Co., 1958. B-Br bond distance was reported by T. Wentink, Jr., and V. H. Tiemann, loc. cit. Br-Br angle was taken from L. E. Sutton (editor), "Tables of Interatomic Distances and Configurations in Molecules and Ions," Special Publication No. 11, The Chemical Society, London, 1958. The individual moments of inertia were  $I_A = I_B = 419.167 \times 10^{-39} \text{ g. cm.}^2$ ,  $I_C = 836.375 \times 10^{-39} \text{ g. cm.}^2$ .

Heat of Formation

The dissociation energy ( $D_0^0$ ) of BCl(g) has been reported by G. Herzberg<sup>1</sup>, A. G. Gaydon<sup>2</sup> and R. F. Barrow<sup>3</sup>, respectively. Hence the corresponding values of  $\Delta H_f^0$  for BCl(g) were derived. The results are given as follows.

| Investigator          | e.v.          | kcal.mole <sup>-1</sup> | $\Delta H_f^0$ kcal.mole <sup>-1</sup> |
|-----------------------|---------------|-------------------------|--|
| Herzberg <sup>1</sup> | 4.2           | 96.9                    | 62.6                                   |

- 1 G. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Company, Inc., New York, 1950.
- 2 A. G. Gaydon, "Dissociation Energies", Chapman and Hall Ltd., London, 1953.
- 3 R. F. Barrow, Trans. Faraday Soc. **56**, 952 (1960).

The last value of  $\Delta H_f^0$  298.15 listed in the above table is adopted. Using the bond energy,  $D^0(\text{B-Cl})$ , obtained from BCl<sub>3</sub>(g) molecule, the heat of formation ( $\Delta H_f^0$  298.15) for BCl(g) was calculated as  $37.8 \text{ kcal mole}^{-1}$  employing the same ratio of  $D^0(\text{B-X})$  / average bond energy of B<sub>3</sub> as found in Bf(g) and Bf<sub>3</sub>(g), which is within the uncertainty of the value evaluated from dissociation energy.

Heat Capacity and Entropy

The spectroscopic constants were obtained from G. Herzberg, loc. cit. and corrected to the average isotopic species. The principal moment of inertia (I) is  $4.0514 \times 10^{-39} \text{ g cm}^2$ .

$\omega_e X_0 = [5] \text{cm}^{-1}$   
 $\sigma_e = 1$   
 $\nu_B = [1.73] \text{Å}$

Heat of Formation

Several values of the appearance potential of BCl<sup>+</sup> from BCl<sub>3</sub> have been reported. Oberghaus (1) gave 19.2eV, Harriott and Craggs (2) reported 18.54 ± 0.07eV, and Koski et al. (3) obtained two values of 17.2 ± 0.2eV and 20 ± 0.2eV. We make the presumption that the higher values, 19.2 and 20, refer to the reaction BCl<sub>3</sub>(g) + e<sup>-</sup> + BCl + 2Cl(g) + 2e<sup>-</sup> and the other values to BCl<sub>3</sub>(g) + e<sup>-</sup> + BCl + Cl<sub>2</sub>(g) + 2e<sup>-</sup>. Using the lower value in each case to help eliminate any excess kinetic energy, we obtain ΔH<sub>f,298</sub><sup>o</sup>(BCl<sup>+</sup>, g) = 289 and 300 kcal/mol, respectively. We adopt an average value of ΔH<sub>f,298</sub><sup>o</sup>(BCl<sup>+</sup>, g) = 295 ± 10 kcal/mol, which corresponds to an ionization potential for BCl(g) of 11.3 ± 0.3eV.

Heat Capacity and Entropy

BCl<sup>+</sup> is isoelectronic with BaCl and the ground state configuration and electronic levels are estimated by comparison with BaCl. The bond length, frequency and anharmonicity constant are estimated between the values for BCl and BCl<sub>2</sub>; the rotational constant is calculated from the bond length and atomic masses, and σ<sub>e</sub> is obtained from the above constants assuming a Morse potential function.

The enthalpy at 0°K is -2.118 kcal/mol.

Bond Distance: B-Cl = [1.73] Å B-F = [1.295] Å  
 Bond Angle: F-B-Cl = [120]°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.81165 X 10<sup>-115</sup>] g.<sup>3</sup> cm.<sup>6</sup>  
 $\sigma = 1$

Heat of Formation.

The value of  $\Delta H_f^o$  298.15 for BClF(g) was estimated based on an assumption that  $\Delta H_f^o = 0$  for the reaction BCl<sub>2</sub>(g) + BF<sub>2</sub>(g) = 2BClF(g). The values of  $\Delta H_f^o$  298.15 of BCl<sub>2</sub>(g) and BF<sub>2</sub>(g), used for calculation, are -20 and -130 kcal. mole<sup>-1</sup>, respectively.

Heat Capacity and Entropy.

The ground state quantum weight and bond angle were assumed to be the same as those for BF<sub>2</sub>(g). The bond distances of B-Cl and B-F were estimated by comparison with those in BCl<sub>3</sub>(g) and BF<sub>3</sub>(g) molecules, respectively. The vibrational frequencies were estimated from the corresponding values for BCl<sub>2</sub>(g) and BF<sub>2</sub>(g). The three principal moments of inertia are: I<sub>A</sub> = 1.48569 X 10<sup>-38</sup>, I<sub>B</sub> = 7.7980 X 10<sup>-40</sup> and I<sub>C</sub> = 1.56367 X 10<sup>-38</sup> g. cm.<sup>2</sup>

Dec. 31, 1960; Mar. 31, 1961; Dec. 31, 1963; Dec. 31, 1964

Point Group = C<sub>2v</sub>

S<sub>298</sub><sup>o</sup>.15 = 65.86 cal. deg.<sup>-1</sup> mole<sup>-1</sup>

Ground State Quantum Weight = 1

ΔH<sub>f</sub><sup>o</sup> = -211 ± 5 kcal. mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup>.298.15 = -211.6 ± 5 kcal. mole<sup>-1</sup>

Vibrational Frequencies and Degeneracies

| ω, cm. <sup>-1</sup> | g        |
|----------------------|----------|
| 1250 (1)             | 1430 (1) |
| 697 (1)              | 366 (1)  |
| 429 (1)              | 600 (1)  |

Bond Distance B-Cl = [1.73] Å B-F = [1.295] Å

Bond Angle: F-B-Cl = [120°] F-B-F = [120°] σ = 2

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 3567.6 X 10<sup>-117</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The values for BCl<sub>2</sub>F and BClF<sub>2</sub> of ΔH<sub>f</sub><sup>o</sup>.298.15 = -154 and ΔH<sub>f</sub><sup>o</sup>.298.15 = -211.6 kcal. mole<sup>-1</sup>, respectively, are obtained from the average bond energies of BF<sub>3</sub> and BCl<sub>3</sub>. The calculated values were each made less negative by about 0.8 kcal. mole<sup>-1</sup> in order to make them consistent with the equilibrium measurements of T. H. Higgins, E. C. Leisegang, C. J. G. Raw, and A. J. Roscow, J. Chem. Phys. 23, 1544 (1955) and S. R. Gunn and R. H. Sanborn, J. Chem. Phys. 33, 955 (1960) for the reaction

Values for the heat of reaction are ΔH<sub>r</sub><sup>o</sup>.298.15 = +1.68 kcal. mole<sup>-1</sup> and ΔH<sub>r</sub><sup>o</sup>.298.15 = 1.1 (uncertainty of -0.5 to +0.6) kcal. mole<sup>-1</sup>, the former calculated from the measured equilibrium constant and the statistical entropy change and the latter obtained from the variation of the equilibrium constant with temperature. Selection of ΔH<sub>r</sub><sup>o</sup>.15 = 1.6 kcal. mole<sup>-1</sup> fixes the sum of the heats of formation of BClF<sub>2</sub> and BCl<sub>2</sub>F as -385.6 kcal. mole<sup>-1</sup>, but it does not determine the individual values. Thus, the selected heats of formation are only as accurate as the average bond energy calculations on which they are based. A reasonable estimate of the uncertainty would be ± 5 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The observed frequencies of L. P. Lindeman and M. K. Wilson, J. Chem. Phys. 24, 242 (1956), were adjusted to the normal isotopic composition of 81.2% <sup>10</sup>B and 18.8% <sup>11</sup>B. The bond angles were assumed to be 120° and the bond lengths were taken to be the same as in the respective trihalides. As a result, the principal moments of inertia are I<sub>A</sub> = 17.6044 X 10<sup>-39</sup>, I<sub>B</sub> = 7.935 X 10<sup>-39</sup>, and I<sub>C</sub> = 25.5394 X 10<sup>-39</sup> g. cm.<sup>2</sup>.

(IDEAL GAS)

BORON OXIDE CHLORIDE (BOCl)

The vapor-phase equilibria existing in the B<sub>2</sub>O<sub>3</sub> + BCl<sub>3</sub> system were determined by an effusion method in the temperature range 1234-1389°K. by J. Blauer and M. Farber, Trans. Faraday Soc. 60, 301 (1964). Based on the equilibrium constants reported for the reaction 1/3 B<sub>2</sub>O<sub>3</sub>(l) + 1/3 BCl<sub>3</sub>(g) = BOCl(g), the second and third law values of ΔH<sub>f</sub><sup>o</sup> 298.15 were evaluated as 57.7 and 56.3 kcal. mole<sup>-1</sup>, respectively. The third law value for ΔH<sub>f</sub><sup>o</sup> 298.15 was adopted for the calculation of the heat of formation (ΔH<sub>f</sub><sup>o</sup> 298.15) for BOCl(g).

BORON OXIDE CHLORIDE (BOCl)

Heat Capacity and Entropy.

(IDEAL GAS)

BORON OXIDE CHLORIDE (BOCl)

The molecular structure was assumed to be linear. The vibrational frequencies (ω<sub>v</sub>) were estimated from the values calculated by the valence force method described by G. Herzberg, "Infrared and Raman Spectra", D. Van Nostrand Company, Inc., 1945, using estimated force constants, k<sub>1</sub> = 5.2 X 10<sup>5</sup>, k<sub>2</sub> = 16.7 X 10<sup>5</sup> dynes cm.<sup>-1</sup> and k<sub>3</sub> = 0.40 X 10<sup>11</sup> dynes cm. rad.<sup>-1</sup>. The B-O and B-Cl bond distances were assumed to be the same as those in B<sub>2</sub>O<sub>3</sub>(g) and BCl<sub>3</sub>(g), respectively. The moment of inertia is 1.6958 X 10<sup>-38</sup> g. cm.<sup>2</sup>

Bond Distances: B-Cl = [1.73] Å

Bond Angle: Cl-B-Cl = [120°]

Product of the Moments of Inertia:  $I_A I_B I_C = [0.49841 \times 10^{-11.5}] \text{ g.}^3 \text{ cm.}^6$

$\sigma = 2$

Heat of Formation.

The heat of formation was estimated by analogy with BF<sub>3</sub>, specifically the ratio was taken as 0.347.

$\Delta H_f^0(\text{BCl}_2) \rightarrow \text{BX}_2 + X / \Delta H_f^0(\text{BX}_3) \rightarrow \text{B} + 3X$

Heat Capacity and Entropy.

The vibrational frequencies were obtained from force constants transferred from the trichloride given by O. Harzberg "Infrared and Raman Spectra of Polyatomic Molecules", D. Van Nostrand, Inc., (1945). The bond length was taken between those of the mono and trichlorides and the angle was estimated to be the same as that in the trichloride. The ground state quantum weight was taken as two on account of the one unpaired electron.

The individual moments of inertia were  $I_B = 1.1661 \times 10^{-39} \text{ g. cm.}^2$ ,  $I_A = 26.4189 \times 10^{-39} \text{ g. cm.}^2$  and  $I_C = 27.5851 \times 10^{-39} \text{ g. cm.}^2$ .

June 30, 1968

(IDEAL GAS)

BORON DICHLORIDE UNIPOSITIVE ION ( $\text{BCl}_2^+$ )

GFW = 81.71645

Point Group [ $D_{\infty h}$ ]

$\Delta H_f^\circ = 147.4 \pm 5$  kcal/mol

$S_{298.15}^\circ = [61.6 \pm 2]$  gibbs/mol

$\Delta H_f^\circ_{298.15} = 148.0 \pm 5$  kcal/mol

Electronic Levels and Quantum Weights

| State       | $\omega_i, \text{cm}^{-1}$ | $g_i$ |
|-------------|----------------------------|-------|
| $1_g^+$     | 0                          | 1     |
| $1_B^-$     | [16000]                    | 1     |
| $1_{A_1}^-$ | [35000]                    | 1     |

Vibrational Frequencies and Degeneracies

| $\omega_i, \text{cm}^{-1}$ |
|----------------------------|
| [500] (1)                  |
| [150] (2)                  |
| [800] (1)                  |

Bond Distance: B-Cl = [1.74] Å

Bond Angle: Cl-B-Cl = [180°]

Rotational Constant:  $B_0 = [0.0785]$   $\text{cm}^{-1}$

$\sigma = 2$

Heat of Formation

The appearance potential (AP) of the positive ion fragment  $\text{BCl}_2^+$  (g) from  $\text{BCl}_3$  (g) was determined mass spectrometrically by Oberbaugh (1), Marriott (2), and Koski (3) as  $13.2 \pm 0.5$ ,  $13.01 \pm 0.02$ , and  $11.8 \pm 0.2$  eV, respectively. From the reaction  $\text{BCl}_3 + e^- = \text{BCl}_2 + \text{Cl} + 2e^-$ , the corresponding values of  $\Delta H_f^\circ$  for  $\text{BCl}_2^+$  (g) are derived to be  $180.4 \pm 11.5$ ,  $176.0 \pm 0.5$ , and  $148.1 \pm 4.6$  kcal/mol, using  $\Delta H_f^\circ = -96.078$  and  $28.520$  kcal/mol for  $\text{BCl}_3$  (g) and  $\text{Cl}$  (g). The value of  $\Delta H_f^\circ$  for  $\text{BCl}_2^+$  (g) is adopted as  $148 \pm 5$  kcal/mol, since the lowest value is likely to have the least excess kinetic energy in the fragments.

Heat Capacity and Entropy

The molecular structure is assumed to be linear using the Walsh (4) predictions for 16 valence electron  $\text{XY}_2$  molecules. The electronic states, levels and vibrational frequencies are estimated by comparison with those for  $\text{CO}_2$  (5). The B-Cl bond distance is estimated using the method of Krasnov (6). The moment of inertia is  $3.564 \times 10^{-38}$  g  $\text{cm}^2$ . The enthalpy at 0°K is  $-3.07$  kcal/mol.

|-------------------------------|
| [740] (1)                     |
| [245] (1)                     |
| [990] (1)                     |

Bond Distance: B-Cl = [1.74] Å  
Bond Angle: Cl-B-Cl = [120°]  
Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [8.788 × 10<sup>-41</sup>] g<sup>3</sup> cm<sup>6</sup>  
σ = 2

Heat of Formation

The electron captured by BCl<sub>2</sub> should go into a non-bonding orbital according to the correlation diagrams of Walsh (1), thus one expects a small electron affinity. In fact one reasonable estimate of the dissociation energy yields a negative electron affinity (EA). Consider the isoelectronic reactions BCl<sub>2</sub><sup>-</sup> → B<sup>-</sup> + 2Cl and CCl<sub>2</sub> → C + 2Cl, if we make the assumption that these binding energies are the same then ΔHf<sub>298</sub>(BCl<sub>2</sub><sup>-</sup>, g) = 12 kcal/mol or EA(BCl<sub>2</sub><sup>-</sup>) = -32 kcal. Another possible estimate is obtained from the isoelectronic reactions BCl<sub>2</sub><sup>-</sup> + BCl + Cl<sup>-</sup> → BCl<sub>3</sub> + Cl<sup>-</sup> + Ar, although the latter reaction is unknown we expect a zero bond strength; applying this to the first reaction yields ΔHf<sub>298</sub>(BCl<sub>2</sub><sup>-</sup>, g) = -22 kcal/mol or EA(BCl<sub>2</sub><sup>-</sup>) = 2 kcal. In consideration of the above arguments we choose EA(BCl<sub>2</sub><sup>-</sup>) = 6 kcal (2) which gives ΔHf<sub>298</sub>(BCl<sub>2</sub><sup>-</sup>, g) = -26 kcal/mol.

Heat Capacity and Entropy

The molecular structure is assumed to be bent using the correlations of A. D. Walsh (1) for 18 valence electron XY<sub>2</sub> molecules. The B-Cl bond distance is estimated using the method of Krasnov (2). The Cl-B-Cl bond angle is taken as 120°. The electronic levels, quantum weights and vibrational frequencies are estimated by comparison with those for CF<sub>2</sub>(1) and other related isoelectronic molecules. The three principal moments of inertia are I<sub>A</sub> = 1.179 × 10<sup>-39</sup>, I<sub>B</sub> = 2.873 × 10<sup>-38</sup> and I<sub>C</sub> = 2.791 × 10<sup>-38</sup> g cm<sup>2</sup>. The enthalpy at 0°K is -2.76 kcal/mol.

Bond Distance: B-Cl = [1.75] Å B-F = [1.295] Å

Bond Angle: Cl-B-Cl = [120°] F-B-Cl = [120°]

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 12020 X 10<sup>-117</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The values for BCl<sub>2</sub>F and BClF<sub>2</sub> of ΔH<sub>f</sub><sup>0</sup> 298.15 = -154 and ΔH<sub>f</sub><sup>0</sup> 298.15 = -211.6 kcal. mole<sup>-1</sup>, respectively, are obtained from the average bond energies of BF<sub>3</sub> and BCl<sub>3</sub>. The calculated values were each made less negative by about 0.8 kcal. mole<sup>-1</sup> in order to make them consistent with the equilibrium measurements of T. H. S. Higgins, E. C. Betagang, C. J. G. Raw, and A. J. Rosanow, J. Chem. Phys. 23, 1544 (1955) and S. R. Ounn and R. H. Sanborn, J. Chem. Phys. 33, 955 (1960) for the reaction

Values for the heat of reaction are ΔH<sub>r</sub><sup>0</sup> 298.15 = +1.68 kcal. mole<sup>-1</sup> and ΔH<sub>r</sub><sup>0</sup> 298.15 = 1.1 (uncertainty of -0.5 to +0.8) kcal. mole<sup>-1</sup>, the former calculated from the measured equilibrium constant and the statistical entropy change and the latter obtained from the variation of the equilibrium constant with temperature. Selection of ΔH<sub>r</sub><sup>0</sup> 298.15 = 1.6 kcal. mole<sup>-1</sup> fixes the sum of the heats of formation of BCl<sub>2</sub>F and BClF<sub>2</sub> as -365.6 kcal. mole<sup>-1</sup>, but it does not determine the individual values. Thus, the selected heats of formation are only as accurate as the average bond energy calculations on which they are based. A reasonable estimate of the uncertainty would be ± 5 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The spectroscopic constants are based on the work of L. P. Lindeman and M. K. Wilson, J. Chem. Phys. 24, 242 (1956), who observed ν<sub>1</sub>, ν<sub>2</sub>, ν<sub>3</sub>, and ν<sub>4</sub>, and calculated ν<sub>1</sub>, ν<sub>2</sub>, ν<sub>3</sub>, and ν<sub>5</sub>. The frequencies were adjusted to the normal isotopic composition of 61.2% <sup>10</sup>B and 38.8% <sup>11</sup>B. The bond angles were taken to be 120° while the bond lengths were assumed to be the same as in the respective trihalides. As a result, the principal moments of inertia are I<sub>A</sub> = 11.8748 X 10<sup>-39</sup>, I<sub>B</sub> = 26.4268 X 10<sup>-39</sup>, and I<sub>C</sub> = 38.3016 X 10<sup>-39</sup> g. cm.<sup>2</sup>.

Bond Distances: B-H = 1.13 ± 0.2 Å B-Cl = [1.75] Å

Bond Angle: Cl-B-H = 119.7 ± 3° Cl-B-H = 120.15 ± 1.5°

Product of the Moments of Inertia:  $I_A I_B I_C = 1.39215 \times 10^{-114} \text{ g. cm.}^6$

Heat of Formation.

The chemical equilibria for the following two reactions: (A)  $\text{BCl}_3(\text{g}) + \text{H}_2(\text{g}) = \text{BHC}_2(\text{g}) + \text{HCl}(\text{g})$ , and (B)  $2\text{BCl}_2(\text{g}) = \text{B}_2\text{H}_6(\text{g}) + 4\text{BCl}_3(\text{g})$ , were investigated by (1) J. H. Murib, D. Horvitz, and C. A. Bonecutter, Ind. Eng. Chem. Prod. Res. Develop., 2, 275 (1963); (2) P. H. Mook, O. R. Seiler, and E. R. Matson, "Process Development, Preplant and Pilot Plant Investigations - High Energy Boron Fuels," ASDR 62-7-558 A, Vol. IV, March 1962; and (3) L. Lynda and C. D. Bass, Inorg. Chem., 3, 1147 (1964). Using the reported equilibrium constants, the corresponding enthalpy changes and the respective  $\Delta H_f^\circ$  values were evaluated. The results obtained are presented as follows.

| Reaction | Temperature, °K. | Third Law Value | Second Law Value | References |
|----------|------------------|-----------------|------------------|------------|
| A        | 873 - 973        | 16.19           | 15.57 ± 0.8      | (1)        |
| A        | 1073 - 1273      | 13.81           | 13.50 ± 3.0      | (2)        |
| B        | 273              | -17.85          | -59.6            | (1)        |
| B        | 298              | -19.09          | -59.4            | (3)        |

\*Based on the third law value of  $\Delta H_f^\circ$  298.15°

The value of  $\Delta H_f^\circ$  298.15 for  $\text{BHC}_2(\text{g})$  is selected as  $-59.3 \pm 1 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The molecular structure, B-H bond distance and Cl-B-Cl bond angle were obtained from L. Lynda and C. D. Bass, J. Chem. Phys., 40, 1590 (1964). The B-Cl bond distance was assumed to be the same as that in  $\text{BCl}_3(\text{g})$ . The vibrational frequencies adopted were reported by C. D. Bass, L. Lynda, T. Wolfram, and R. E. DeWames, J. Chem. Phys., 40, 3511 (1964), and corrected to the average isotopic species. It has been pointed out that the complete assignment of the infrared spectra of  $\text{BHC}_2(\text{g})$  is quite difficult due to the unavoidable presence of  $\text{BCl}_3(\text{g})$ . The adopted frequencies were obtained using the Green's function and partitioning techniques, taking  $\text{BHC}_2$  as an "isotopic" species of  $\text{BCl}_3$ . An excellent agreement between the calculated and observed spectra reported by L. Lynda and C. D. Bass, loc. cit. was claimed. Spectra of the mixture of  $\text{BCl}_3$ ,  $\text{HBCl}_2$ , and  $\text{DBC}_2$  are quite complex and have been observed by L. Lynda and D. R. Stern, J. Am. Chem. Soc., 81, 5006 (1959), H. O. Nadeau and D. M. Oaka, Jr., Anal. Chem., 32, 1481 (1961), and H. W. Mayers and R. F. Putnam, Inorg. Chem., 2, 855 (1963) and only three bands were correlated with  $\text{HBCl}_2$ . Analysis of infrared data from previous works, according to the conventional Wilson's method of symmetry coordinates, has been undertaken by O. B. de Mandrola and J. P. Westerkamp, Spectrochim. Acta, 20, 1633 (1964). Based on four observed frequencies, a set of six frequencies was derived and assigned. The three principal moments of inertia are:  $I_A = 2.6980 \times 10^{-38}$ ,  $I_B = 1.7957 \times 10^{-35}$  and  $I_C = 2.87557 \times 10^{-38} \text{ g. cm.}^2$

Point Group D<sub>3h</sub>  
 $\Delta H_f^\circ = 69.328 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^\circ = -96.08 \pm 0.50 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^\circ = -96.31 \pm 0.50 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^\circ = 298.15$   
Ground State Quantum Weight = 1

Bond Distance: B-Cl = 1.75 Å  
Bond Angle: Cl-B-Cl = 120°  
Product of the Moments of Inertia:  $I_A I_B I_C = 3.95517 \times 10^{-113} \text{ g.}^3 \text{ cm.}^6$   
 $\sigma^- = 6$

Heat of Formation.

The enthalpy change ( $\Delta H_f^\circ$ ) of the reaction  $B(\text{amorph}) + 3/2 \text{ Cl}_2(\text{g}) = \text{BCl}_3(\text{g})$  has been determined in a calorimeter by W. H. Johnson, R. G. Miller and E. J. Prosen, *J. Res. Natl. Bur. Std.* **62**, 213 (1959). From the reported value,  $\Delta H_f^\circ = -97.51 \pm 0.32 \text{ kcal. mole}^{-1}$ , the heat of formation ( $\Delta H_f^\circ$ ) for  $\text{BCl}_3(\text{g})$  was derived as  $-86.31 \pm 0.50 \text{ kcal. mole}^{-1}$ , using  $\Delta H_f^\circ = 1.20 \pm 0.40 \text{ kcal. mole}^{-1}$  for the reaction  $B(\text{c}) = B(\text{amorph})$ . Some other related heats of reaction reported by previous investigators are presented as follows.

| Investigator                      | Reaction  | $\Delta H_f^\circ$ , kcal. mole <sup>-1</sup> |
|-----------------------------------|---|---|

The heats of formation for  $\text{BCl}_3(\text{l})$  derived from the heats of hydrolysis reported by other investigators were reviewed by W. H. Johnson, R. O. Miller and E. J. Prosen, *loc. cit.*

**Heat Capacity and Entropy.**

The bond distance of B and Cl atoms has been reported to be  $1.73 \pm 0.02$ ,  $1.76 \pm 0.02$  and  $1.75 \text{ Å}$  by H. A. Levy and L. O. Brockway, *J. Am. Chem. Soc.* **59**, 2085 (1937), A. H. Gregg, O. C. Hampson and O. I. Jenkins, *P. L. F. Jones and L. E. Sutton, Trans. Faraday Soc.* **53**, 852 (1957), and C. Spencer and W. N. Lipscomb, *J. Chem. Phys.* **29**, 355 (1958), respectively. The last value is adopted. The values of vibrational frequencies used were reported by L. P. Lindeman and M. K. Wilson, *J. Chem. Phys.* **24**, 242 (1956). The vibrational frequencies were also determined by A. B. D. Ceasari, *Proc. Roy. Soc. A* **148**, 87 (1935), T. F. Anderson, E. N. Lasseter and D. M. Yost, *J. Chem. Phys.* **4**, 703 (1936), and R. E. Scruby, J. R. Lacher and J. D. Park, *J. Chem. Phys.* **19**, 386 (1951). The molecular structure was given by H. A. Levy, *et al.*, *loc. cit.* The three principal moments of inertia are:  $I_A = I_B = 2.7042 \times 10^{-38}$  and  $I_C = 5.4085 \times 10^{-38} \text{ g. cm.}^2$

Heat of Formation

The equilibria of the reaction  $2/3 \text{ B(c)} + 1/3 \text{ BF}_3(\text{g}) = \text{BF}(\text{g})$  were studied by J. Blauer, M. A. Greenbaum and M. Farber, by means of transpiration at pressures below  $300 \mu$ . The values of  $\log K_p$  at 1375 and 1476°K. were reported as  $-3.99 \pm 0.02$  and  $-3.30 \pm 0.05$ , respectively. By the third law method the value of  $\Delta H_f^{298.15}$  for the reaction was derived to be  $61.38 \text{ kcal. mole}^{-1}$ , yielding  $\Delta H_f^{298.15} = -28.7 \pm 2.6 \text{ kcal. mole}^{-1}$  for  $\text{BF}(\text{g})$ . The system  $\text{B} + \text{CaF}_2$  was studied mass spectrometrically in a graphite Knudsen cell by D. L. Hildenbrand. The equilibria involving  $\text{BF}(\text{g})$  were observed. Intensity measurements were made at temperatures, 1583-1754°K. From the third law value,  $\Delta H_f^{298.15} = 12.2 \pm 0.3 \text{ kcal. mole}^{-1}$ , for the reaction  $\text{BF}_3(\text{g}) + \text{Ca}(\text{g}) = \text{BF}(\text{g}) + \text{CaF}_2(\text{g})$ , the value of  $\Delta H_f^{298.15}$  for  $\text{BF}(\text{g})$  was derived as  $-26.7 \pm 2 \text{ kcal. mole}^{-1}$ . The dissociation energy ( $D_0$ ) of  $\text{BF}(\text{g})$  molecule has been reported by O. Herzberg, A. G. Gaydon, and R. F. Barrow, respectively. Hence the corresponding values of  $\Delta H_f^{298.15}$  for  $\text{BF}(\text{g})$  were derived. The results are compared with those obtained from equilibrium data as follows.

- O. Herzberg, Spectra of Diatomic Molecules, D. Van Nostrand Company, New York, 1950.  $\Delta H_f^{298.15}$  was calculated based on  $D_0 = 185 \text{ kcal. mole}^{-1}$ .
- A. G. Gaydon, "Dissociation Energies", Chapman and Hall Ltd., London, 1953.  $\Delta H_f^{298.15}$  was derived from  $D_0 = 8.5 \pm 0.5 \text{ e.v.}$
- R. F. Barrow, Trans. Faraday Soc. 56, 952 (1960).  $\Delta H_f^{298.15}$  was calculated based on  $D_0 = 185 \text{ kcal. mole}^{-1}$ .
- P. Oross, C. Gayman, D. L. Levi and R. H. Lewin, "Stability of Lower Boron Halides", Final Technical Report, August 24, 1963, Fluorine Research Institute Limited, England. The reported value,  $\Delta H_f^{298.15} = -28 \pm 3 \text{ kcal. mole}^{-1}$ , is a preliminary estimated one.
- D. L. Hildenbrand, "Thermodynamic Properties of Propellant Combustion Products", QLR-65-3, Philco Corporation, California.

The value of  $\Delta H_f^{298.15}$  adopted is the average of the first and last  $\Delta H_f^{298.15}$  values listed in the above table.

Heat Capacity and Entropy

The spectroscopic constants used were obtained from R. Onaka, J. Chem. Phys. 21, 374 (1957) and corrected to the average isotopic species. Spectroscopic constants for  $\text{BF}(\text{g})$  are also reported by O. Herzberg, loc. cit. The moment of Inertia ( $I$ ) is  $1.8321 \times 10^{-39} \text{ g. cm.}^2$

Bond Distance: B-P = [1.30] Å B-O = [1.20] Å  
 Bond Angle: O-B-P = [180°]  
 B<sub>0</sub> = [0.30393] cm.<sup>-1</sup>

Heat of Formation  
 The equilibrium constants for the reaction B<sub>2</sub>O<sub>3</sub>(l) + BF<sub>3</sub>(g) = 3BOF(g) in the temperature range 1054-1253°K. were determined by M. Parber and J. Blauer, Trans. Faraday Soc. 59, 2080 (1962), using the so-called Molecular Flow Reaction Method. The value of ΔH<sub>f</sub><sup>0</sup> for this reaction was evaluated by both the second and third law methods, using the equilibrium constants corrected for the trimer and correcting K<sub>p</sub> at 1200°K. from 9.6 X 10<sup>-11</sup> to 9.6 X 10<sup>-10</sup>. D. L. Hildenbrand, L. P. Theard and A. M. Saul, J. Chem. Phys. 39, 1973 (1963) analyzed the vapor above mixture of MgP<sub>2</sub> and B<sub>2</sub>O<sub>3</sub> contained in a Knudsen cell with a mass spectrometer and found that in the temperature range 980-1230°K. the vapor is composed of BF<sub>3</sub>(g), (BOF)<sub>2</sub>(g) and BOF(g) species. From the reported temperature dependence of appropriate ion intensities the enthalpy change of the reaction (BOF)<sub>2</sub>(g) = 3BOF(g) was derived by the second law method as 127.9 kcal. mole<sup>-1</sup> at 1115°K. or 129.75 kcal. mole<sup>-1</sup> at 298.15°K. The results obtained are presented as follows, using JANAP free energy functions and auxiliary data.

Investigator Parber and Blauer  
 Reaction B<sub>2</sub>O<sub>3</sub>(l) + BF<sub>3</sub>(g) = 3BOF(g)  
 Hildenbrand, et al. (BOF)<sub>2</sub>(g) = 3BOF(g)  
 Calculation based on the third law value and one point rejected due to statistical test.  
 The adopted value of ΔH<sub>f</sub><sup>0</sup> 298.15 for BOF(g) is the weighted average of the two ΔH<sub>f</sub><sup>0</sup> 298.15 values listed above.

Heat Capacity and Entropy  
 The molecular structure was assumed to be linear. The vibrational frequencies (Δ) were estimated from the Δ values calculated by the valence force method described by G. Herzberg, "Infrared and Raman Spectra", D. Van Nostrand Company, Inc., 1945, using estimated force constants, k<sub>1</sub> = 10 X 10<sup>5</sup>, k<sub>2</sub> = 25.6 X 10<sup>5</sup> dynes cm.<sup>-1</sup> and k<sub>3</sub> = 0.47 X 10<sup>-11</sup> dynes cm. rad.<sup>-1</sup>. The B=O and B-P bond distances were assumed to be the same as those in BO(g) and BP<sub>3</sub>(g) molecules. The moment of inertia is 9.0464 X 10<sup>-39</sup> g. cm.<sup>2</sup>.

Heat of Formation

The heat of formation ( $\Delta H_f^o 298.15$ ) was obtained from J. L. Margrave, J. Phys. Chem. **66**, 1209 (1962), from appearance potentials.

Heat Capacity and Entropy

The bond distance and angle were assumed to be the same as those in BF<sub>3</sub>(g) molecule. The vibrational frequencies were calculated using force constants transferred from those for BF<sub>3</sub>(g) given by G. Herzberg, "Infrared and Raman Spectra of Polyatomic Molecules", D. Van Nostrand, Inc., 1945. The three principal moments of inertia are:  $I_A = 7.9278 \times 10^{-39}$ ,  $I_B = 5.8710 \times 10^{-40}$  and  $I_C = 8.5149 \times 10^{-39}$  g. cm.<sup>2</sup>

Heat of Formation

The electron impact reaction at low pressure in BF<sub>3</sub>(g) has been studied with a mass spectrometer by Osberghaus (1), Law (2), and Harriott (3). From the reported appearance potentials 17.0 ± 0.5, 16.2 ± 0.2, and 16.7 ± 0.05 eV and assumed process BF<sub>2</sub><sup>+</sup> + e = BF<sub>2</sub> + F + 2e, we calculate the corresponding values of  $\Delta H^{\circ}_{298}$  (BF<sub>2</sub><sup>+</sup>, g) as 102.8 ± 11.5, 84.4 ± 4.6, and 83.7 ± 1.2 kcal/mol, using  $\Delta H^{\circ}_0 = 270.977$  and 18.357 kcal/mol for BF<sub>3</sub>(g) and F(g). The adopted value of  $\Delta H^{\circ}_{298}$  for BF<sub>2</sub><sup>+</sup>(g) is 84 ± 2 kcal/mol, since the lower values are likely to have the least excess kinetic energy in the fragments.

Heat Capacity and Entropy

The molecular structure is assumed to be linear using the Walsh (4) prediction for 16 valence electron XY<sub>2</sub> molecules. The electronic states and levels, and vibrational frequencies are estimated by comparison with those for CO<sub>2</sub>(g). The B-F bond distance is calculated by the method recommended by Krasnov (5). The moment of inertia is 1.083 × 10<sup>-39</sup> g cm<sup>2</sup>. The enthalpy at 0°K is -2.54 kcal/mol.

$\sigma = 2$

Heat of Formation

The electron captured by BF<sub>2</sub> should go into a non-bonding orbital according to the correlation diagrams of Welsh (1), thus we would expect a small electron affinity. Two estimates of the dissociation energy of BF<sub>2</sub><sup>-</sup> indicate a negative electron affinity (EA); consider the isoelectronic reactions BF<sub>2</sub><sup>-</sup> + B<sup>+</sup> + 2F + C + 2F → C + 2F. If we make the reasonable assumption that the atomization energies are the same then  $\Delta H_f^{298}(\text{BF}_2^-) = -86 \text{ kcal/mol}$ , or  $\text{EA}(\text{BF}_2^-) = -44 \text{ kcal}$ . Another approach is to consider the isoelectronic reactions BF<sub>2</sub><sup>-</sup> + BF + F<sup>-</sup> and BF<sub>2</sub> + BF + Ne, although the latter reaction is unknown we would expect zero bond strength, and if used in the first reaction this yields  $\Delta H_f^{298}(\text{BF}_2^-) = -90 \text{ kcal/mol}$ , or  $\text{EA}(\text{BF}_2^-) = -40 \text{ kcal}$ .

In consideration of the above we choose  $\text{EA}(\text{BF}_2^-) = 6 \text{ kcal/g}$ , which gives  $\Delta H_f^{298}(\text{BF}_2^-) = -136 \text{ kcal/mol}$ .

Heat Capacity and Entropy

The molecular structure and B-F bond distance are assumed to be the same as those for the BF<sub>2</sub>(g) molecule. The electronic levels, quantum heights and vibrational frequencies are estimated by comparison with those for CF<sub>2</sub>(g) which is isoelectronic with BF<sub>2</sub><sup>-</sup>. The three principal moments of inertia are: I<sub>A</sub> = 5.904 x 10<sup>-40</sup>, I<sub>B</sub> = 7.997 x 10<sup>-39</sup> and I<sub>C</sub> = 8.587 x 10<sup>-39</sup> g cm<sup>2</sup>. The enthalpy at 0°K is -2.52 kcal/mol.

Bond Distances: B-H = 1.15 Å B-F = 1.30 ± 0.15 Å  
 Bond Angle: F-B-F = 120 ± 5° F-B-H = 120 ± 2.5°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 7.5168 X 10<sup>-116</sup> g.<sup>3</sup> cm.<sup>3</sup>

σ = 2

Heat of Formation.

The equilibrium pressures at 298 and 360° K. for the reaction 1/6 B<sub>2</sub>H<sub>6</sub>(g) + 2/3 BF<sub>3</sub>(g) = HBF<sub>2</sub>(g) were determined by R. F. Porter and S. K. Mason, J. Phys. Chem. 69, 2208 (1965). By the third law method, the enthalpy change was evaluated to be 3.06 ± 0.35 kcal. mole<sup>-1</sup>. Based on the values of ΔH<sub>f</sub><sup>0</sup> 298.15 for B<sub>2</sub>H<sub>6</sub>(g) and BF<sub>3</sub>(g) as 9.8 and -270.1 kcal. mole<sup>-1</sup>, respectively, the heat of formation for HBF<sub>2</sub>(g) was derived to be -175.4 ± 0.8 kcal. mole<sup>-1</sup>. The drift in the third law heat of reaction is 3.6 e.u.

Heat Capacity and Entropy.

The infrared spectrum of HBF<sub>2</sub>(g) has been observed by the following investigators:  
 T. D. Coyle, J. J. Ritter and T. C. Farrer, Proc. Chem. Soc. 25 (1964).  
 M. Perce and L. N. Becke, J. Chem. Phys. 43, 721 (1965).  
 L. Lynds, J. Chem. Phys. 42, 1124 (1965).  
 R. F. Porter and S. K. Mason, J. Phys. Chem. 69, 2208 (1965).

The vibrational frequencies, except ν<sub>5</sub>, were obtained from Porter and Mason, and corrected to the average isotopic species. The value of ν<sub>5</sub> was estimated by comparison with the same value reported by other investigators. The molecular structure, bond distances and angle were obtained from Perce and Becke, loc. cit. The three principal moments of inertia are: I<sub>A</sub> = 7.9859 X 10<sup>-39</sup>, I<sub>B</sub> = 1.0404 X 10<sup>-39</sup> and I<sub>C</sub> = 9.0362 X 10<sup>-39</sup> g. cm.<sup>2</sup>

The vibrational-rotational spectrum of HBF<sub>2</sub>(g) has been studied by L. Lynds and C. D. Bass, J. Chem. Phys. 43, 4357 (1965). The values of ν<sub>1</sub>, ν<sub>2</sub>, ν<sub>3</sub> and ν<sub>6</sub> were assigned as 1164.2, 2620.8, 541.5 and 923.5 cm.<sup>-1</sup>, respectively, which are in fair agreement with the adopted values reported by Porter and Mason, loc. cit.

| [1250](1)                            | [480](1)                             |

Bond Distance: B-F = [1.30] Å B-O = [1.36] Å O-H = [0.96] Å

Bond Angle: F-B-F = [120]° F-B-O = [120]° B-O-H = [105]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [1.05094 X 10<sup>-114</sup>] g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation: ΔH<sub>f</sub><sup>o</sup> 298.15 was calculated based on an assumption that ΔH<sub>f</sub><sup>o</sup> 298.15 = 0 for the reaction 2/3 BF<sub>3</sub>(g) + 1/3 B(OH)<sub>3</sub>(g) = BOHF<sub>2</sub>(g).

Heat Capacity and Entropy.

The vibrational frequencies were obtained from J. S. Gordon, Astrocytems International, Inc., private communication, November 2, 1962. The B-F and O-H bond distances were assumed to be the same as those in BF<sub>3</sub>(g) and H<sub>2</sub>O(g) molecules, respectively. The B-O bond distance and the bond angles were estimated from related molecules. The three principal moments of inertia are: I<sub>A</sub> = 7.8114 X 10<sup>-39</sup>, I<sub>B</sub> = 8.3533 X 10<sup>-39</sup> and I<sub>C</sub> = 1.61447 X 10<sup>-38</sup> g. cm.<sup>2</sup>

Bond Distance: B-F = 1.30 ± 0.05 Å

Bond Angle: F-B-O = 117 ± 5°

B-O = 1.40 ± 0.05 Å

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 9.9464 × 10<sup>-115</sup> g<sup>3</sup> cm<sup>6</sup>

σ = 2

Heat of Formation

The molecule BF<sub>2</sub>O(g) is similar to BO<sub>2</sub>(g) in that both have an extra electron. Based on an assumption that D°(F<sub>2</sub>B-O) = D°(OB-O) = 10 = 134.3 kcal/mol, where the quantity -10 kcal/mol is estimated as the resonance stabilization energy in BO<sub>2</sub>(g), the heat of formation (ΔHf°<sub>298,15</sub>) for BF<sub>2</sub>O(g) is calculated to be -208 kcal/mol.

Assuming D°(F<sub>2</sub>BO-H) = D°(HO-H) = 118 kcal/mol, the value of ΔHf°<sub>298,15</sub>(F<sub>2</sub>BO,g) is evaluated as -191.6 kcal/mol, using ΔHf° = 51.65 and -257.35 kcal/mol for H(g) and F<sub>2</sub>BOH(g), respectively.

The value of ΔHf°<sub>298,15</sub> for BOF<sub>2</sub>(g) is tentatively adopted as -200 ± 15 kcal/mol.

Heat Capacity and Entropy

The 4465-Å emission spectrum was observed in a discharge through BF<sub>3</sub> and O<sub>2</sub> by C. W. Mathews, J. Mol. Spectry, **19**, 203 (1956). The emitter of the discharge was shown to be either the planar BOF<sub>2</sub> molecule or molecule-ion BOF<sub>2</sub><sup>+</sup>. No experimental evidence has been found to distinguish between them. The molecular structure, bond distances and angles were reported by Mathews, based on a rotational analysis of the emission spectrum. These values are adopted here.

Three vibrational frequencies for both <sup>11</sup>B<sup>16</sup>O<sub>2</sub> and <sup>10</sup>B<sup>16</sup>O<sub>2</sub> molecules (or ions) were determined by vibrational analysis of the 5800 - Å bands of the emission spectrum by C. W. Mathews and K. K. Innes, J. Mol. Spectry, **15**, 199 (1955). These values are corrected to the average isotopic species and adopted. The last three frequencies are estimated from values calculated by the valence-force method, using force constants transferred from CO<sub>2</sub>(g).

The ground state quantum weight is taken as 2 because of the extra electron. The other two electronic levels are estimated from the band systems at 5800 and 4465 Å, assuming that two systems have a common lower state, i.e. the ground state.

The three principal moments of inertia are: I<sub>A</sub> = 8.4647 × 10<sup>-39</sup>, I<sub>B</sub> = 7.4045 × 10<sup>-39</sup> and I<sub>C</sub> = 1.5869 × 10<sup>-38</sup> g cm<sup>2</sup>.

Boron Trifluoride (BF<sub>3</sub>)  
(Ideal Gas)

Point Group D<sub>3h</sub>  
S<sub>298.15</sub> = 60.77 ± 0.01 gibbs/mol  
Ground State Quantum Weight = 1

ΔH<sub>f,0</sub><sup>o</sup> = -270.7 ± 0.4 kcal/mol  
ΔH<sub>f,298.15</sub><sup>o</sup> = -271.42 ± 0.4 kcal/mol

Vibrational Frequencies and Degeneracies

Bond Distance: B-F = 1.307 ± 0.002 Å  
Bond Angle: F-B-F = 120°  
Products of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 1.0563 × 10<sup>-114</sup> g<sup>3</sup> cm<sup>6</sup> σ = 6

Heat of Formation

The adopted heat of formation was selected by a simultaneous adjustment of several interrelated pieces of data relating to the heat of formation of HF (see HF, § table 12-31-56). The data which were considered relating directly to BF<sub>3</sub> were as follows.  
A. NF<sub>3</sub>(g) + B(C, β) + BF<sub>3</sub>(g) + 0.5 H<sub>2</sub> ΔH<sub>r,298</sub><sup>o</sup> = -231.46 ± 1.2 kcal/mol  
Ludwig and Cooper (1) report the above value after correction for 0.44 percent impurities in the boron. As much as 5 percent unburned boron was determined by analysis.

B. 1.5 F<sub>2</sub>(g) + B(C, β) + BF<sub>3</sub>(g)  
Wise et al. (2) originally reported ΔH<sub>r,298</sub><sup>o</sup> = -270.1 ± 0.24 kcal/mol but later reanalysis (3) of the impurities and due allowance for their effect changed this to -271.6 ± 0.9 kcal/mol. Johnson et al. (3) using zone refined boron obtained ΔH<sub>r,298</sub><sup>o</sup> = -271.65 ± 0.22 kcal/mol after correction for 0.12 percent impurities. Domalski and Armstrong (4) obtained ΔH<sub>r,298</sub><sup>o</sup> = -271.03 ± 0.51 kcal/mol from a combustion in the presence of Teflon, the boron contained 0.32 percent impurities and corrections were included. The above reaction constituted about 0.35 of the total energy measured. The measurements of Gross et al. (5), although on a zone refined sample, did not include a complete purity analysis and their data were not included since probable impurities could introduce serious errors.

C. 3HF(50 H<sub>2</sub>O) + B(C, β) + 0.75 O<sub>2</sub>(g) + BF<sub>3</sub>(g) + 1.5 H<sub>2</sub>O(l)  
From the measurements of Gunn (6) on the reaction of BF<sub>3</sub>(g) + 15.67 HF(3.747 H<sub>2</sub>O) + [solution] and Good and Hanson (7) for the reaction B(C, β) + 0.75 O<sub>2</sub>(g) + 18.57 HF(3.065 H<sub>2</sub>O) + [solution] + 1.5 H<sub>2</sub>O(l), where this resulting solutions have the same composition, we obtain ΔH<sub>r,298</sub><sup>o</sup> = -142.77 ± 0.5 kcal/mol. Further details of the simultaneous solution are given by Syverud (8).

Heat Capacity and Entropy

The fundamental frequencies were selected from the measurements of Lindeman and Wilson (9), McKean (10), Nielsen (11), Anderson et al. (12) and Yost et al. (13). The bond lengths and structure are those reported by Gin et al. (14) which are in agreement with those of Kuchitsu and Konaka (15) from gas phase electron diffraction. These measurements disagree with the earlier determinations of Nielson (11) and Levy and Brockway (16) but are considerably more precise and are adopted. The individual moments of inertia are I<sub>A</sub> = I<sub>B</sub> = 8.083 × 10<sup>-39</sup> g cm<sup>2</sup> and I<sub>C</sub> = 16.166 × 10<sup>-39</sup> g cm<sup>2</sup>.

GFW = 125.907

(CRYSTAL)

POTASSIUM TETRAFLUOROBORATE (KBF<sub>4</sub>)

Potassium Tetrafluoroborate (KBF<sub>4</sub>)  
(Crystal) GFW = 125.907

$\Delta H_f^\circ =$  Unknown  
 $\Delta H_f^\circ_{298.15} = -451.0 \pm 1$  kcal/mol  
 $\Delta H^\circ = 3.36 \pm 0.04$  kcal/mol  
 $\Delta H_m^\circ = 4.22 \pm 0.04$  kcal/mol  
 $\Delta H_{298.15}^\circ = [80]$  kcal/mol

$S_{298.15}^\circ = 32.00 \pm 4.0$  gibbs/mol

Tt = 566°K

Tm = 843°K

**Heat of Formation**  
 Bills and Cotton (1) measured the enthalpies of several reactions at 25°C which led to the following result:  
 $H_2BO_3(c) + 4(HF \cdot 23 H_2O) + KNO_3(c) \rightarrow KBF_4(c) + HNO_3 \cdot 92 H_2O + 3H_2O$   
 $\Delta H_r = -19.26 \pm 0.6$  kcal/mol

Combining this result with the following heat of formation data,

$\Delta H_f^\circ(H_2O, l) = -68.315$  kcal/mol (2)  
 $\Delta H_f^\circ(HF \cdot 23 H_2O) = -76.75 \pm 0.1$  kcal/mol (3)  
 $\Delta H_f^\circ(KNO_3, c) = -118.22$  kcal/mol (4)  
 $\Delta H_f^\circ(HNO_3 \cdot 52 H_2O) = -49.44$  kcal/mol (5)  
 $\Delta H_f^\circ(H_2O, g) = -68.315$  kcal/mol (5)  
 $\Delta H_f^\circ(KBF_4, c) = -451.6 \pm 1.2$  kcal/mol

We derive,  $\Delta H_f^\circ(KBF_4, c) = -451.6 \pm 1.2$  kcal/mol.

Gross, Hayman, and Joël (6) recently measured the following heats of reaction:

$KBF_4(c) + BF_3(g) \rightarrow NaBF_4(c)$   $\Delta H_r = -32.04 \pm 0.12$  kcal/mol  
 $KBF_4(c) + HF(aq.) \rightarrow Soln A$   $\Delta H_r = +8.14 \pm 0.18$  kcal/mol  
 $NaBF_4(c) + HF(aq.) \rightarrow Soln A$   $\Delta H_r = -2.84 \pm 0.13$  kcal/mol

These data combine to give,  $\Delta H_r = -43.13 \pm 0.22$  kcal/mol, for the reaction

$KF(c) + BF_3(g) \rightarrow KBF_4(c)$

Combining this result with the following heats of formation,

$\Delta H_f^\circ(KF, c) = -135.9 \pm 0.1$  kcal/mol (7)  
 $\Delta H_f^\circ(BF_3, g) = -271.42 \pm 0.4$  kcal/mol (7)

We derive,  $\Delta H_f^\circ(KBF_4, c) = -450.5 \pm 0.7$  kcal/mol. An average value,  $\Delta H_f^\circ(KBF_4, c) = -451.0 \pm 1$  kcal/mol, of these two results is adopted here.

**Heat Capacity and Entropy**

The heat capacity data are calculated from the high temperature enthalpy data of Dworkin and Bredig (8).  $\Delta H_t^\circ$  is calculated from their high temperature enthalpy data. Chosen such that a third-law analysis of the equilibrium data for the reaction  $KBF_4(c, l) \rightleftharpoons KF(c, l) + BF_3(g)$  reported by de Boer and van Liempt (9) gives the experimentally determined heat of reaction at 25°C (8).

**Transition Data**

It is from the high temperature studies of Dworkin and Bredig (8).  $\Delta H_t^\circ$  is calculated from their high temperature enthalpy data.

**Melting Data**

Tm has been reported as 803°K by de Boer and van Liempt (9) and 843°K by Dworkin and Bredig (8). Dworkin and Bredig's value is adopted here.  $\Delta H_m^\circ$  is calculated from their high temperature enthalpy data.

**Sublimation Data**

$\Delta H_{298}^\circ$  is estimated by comparison with data for LiAlF<sub>4</sub>(c) reported by Hildenbrand and Theard (10).

Sept. 30, 1962; Dec. 31, 1963; Mar. 31, 1965; Dec. 31, 1969

Potassium Tetrafluoroborate (KBF<sub>4</sub>)

GFW = 125.907

ΔHf° = Unknown

ΔHf°<sub>298.15</sub> = -446.8 ± 1.5 kcal/mol

ΔHm° = 4.22 ± 0.04 kcal/mol

S°<sub>298.15</sub> = 35.88 ± 4.0 gibbs/mol

Tm = 843°K

Heat of Formation

ΔHf°(l) is calculated from ΔHf°(c) by adding the heat of melting and the difference in H<sub>803</sub>-H<sub>298</sub> between the crystal and liquid.

Heat Capacity and Entropy

The heat capacity data are calculated from the high temperature enthalpy data of Dworkin and Bredig (1). S°<sub>298</sub> is calculated in a manner analogous to the heat of formation.

Melting Data

Tm has been reported as 803°K by de Boer and van Liempt (2) and 843°K by Dworkin and Bredig (1). Dworkin and Bredig's value is adopted here. ΔHm° is calculated from their high temperature enthalpy data.

GFM = 125.907

(IDEAL GAS)

POTASSIUM TETRAFLUOROBORATE (KBF<sub>4</sub>)

Potassium Tetrafluoroborate (KBF<sub>4</sub>)

(Ideal Gas) GFW = 125.907

Point Group [C<sub>3v</sub>]

S<sub>298.15</sub> = [75.35 ± 3] gibbs/mol

Ground State Quantum Weight = [1]

ΔH<sub>f</sub><sup>0</sup> = [-369.0 ± 5] kcal/mol

ΔH<sub>f</sub><sup>0</sup><sub>298.15</sub> = [-371.0 ± 5] kcal/mol

Vibrational Frequencies and Degeneracies

Bond Distances: B-F = 1.380 Å K-F = 2.752 Å B-K = [2.863] Å

Bond Angle: F-B-F = 109°28' Fax-B-K = [110°]

Product of Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [4.529 × 10<sup>-11</sup>] g<sup>3</sup> cm<sup>6</sup>

Heat of Formation

ΔH<sub>f</sub><sup>0</sup>(g) is calculated from ΔH<sub>f</sub><sup>0</sup>(c) and the estimated heat of sublimation.

Heat Capacity and Entropy

The vibrational frequencies are estimated by comparison with data for BF<sub>4</sub><sup>-</sup>, BF<sub>3</sub>, KF, and K<sub>2</sub>F<sub>2</sub>. The infrared and Raman spectra of BF<sub>4</sub><sup>-</sup> in various phases have been reported by [1, 2, 3, 4]. The molecular structure is assumed to be the same as for KAlF<sub>4</sub> as discussed by Porter and Zeller [5]. The B-F and K-F bond lengths and F-B-F bond angle are average values of the crystallographic data recently reported by Clark and Lynton [6]. The B-K bond length is calculated from the above structural data according to the assumed molecular model. The individual moments of inertia are I<sub>A</sub> = I<sub>B</sub> = 5.292 × 10<sup>-38</sup> g cm<sup>2</sup> and I<sub>C</sub> = 1.617 × 10<sup>-38</sup> g cm<sup>2</sup>.

$\omega_e = [2368] \text{ cm.}^{-1}$

$B_e = 12.036 \text{ cm.}^{-1}$

$\alpha_e = .413 \text{ cm.}^{-1}$

$r_e = 1.2325 \text{ \AA}$

Heat of Formation.

$\Delta H_f^{\circ} 298.15$  was calculated from  $D_0$  (BH) =  $3.39 \pm 0.04$  e.v. reported by A. C. Hurley, Proc. Royal Soc. (London), A281, 237 (1961). Hurley stated "by combining an analysis of the spectroscopic data with theoretical calculations we obtain a greatly improved estimate of  $D_0$  (BH)". This value and the other  $D_0$  (BH) values which are tabulated below are based on the same spectroscopic data but differ due to different methods of analysis.

$D_0$  (BH)

$3.0 \pm 0.4$  e.v.

3.5 e.v.

< 3.51 e.v.

$3.38 \pm 0.04$  e.v.

The selected  $D_0$  (BH) value as reported by Hurley (loc. cit.).

Reference  
The potential energy curve of the  $A^1\Pi$  state was determined and was found to have a maximum and a minimum in agreement with Herzberg and Munnich (loc. cit.).

Reference  
The molecular constants from O. Herzberg (loc. cit.) were adjusted for the natural abundance of  $B^{10}$  and  $B^{11}$ . Because the constants  $\omega_e$  and  $\omega_e x_e$  could not be determined directly from the spectrum, Almy and Horsfall (loc. cit.) obtained estimates for the ground state  $X^1\Sigma^+$  from the rotational constants for this state and the relations  $D_e = 4 B_e^2 / \omega_e^2$  and  $\omega_e x_e / \omega_e = 0.6 \alpha_e / B_e$ .

Heat Capacity and Entropy.

The molecular constants from O. Herzberg (loc. cit.) were adjusted for the natural abundance of  $B^{10}$  and  $B^{11}$ . Because the constants  $\omega_e$  and  $\omega_e x_e$  could not be determined directly from the spectrum, Almy and Horsfall (loc. cit.) obtained estimates for the ground state  $X^1\Sigma^+$  from the rotational constants for this state and the relations  $D_e = 4 B_e^2 / \omega_e^2$  and  $\omega_e x_e / \omega_e = 0.6 \alpha_e / B_e$ .

Heat of Formation

The heat of formation of the hypothetical species HBO(g) is controversial. Using  $\Delta H_f^{\circ} 298.15 = [255] \text{ kcal. mole}^{-1}$  for the reaction HBO(g) = H(g) + B(g) + O(g), the value of  $\Delta H_f^{\circ} 298.15$  for HBO(g) is calculated as [-13] kcal. mole<sup>-1</sup>. The value of  $\Delta H_f^{\circ} 298.15$  is the sum of the constituent bond energies, i.e. D(H-B) = 87 and D(B-O) = 168 kcal. mole<sup>-1</sup>. The D(H-B) value is derived from the dissociation of BH<sub>3</sub>(g) and D(B=O) value is calculated as the average value of the B=O bond energies, 175 and 161 kcal. mole<sup>-1</sup>, in B<sub>2</sub>O(g) and B<sub>2</sub>O<sub>2</sub>(g) molecules, respectively.

However, by comparison with the following dissociation reactions

$(\text{FBO})_3(\text{g}) \rightarrow 3 \text{ FBO}(\text{g}) \quad \Delta H_f^{\circ} 298.15 = 135 \text{ kcal. mole}^{-1} \text{ or } 45 \text{ kcal. mole}^{-1} \text{ per mole of FBO(g)}$   
 $(\text{HBO})_3(\text{g}) \rightarrow 3 \text{ HBO}(\text{g}) \quad \Delta H_f^{\circ} 298.15 = 141.8 \text{ kcal. mole}^{-1} \text{ or } 47 \text{ kcal. mole}^{-1} \text{ per mole of HBO(g)}$   
 $(\text{ClBO})_3(\text{g}) \rightarrow 3 \text{ ClBO}(\text{g}) \quad \Delta H_f^{\circ} 298.15 = 170.6 \text{ kcal. mole}^{-1} \text{ or } 57 \text{ kcal. mole}^{-1} \text{ per mole of ClBO(g)}$

It is estimated  $\Delta H_f^{\circ} 298.15 = [70] \text{ kcal. mole}^{-1}$  for the reaction  $1/3(\text{HBO})_3(\text{g}) \rightarrow \text{HBO}(\text{g})$ , based on the electronegativity difference among the F, Cl and H atoms. Hence the value of  $\Delta H_f^{\circ} 298.15$  for HBO(g) is calculated to be -27 kcal. mole<sup>-1</sup>. The adopted value of  $\Delta H_f^{\circ} 298.15$  for HBO(g) is  $1/2(-13-27) = -20 \text{ kcal. mole}^{-1}$ . The uncertainty is given as  $\pm 20 \text{ kcal. mole}^{-1}$ . Other methods of estimation have been tried such as the comparison of the difference in  $\Delta H_f^{\circ} 298.15$  between H-CH<sub>3</sub> and HO-CH<sub>3</sub> with the corresponding difference between H-BO and HO-BO, etc. They lead to very large negative values for  $\Delta H_f^{\circ} 298.15(\text{HBO, g})$ . However, a value of  $260 \pm 15 \text{ kcal. mole}^{-1}$  for the atomization of HBO(g) was used by L. V. Ourvech, et al., "Thermodynamic Properties of Individual Substances," Vol. I, Academy of Science, USSR, Moscow, 1962, which was obtained by comparison with the dissociation energies for BO, BH, CH and HCN molecules.

Heat Capacity and Entropy

The vibrational frequencies and molecular structure were obtained from W. H. Evans, private communication, October 6, 1960. The bond lengths of H-B and B-O in the HBO(g) molecule were assumed to be the same as those in the BH(g) and BO(g) molecules, respectively. The moment of inertia (I) is calculated as  $2.1561 \times 10^{-39} \text{ g. cm.}^2$

Bond Distance: B-H = [1.265] Å  
 B-O = [1.265] Å

σ = 1

Rotational Constant: B<sub>0</sub> = [1.208] cm<sup>-1</sup>

Heat of Formation

Using the correlations developed by A. D. Walsh, J. Chem. Soc. 2288 (1933) for HB molecules the electron removed by ionization ought to be a bonding electron. This indicates a high ionization potential and also the bond dissociation energy of BO-H<sup>+</sup> should be significantly less than BO-H. Assuming a decrease of 40 kcal we obtain ΔH<sub>f</sub><sup>o</sup>(HBO<sup>+</sup>, g) = 335 ± 20 kcal/mol which corresponds to an ionization potential of 355 kcal or 15.4 ± 1 eV. This is in accord with the ionization potential of BO, 12.8 eV, from National Bureau of Standards Report 8628, Jan. 1, 1965, which should be less than HBO since this electron in BO is unpaired.

Heat Capacity and Entropy

According to the correlations of Walsh loc.cit., the molecule should be linear and since this unpaired electron is in a pi orbital, the ground state should be <sup>2</sup>Π. A first excited state is estimated at 20000 cm<sup>-1</sup> to be <sup>2</sup>Σ by analogy with the isoelectronic molecule CO<sup>+</sup>. Since HBO<sup>+</sup> is lacking a bonding electron compared to HBO, we assume that the bond lengths will be slightly longer than in HBO. The vibrational frequencies are also estimated from those in HBO by assuming all values to be 10 per cent lower due to the weaker bonding.

The enthalpy at 0°K is -2.275 kcal/mol.

Metaboric Acid (HBO<sub>2</sub>)  
(Crystal) Mol. Wt. = 43.828

METABORIC ACID (HBO<sub>2</sub>) (CRYSTAL)

$S_{298.15}^0 = [11.7 \pm 1.0] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^0 = \text{Unknown}$   
 $\Delta H_f^0 298.15 = -191.87 \pm 0.20 \text{ kcal. mole}^{-1}$   
 $\Delta H_m^0 = \text{Unknown}$   
 $\Delta H_f^0 298.15 = 57.9 \pm 1.0 \text{ kcal. mole}^{-1}$

Heat of Formation.

The enthalpy change ( $\Delta H_f^0$ ) of the reaction  $\text{HBO}_2(\text{c, I}) + \text{H}_2\text{O}(\text{l}) = \text{H}_2\text{BO}_3(\text{c})$  has been determined by M. V. Kilday and E. J. Prosen, *J. Am. Chem. Soc.* **82**, 5508 (1960). From the value,  $\Delta H_f^0 298.15 = -1.28 \text{ kcal. mole}^{-1}$ , the heat of formation ( $\Delta H_f^0 298.15$ ) for  $\text{HBO}_2(\text{c, I})$  is derived to be  $-191.87 \pm 0.20 \text{ kcal. mole}^{-1}$  which is adopted. The heats of solution of  $\text{HBO}_2(\text{c, I})$  in  $\text{H}_2\text{O}(\text{l})$  was measured by N. D. Sokolova, S. M. Skuretov, A. M. Shemonaeva and V. M. Yuldasheva, *Russ. J. Inorg. Chem.* **6**, 395 (1961). Based on the reported value,  $\Delta H_f^0 298.15 = 1.76 \pm 0.01 \text{ kcal. mole}^{-1}$  for the reaction  $\text{HBO}_2(\text{c, I}) + 503 \text{ H}_2\text{O}(\text{l}) = \text{H}_3\text{BO}_3 \cdot 500 \text{ H}_2\text{O}(\text{Sol.})$ , the heat of formation for  $\text{HBO}_2(\text{c, I})$  was derived as  $-189.46 \pm 0.20 \text{ kcal. mole}^{-1}$ , using  $\Delta H_f^0 298.15(\text{H}_2\text{O, l}) = -68.317$  and  $\Delta H_f^0 298.15(\text{H}_3\text{BO}_3 \cdot 500 \text{ H}_2\text{O, Sol.}) = -286.02 \pm 0.20 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The values of heat capacity for  $\text{HBO}_2(\text{c, I})$  were estimated by comparison with those of its constituent oxides.  $S_{298.15}^0$  was calculated as the sum of the entropy contributions from  $\text{H}^+$  and  $\text{BO}_2^-$  in  $\text{HBO}_2(\text{c})$  suggested by K. K. Kelley, private communication, June 1960, and O. Kubaschewski and E. L. Evans, "Metallurgical Thermochemistry", Pergamon Press, New York, 1958.

Melting Data.

P. C. Kreczek, O. W. Morey and H. E. Merwin, *Am. J. Sci.* [5] **35A**, 143 (1938) reported the existence of three crystal forms of  $\text{HBO}_2(\text{c})$ , namely  $\text{HBO}_2(\text{c, I})$ , m.p.  $503 \pm 1^\circ\text{K}$ ;  $\text{HBO}_2(\text{c, II})$ , m.p.  $474.1 \pm 0.5^\circ\text{K}$ ; and  $\text{HBO}_2(\text{c, III})$ , m.p.  $449.2 \pm 0.2^\circ\text{K}$ . However, there was no solid phase equilibrium found among these three crystals. N. D. Sokolova, S. M. Skuretov, A. M. Shemonaeva and V. M. Yuldasheva, loc. cit., measured the heats of solution in water of  $\text{HBO}_2(\text{c, I})$  and  $\text{HBO}_2(\text{c, II})$  and derived the heat of transition as  $\Delta H_t^0 298.15(\text{II} \rightarrow \text{I}) = 1.29 \text{ kcal. mole}^{-1}$ .

Heat of Sublimation.

The value of  $\Delta H_s^0 298.15$  was calculated as the difference between the  $\Delta H_f^0 298.15$  values for  $\text{HBO}_2(\text{g})$  and  $\text{HBO}_2(\text{c, I})$ .

## Heat of Formation.

The equilibrium pressures of the reaction 1/2 B<sub>2</sub>O<sub>3</sub>(l) + 1/2 H<sub>2</sub>O(g) = HBO<sub>2</sub>(g) have been measured by several investigators. Using the equilibrium data reported, the heats of reaction (ΔH<sub>f</sub><sup>o</sup>) were evaluated by both the second and third law methods. The corresponding heats of formation for HBO<sub>2</sub>(g) were derived based on the ΔH<sub>f</sub><sup>o</sup> 298.15 values obtained by the third law method. The results obtained are presented as follows.

| Investigator                      | Temperature, °K. | ΔH <sub>f</sub> <sup>o</sup> , 298.15, kcal. mole <sup>-1</sup> | Second Law Value | Third Law Value | ΔH <sub>f</sub> <sup>o</sup> , 298.15, kcal. mole <sup>-1</sup> |
|-----------------------------------|------------------|---|------------------|-----------------|---|

<sup>1</sup>D. J. Maschi, M. A. Chupka and J. Barkowitz, J. Chem. Phys. **33**, 530 (1960). The ΔH<sub>f</sub><sup>o</sup> 298.15 values, 0.25 ± 6.0 end -5.15 kcal. mole<sup>-1</sup>, were obtained based on the reaction 1/2 B<sub>2</sub>O<sub>3</sub>(g) + 1/2 H<sub>2</sub>O(g) = HBO<sub>2</sub>(g).

<sup>2</sup>D. White, D. E. Mann, P. N. Welsh and A. Sommer, J. Chem. Phys. **32**, 488 (1960). The ΔH<sub>f</sub><sup>o</sup> 298.15 value was derived using ΔH<sub>f</sub><sup>o</sup> 298.15 obtained by the second law method.

<sup>3</sup>S. P. Randall and J. L. Margrave, J. Inorg. Nucl. Chem. **18**, 29 (1960). The partial pressure of HBO<sub>2</sub>(g), P<sub>HBO<sub>2</sub></sub> = 3.813 X 10<sup>-4</sup> atm., was calculated from the total pressure by the relation P<sub>HBO<sub>2</sub></sub> = P<sub>total</sub> - 3 P<sub>H<sub>2</sub>O</sub> - 3 P<sub>H<sub>2</sub>B<sub>3</sub>O<sub>6</sub></sub> where P<sub>H<sub>2</sub>B<sub>3</sub>O<sub>6</sub></sub> = 3.030 X 10<sup>-5</sup> and P<sub>H<sub>2</sub>O</sub> = 2.1468 X 10<sup>-5</sup> atm.

<sup>4</sup>M. Farber, et al., "Thermodynamics of Reactions Involving Light Metal Oxides and Propellant Gases", OR-1987-5, May 9 - Aug 9, 1961; OR-1987-7, Nov. 9 - Feb. 9, 1962 and Final Report, May 9, 1962 through June 30, 1962, Rocket Power, Inc., California. The first and last sets of data were determined by the Molecular Flow Method and the rest, by Effusion Method.

The value of ΔH<sub>f</sub><sup>o</sup> 298.15 for HBO<sub>2</sub>(g) adopted is the weighted average of the ΔH<sub>f</sub><sup>o</sup> 298.15 value listed above.

## Heat Capacity and Entropy.

All molecular and spectroscopic constants were taken from D. White, D. E. Mann, P. N. Welsh and A. Sommer, loc. cit. The three principal moments of inertia are: I<sub>A</sub> = 1.155 X 10<sup>-40</sup>, I<sub>B</sub> = 9.1050 X 10<sup>-39</sup> and I<sub>C</sub> = 9.2205 X 10<sup>-39</sup> g.<sup>2</sup> cm.<sup>2</sup>

Point Group [D<sub>∞h</sub>]  
S<sub>298.15</sub> = [43.045] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
Ground State Quantum Weight = [2]

ΔH<sub>f</sub><sup>o</sup> 0 = 48 ± 15 kcal. mole<sup>-1</sup>  
ΔH<sub>f</sub><sup>o</sup> 298.15 = 48 ± 15 kcal. mole<sup>-1</sup>

Vibrational Frequencies and Degeneracies  
ω<sub>j</sub>, cm.<sup>-1</sup> [ω<sub>j</sub>, cm.<sup>-1</sup>]  
[2450](1) [840](2) [2650](1)

Bond Distance: B-H = [1.20 Å]

Bond Angle: H-B-H = [180°]

Rotational Constant: B<sub>0</sub> = 5.80683 cm.<sup>-1</sup>

Heat of Formation.

ΔH<sub>f</sub><sup>o</sup> 298.15 was calculated from appearance potentials reported by T. P. Fehlner and W. S. Koski, J. Am. Chem. Soc. 85, 2753 (1964) and the JANAF (B<sub>2</sub>H<sub>6</sub>(g)) ΔH<sub>f</sub><sup>o</sup> 298.15 = +9.8 kcal. mole<sup>-1</sup>. For example

The ΔH<sub>f</sub><sup>o</sup> data is summarized below.

Investigator

T. P. Fehlner and W. S. Koski (loc. cit.)

C. J. O'Brien and J. R. Perath, Mercurat Corp., Van Nuys, Calif., and J. Fentler, Oilin Matheson Chemical Corp., New York 22, N.Y., "Estimation of the Heats of Formation of Gaseous Combustion Product Molecules", October 1959.

P. C. H. Jordan and H. C. Longuet-Higgins, Mol. Phys. 5, 121 (1962).

Bond Distance: B-O = [1.27] Å    O-H = [0.97] Å  
 Bond Angle: H-O-B = [105]°    O-B-O = [180]°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [2.42627 x 10<sup>-116</sup>] g.<sup>3</sup> cm.<sup>6</sup>    σ = 2

Heat of Formation.

The value of ΔH<sub>f</sub><sup>0</sup> 298.15 for B(OH)<sub>2</sub>(g) was calculated by using the bond energy, D°(B-OH) = 132.7 kcal. mole<sup>-1</sup>, and the heats of formation for B(g) and OH(g) as 132.80 and 9.33 kcal. mole<sup>-1</sup>, respectively.

Heat Capacity and Entropy.

The vibrational frequencies were estimated by comparison with those for B(OH)<sub>3</sub>(g) and other related molecules. The bond distances and angles were estimated by comparison with those for B(O)<sub>2</sub>(g) and H<sub>2</sub>O<sub>2</sub>(g) molecules. The molecular configuration is assumed to be trans which is considered as more stable than the cis-form. The three principal moments of inertia are: I<sub>A</sub> = 2.6870 x 10<sup>-40</sup>, I<sub>B</sub> = 9.3682 x 10<sup>-39</sup> and I<sub>C</sub> = 9.6369 x 10<sup>-39</sup> g. cm.<sup>2</sup>

Point Group [D<sub>3h</sub>]

$\Delta H_f^0 = 26.4 \pm 10$  kcal. mole<sup>-1</sup>

$\Delta H_f^0 = 25.5 \pm 10$  kcal. mole<sup>-1</sup>

Product of the Moments of Inertia:  $I_A I_B I_C = [7.71 \times 10^{-11}]$  g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation

$\Delta H_f^0$  298.15 was calculated from appearance potentials reported by T. P. Fehlner and W. S. Koski J. Am. Chem. Soc. 86, 2733 (1964). For example

The heat of formation data is summarized below.

Reaction:  $B_2H_6(g) \rightarrow 2BH_3(g)^*$

\*The auxiliary  $\Delta H_f^0$  298.15( $B_2H_6$ ) was from the JANAF Table dated Dec. 31, 1964

Heat Capacity and Entropy.

The molecular configuration, [planar, H-B-H angle = 120°], was estimated by A. Shepp and S. H. Bauer, J. Am. Chem. Soc. 76, 265 (1954) as well as by P. C. H. Jordan and H. C. Longuet-Higgins, (loc. cit.). In addition Shepp and Bauer estimated the bond distance and the vibrational frequencies. Jordan and Longuet-Higgins estimated the electronic configuration [ $1A_1$ ]. The principal moments of inertia calculated from these molecular constants are,  $I_A = I_B = 3.378 \times 10^{-40}$  and  $I_C = 6.756 \times 10^{-40}$  g. cm.<sup>2</sup>

Heat of Formation  
The heat of formation (ΔH<sub>f</sub><sup>o</sup>) of H<sub>3</sub>BO<sub>3</sub>(c) was taken from W. D. Good, M. Mansson and J. P. McCollough, Quarterly Technical Report No. 9, Nov. 4, 1963, U. S. Bur. Mines, Bartlesville, Oklahoma. The value was derived based on the following measurements

B(c) + 0.75 O<sub>2</sub>(g) + 18.674 HF·57.219 H<sub>2</sub>O(l) = HBF<sub>4</sub>·14.674 HF·58.719 H<sub>2</sub>O(l)  
H<sub>3</sub>BO<sub>3</sub>(c) + 18.674 HF·55.719 H<sub>2</sub>O(l) = HBF<sub>4</sub>·14.675 HF·58.719 H<sub>2</sub>O(l)

The heats of solution of H<sub>3</sub>BO<sub>3</sub>(c) in water have been measured by many investigators. L. G. Fasolino, "Heat of Formation of B<sub>2</sub>O<sub>3</sub>(c) and B<sub>2</sub>O<sub>3</sub>(am.)", NONR-3608 (00), June 2, 1964, National Research Corporation, Massachusetts, obtained the value, ΔH<sub>f</sub><sup>o</sup> 298.15 = 5.45 ± 0.01 kcal mole<sup>-1</sup> for the reaction H<sub>3</sub>BO<sub>3</sub>(c) + 504 H<sub>2</sub>O(l) = H<sub>3</sub>BO<sub>3</sub>·504 H<sub>2</sub>O(sol.) which leads to ΔH<sub>f</sub><sup>o</sup> 298.15 (H<sub>3</sub>BO<sub>3</sub>·504 H<sub>2</sub>O, sol.) = -256.02 kcal mole<sup>-1</sup>. The ΔH<sub>f</sub><sup>o</sup> 298.15 value is in reasonable agreement with the value reported by J. Smieko and L. S. Mason, J. Am. Chem. Soc. 72, 3679 (1950) in which the heats of solution and dilution of H<sub>3</sub>BO<sub>3</sub>(c) were given. The heats of solution of H<sub>3</sub>BO<sub>3</sub>(c) in water measured by other previous investigators were reviewed by L. G. Fasolino, loc. cit.

Heat Capacity and Entropy  
The low temperature (16-295°K) heat capacities were reported by H. L. Johnston and E. C. Kerr, J. Am. Chem. Soc. 72, 4733 (1950). The heat capacities above 300°K were estimated by comparison with those of its constituent oxides. S<sub>298.15</sub> was obtained from H. L. Johnston and E. C. Kerr, loc. cit., using S<sub>17</sub> = 0.18 cal deg<sup>-1</sup> mole<sup>-1</sup>.

Melting Data  
The value of T<sub>m</sub> was taken from F. C. Kracek, G. W. Morey and H. E. Merwin, Am. J. Sci. [5] 35A, 143 (1938). However, H<sub>3</sub>BO<sub>3</sub>(c) is in a metastable state at T<sub>m</sub>. Measurements of the decomposition pressure of H<sub>3</sub>BO<sub>3</sub>(c) to form HBO<sub>2</sub>(c, II or III) and H<sub>2</sub>O(g) have been made by H. Menzel, H. Schulz and H. Deckert, Z. anorg. allgem. Chem. 220, 49 (1934); A. Thiel and H. Siebeneck, Z. anorg. allgem. Chem. 220, 236 (1934); M. V. Stachelberg, F. Quetram and J. Dressel, Z. Elektrochem. 43, 14 (1937); S. Bezzi, Gazz. chim. ital. 65, 766 (1935); and H. Tazaki, J. Sci. Hiroshima Univ. Ser. A 10, 37, 55, 63, 109, 113 (1939). The decomposition pressures of the system H<sub>3</sub>BO<sub>3</sub>(c) = H<sub>2</sub>O(g) + HBO<sub>2</sub>(c, I), at the temperatures of 312 to 352°K, have been reported by E. D. West, "The properties of Boron Compounds", ARL Technical Report 60-278, May 1960, National Bureau of Standards.

Temperature of Decomposition  
The decomposition temperature (T<sub>d</sub>) is calculated as the temperature at which the free energy change of the reaction H<sub>3</sub>BO<sub>3</sub>(c) + HBO<sub>2</sub>(c) + H<sub>2</sub>O(g) approaches zero.

Heat of Sublimation  
The heat of sublimation (ΔH<sub>g</sub><sup>o</sup> 298.15) is derived as the difference between the ΔH<sub>f</sub><sup>o</sup> 298.15 values for H<sub>3</sub>BO<sub>3</sub>(g) and H<sub>3</sub>BO<sub>3</sub>(c).

ΔH<sub>f</sub><sup>o</sup> 0 = -258.23 ± 0.20 kcal mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup> 298.15 = -261.47 ± 0.20 kcal mole<sup>-1</sup>

ΔH<sub>m</sub><sup>o</sup> = Unknown

ΔH<sub>g</sub><sup>o</sup> 298.15 = 24.3 ± 0.7 kcal mole<sup>-1</sup>

T<sub>m</sub> = 444.1 ± 0.2°K

T<sub>d</sub> = (330)°K

ΔH<sub>f</sub><sup>o</sup> 298.15 = -173.4 ± 0.2

+14.6 ± 0.1

MOL. WT. = 61.844

(IDEAL GAS)

BORIC ACID (H<sub>3</sub>BO<sub>3</sub>)

Boric Acid (H<sub>3</sub>BO<sub>3</sub>) Mol. Wt. = 61.844

σ<sup>-</sup> = 3

Heat of Formation.

The vapor pressures of H<sub>3</sub>BO<sub>3</sub>(c), 109 - 140°C, were measured by M. V. Stackelberg, F. Quatram and J. Dressel, Z. Electrochem. 53, 14 (1957). Using the vapor pressures reported, the heats of sublimation of H<sub>3</sub>BO<sub>3</sub>(c) were evaluated to be 24.4 ± 0.6 and 24.22 kcal. mole<sup>-1</sup> by the second and third law methods, respectively. The heat of formation (ΔH<sub>f</sub><sup>o</sup> 298.15) for H<sub>3</sub>BO<sub>3</sub>(c) was calculated from the ΔH<sub>f</sub><sup>o</sup> 298.15 and ΔH<sub>f</sub><sup>o</sup> 298.15 for H<sub>3</sub>BO<sub>3</sub>(c). The ΔH<sub>f</sub><sup>o</sup> 298.15 value adopted is the average of the second and third law values mentioned previously.

Heat Capacity and Entropy.

The molecular structure and constants were taken from O. W. F. T. Pistorius, J. Chem. Phys. 31, 1454 (1959) based on an X-ray diffraction study on H<sub>3</sub>BO<sub>3</sub>(c) by W. H. Zachariasen, Acta Cryst. 7, 305 (1954). The O-H bond distance was reestimated as 0.96 Å instead of 0.88 Å reported. From the existing infrared and Raman spectra data on H<sub>3</sub>BO<sub>3</sub>(c) and its aqueous solution C. W. F. T. Pistorius, loc. cit., carried out a normal coordinate treatment by means of Wilson's F-O matrix method and calculated the fifteen fundamental frequencies for H<sub>3</sub>BO<sub>3</sub>(c). For H<sub>3</sub>BO<sub>3</sub>(g) twelve reported frequencies were used and corrected to the average isotopic species. The three torsional frequencies, 824(1) and 209(2) cm.<sup>-1</sup>, were not used based on an assumption that there are three internal rotations, i.e. three OH groups, each rotates about its own B-O bond. Employing the model of having three free rotating OH tops, the value of S<sub>400</sub> was evaluated statistically as 75.522 cal. deg.<sup>-1</sup> mole<sup>-1</sup>. The corresponding value obtained by using the second law value of ΔS<sub>400</sub><sup>o</sup>, 48.39 ± 1.42 cal. deg.<sup>-1</sup> mole<sup>-1</sup>, for the reaction H<sub>3</sub>BO<sub>3</sub>(c) = H<sub>3</sub>BO<sub>3</sub>(g), is 75.97 ± 1.42 cal. deg.<sup>-1</sup> mole<sup>-1</sup> which is in good agreement with the S<sub>400</sub><sup>o</sup> value based on a model having three free rotating groups. Thus the assumed model is adopted to evaluate the thermodynamic functions. The three principal moments of inertia are: I<sub>A</sub> = I<sub>C</sub> = 8.3320 × 10<sup>-39</sup> g. cm.<sup>2</sup>, and I<sub>B</sub> = 1.6664 × 10<sup>-35</sup> g. cm.<sup>2</sup>. The reduced moment of inertia for OH top is I<sub>r</sub> = 1.15321 × 10<sup>-40</sup> g. cm.<sup>2</sup>. The infrared absorption spectrum of H<sub>3</sub>BO<sub>3</sub>(g) was observed under conditions where one atmosphere of water vapor with a path length of approximately one meter as background, by F. T. Greene, O. E. Leroi, S. P. Randall, J. R. Soulen, L. H. Spinar and J. L. Margrave, "Spectra and Thermodynamic Properties of Light-Element Oxides and Hydroxides", Proceedings of the Conference on Propellant Thermodynamics and Handling, Columbus, Ohio, July, 1959. The following fundamentals were obtained: 3220 cm.<sup>-1</sup> S., 1490 cm.<sup>-1</sup> S., 881 cm.<sup>-1</sup> S., 881 cm.<sup>-1</sup> W., and 669 cm.<sup>-1</sup> W.

MOL. WT. = 53.952

(CRYSTAL)

POTASSIUM TETRAHYDROBORATE (KBH<sub>4</sub>)

$\Delta H_f^0 = -52.15 \pm .55 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^{298.15} = -54.23 \pm .55 \text{ kcal. mole}^{-1}$

$S_{298.15} = 25.48 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $T_d = [770]^\circ\text{K}$

Heat of Formation.

The heat of reaction of KBH<sub>4</sub>(c) with hydrochloric acid has been measured by solution calorimetry and reported by W. H. Johnson, R. H. Schumm, I. H. Wilson, and E. J. Prosen, *J. Res. Nat'l. Bur. Std.* **65A**, 97 (1961)

$\text{KBH}_4(\text{c}) + \text{HCl}(\text{g}) + 3\text{H}_2\text{O}(\text{liq}) \rightarrow \text{KCl}(\text{c}) + \text{H}_3\text{BO}_3(\text{c}) + 4\text{H}_2(\text{g}) \quad \Delta H_r = -84.82 \pm .44 \text{ kcal. mole}^{-1}$   
The  $\Delta H_f^{298.15}$  value for HCl(g) and H<sub>3</sub>BO<sub>3</sub>(c) were obtained from the JANAF Tables. The  $\Delta H_f^{298.15}$  value for KCl(c) was calculated from  $\Delta H_f^{298.15} \text{ K}^+ = -60.52 \text{ kcal. mole}^{-1}$ ,  $\Delta H_f^{298.15} \text{ Cl}^- = -39.952 \text{ kcal. mole}^{-1}$  and  $\Delta H$  dilution = 4.12 kcal. mole<sup>-1</sup> obtained from NES. Rept. 8504, 1 July 1964 - Appendix III by W. H. Evans.  $\Delta H_f^{298.15}$  for H<sub>2</sub>O(liq) value of  $\Delta H_f^{298.15} = -55.0 \pm 1.0 \text{ kcal. mole}^{-1}$  by solution calorimetry.

Heat Capacity and Entropy.

C<sub>p</sub> and S° at temperatures below 298.15°K were reported by G. T. Furukawa, M. L. Reilly, and J. H. Pisciorelli, *J. Res. Nat'l. Bur. Std.* **68A**, 651 (1964). The values of C<sub>p</sub> in the range from 298.15 to 700°K were obtained from T. B. Douglas and A. W. Harman, *J. Res. Nat'l. Bur. Std.* **60**, 117 (1956). These two sets of C<sub>p</sub> data were plotted and joined smoothly at 298.15°K. The values of C<sub>p</sub> above 700°K were estimated by graphical extrapolation.

Temperature of Decomposition.

The temperature of decomposition (into constituent elements) was estimated according to a report by T. B. Douglas and A. W. Harman, loc. cit.

ΔH<sub>f</sub><sup>0</sup> = -43.105 ± 0.05 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>0</sup> 298.15 = -45.522 ± 0.05 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>0</sup> = Unknown

S<sub>298.15</sub><sup>0</sup> = 18.120 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = [750°K.]

Heat of Formation.  
 The heat of formation of LiBH<sub>4</sub>(c) was calculated from the solution calorimetry of W. D. Davis, L. S. Mason, and G. Stegeman J. Am. Chem. Soc. **71**, 2775 (1949). The heats of reaction were measured for the following reactions:  
 LiBH<sub>4</sub>(c) + 1.25(HCl·200 H<sub>2</sub>O) + 3 H<sub>2</sub>O(l) → (NaCl + H<sub>3</sub>BO<sub>3</sub> + 0.25 HCl)·247 H<sub>2</sub>O + 4 H<sub>2</sub>(g) ΔH<sub>1,298.15</sub> = -72.14 kcal.  
 LiCl·60 H<sub>2</sub>O + H<sub>3</sub>BO<sub>3</sub>·60 H<sub>2</sub>O + 0.25(HCl·508 H<sub>2</sub>O) → (LiCl + H<sub>3</sub>BO<sub>3</sub> + 0.25 HCl)·247 H<sub>2</sub>O ΔH<sub>2,298.15</sub> = 0.00 kcal. (assumed)  
 H<sub>3</sub>BO<sub>3</sub>·60 H<sub>2</sub>O + ∞ H<sub>2</sub>O → H<sub>3</sub>BO<sub>3</sub>·∞ H<sub>2</sub>O ΔH<sub>3,298.15</sub> = 0.200 kcal.

The summation of the above reactions yields:  
 LiBH<sub>4</sub>(c) + 1.25(HCl·200 H<sub>2</sub>O) + 3 H<sub>2</sub>O(l) + ∞ H<sub>2</sub>O → LiCl·60 H<sub>2</sub>O + H<sub>3</sub>BO<sub>3</sub>·∞ H<sub>2</sub>O + 4 H<sub>2</sub>(g)  
 + 0.25(HCl·508 H<sub>2</sub>O) + 4 H<sub>2</sub>(g)  
 The heat of formation of Lithium Borohydride crystal was calculated to be -45.522 kcal. mole<sup>-1</sup> with the following auxiliary data:

| Compound  | Heat of Formation at 298.15 | Reference  |
|---|-----------------------------|--|
| HCl (508 H <sub>2</sub> O)                          | -39.815                     | HCl(g) JANAF; Dilution data from NES. Rept. 8504, 1 July 1964 Appendix III by W. H. Evans  |
| HCl (200 H <sub>2</sub> O)                          | -39.696                     | HCl(g) JANAF; Dilution data from W. H. Evans, loc. cit.  |
| LiCl (60 H <sub>2</sub> O)                          | -106.023                    | Li <sup>+</sup> see NaBH <sub>4</sub> table; Cl <sup>-</sup> and dilution data W. H. Evans, loc. cit.                                  |
| H <sub>3</sub> BO <sub>3</sub> (∞ H <sub>2</sub> O) | -256.05                     | JANAF H <sub>3</sub> BO <sub>3</sub> (c) and dilution data from J. Smisko and L. S. Mason J. of Am. Chem. Soc. <b>72</b> , 3879 (1950) |

\*This ΔH<sub>f</sub> 298.15 value was obtained from J. Smisko and L. S. Mason loc. cit.

Heat Capacity and Entropy.  
 The low temperature heat capacities, 15.72 - 302.88 °K were obtained from the measurements by N.C. Hallett and H. L. Johnston, J. Am. Chem. Soc., **75**, 1496 (1953). The C<sub>p</sub> values above 298.15°K were estimated by comparison with the C<sub>p</sub>'s for NaBH<sub>4</sub>.

The entropy was based on S<sub>15</sub><sup>0</sup> (extrap) = 0.0874 reported by N. C. Hallett and H. L. Johnston loc. cit.

Melting Data.  
 T<sub>m</sub> was estimated by comparison with the T<sub>m</sub> for NaBH<sub>4</sub>.

$\Delta H_f^o = -43.86 \pm .07$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^o = -45.85 \pm .07$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^o = 0.2388$  kcal. mole<sup>-1</sup>  
 $\Delta H_m^o = \text{Unknown}$

$S_{298}^{298} = 24.232$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m = 189.9^\circ\text{K}$   
 $T_m = 770^\circ\text{K}$

Heat of Formation.

The heat of formation was calculated from the solution calorimetry of W. D. Davis, L. S. Mason and G. Stegeman, J. Am. Chem. Soc. 71, 2775 (1949). The heats of reaction and mixing were measured for the following reactions:

The summation of the above equations yields:

$\Delta H_r = -63.869$  kcal. mole<sup>-1</sup>

The  $\Delta H_f$  298.15 values for HCl were obtained from JANAF value for HCl(g) and heat of dilution data of NBS. Rept. 8504, 1 July 1964 - Appendix III by W. H. Evans. The  $\Delta H_f$  298.15 H<sub>2</sub>O(l) value was obtained from W. H. Evans loc. cit. The  $\Delta H_f$  298.15 value for NaCl was obtained from JANAF value of NaCl(c) together with dilution data from W. H. Evans, loc. cit. The  $\Delta H_f$  298.15 value for H<sub>3</sub>BO<sub>3</sub> was obtained from JANAF value for H<sub>3</sub>BO<sub>3</sub>(c) together with dilution data of J. Smiako and L. S. Mason, J. of Am. Chem. Soc. 72, 3679 (1950).

Heat Capacity and Entropy.

The low temperature heat capacity (15.76 - 301.25) was obtained from H. L. Johnston and N. C. Hallett, J. Am. Chem. Soc. 75, 1467 (1953). In the area of transition (169-193.5°K) the average  $\Delta H = 635.3$  cal./mole and the average  $\Delta S = 3.35$  cal./mole °K were adopted from H. L. Johnston and N. C. Hallett, loc. cit. Using the present base line these  $\Delta H$  and  $\Delta S$  values yield a heat of transition of 0.2388 kcal. mole<sup>-1</sup>. The low temperature heat capacity was fitted with the smoothed heat capacity data (288.15 - 700°K) of T. B. Douglas and A. W. Harman, J. Research Natl. Bur. Standards 60, 117 (1956). The heat capacity above 700°K was extrapolated from the plot of both sets of data.

Transition Data.

The temperature and heat of transition were obtained from H. L. Johnston and N. C. Hallett loc. cit.

Melting Date.

The melting date was obtained from T. B. Douglas and A. W. Harman loc. cit.

Boron Iodide (BI)

Ground State Configuration [1Σ<sup>+</sup>]

S<sub>298.15</sub><sup>o</sup> = [55.604] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup> = [72.7 ± 10] kcal. mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup> 298.15 = [73.0 ± 10] kcal. mole<sup>-1</sup>

Electronic Levels and Quantum Weight

| E <sub>i</sub> | C <sub>i</sub> , cm. <sup>-1</sup> | E <sub>i</sub> |
|----------------|------------------------------------|----------------|
|                | 0                                  | [1]            |

ω<sub>e</sub>x<sub>e</sub> = [3.04] cm.<sup>-1</sup>

α<sub>e</sub> = [0.3912] cm.<sup>-1</sup>

r<sub>e</sub> = [2.08] Å

Heat of Formation.

The ratio D(BF) / (ΔH(BF<sub>3</sub>)/3) = 1.177, where ΔH<sub>f</sub> signifies the heat of atomization, was applied to BI<sub>3</sub> giving D(BI) = 84.4 kcal. mole<sup>-1</sup> and ΔH<sub>f</sub> 298 = 75 ± 10 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The bond length was first estimated by comparison with the ratio of the bond lengths in the other boron trihalides and monohalides. The vibrational frequency was then calculated using Guggenheimer's Relation [Proc. Phys. Soc. (London) 58, 456 (1946)] which was checked using BBr and shown to give an excellent fit. The quantity X<sub>e</sub>μ<sub>e</sub><sup>2</sup>/2, where μ<sub>e</sub> is the reduced mass, has been shown to be constant for similar molecules and its value was transferred from BBr to give X<sub>e</sub> and ω<sub>e</sub>x<sub>e</sub> for BI. α<sub>e</sub> was then calculated using the Morse potential function and E<sub>e</sub> was determined from the bond length. The ground state configuration was assumed to be the same as that in BBr.

Point group (C<sub>2v</sub>)  
 $S_{298.15}^{\circ} = [73.964] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 Ground State Quantum Weight [2]

Vibrational Levels and Degeneracies  
 $\omega_e, \text{ cm.}^{-1}$   
 (550)(1)  
 (110)(1)  
 (770)(1)

Bond Distance: B-I =  $[2.06] \text{ \AA}$   
 Bond Angle: I-B-I =  $[120^{\circ}]$   
 Product of the Moments of Inertia:  $I_A I_B I_C = 3.33503 \times 10^{-113} \text{ g.}^3 \text{ cm.}^6$   
 $\sigma = 2$

Heat of Formation.  
 The heat of formation was estimated by analogy with BF<sub>3</sub>, specifically the ratio  
 $\Delta H_f(BX_3) \rightarrow BX_2 + X / \Delta H_f(BX_3) \rightarrow B + 3X$   
 was taken as 0.347.

Heat Capacity and Entropy.

The vibrational frequencies were obtained from force constants transferred from the trihalide given by O. Herzberg "Infrared and Raman Spectra of Polyatomic Molecules", D. Van Nostrand, Inc., (1945). The bond length was taken between those of the mono end trihalide and the angle was estimated to be the same as that in the trihalide. The ground state quantum weight was taken as two on account of the one unpaired electron.

The individual moments of inertia were  $I_B = 1.8278 \times 10^{-39} \text{ g. cm.}^2$ ,  $I_A = 134.1670 \times 10^{-39} \text{ g. cm.}^2$  and  $I_C = 135.9946 \times 10^{-39} \text{ g. cm.}^2$

Bond Distances: B-I = [2.03 ± 0.03] Å  
 Bond Angle: I-B-I = [120°]  
 Product of the Moments of Inertia = [4.418202] X 10<sup>-111</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation  
 W. S. Koski, J. J. Kaufman and C. F. Pachuki, J. Am. Chem. Soc. 81, 1326 (1959) measured the appearance potential of the B<sup>+</sup> ion from BI<sub>3</sub>. Assuming the reaction

one can calculate the heat of atomization of BI<sub>3</sub> as 8.53 ± 0.5 e.v. The analogous reaction for BI<sub>3</sub> can be checked independently and shows the process to be valid. This value leads to a ΔH<sub>f</sub><sup>0</sup> 298 = 17.0 ± 12 kcal. mole<sup>-1</sup>, if the process is assumed to occur at 298°K.

Heat Capacity and Entropy  
 Vibrational frequencies were taken from T. Wentink and V. H. Tiemann, J. Chem. Phys. 28, 828 (1958) modified according to the natural abundance of boron. The B-I distance was estimated by Koski et al., loc. cit., and the angle was estimated by analogy with the other boron trihalides. The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 1.30238 X 10<sup>-37</sup> and I<sub>C</sub> = 2.60476 X 10<sup>-37</sup> g. cm.<sup>2</sup>

June 30, 1961 Dec. 31, 1964

$\Delta H_f^0 = -241.96 \pm .20$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^{298.15} = -243.29 \pm .20$  kcal. mole<sup>-1</sup>  
 $\Delta H_m = 8.093 \pm .10$  kcal. mole<sup>-1</sup>

Heat of Formation.

O. C. Sinke, Thermal Research Laboratory, The Dow Chemical Co., private communication, July 1960 has measured  $\Delta H_f^{298.15}$  for the following reaction:

$\Delta H_f^{298.15} = -10.93 \pm 0.05$  kcal. mole<sup>-1</sup>

From this heat of reaction the  $\Delta H_f^{298.15}$  for  $LiBO_2(c)$  is calculated to be  $-243.29$  kcal. mole<sup>-1</sup> with the following auxiliary heats of formation:

$\Delta H_f^{298.15}$  (kcal. mole<sup>-1</sup>)

$H_3BO_3 \cdot 11H_2O$  -258.23

$HNO_3 \cdot 11H_2O$  -49.44

$H_2O(l)$  -68.315

$LiNO_3 \cdot 11H_2O$  -115.747

 R. G. Lawrence Radiation Lab. UCR-7952, 5,  
 July, (1954).

\*\*Dilution and other auxiliary data from W. H. Evans, loc. cit.

L. Shartsias and W. Capps, J. Am. Ceram. Soc. 37, 27 (1954), measured the heats of solution in nitric acid of various  $Li_2O-B_2O_3$  glasses and crystalline mixtures containing 0 to 48 mole %  $Li_2O$ . These results were extrapolated to 50 mole % and yielded  $\Delta H_f^{298.15} = -45.20$  kcal. for the following reaction:

With JANAF values for  $Li_2O(c)$  and  $B_2O_3(c)$  the  $\Delta H_f^{298.15}$  for  $LiBO_2(c)$  was calculated to be  $-245.97 \pm .80$  kcal. mole<sup>-1</sup>. This value is in fair agreement with the value adopted for the table.

$\Delta H_f^{298.15} = -53.115 \pm 0.019$  kcal. mole<sup>-1</sup>

$\Delta H_f^{298.15} = +1.02$  kcal. mole<sup>-1</sup>

$\Delta H_f^{298.15} = 0.00$

$\Delta H_f^{298.15} = 0.00$

$\Delta H_f^{298.15} = .171$  kcal. mole<sup>-1</sup>

Heat Capacity and Entropy.

P. L. Oetting and W. E. Hutton, The Dow Chemical Company, private communication, April, 1961, have measured  $C_p$  from 15° to 328°K. R. A. McDonald, Thermal Research Laboratory The Dow Chemical Company, private communication, April, 1961 has measured  $H_f^{298.15}$  from 289° to 1116°K. The above data were adopted for the table. The  $C_p$  values above  $T_m$  were obtained by graphical extrapolation.

The entropy was based on  $S^0 = .013$  cal. mole<sup>-1</sup> deg<sup>-1</sup> at 15°K. calculated from the low temperature  $C_p$  values of P. L. Oetting and W. E. Hutton loc. cit.

Melting Data.

The  $T_m$  and  $\Delta H_m$  adopted for this table were obtained from R. A. McDonald loc. cit. The following cryoscopic data have been published: C. Petit and M. Jaeger, Compt. rend. 244, 1734 (1957),  $T_m = 1108^\circ K$ ,  $\Delta H_m = 7.4$  kcal. mole<sup>-1</sup>; O. Zarsycki, colloques Intern, centre, nat'l. recherche sci. (Paris) 35, Electrolyse C34-C37 (1952),  $\Delta H_m = 8.3 \pm 0.8$  kcal. mole<sup>-1</sup>; C. Sutra, Compt. rend. 234, 1283 (1952),  $T_m = 1113^\circ K$ , and  $\Delta H_m = 8.3$  kcal. mole<sup>-1</sup>.

$S_{298.15}^{\circ} = [15.591] \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^{\circ} 298.15 = [-238.819] \text{ kcal. mole}^{-1}$   
 $\Delta F_f^{\circ} 298.15 = [-226.365] \text{ kcal. mole}^{-1}$   
 $T_m = 1117 \pm 1^{\circ}\text{K.}$   
 $T_b = [2284]^{\circ}\text{K.}$   
 $\Delta H_m^{\circ} = [50.79] \text{ kcal. mole}^{-1}$

Heat of Formation.  
 $\Delta H_f^{\circ}(l)$  was obtained from  $\Delta H_f^{\circ}(c)$  by addition of  $\Delta H_m^{\circ}$  end difference between ( $H_{1117}^{\circ} - H_{298.15}^{\circ}$ ) for the crystal and liquid.

Heat Capacity and Entropy.

R. A. McDonald, Thermal Research Laboratory, The Dow Chemical Company, private communication, April 1961, has measured  $H_m - H_{298.15}$  from 1118° to 1707°K. The constant value of  $C_p$  measured between 1118° and 1707°K. has been extrapolated above and below this range. Lithium metaborate is assumed to have a glass transformation temperature at 745°K. below which  $C_p$  of the glass is assumed equal to that of the crystal.

The entropy of the liquid was calculated from the entropy of the crystal in a manner analogous to the heat of formation.

Melting Data.

The  $\Delta H_m$  end  $T_m$  values were obtained from R. A. McDonald loc. cit.

Vaporization Data.

The boiling point was found from graphing the  $\Delta F_f^{\circ}$ 's of the liquid and gas. The heat of vaporization was found from the difference in  $\Delta H_f^{\circ}$ 's of the liquid and gas at  $T_b$ .

Point Group C<sub>2v</sub>  
 $\Delta H_f^0 = -159.54 \pm 1.1$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^{298.15} = -160.38 \pm 1.1$  kcal. mole<sup>-1</sup>  
 Ground State Quantum Weight = [1]

Bond Distances: Li-O = 1.82 Å, O-B = 1.36 Å, B-O = 1.20 Å  
 Bond Angles: LiOB = 100°, O-B-O = 180°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 4.01933 X 10<sup>-115</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The adopted heat of formation at 298.15 was evaluated by the third-law method using vapor pressure data reported by D. L. Hildenbrand, M. P. Hall and N. D. Potter, J. Chem. Phys. 39, No. 2, 296 (1963). The heat of reaction at 298.15 was found to be 82.908 kcal. mole<sup>-1</sup> thus giving the value  $\Delta H_f^{298.15} = -160.382$  kcal. mole<sup>-1</sup>. A second-law method was also used on the data of D. L. Hildenbrand et. al., loc. cit. and yielded a  $\Delta H_f^{298.15} = 91.375$  kcal. mole<sup>-1</sup> thus giving  $\Delta H_f^{298.15} = -161.915$  kcal. mole<sup>-1</sup>. A. Buehler and J. B. Berkowitz-Mattuck, J. Chem. Phys. 39, No. 2, 286 (1963), have measured the vaporization of lithium metaborate mass spectrometrically in an effusion cell. The second law value reported by A. Buehler and J. B. Berkowitz-Mattuck, loc. cit. for  $\Delta H_f^{1060}$  was  $79 \pm 3$  kcal. mole<sup>-1</sup> which yields  $\Delta H_f^{298.15} = 84.078$  kcal. mole<sup>-1</sup> thus giving  $\Delta H_f^{298.15} = -159.212$  kcal. mole<sup>-1</sup> with JANAF auxiliary values.

Heat Capacity and Entropy.

A. Buehler and E. P. Merram, J. Chem Phys. 39, No. 2, 292, (1963), observed and assigned two vibrational frequencies to lithium metaborate which were adopted for this table. The other vibrational frequencies were estimated by comparison with similar molecules. D. White, Ohio State University, in a private communication quoted in D. L. Hildenbrand et. al. loc. cit. assigned vibrational frequencies from matrix-isolation experiments. When these frequencies were used in a third and second law analysis of Hildenbrand's data, the drift in the third law was much larger and the agreement between the second and third law was also much poorer than that using the frequencies employed in this table. The molecular constants were obtained from P. A. Akshin and V. P. Spiridonov, Zhur. Struktr. Khim. 2, 63 (1961). The individual moments of inertia are: I<sub>A</sub> = 1.22164 X 10<sup>-38</sup> g. cm.<sup>2</sup>, I<sub>B</sub> = 2.2710 X 10<sup>-39</sup> g. cm.<sup>2</sup>, and I<sub>C</sub> = 1.44875 X 10<sup>-38</sup> g. cm.<sup>2</sup>.

BORON NITRIDE (BN)

(CRYSTAL)

OFW = 24.8177

$\Delta H_f^\circ = -59.27 \pm 0.37$  kcal/mol  
 $\Delta H_f^{298} = -59.37 \pm 0.37$  kcal/mol  
 $S_{298.15}^\circ = 3.536$  gibbs/mol  
 $T_0 = 2600 \pm 100^\circ K$

Heat of Formation.

The adopted heat of formation was determined by Wise et al. using combustion in fluorine. Other recent calorimetric values are in good agreement as summarized below. Torsion-effusion studies of the decomposition  $BN(c) \rightarrow B(am) + 0.5 N_2(g)$  by D. L. Hildenbrand and W. F. Hall, J. Phys. Chem. **67**, 888 (1963), yield essentially the same  $\Delta H_f^\circ$  and indicate that the condensation coefficient,  $\alpha$ , is  $< 6 \times 10^{-3}$  for  $N_2(g)$  on the surface of the sample. Use of  $\alpha = 6 \times 10^{-3}$  brings the following decomposition studies into reasonable agreement: Langmuir studies by L. H. Dreyer, V. V. Dadaps and J. L. Margrave, J. Phys. Chem. **58**, 1556 (1962); mass spectrometric studies by P. O. Schissel and W. S. Williams, Bull. Am. Phys. Soc., **II**, 4, 139 (1959); and Knudsen effusion studies by M. Hoch and D. White, Technical Research Report MCC-1023-TM-214, Ohio State University Research Foundation, Columbus, Ohio, October, 1958.

Heat Capacity and Entropy.

The low temperature heat capacity was taken from E. F. Westrum, Jr., private communication, May 19, 1960. The intermediate heat capacity (300-1650°C) was obtained from R. A. McDonald and D. R. Stull, J. Phys. Chem. **65**, 1918 (1961). The high temperature Cp was taken from H. Prophet and D. R. Stull, J. Chem. Eng. Data **9**, No. 1, 78, January 1963. The heat capacities in the three temperature ranges were plotted and then graphically smoothed. A. S. Dworikin, D. J. Sasmor, and A. R. Van Artadalen, loc. cit., also reported heat capacity (50-300°K) not employed in this table.

The entropy was obtained by integration of the heat capacity data from E. F. Westrum, Jr., loc. cit., based upon  $S_{10}^\circ = 0.0028$  eu.

Temperature of Decomposition.

Observations by The Dow Chemical Company under Contract No. AF 33(816)-6149 show decomposition to elements at 1 atm total pressure at  $2600 \pm 100^\circ K$ . The decomposition temperature calculated from these tables is  $2832^\circ K$ ; presumably this discrepancy is associated with uncertainties in the high temperature enthalpies of  $BN(c)$ ,  $B(c)$  and  $E(1)$  and the enthalpy of melting of  $B(c)$ .

Ground State Configuration  $3^1\Pi$   
 $S^{\circ}_{298.15} = 50.73 \text{ gibbs/mol}$   
 $\Delta H^{\circ}_{298.15} = 113 \text{ kcal/mol}$   
 $\Delta H^{\circ}_{298.15} = 114 \pm 30 \text{ kcal/mol}$

Heat of Formation

The heat of formation is based on  $D_0 = 5.7 \text{ eV}$  which was calculated from  $\omega_e$  and  $\omega_e x_e$  observed by A. E. Douglas and G. Herzberg, Can. J. Research 18A, 179 (1940). An uncertainty of  $\pm 1.3 \text{ eV}$  was assigned from consideration of other information which places the dissociation energy between 4 and 7 eV. The value  $D_0 = 4.0 \pm 0.5 \text{ eV}$  was selected by A. G. Gaydon, "Dissociation Energies," second edition, Chapman and Hall Ltd, London, 1953, from his own extrapolation of the spectroscopic data. An upper limit of  $D_0 \leq 7.0 \text{ eV}$  results from the upper limit for the pressure of BN(c)  $\rightarrow$  BN(g) obtained from the  $B^+$  ion intensity at 1600°C observed by P.A. Akhabin and Yu. S. Klodeev, Zh. Neorgan. Khim., 7, 941 (1962). It is likely that the BN(g) pressure is even smaller since it is known that BN(c)  $\rightarrow$  B(s) + 0.5 N<sub>2</sub>(g) and Akhabin's pressure limit are the same magnitude as that of B(s)  $\rightarrow$  B(g). V. V. Fesenko, Forochimovaya Met., Akad. Nauk Ukr. S. S. R., 4, 80-5 (1961) [cf. Chem. Abstr. 56, 10997 (1962)], reports a standard heat of sublimation of 160 kcal/mol for BN(c)  $\rightarrow$  BN(g) and also gives pressures for BN(g) at 2500 and 3000°K which are stated to be two orders less than the equilibrium pressure of nitrogen. Fesenko's original article is not yet available to us and it is not clear from the abstract whether the values are based on new data or are mere calculations. The reported pressures yield  $D_0 = 6.2 \text{ eV}$ , but here again the BN(g) pressures are of the same magnitude as the JANAF values for B(s)  $\rightarrow$  B(g).

Some estimated values for  $D_0$  (ranging from 5.4 to 6.4 eV) are summarized below along with the experimental evidence.

Heat Capacity and Entropy

The molecular constants are based on emission spectra of the  $3^1\Pi - 3^1\Pi$  transition obtained by Douglas and Herzberg, loc. cit. Observation of the same triplet in absorption by B. A. Thrush, Nature 160, 1044 (1960), strongly suggests that the ground state of BN is  $3^1\Pi$  in contrast to  $1^1\Sigma$  as observed for the isoelectronic molecules BeO and C<sub>2</sub>. Electronic levels for the  $3^1\Pi$  states are taken from Douglas and Herzberg while values for  $1^1\Sigma^+$  and  $1^1\Pi$  have been estimated from the SCF calculations of J. L. Mease and M. Ehrlicher, Helv. Chim. Acta 47, 314 (1964).

ΔH<sub>f</sub><sup>0</sup> = -232.9 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>0</sup> 298.15 = -234 ± 2 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>0</sup> = 8.86 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>0</sup> 298.15 = 77.00 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>0</sup> = 17.573 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 1233°K.

Heat of Formation.

W. H. Evans, D. D. Magman and E. J. Prosen in NBS Report No. 4943, "Thermodynamic Properties of Some Boron Compounds", August, 1956, extrapolated from the graph of L. Shartsis and W. Capps, J. Am. Ceram. Soc. 37, 27 (1954) the heat of solution to be -25.4 kcal. mole<sup>-1</sup> for the first reaction in 2N nitric acid. G. Grenier and D. White, J. Chem. Phys. 51, 1661 (1957) measured the heat of solution at 273.15°K. in 2N nitric acid for the first reaction and found a value of -20.43 kcal. mole<sup>-1</sup>. The heats of solution for the second and third reactions were obtained from L. Shartsis and W. Capps, loc. cit.

1. Na<sub>2</sub>O·B<sub>2</sub>O<sub>3</sub>(c) + Solvent I = end Solution 1
2. B<sub>2</sub>O<sub>3</sub>(c) + Solvent I = end Solution 1
3. Na<sub>2</sub>O(c) + Solvent II = Solvent II

ΔH<sub>2</sub><sup>0</sup> = -3.64 kcal./mole  
 ΔH<sub>3</sub><sup>0</sup> = -83.9 kcal./mole

The combination of the above reactions yields:

The ΔH<sub>f</sub><sup>0</sup> 298.15's for Na<sub>2</sub>O and B<sub>2</sub>O<sub>3</sub> are JANAF values. The ΔH<sub>f</sub><sup>0</sup> 298.15 value of -234.000 kcal. mole<sup>-1</sup> employed in this table was obtained by taking the average of the values given above for reaction 1. Since there were uncertainties in the extrapolation and in assuming no contraction for the measurements at 273.15°K., an average value was considered preferable.

Heat Capacity and Entropy.

The low temperature heat capacities (5-298.15°K.) and S<sub>298.15</sub><sup>0</sup> were obtained from G. Grenier and E. F. Westrum, J. Am. Chem. Soc. 78, 6226 (1956). The heat capacities at the higher temperatures were altered slightly from the estimate of K. K. Kelley, U. S. Bureau of Mines Bulletin 393 (1935).

Melting Data.

The T<sub>m</sub> was obtained from H. S. Van Klooster, Z. Anorg. Chem. 59, 122 (1911). The adopted ΔH<sub>m</sub><sup>0</sup> was calculated by K. K. Kelley loc. cit. from H. S. Van Klooster's work. K. K. Kelley also calculated a ΔH<sub>m</sub><sup>0</sup> of 9.3 kcal. mole<sup>-1</sup> from M. H. LaChâtelier, Compt. rend. 118, 800 (1894).

Sublimation Data.

The ΔH<sub>g</sub><sup>0</sup> was obtained from the mass spectrometric investigations of A. Büchler and J. B. Berkowitz-Mattuck, J. Chem. Phys. 39, 266 (1963).

ΔH<sub>f</sub><sup>o</sup> 298.15 = 20.560 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> = 0.66 kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 1239°K.

Heat of Formation.

ΔH<sub>f</sub><sup>o</sup> 298.15(l) was obtained from ΔH<sub>f</sub><sup>o</sup>(c) by addition of ΔH<sub>m</sub><sup>o</sup> end difference between (H<sub>1239</sub>-H<sub>298.15</sub>) for the crystal end liquid.

Heat Capacity and Entropy.

Sodium metaborate is assumed to have a glass transformation at 826°K. below which C<sub>p</sub> of the glass is assumed equal to that of the crystal. Above 826°K. the heat capacity was estimated as a constant value by assuming 0.75 calories contribution from each atom. The S<sub>298.15</sub> was obtained in a manner analogous with ΔH<sub>f</sub><sup>o</sup> 298.15.

Melting Data.

See crystal table.

Sodium Metaborate (NaBO<sub>2</sub>)

(Ideal Gas) Mol. Wt. = 65.811

SODIUM METABORATE (NaBO<sub>2</sub>) (IDEAL GAS)

Bond Distances: Na-O = 2.14 Å, O-B = 1.36 Å, B-O = 1.20 Å  
 Bond Angles: NaOB = 100°, O-B-O = 180°  
 Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = 2.566657 X 10<sup>-114</sup> g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The heat of formation was calculated from the heat of sublimation of 73 ± 3 kcal. mole<sup>-1</sup> measured mass spectrometrically at 1070°K. by A. Bidchler and J. B. Berkowitz - Mattuck, J. of Chem. Phys. 39, 286 (1963) by addition of the difference between (H<sub>1070</sub> - H<sub>298.15</sub>) for the crystal and gas.

Heat Capacity and Entropy.

A. Bidchler and E. P. Murrain, J. Chem. Phys. 32, No. 2, 292, (1963), observed and assigned two vibrational metaborate frequencies, which were adopted for this table. The other vibrational frequencies were estimated by comparison with lithium metaborate. The molecular constants were obtained from P. A. Akishin and V. P. Spiridonov, Zhur. Strukt. Khim. 2, 63 (1961). The individual moments of inertia are: I<sub>A</sub> = 4.2923 X 10<sup>-39</sup>, I<sub>B</sub> = 22.4009 X 10<sup>-39</sup>, and I<sub>C</sub> = 26.6933 X 10<sup>-39</sup> g. cm.<sup>2</sup>

Heat of Formation

The heat of formation has recently been determined by several workers whose values are in close agreement. P. E. Blackburn, A. Buchler, and J. L. Stauffer, *J. Phys. Chem.*, **70**, 2469 (1966), measured the ion currents corresponding to  $BO^+$  and  $B_2O_2^+$  as a function of temperature in a mass spectrometer. From a least squares fit of the data they report  $\Delta H = 56.6 \pm 1.8$  kcal for the reaction  $1/2B_2O_2(g) + BO(g)$ ; this yields  $\Delta H^{\circ}_{298}(BO, g) = 2.1 \pm 2.8$  kcal/mol using  $\Delta H^{\circ}_{298}(B_2O_2, g) = -109 \pm 2$  kcal/mol. L. De Galan, *Physica*, **31**, 1286 (1965), from flame photometric measurements reports  $D^{\circ}_0(BO) = 8.3e/(191.4$  kcal), which corresponds to  $\Delta H^{\circ}_{298}(BO, g) = -0.1$  kcal/mol.

P. Coppens, S. Smoe and J. Drowart, *Trans. Faraday Soc.*, **54**, 630 (1968), from a mass spectrometric study of several isomolecular exchange reactions, conclude that  $D^{\circ}_0(BO) = 8.29 \pm 0.1e/(191.2 \pm 2.3$  kcal) or  $\Delta H^{\circ}_{298}(BO, g) = 0.1 \pm 2.3$  kcal/mol. M. Farber, M. A. Frisch, G. Grenier and H. C. Ko, Rocket Power, Inc., Report No. AFRL-TR-67-244, Final Report under Contract F04611-67-C-0010, Nov. 1967 (available as AD802037), investigated the same reaction as Blackburn et al. and report  $\Delta H^{\circ}_{1900} = 53.8 \pm 1.9$  kcal, which yields  $\Delta H^{\circ}_{298}(BO, g) = 0.9 \pm 2.9$  kcal/mol.

We adopt a median value of  $0 \pm 2$  kcal/mol which includes all the determinations.

Heat Capacity and Entropy

The molecular and vibrational constants for the ground state are from G. Herzberg "Spectra of Diatomic Molecules," D. Van Nostrand Co., Inc., New York, 1950. The electronic levels are also given by Herzberg with the exception of the level at 39957, a  $^2$  level designated B' by A. A. Mal'tsev and D. I. Kataev, *Vestn. Mosk. Univ. Ser. II*, **22**, 2 (1967). The molecular constants were all adjusted to reflect normal isotopic abundances.

Bond Distance: B-O = 1.263 Å  
 Bond Angle: O-B-O = 180°  
 Rotational Constant: B<sub>0</sub> = 0.3303 cm<sup>-1</sup> σ = 2

Heat of Formation

Greene (1) measured the vapor pressure of B<sub>2</sub>O<sub>2</sub> and examined the infrared absorption spectra of B<sub>2</sub>O<sub>3</sub>, B<sub>2</sub>O<sub>2</sub> and B<sub>2</sub>O. The isotope shift and oxygen and temperature dependencies of the boric acid fluctuation bands were studied. The enthalpy change, ΔH<sub>f</sub>°(2100°K) = 76 ± 2 kcal/mol, for the reaction 1/2B<sub>2</sub>O<sub>3</sub>(s) + 1/4 O<sub>2</sub>(g) = B<sub>2</sub>O<sub>2</sub>(g), was obtained spectroscopically. Based on this data and ΔH<sub>f</sub>°(2100°K, B<sub>2</sub>O<sub>3</sub>, s) = -291.05 kcal/mol, we derive ΔH<sub>f</sub>°(298°K, B<sub>2</sub>O<sub>2</sub>, g) = -68.4 ± 2 kcal/mol.

Rusin (2) determined the equilibrium constant of the reaction HBO<sub>2</sub>(g) + OH(g) = B<sub>2</sub>O<sub>2</sub>(g) + H<sub>2</sub>O(g) by simultaneously recording the pressure and spectra at 3000 - 3200°K of HBO<sub>2</sub> and B<sub>2</sub>O<sub>2</sub>, which were produced from the combustion in a bomb of mixtures of H, O, CO and a small amount of B<sub>2</sub>H<sub>6</sub>. Using the experimental value K<sub>p</sub> 3100 = 0.9, and JANAF free energy functions for the reactants and products, we obtain ΔH<sub>f</sub>°(298°K) = 0.53 kcal/mol for that reaction. Employing ΔH<sub>f</sub>°(298°K) = -66.24 kcal/mol.

In a study of gases from flames containing trimethylborate stabilized on flat porous metal burners, Kaskan (3) obtained data consistent with the bands being due to the molecule B<sub>2</sub>O<sub>2</sub>(g). The temperature dependence of the equilibrium constants for the reaction OH(g) + HBO<sub>2</sub>(g) = H<sub>2</sub>O(g) + B<sub>2</sub>O<sub>2</sub>(g) was investigated and the data were reported to be consistent with a value ΔH<sub>f</sub>°(1800°K) = -16 kcal/mol. Based on this ΔH<sub>f</sub>°(1800°K) value, we calculate the heat of formation at 298°K for B<sub>2</sub>O<sub>2</sub>(g) to be -83.62 kcal/mol. Kaskan (4) has studied the effect of oxygen on the intensity of absorption (5470 Å) in the green or "fluctuation" bands of the gas phase in equilibrium with B<sub>2</sub>O<sub>3</sub>(s). At constant temperature the absorptivity was found to depend on the 1/4 power of the oxygen pressure. This is interpreted as evidence that the absorbing species is B<sub>2</sub>O<sub>2</sub>(g). The reaction 1/2B<sub>2</sub>O<sub>3</sub>(s) + 1/4 O<sub>2</sub>(g) = B<sub>2</sub>O<sub>2</sub>(g) was found to be 70 kcal/mol endothermic in the temperature range 1660 - 1950°K, yielding ΔH<sub>f</sub>°(B<sub>2</sub>O<sub>2</sub>, g) = -75.28 kcal/mol. Rusin et al. (2) discussed the discrepancy between their results and those of the above two investigations and commented that the results of Kaskan (3, 4) were derived based on the assumption that Beer's law was obeyed over the temperature range 1400 - 2200°K. Actually, the relative population of the principal electronic state X<sup>2</sup> of the B<sub>2</sub>O<sub>2</sub> molecule changes greatly over this temperature range. Therefore the expression for the dependence of the optical density on the concentration of B<sub>2</sub>O<sub>2</sub> must be corrected to allow for the variation of λ with temperature.

The heat of formation of B<sub>2</sub>O<sub>2</sub>(g) at 298°K is selected as -68 ± 2 kcal/mol.

Heat Capacity and Entropy

The electronic levels and quantum weights are obtained from Johns (5). Vibrational frequencies, bond distance and rotational constant were reported by Johns (5), Sommer (6), and Snowden (7). The values adopted are those determined by Snowden (7). Snowden used a (1:1) mixture of KBr<sub>4</sub> and B<sub>2</sub>O<sub>2</sub> placed in a 13 mm Vycor tube. The mixture was heated to produce a vapor which passed through an external electrodeless discharge. The intense emission spectrum of the B<sub>2</sub>O<sub>2</sub> molecule was observed. The fluorescence spectrum obtained by Johns was too weak for a full characterization of the electronic ground state. The moment of inertia is 4.6743 × 10<sup>-39</sup> g cm<sup>2</sup>.

Heat of Formation

D. E. Jensen, AeroChem TP-187A, Dec. 1968, AeroChem Research Laboratories, Inc., Princeton, N. J., has obtained equilibrium constants for the reaction  $\text{HBO}_2 + e^- \rightarrow \text{H} + \text{BO}_2^-$ . This involves several assumptions the most basic of which is that boron added to H<sub>2</sub>/N<sub>2</sub>O<sub>2</sub> flames is converted completely to HBO<sub>2</sub>. The free electrons are produced by addition of potassium to the flames, and their concentration is measured directly by a microwave cavity resonance method. The hydrogen atom concentration is taken from previous studies on such flames. The BO<sub>2</sub><sup>-</sup> concentration is obtained from the difference between the K<sup>+</sup> concentration and the free electron measurement. The K<sup>+</sup> concentration is measured by an electrostatic probe.

By 2nd and 3rd law analysis of the data, 11 points read back from a plot, we obtain ΔHf<sub>298</sub>(II) = 27.5 ± 4 kcal and ΔHf<sub>298</sub>(III) = 20 ± 2 kcal with a drift of -3.7 ± 1.5 eu. The third law value yields ΔHf<sub>298</sub>(BO<sub>2</sub><sup>-</sup>) = -166 ± 6 kcal/mol where the uncertainty includes possible errors in the functions. This corresponds to an electron affinity of BO<sub>2</sub> equal to 98 ± 6 kcal/mol (4.25 eV).

Heat Capacity and Entropy

The molecular structure is assumed to be linear using the Walsh (1) prediction for 16 valence electron XY<sub>2</sub> molecules. The electronic states are taken from those for CO<sub>2</sub>(g) (2), which is isoelectronic with BO<sub>2</sub><sup>-</sup>(g). The electronic level 35000 cm<sup>-1</sup> and vibrational frequencies are estimated by comparison with the corresponding values for CO<sub>2</sub>, CO<sub>2</sub><sup>+</sup>, and BO<sub>2</sub>, and, the data of Vasco and Srb (3) on the BO<sub>2</sub><sup>-</sup> ion in alkali halide lattices. The B-O bond distance in BO<sub>2</sub><sup>-</sup>(g) is assumed to be smaller than the B-O bond in BO<sub>2</sub>(g), because the BO<sub>2</sub><sup>-</sup>(g) molecule has one more bonding electron than the BO<sub>2</sub>(g) molecule. The moment of inertia is 8.302 × 10<sup>-39</sup> g cm<sup>2</sup>. The enthalpy at 0°K is -2.30 kcal/mol.

BORON MONOSULFIDE (BS) (IDEAL GAS) MOL. WT. = 42.89

Ground State Configuration  $2\Sigma$   
 $S_{298.15} = 51.645 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^0 = 79 \pm 18 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^0 298.15 = 80 \pm 18 \text{ kcal. mole}^{-1}$

Electronic Levels and Quantum Weight  
 $\frac{E_1}{0}$   
 $\omega_e = 1188.23 \text{ cm.}^{-1}$   
 $\alpha'_e = 0.80586 \text{ cm.}^{-1}$   
 $\alpha''_e = 0.00618 \text{ cm.}^{-1}$   
 $\sigma = 1$   
 $r_e = 1.609 \text{ \AA}$

Heat of Formation.  
 The value of  $\Delta H_f^0 298.15$  for BS(g) was calculated based on  $D_0^0 = 5.1 + 0.8 \text{ e.v.}$  for BS(g) reported by A. G. Gaydon, "Dissociation Energies and Spectra of Diatomic Molecules", Chapman and Hall, Ltd., London, 1953.

Heat Capacity and Entropy.  
 The ground state configuration,  $\omega_e$ ,  $\omega_e^x$ ,  $B_e$ ,  $\alpha'_e$  and  $r_e$  were reported by P. B. Zeeman, Can. J. Phys. 29, 336 (1951). The molecular constants used for calculation were corrected to the average isotopic species. The moment of inertia is  $3.47762 \times 10^{-39} \text{ g. cm.}^2$

Mar. 31, 1963; June 30, 1965

TITANIUM MONOBORIDE (TiB)

MOL. WT. = 58.711

(CRYSTAL)

ΔH<sub>f</sub><sup>o</sup> = Unknown

ΔH<sub>f</sub><sup>o</sup> 298.15 = -38.3 ± 9 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = [8.3 ± 1.5] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

T<sub>d</sub> = [2500]\*K.

Heat of Formation.

P. O. Schlessel and O. C. Trulsson, *J. Phys. Chem.*, **66**, 1492 (1962) used a mass spectrometer with Knudsen cells to study the vaporization of the titanium-boron system and obtained ΔF<sub>2340</sub><sup>o</sup> = -118.54 kcal. mole<sup>-1</sup> for the reaction TiB(c) = Ti(g) + B(g). This corresponds to ΔF<sub>2340</sub><sup>o</sup>(TiB(c)) = -33.266 ± 9 kcal. mole<sup>-1</sup>, where 4 kcal. mole<sup>-1</sup> of the uncertainty is due to the heat of sublimation of boron. When this is reduced to 298°K. one obtains ΔH<sub>f</sub><sup>o</sup> 298(TiB(c)) = -38.3 ± 9 kcal. mole<sup>-1</sup>. This value implies a high stability for TiB. This is also indicated by the phase studies of H. Nowotny, P. Benesovsky, C. Brukl and O. Schob, *Monatshefte für Chemie* **92**, 403 (1961).

Heat Capacity and Entropy.

The heat capacities from 298 to 1200°K. were estimated from that of TiB<sub>2</sub> by assuming the difference to be the same as that between CrB and CrB<sub>2</sub> as determined by R. Mezaki, E. W. Tillex, D. W. Barnes and J. L. Margrave (Paper presented at the International Symposium on Nuclear Materials, Vienna, May 1962). A linear extrapolation was assumed above 1200°K.

The heat capacities above 298°K. were also estimated from the relationship C<sub>p</sub>(Ti) + C<sub>p</sub>(2B) - C<sub>p</sub>(TiB<sub>2</sub>) = 2/3 [C<sub>p</sub>(Ti) + C<sub>p</sub>(B) - C<sub>p</sub>(TiB)]. This estimation agreed with the above to 4% over the temperature range 400 to 1000°K.

S<sub>298</sub><sup>o</sup>(TiB, c) = 8.3 cal. mole<sup>-1</sup> deg.<sup>-1</sup> was calculated by the method of W. M. Latimer, *J. Am. Chem. Soc.*, **73**, 1480 (1951). Using JANAP S<sub>298</sub><sup>o</sup>(TiB<sub>2</sub>, c) = 6.8 cal. mole<sup>-1</sup> deg.<sup>-1</sup> and Latimer's value of 9.8 e.u. for the entropy contribution of Ti, an entropy contribution of -1.5 e.u. per Boron atom was calculated.

Decomposition Data.

The phase diagram given in "The Metallurgy of the Rarer Metals - No. 4 Titanium", by A. D. McQuillan and M. K. McQuillan, Academic Press, New York (1956) was used to estimate the decomposition temperature. This diagram shows the decomposition products are TiB<sub>2</sub> and Ti<sub>3</sub>B. However, Nowotny et al. (loc. cit.) have shown Ti<sub>2</sub>B to be nonexistent and so the decomposition products are not defined, probably a eutectic of TiB and TiB<sub>2</sub> is involved.

Heat of Formation.

The equilibrium vapor pressure of the reaction B<sub>2</sub>(g) → B(g) + B(g) was determined by O. Verhaegen and J. Drowart, J. Chem. Phys. 27, 1367 (1962). Using the value, P<sub>B<sub>2</sub></sub>(g)/P<sub>B</sub>(g) = 9 × 10<sup>-5</sup> at 2330 K. where P is partial pressure, the heat of reaction (ΔH<sub>f</sub><sup>0</sup> 298.15) was evaluated to be -62.2 ± 5.0 kcal. mole<sup>-1</sup>. This leads to ΔH<sub>f</sub><sup>0</sup> 298.15 = 195.0 ± 6.4 kcal. mole<sup>-1</sup> for B<sub>2</sub>(g) or D<sub>0</sub> = 3.0 e.v. which is in excellent agreement with the value, D<sub>0</sub> = 3.0 ± 0.5 e.v. reported by A. O. Ouydon, "Dissociation Energies", Chapman and Hall Ltd., London, 1953. The value, D<sub>0</sub> = 3.6 e.v., estimated by G. Herzberg, "Spectra of Diatomic Molecules", D. Van Nostrand Company, Inc., 1950, yields ΔH<sub>f</sub><sup>0</sup> 298.15 = 181.6 kcal. mole<sup>-1</sup> for B<sub>2</sub>(g) which is not used.

Heat Capacity and Entropy.

Molecular and spectroscopic constants were obtained from O. Herzberg, loc. cit. and corrected to the average isotopic species. The principal moment of inertia (I) is 2.26779 × 10<sup>-39</sup> g. cm.<sup>2</sup>

Heat of Formation.

The heat of formation was obtained from mass spectrometric studies; the following reactions at 1500°K. were reported by P. E. Blackburn and A. Eichler, Internat. Technical Report No. 1, March 1965:

1. B<sub>2</sub>O<sub>3</sub>(1) → B<sub>2</sub>O<sub>3</sub>(g) ΔH<sub>1</sub> = 92.226 kcal/mole
2. 1/3 Be<sub>3</sub>P<sub>2</sub>O<sub>6</sub>(c) + 2/3 B<sub>2</sub>O<sub>3</sub>(1) → Be(B<sub>2</sub>O<sub>2</sub>)<sub>2</sub>(g) ΔH<sub>2</sub> = 118 ± 2 kcal/mole
3. Be<sub>3</sub>P<sub>2</sub>O<sub>6</sub>(c) → 3BeO(c) + B<sub>2</sub>O<sub>3</sub>(g) ΔH<sub>3</sub> = 112 ± 1 kcal/mole
4. Be<sub>3</sub>P<sub>2</sub>O<sub>6</sub>(c) → 2BeO(c) + Be(B<sub>2</sub>O<sub>2</sub>)<sub>2</sub>(g) ΔH<sub>4</sub> = 137 ± 3 kcal/mole
5. 3BeO(c) + B<sub>2</sub>O<sub>3</sub>(1) → Be<sub>3</sub>P<sub>2</sub>O<sub>6</sub>(c) ΔH<sub>5</sub> = -23 kcal/mole
6. BeO(c) + B<sub>2</sub>O<sub>3</sub>(g) → Be(B<sub>2</sub>O<sub>2</sub>)<sub>2</sub>(g) ΔH<sub>6</sub> = 22 kcal/mole

The value of ΔH<sub>1</sub> was obtained from JANAF values for B<sub>2</sub>O<sub>3</sub>(1) and B<sub>2</sub>O<sub>3</sub>(g). The values for ΔH<sub>2</sub>, ΔH<sub>3</sub> and ΔH<sub>4</sub> were obtained from P. E. Blackburn and A. Eichler loc. cit. The value for ΔH<sub>5</sub> was obtained by taking the average of ΔH<sub>2</sub>-ΔH<sub>1</sub> + 1/3 ΔH<sub>3</sub> = -19.774 kcal/mole, and ΔH<sub>5</sub> = 5/2 (ΔH<sub>2</sub>-ΔH<sub>1</sub>) = -28.5 kcal/mole. The ΔH<sub>6</sub> value was obtained by taking the average of ΔH<sub>6</sub> = ΔH<sub>4</sub>-ΔH<sub>3</sub> = 25 kcal/mole and ΔH<sub>6</sub> = ΔH<sub>2</sub>-ΔH<sub>1</sub> + 1/3 ΔH<sub>3</sub> = 18.107 kcal/mole. The ΔH<sub>f</sub> 298.15 of BeB<sub>2</sub>O<sub>4</sub> was calculated from reaction 6 with auxiliary JANAF values.

Heat Capacity and Entropy.

The vibrational frequencies estimated by comparison with B<sub>2</sub>O<sub>3</sub>, were adjusted to obtain an S<sub>1500</sub> = 127 obtained in a manner analogous with ΔH<sub>f</sub> from the report of P. E. Blackburn and A. Eichler loc. cit. The frequencies listed are not in point group order. All other molecular constants were estimated by comparison with related boron oxide molecules. The individual moments of inertia are I<sub>A</sub> = 8.5561 X 10<sup>-39</sup> g. cm.<sup>2</sup>, I<sub>B</sub> = 75.1345 X 10<sup>-39</sup> g. cm.<sup>2</sup> and I<sub>C</sub> = 83.6809 X 10<sup>-39</sup> g. cm.<sup>2</sup>

Heat of formation:  
 $\Delta H_f^\circ = 144,655$   
 $\Delta H_f^\circ = 144,655$   
 $\Delta H_f^\circ = 144,655$

The adopted  $\Delta H_f^\circ(\text{c})$  values were estimated by P. Gross, Ph.D. thesis, Massachusetts Institute of Technology, Administration Report No. 5, Solid State Chemistry, February - April 1956. From equilibrium data relating to the same reaction at 1000°K, P. E. Ruckenstein and A. Buchler, J. Phys. Chem. 62, 4750 (1958). The discrepancy of 231 - 2 and 24.5 - 5 kcal/mol which correspond to 21.7 and 23.2 kcal/mol at 298°K. The discrepancy of 8.0 kcal/mol is attributed primarily to the equilibrium values. These values result from differences between the heat of reaction calculated from the variation with temperature of enthalpies for  $\text{Be}_2\text{O}$  and  $\text{Be}_2\text{O}_2$ , respectively, over the systems  $\text{BeO}(\text{s}) + \text{Be}_2\text{O}_2(\text{s})$  and  $\text{Be}_2\text{O}_2(\text{s}) + \text{BeO}(\text{s})$ . The reported reactions and their heats are:

| Reactions  | $\Delta H_{1500}^\circ$ (kcal/mol) |
|--|------------------------------------|
| (a) $\text{Be}_2\text{O}(\text{s}) + \text{Be}_2\text{O}_2(\text{s})$  | 112 ± 1                            |
| (b) $\text{Be}_2\text{O}_2(\text{s}) + 3 \text{BeO}(\text{s}) + \text{Be}_2\text{O}_3(\text{s})$                               | 118 ± 2                            |
| (c) $1/3 \text{Be}_2\text{O}_2(\text{s}) + 2/3 \text{Be}_2\text{O}_3(\text{s}) + \text{Be}(\text{Be}_2\text{O}_3)_2(\text{s})$ | 157 ± 3                            |
| (d) $\text{Be}_2\text{O}_2(\text{s}) + 2 \text{BeO}(\text{s}) + \text{Be}(\text{Be}_2\text{O}_3)_2(\text{s})$                  |                                    |

The heat capacity was estimated from that for  $\text{BeO}(\text{s})$  and  $\text{Be}_2\text{O}(\text{s})$ . The adopted  $\Delta H_{1500}^\circ$  is an average value from the following three estimates. Ruckenstein and Buchler, loc. cit., report  $K_p = 2.7 \times 10^5$  and  $K_p = 9.3 \times 10^5$  at 1500°K for reactions a and b (see heat of formation) based on vacuum balance data and ion intensities, respectively. These  $K_p$ 's yield  $\Delta H_{1500}^\circ = -31.7$  kcal/mol for  $3 \text{BeO}(\text{s}) + \text{Be}_2\text{O}_2(\text{s})$ . Combining this with the JANAP value for  $\Delta H_{1500}^\circ = -12.84$  kcal/mol, we get  $\Delta H_{1500}^\circ = -8.5$  and  $\Delta H_{1500}^\circ = 22.9$  eu. This entropy agrees with 23 eu estimated from the sum of entropies for the component oxides; however, the entropy for  $\text{Be}_2\text{O}_2(\text{s})$ , observed by E. K. Kelley, S. S. Toad and C. H. Snowdon, J. Am. Chem. Soc. 70, 1350 (1948), is larger than that of the component oxides by 2.5 eu. Use of this increase gives 25.5 eu for  $\text{Be}_2\text{O}_2(\text{s})$ .

Melting Data

$T_m$  was obtained from P. E. Ruckenstein and A. Buchler, loc. cit.

Heat of Formation

S. R. Gunn, L. G. Green and A. I. Von Egidy, J. Phys. Chem. 63, 1787 (1959) determined the enthalpy change (ΔH<sub>f</sub><sup>0</sup>) of the reaction B<sub>2</sub>Cl<sub>4</sub>(g) + Cl<sub>2</sub>(g) = 2BCl<sub>3</sub>(g). From the value, ΔH<sub>f</sub><sup>0</sup> 298.15 = -67.3 ± 0.6 kcal. mole<sup>-1</sup>, the heat of formation for B<sub>2</sub>Cl<sub>4</sub>(g) was calculated as -125.32 ± 1.20 kcal. mole<sup>-1</sup>. Based on ΔH<sub>f</sub><sup>0</sup> 298.15 = 8.029 kcal. mole<sup>-1</sup> reported by G. Urry, T. Szwarc, R. E. Moore and H. I. Schlesinger, J. Am. Chem. Soc. 76, 5293 (1954), the heat of formation for B<sub>2</sub>Cl<sub>4</sub>(g) was derived to be -116.9 ± 1.2 kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy

The vibrational frequencies, molecular structure and constants were taken from D. E. Mann and L. Pano, J. Chem. Phys. 25, 1665 (1957). The barrier restricting internal rotation about the B-B single bond is fixed at 1.53 ± 0.60 kcal. mole<sup>-1</sup> obtained from E. A. Mason and M. K. Kreevoy, J. Am. Chem. Soc. 77, 5608 (1955). The three principal moments of inertia are I<sub>A</sub> = 1.00465 X 10<sup>-37</sup>, I<sub>B</sub> = 2.28520 X 10<sup>-38</sup> and I<sub>C</sub> = 1.00465 X 10<sup>-37</sup> g. cm<sup>2</sup>. The reduced moment of inertia for BCl<sub>2</sub> top is I<sub>r</sub> = 1.3213 X 10<sup>-38</sup> g. cm<sup>2</sup>.

Heat of Formation

The heat of formation was calculated based on the value, ΔH<sub>f</sub><sup>0</sup> = -82.0 ± 1.0 kcal. mole<sup>-1</sup> for the reaction B<sub>2</sub>F<sub>4</sub>(g) + Cl<sub>2</sub>(g) = 0.92 BF<sub>3</sub>(g) + 0.46 BF<sub>2</sub>Cl(g) + 0.30 BCl<sub>3</sub>(g) reported by S. R. Gunn and L. G. Green, J. Phys. Chem. 65, 178 (1961).

Heat Capacity and Entropy

The molecular and spectroscopic constants were obtained from J. N. Gayles and J. Self, J. Chem. Phys. 40, 3550 (1964). The vibrational frequencies were corrected to the average isotopic species. The molecular configuration was reported to be staggered, analogous to that observed for B<sub>2</sub>Cl<sub>4</sub>(g). The angle between two B-BF<sub>2</sub> planes is approximately 90°. The thermodynamic functions were evaluated based on an assumption that there is free rotation at B-B bond between the two BF<sub>2</sub> rotating tops. The internal moment of inertia is 4.12218 X 10<sup>-39</sup> g. cm.<sup>2</sup>. The three principal moments of inertia are: I<sub>A</sub> = 3.63497 X 10<sup>-38</sup> g. cm.<sup>2</sup>, I<sub>B</sub> = 1.64887 X 10<sup>-38</sup> g. cm.<sup>2</sup>, I<sub>C</sub> = 3.63497 X 10<sup>-38</sup> g. cm.<sup>2</sup>. The reduced moment of inertia for BF<sub>2</sub> top is I<sub>r</sub> = 4.12218 X 10<sup>-39</sup> g. cm.<sup>2</sup>.

ΔH<sub>f</sub>° = Unknown  
 ΔH<sub>f</sub>° 298.15 = -337.1 ± 2.0 kcal. mole<sup>-1</sup>  
 ΔH<sub>m</sub>° = Unknown  
 ΔH<sub>m</sub>° 298.15 = [30.1] kcal. mole<sup>-1</sup>

S<sub>298.15</sub>° = [30 ± 1] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = Unknown

Heat of Formation.

The enthalpy change, ΔH<sub>f</sub>° 298.15 = -91.3 ± 1.0 kcal. mole<sup>-1</sup>, for the reaction B<sub>2</sub>(OH)<sub>4</sub>(c) + (m + 2)·AgNO<sub>3</sub>(aq.) + (n + 2)·H<sub>2</sub>O(l) = 2Ag(c) + [2H<sub>3</sub>BO<sub>3</sub> + 2HNO<sub>3</sub> + mAgNO<sub>3</sub>]·nH<sub>2</sub>O(aq.) was determined calorimetrically by A. Finch, P. J. Gardner and I. J. Hyman, Trans. Faraday Soc. 51, 649 (1965). The heat of formation of B<sub>2</sub>(OH)<sub>4</sub>(c) was reported to be -335.1 kcal. mole<sup>-1</sup>. This value was corrected to be -337.1 ± 2 kcal. mole<sup>-1</sup> by use of more recent data on the ΔH<sub>f</sub>° 298.15 values used for calculation.

Heat Capacity and Entropy.

The heat capacity for B<sub>2</sub>(OH)<sub>4</sub>(c) was estimated by comparison with those for B(OH)<sub>3</sub>(c). The value of S<sub>298.15</sub>° was calculated based on 3 cal. deg.<sup>-1</sup> mole<sup>-1</sup> per atom for B<sub>2</sub>(OH)<sub>4</sub>(c), which was obtained from the corresponding values for H<sub>2</sub>O(c) and B(OH)<sub>3</sub>(c).

Heat of Sublimation.

The value, ΔH<sub>g</sub>° 298.15, was calculated as the difference between ΔH<sub>f</sub>° 298.15 for B<sub>2</sub>(OH)<sub>4</sub>(g) and B<sub>2</sub>(OH)<sub>4</sub>(c).

Rotation (1)

Bond Distances: B-B = [1.67] Å B-O = [1.36] Å B-H = [1.09] Å

Bond Angles: H-O-B = [114]° O-B-O = [120]° O-B-B = [120]°

Product of the Moments of Inertia:  $I_A I_B I_C = [2.2995 \times 10^{-113}] \text{ g.}^3 \text{ cm.}^6$

Heat of Formation:  $\Delta H_f^\circ = 79 \text{ kcal. mole}^{-1}$ . The heat of formation ( $\Delta H_f^\circ$ ) for  $B_2(OH)_4(g)$  was calculated, using bond energies,  $D(B-OH) = 132$  and  $D(B-B) = 79 \text{ kcal. mole}^{-1}$ . The bond energy  $D(B-OH)$  was taken from that in  $B(OH)_3(g)$  and  $D(B-B)$  was estimated by comparison with that in  $B_2P_4(g)$ .

Heat Capacity and Entropy.

The molecular structure was assumed to be the same as that for  $B_2P_4(g)$ , i.e. the two  $B(OH)_2$  units have staggered configuration, and free rotation about B-B bond. The B-B bond distance was taken as that in  $B_2P_4$  molecule. Those for B-O and B-H bond and bond angles were adopted from  $H_3BO_3$  molecule. Eleven vibrational frequencies were assumed to be the same as those for  $B_2P_4(g)$ . In addition to these were added four OH torsion frequencies, 824(2) and 209(2), four OH stretching, 3200(4), and four B-O-H bending frequencies, 1200(2) and 880(2). The thermodynamic functions were evaluated based on a molecular model having free internal rotation of two  $B(OH)_2$  groups about B-B bond. The reduced moment of inertia for the rotation is calculated as  $4.10146 \times 10^{-39} \text{ g. cm.}^2$ . The three principal moments of inertia are:  $I_A = 1.64037 \times 10^{-38}$  and  $I_B = I_C = 3.7441 \times 10^{-39} \text{ g. cm.}^2$ .

Sources of Auxiliary data: From the JANAF tables,  $\Delta H_f^\circ$  298.15 = -1.2, -96.31, -22.063 kcal. mole<sup>-1</sup> of B(am), BCl<sub>3</sub>(g) and HCl(g) respectively. From P. D. Rossini et al. (11) The  $\Delta H_f^\circ$  298.15 = 5.6 kcal. mole<sup>-1</sup> of BCl<sub>3</sub>. From D. D. Wagman (12) the  $\Delta H_f^\circ$  298.15 of HCl + 1000H<sub>2</sub>O = -39.657 kcal. mole<sup>-1</sup>. From Good et al. (5) the  $\Delta H_f^\circ$  298.15 of H<sub>2</sub>BO<sub>3</sub>(c) = -261.47 ± 0.20 kcal. mole<sup>-1</sup> and the H<sub>2</sub>BO<sub>3</sub> solution data of Rasolno (6).  $\Delta H_f^\circ$  298.15 of (CH<sub>3</sub>)<sub>3</sub>N(g) = -9.9 ± 0.4 kcal. mole<sup>-1</sup> from I Jaffe (10).

**Heat Capacity and Entropy.**  
 The molecular constants reported by B. L. Cornell, "Electron Diffraction Investigation of Diborane and Boron-alkyle", Thesis, Iowa State University of Science and Technology, 1963, were selected. They agree well with those reported by K. Heberg, and V. Schomaker, J. Chem. Phys. **22**, 985 (1954). The principal moments are I<sub>A</sub> = 1.0578 × 10<sup>-39</sup>, I<sub>B</sub> = 4.6416 × 10<sup>-39</sup>, and I<sub>C</sub> = 5.0229 × 10<sup>-39</sup> g.<sup>2</sup> cm.<sup>2</sup>

The vibrational frequencies for B<sub>2</sub>H<sub>6</sub> were those listed by E. C. Wu, Thesis, University of Minn. 1962, "Assignments and Force Constants of Diborane and Isotopic Derivatives" except for  $\nu_8$ ,  $\nu'_{10}$  and  $\nu'_{14}$  which were taken from the calculated frequency column of table VIII-1 page 55 of the Thesis.

$$\Delta H_f^o = -21.8 \pm 2.0 \text{ kcal. mole}^{-1}$$

$$\Delta F_f^o = -22.0 \pm 2.0 \text{ kcal. mole}^{-1}$$

$$S_{298.15}^o = 8.60 \pm 0.04 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$T_D = [1320]^\circ\text{K}$$

Heat of Formation.

The equilibrium constants (983 - 1108°K.) for the reaction  $2\text{MgB}_2(\text{c}) = \text{Mg}(\text{g}) + \text{MgB}_4(\text{c})$  were determined by M. Wright and P. N. Walsh, "The Vaporization of  $\text{MgB}_4(\text{c})$ ", Technical Research Report OMCC-HRF-55, Jan. 9, 1958, Ohio State University Research Foundation. The corresponding second and third law values of  $\Delta H_f^o$  298.15 for this reaction were derived as  $53.1 \pm 4.7$  and  $54.1 \text{ kcal. mole}^{-1}$ , respectively. Using the third law value obtained, i.e.  $\Delta F_f^o$  298.15 =  $54.1 \text{ kcal. mole}^{-1}$ , for the reaction, the  $\Delta H_f^o$  298.15 for  $\text{MgB}_2(\text{c})$  was evaluated as  $-22.0 \pm 2.0 \text{ kcal. mole}^{-1}$ .

Heat Capacity and Entropy.

The low temperature (21.12 - 304.22°K.) heat capacities were measured by R. M. Swift and D. White, J. Am. Chem. Soc. 79, 3641 (1957). Above 298.15°K. the values of  $C_p$  were estimated by comparison with those of other related borides.  $S_{298.15}^o$  was reported by R. M. Swift and D. White, loc. cit., using  $S_{20}^o$  (extrap.) =  $0.005 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$ .

Temperature of Decomposition.

$T_D$  was taken from L. Y. Markovskiy, Y. D. Kondrashev, and G. V. Kaputovskaya, Zhur. Obshchei Khim., 25, 409 (1955). On heating to high temperatures  $\text{MgB}_2(\text{c})$  decomposes into boride phases A, B, and C with the separation of Mg. The composition of phase A is close to  $\text{MgB}_6$  and that of C is close to  $\text{MgB}_{12}$ .

Point Group [C<sub>2v</sub>]  
S<sub>298.15</sub> = [54.4] gibbs/mol  
Ground State Quantum Weight = [1]

$$\Delta H_f^\circ = 22 \pm 25 \text{ kcal/mol}$$

$$\Delta H_f^\circ = 23 \pm 25 \text{ kcal/mol}$$

Bond Distance: B-O = [1.26] Å  
Bond Angle: B-O-B = [150]°

Product of the Moments of Inertia: I<sub>A</sub>I<sub>B</sub>I<sub>C</sub> = [4.7324] X 10<sup>-117</sup> g<sup>3</sup> cm<sup>6</sup>

Heat of Formation.

The heat of formation was calculated from the estimated heat of reaction  $\Delta H_f^\circ = 300 \pm 25$  kcal/mol for B<sub>2</sub>O(g) → 2B(g) + O(g), using the JANAF auxiliary data for B(g) and O(g). The value of  $\Delta H_f^\circ$  was assumed to be the sum of the heats of dissociation, 120 kcal/mol for B<sub>2</sub>O(g) → B<sub>2</sub>(g) + B(g) and 180 kcal/mol for B<sub>2</sub>(g) → B(g) + O(g). The former was estimated and the latter was derived from the JANAF values.

The possible existence of B<sub>2</sub>O(g) in the burning of boron under reducing conditions was discussed by Gilbert S. Bohn in a paper presented at the Combustion Institute, at University of Denver, Apr. 25-27, 1966. He estimated the heat of formation to lie between -27 and +23 kcal/mol, but favored the value of +23 kcal/mol in the theoretical calculations of boron burning in air.

Heat Capacity and Entropy.

The bent molecular structure and the molecular constants were estimated by comparison with those in B<sub>2</sub>O(g), AlO(g) and Al<sub>2</sub>O(g). The three principal moments of inertia are I<sub>A</sub> = 0.1624 X 10<sup>-39</sup>, I<sub>B</sub> = 5.318 X 10<sup>-35</sup> and I<sub>C</sub> = 5.4804 X 10<sup>-39</sup> g cm<sup>2</sup>.

Bond Distance: O-B = 1.20 Å    B-B = 1.70 Å  
Bond Angle: O-B-B = 180°  
Rotational Constant: B<sub>0</sub> = 0.1123 cm<sup>-1</sup>    σ = 2

Heat of Formation  
The heat of formation (ΔH<sub>f</sub>° 298.15) for B<sub>2</sub>O<sub>2</sub>(g) adopted is the weighted average of three ΔH<sub>f</sub>° 298.15 values derived from two different chemical reactions. The chemical reactions related to the production of B<sub>2</sub>O<sub>2</sub>(g) have been studied by several investigators. Using the equilibrium vapor pressure data, the respective values of ΔH<sub>f</sub>° 298.15 were evaluated by both the second and third law methods. The results obtained are based on the latter and presented as follows.

| Investigator                   | Reaction  | Third Law Value | Second Law Value | ΔH <sub>f</sub> ° 298.15, kcal. mole <sup>-1</sup> |
|--------------------------------|---|-----------------|------------------|--|
| Inghram, et al. <sup>1</sup>   | 2/3 B(c) + 2/3 B <sub>2</sub> O <sub>3</sub> (l) = B <sub>2</sub> O <sub>2</sub> (g)    | 94.0            | 91.8 ± 2.2       | -105.5 ± 0.7*                                      |
| Searcy and Myers <sup>2</sup>  | 2/3 B(c) + 2/3 B <sub>2</sub> O <sub>3</sub> (g) = B <sub>2</sub> O <sub>2</sub> (g)    | 24.8            | 25.4 ± 0.2       | -108.0 ± 0.5                                       |
| Scheer <sup>3</sup>            | 2B <sub>2</sub> O(c) + 2B(c) = 2B <sub>2</sub> O(g) + B <sub>2</sub> O <sub>2</sub> (g) | 255.4           | —                | -102.6 ± 10*                                       |
| Rentzepis, et al. <sup>4</sup> | 2/3 B(c) + 2/3 B <sub>2</sub> O <sub>3</sub> (l) = B <sub>2</sub> O <sub>2</sub> (g)    | 89.3            | 77.9 ± 0.2       | -110.2 ± 0.9                                       |
|                                | B <sub>2</sub> O <sub>3</sub> (l) + 3C(c) = 3CO(g) + B <sub>2</sub> O <sub>2</sub> (g)  | —               | —                | -108.5 ± 1.5                                       |
|                                | B <sub>2</sub> O <sub>3</sub> (l) + C(c) = B <sub>2</sub> O <sub>2</sub> (g) + CO(g)    | —               | —                | —  |

\*The value not used for the calculation of the weighted average of ΔH<sub>f</sub>° 298.15 for B<sub>2</sub>O<sub>2</sub>(g).

1 M. G. Inghram, R. P. Porter and W. A. Chupka, J. Chem. Phys. **25**, 438 (1956).  
 2 A. W. Searcy and C. E. Myers, J. Phys. Chem. **51**, 957 (1957).  
 3 M. D. Scheer, J. Phys. Chem. **52**, 450 (1958).  
 4 P. Rentzepis, D. White and P. N. Walsh, J. Phys. Chem. **64**, 1784 (1960). The value of ΔH<sub>f</sub>° 298.15 was obtained from derived log K<sub>f</sub>(B<sub>2</sub>O<sub>2</sub>, g) values by the third law method.

Heat Capacity and Entropy  
The molecular structure and constants, and vibrational frequencies, corrected to the average isotopic species, were taken from A. Sommer, D. White, M. J. Linevsky and D. E. Mann, J. Chem. Phys. **33**, 87 (1963). The moment of inertia (I) is 2.4922 X 10<sup>-38</sup> g. cm<sup>2</sup>.

Dec. 31, 1960; Dec. 31, 1964

$\Delta H_f^{\circ} 0 = -302.16 \pm 0.40$  kcal. mole<sup>-1</sup>  
 $\Delta H_f^{\circ} 298.15 = -303.64 \pm 0.40$  kcal. mole<sup>-1</sup>  
 $\Delta H_m^{\circ} = 5.26 \pm 0.02$  kcal. mole<sup>-1</sup>  
 $\Delta H_s^{\circ} 298.15 = 104.5 \pm 0.6$  kcal. mole<sup>-1</sup>

$S_{298.15}^{\circ} = 12.87 \pm 0.10$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m = 723 \pm 2^{\circ}\text{K.}$

Heat of Formation.

The heat of formation ( $\Delta H_f^{\circ} 298.15$ ) for B<sub>2</sub>O<sub>3</sub>(c) has been reported by many investigators. However, the values obtained were not in good agreement. The value of  $\Delta H_f^{\circ} 298.15$  for B<sub>2</sub>O<sub>3</sub>(c) adopted was taken from L. G. Fasolino, "Heats of Formation of B<sub>2</sub>O<sub>3</sub>(c) and B<sub>2</sub>O<sub>3</sub>(am.)", NMR-3608 (OO), National Research Corporation, Massachusetts, June 2, 1964. The other derived values of  $\Delta H_f^{\circ} 298.15$  for B<sub>2</sub>O<sub>3</sub>(c) are listed in the following table.

| Investigator                        | Reaction   | $\Delta H_f^{\circ} 298.15$ , kcal. mole <sup>-1</sup> | $\Delta H_f^{\circ} 298.15$ , kcal. mole <sup>-1</sup> |
|-------------------------------------|--|--|--|

| Fasolino                            | B <sub>2</sub> O <sub>3</sub> (c) + 348 H <sub>2</sub> O(l) = 2 H <sub>3</sub> BO <sub>3</sub> ·345 H <sub>2</sub> O(Sol.) | -3.45 ± 0.03   | -303.64 ± 0.40   |

<sup>1</sup>W. A. Roth, Z. Naturforsch., **1**, 574 (1946).

<sup>2</sup>W. Eggersgluess, A. G. Monroe and W. G. Parke, Trans. Faraday Soc., **45**, 661 (1949).

<sup>3</sup>E. R. Van Artadalen and K. P. Anderson, J. Am. Chem. Soc., **73**, 579 (1951).

<sup>4</sup>B. H. Eckstein and E. R. Van Artadalen, J. Am. Chem. Soc., **80**, 1352 (1958).

<sup>5</sup>G. L. Gal'chenko, A. N. Kornilov and S. M. Skuratov, Russ. J. Inorg. Chem., **5**, 1039 (1960).

In order to evaluate the values of  $\Delta H_f^{\circ} 298.15$  for B<sub>2</sub>O<sub>3</sub>(c) from the corresponding  $\Delta H_f^{\circ} 298.15$  values, the following auxiliary data (298.15°K) were used:  $\Delta H_f^{\circ}(\text{B, am.}) = 1.2 \pm 0.4$  kcal. mole<sup>-1</sup>,  $\Delta H_f^{\circ} = 4.36$  kcal. mole<sup>-1</sup> for the reaction B<sub>2</sub>O<sub>3</sub>(c) = B<sub>2</sub>O<sub>3</sub>(gl.),  $\Delta H_f^{\circ}(\text{H}_3\text{BO}_3, \text{c}) = -261.47 \pm 0.20$  kcal. mole<sup>-1</sup>,  $\Delta H_f^{\circ}(2 \text{ H}_3\text{BO}_3 \cdot 345 \text{ H}_2\text{O, Sol.}) = -512.04 \pm 0.40$  kcal. mole<sup>-1</sup> and  $\Delta H_f^{\circ}(\text{H}_2\text{O, l}) = -68.317$  kcal. mole<sup>-1</sup>.

Heat Capacity and Entropy.

The low temperature (19.08 - 296.60°K.) heat capacities used were reported by E. C. Kerr, H. N. Hersh and H. L. Johnston, J. Am. Chem. Soc., **72**, 4738 (1950). The high temperature (350.6 - 718.4°K.) heat capacities were derived from the heat content measurements determined by J. C. Southard, J. Am. Chem. Soc., **63**, 3147 (1941). These two sets of C<sub>p</sub> data were plotted and joined smoothly at 298°K. The C<sub>p</sub> values above 718.4°K. were estimated by graphical extrapolation.  $S_{298.15}^{\circ}$  was obtained from E. C. Kerr, H. N. Hersh and H. L. Johnston, loc. cit., based on  $S_{298}^{\circ} = 0.027$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>. The specific heats of B<sub>2</sub>O<sub>3</sub>(c) in the temperature range 51 to 298°K. were also determined by K. K. Kelley, J. Am. Chem. Soc., **53**, 1137 (1931). The C<sub>p</sub> values reported are in good agreement with the values adopted.

Melting Data.

Melting temperature (T<sub>m</sub>) was taken from P. C. Kracek, G. W. Morey and H. E. Merwin, Am. J. Sci., [5] **35A**, 143 (1938). The heat of melting ( $\Delta H_m^{\circ}$ ) was converted from  $\Delta H_m^{\circ} 298.15 = 4.36 \pm 0.02$  kcal. mole<sup>-1</sup> reported by J. C. Southard, loc. cit.

Heat of Sublimation.

The value of heat of sublimation ( $\Delta H_s^{\circ} 298.15$ ) was calculated as the difference in the heats of formation ( $\Delta H_f^{\circ} 298.15$ ) for B<sub>2</sub>O<sub>3</sub>(g) and B<sub>2</sub>O<sub>3</sub>(c).

$\Delta H_f^{\circ} 298.15 = -299.28 \pm 0.40$  kcal. mole<sup>-1</sup>  
 $\Delta H_g^{\circ} = 5.26 \pm 0.02$  kcal. mole<sup>-1</sup>  
 $\Delta H_v^{\circ} = 87.55$  kcal. mole<sup>-1</sup>

$S_{298.15}^{\circ} = 18.739$  cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 $T_m = 723 \pm 2^{\circ}K.$   
 $T_b = 2316^{\circ}K.$

Heat of Formation.

$\Delta H_f^{\circ} 298.15$  for B<sub>2</sub>O<sub>3</sub>(l) was obtained from  $\Delta H_f^{\circ} 298.15$  for B<sub>2</sub>O<sub>3</sub>(c) by adding  $\Delta H_m^{\circ}$  and the difference between  $R_m^{\circ}$  -  $H_{298.15}^{\circ}$  for crystal and liquid.

Heat Capacity and Entropy.

The heat content ( $H_c^{\circ} - H_{298.15}^{\circ}$ ) measurements on B<sub>2</sub>O<sub>3</sub>(glass) and B<sub>2</sub>O<sub>3</sub>(l) were determined, from 381.7 to 1778.8°K., by J. C. Southard, J. Am. Chem. Soc. **63**, 3147 (1941) and, from 1015 to 2154°K., by R. M. Krasovitskaya, P. B. Kantor, L. S. Kan, V. V. Kandyba, L. N. Fomichev, Russ. J. Phys. Chem. **35**, 737 (1961). Based on these data the corresponding heat capacities ( $C_p$ ) were derived. The  $C_p$  values thus obtained were plotted and joined smoothly, assuming a glass transition temperature at 550°K. The heat capacities above 2154°K. were estimated by graphical extrapolation. The entropy was obtained in a manner analogous to that of the heat of formation. The heat capacities of B<sub>2</sub>O<sub>3</sub> glass and liquid have also been measured between 35 and 350°C with a radiation calorimeter by S. B. Thomas and G. S. Parks, J. Phys. Chem. **35**, 2091 (1931). The heat capacity curves obtained have been compared and discussed.

Melting Data.

See the B<sub>2</sub>O<sub>3</sub>(c) table.

Vaporization Data.

The boiling point ( $T_b$ ) was calculated as the temperature at which the difference in  $\Delta H_f^{\circ}$  values for B<sub>2</sub>O<sub>3</sub>(g) and B<sub>2</sub>O<sub>3</sub>(l) becomes zero. The corresponding difference in  $\Delta H_f^{\circ}$  values at  $T_b$  is the heat of vaporization ( $\Delta H_v^{\circ}$ ).

Point Group C<sub>2v</sub>  
 $\Delta H_f^0 = 67.798 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$   
 $\Delta H_f^0 = -198.87 \pm 0.50 \text{ kcal. mole}^{-1}$   
 $\Delta H_f^0 = -199.14 \pm 0.50 \text{ kcal. mole}^{-1}$   
 Ground State Quantum Weight = 1

Bond Distance: O-B = 1.36 ± 0.02 Å      B-O = 1.20 ± 0.03 Å  
 Bond Angle: O-B-O = 180°      B-O-B = 120°  
 Product of the Moments of Inertia:  $I_A I_B I_C = 3.15283 \times 10^{-114} \text{ g.}^3 \text{ cm.}^6$

Heat of Formation ( $\Delta H_f^0, 298.15^\circ$ ) for B<sub>2</sub>O<sub>3</sub>(g) was calculated from the values of  $\Delta H_f^0, 298.15$  and  $\Delta H_f^0, 298.15$  for B<sub>2</sub>O<sub>3</sub>(l). The  $\Delta H_f^0, 298.15$  value was obtained from the analyses of the vapor pressure data of B<sub>2</sub>O<sub>3</sub>(l) by both the second and third law methods. Ten sets vapor pressure data were employed for examination. The results obtained are presented as follows.

| Investigator <sup>1</sup>         | Temperature, °K. | Third Law Value | Second Law Value |

The free energy functions of B<sub>2</sub>O<sub>3</sub>(g) used for calculation are obtained using two estimated vibrational frequencies, 172 and 460 cm<sup>-1</sup>. Similar evaluations were made using 259 and 460 cm<sup>-1</sup> instead, each corresponding third law values of  $\Delta H_f^0$  obtained was lower by more than 1 kcal. mole<sup>-1</sup> than that of the previous ones. The value of  $\Delta H_f^0, 298.15$  for B<sub>2</sub>O<sub>3</sub>(g) adopted is the third law value based on the vapor pressures reported by D. L. Hildenbrand, M. P. Hall and N. D. Potter, loc. cit.

Heat Capacity and Entropy.  
 The bond distances were reported by P. A. Akishin and V. P. Spridinov, Doklady Akad. Nauk. S.S.S.R. **131**, 557 (1960). The bond angle was taken from W. Wetner, Jr. and J. R. W. Mann, J. Chem. Phys. **37**, 292 (1962). The vibrational frequencies were obtained from A. Sommer, D. White, M. J. Linevsky and D. E. Mann, J. Chem. Phys. **38**, 87 (1963) and corrected to the average isotopic species. The three principal moments of inertia are:  $I_A = 3.10959 \times 10^{-38}$ ,  $I_B = 2.9768 \times 10^{-39}$  and  $I_C = 3.4071 \times 10^{-38}$  g. cm<sup>2</sup>.

Heat of Formation.

W. H. Evans in NBS Report 71.92, July 1, 1951, analysed the heats of formation of the lead borate system. L. Shartsis and E. Newman, J. Am. Ceram. Soc. 31, 213 (1948) measured heats of solution of the lead borate glasses in 2 N HNO<sub>3</sub>. In their phase studies C. Mazzetti and P. De Caroli, Gazz. chim. Ital. 56, 19 (1926) established that the compounds formed were PbO·B<sub>2</sub>O<sub>3</sub>, PbO·2B<sub>2</sub>O<sub>3</sub>, PbO·3B<sub>2</sub>O<sub>3</sub> and 2 PbO·5B<sub>2</sub>O<sub>3</sub>. From the Shartsis and Newman paper loc. cit. Evans obtained the following:

$\Delta H_f^0 = -16.2 \text{ kcal. mole}^{-1}$

and estimated a  $\Delta H_{298.15}^0$  of 7.0 kcal. mole<sup>-1</sup> for the conversion to the PbO·B<sub>2</sub>O<sub>3</sub>(crystal). With auxiliary JANAF values the  $\Delta H_f^0 298.15$  was calculated to be - 372 kcal./mole. The results of B. M. Lepinskikh and O. A. Esin, Zhur. Neorg. Khim. 5, 1223 (1961) studying the lead borate system at 1000°K. with cells of the type Pb(liq.)/PbO, B<sub>2</sub>O<sub>3</sub>/Pt/O<sub>2</sub>(g) were in fair agreement with this results of Shartsis and Newman.

Heat Capacity and Entropy.

The heat capacity employed in this table was obtained by graphically smoothing the summation of the heat capacities for B<sub>2</sub>O<sub>3</sub> and PbO.

The entropy at 298.15 was obtained from a consideration of the entropies of sodium and calcium borates and those of the constituent oxides, as given by K. K. Kailley and E. G. King, Bureau of Mines Bull. 592 (1961). These indicate for the reaction:

that the simple addition of entropies will give values at least 2.7 e.u. too low for the reaction. The reason for this is probably structural, the B<sub>2</sub>O<sub>4</sub><sup>2-</sup> ion is a flexible chain. Therefore, the  $S_{298.15}^0$  for PbB<sub>2</sub>O<sub>4</sub> was obtained from the summation of JANAF  $S_{298.15}^0$  for constituent oxides and the addition of 2.7 e.u.

Titanium Diboride (TiB<sub>2</sub>)

(Crystal) Mol. Wt. = 69.522

TITANIUM DIBORIDE (TiB<sub>2</sub>)

(CRYSTAL)

B<sub>2</sub>Ti

MOL. WT. = 69.522

$$\Delta H_f^0 = -66.4 \pm 4.0 \text{ kcal. mole}^{-1}$$

$$\Delta H_f^{298.15} = -68.8 \pm 4.0 \text{ kcal. mole}^{-1}$$

$$\Delta H_m^0 = [24] \text{ kcal. mole}^{-1}$$

$$S_{298.15}^0 = 6.808 \pm 0.1 \text{ cal. deg.}^{-1} \text{ mole}^{-1}$$

$$T_m = 3193^\circ \text{K.}$$

## Heat of Formation.

G. M. Kibler, T. P. Lyon, M. J. Linevsky, and V. J. DeSantis, General Electric Co., report No. WADD-TR-60-646, Part IV (August 1964) studied the vapor pressure of the reaction  $\text{TiB}_2(c) + 1/2 \text{C}(c) = \text{Ti}(g) + 1/2 \text{B}_2(g)$  by comparing the absorption intensity of the 3371.45 Å Ti resonance line of the above reaction at temperature  $T_1$  to Ti(g) over pure titanium metal at temperature  $T_2$ . Using JANAF auxiliary data  $\Delta H_{298}^0 = 81.612 \text{ kcal. mole}^{-1}$  for the above reaction and  $\Delta H_{298}^0(\text{TiB}_2(c)) = -66.9 \text{ kcal. mole}^{-1}$  were calculated.

W. S. Williams, J. Phys. Chem. **65**, 2213 (1961) found 2150 ± 25°K. to be the temperature at which  $\text{TiB}_2(c)$  was formed from a mixture of Ti(c) and B(c). If  $\Delta H_{2150}^0 = 0$  is assumed for the reaction  $\text{Ti}(c) + 2\text{B}(c) = \text{TiB}_2(c) + 3/2 \text{N}_2(g)$  then  $\Delta H_{298}^0(\text{TiB}_2(c)) = -70.7 \text{ kcal. mole}^{-1}$ . If, however,  $\text{N}_2(g)$  is 1/2 atm. then  $\Delta H_{2150}^0 = 4.4 \text{ kcal. mole}^{-1}$  and  $\Delta H_{298}^0(\text{TiB}_2(c)) = -66.3 \text{ kcal. mole}^{-1}$ . He has also shown by stability comparisons that  $\Delta F$  and  $\Delta H > 0$  for the reaction  $\text{TiB}_2 + 3/2 \text{C} = \text{TiC} + 1/2 \text{B}_2$ . Thus  $\Delta H_{298}^0 \text{ TiB}_2 < -51 \text{ kcal. mole}^{-1}$ .

F. O. Schiessel and O. C. Traulsen, J. Phys. Chem. **55**, 1492 (1952) used a mass spectrometer with Knudsen cells to study the vaporization of the titanium-boron system. Only the set of measurements without excess boron or titanium was used. The value  $\Delta H_{298}^0 = 194.9 \text{ kcal. mole}^{-1}$  for the reaction  $\text{TiB}_2(c) = \text{Ti}(g) + 2\text{B}(g)$  was obtained.

This corresponds to  $\Delta H_{298}^0(\text{TiB}_2(c)) = -62.9 \text{ kcal. mole}^{-1}$  using JANAF auxiliary data.

V. A. Epeil'baum and M. I. Starostins, Bor Trudy Konf. Khim. Bors I. Ego Soedinenii **51** (1955-pub.1956) report  $\Delta H_{298}^0(\text{TiB}_2(c)) = -66.85 \pm 2.7 \text{ kcal. mole}^{-1}$  from combustion calorimetry.

C. E. Lowell and W. S. Williams, Rev. Sci. Instr. **32**, 1120 (1961) used high temperature calorimetry to obtain the heat of formation of  $\text{TiB}_2(c)$ . From their data and JANAF auxiliary data  $\Delta H_{298}^0(\text{TiB}_2(c)) = -48.2 \pm 5 \text{ kcal. mole}^{-1}$  was calculated. We question the edibility of the experiment and believe their value is an upper limit.

$\Delta H_{298}^0(\text{TiB}_2(c)) = -66.8 \pm 4 \text{ kcal. mole}^{-1}$  was chosen as representative of the first four investigations.

## Heat Capacity and Entropy.

The heat capacity of  $\text{TiB}_2(c)$  has been determined by the following investigators:

| Investigator   | Method                        | Temperature Range |
|--|-------------------------------|-------------------|
| Westrum  | Adiabatic Calorimetry         | 5- 850°K.         |
| Walker et al. 2  | Drop calorimeter              | 373- 377°K.       |
| Southern Research Institute <sup>3</sup>   | Drop type ice calorimeter     | 586-2689°K.       |
| Mezaki <sup>4</sup>  | Copper-block drop calorimeter | 420-1180°K.       |
| Prophet <sup>5</sup>   | Arc-heating furnace           | 1300-2150°K.      |
| Barrigault et al. 6  | Fulac-method                  | 1733-2417°K.      |
| 1. L. Kaufman and E. V. Clougherty, Technical Documentary Report No. RTD-TDR-63-4086 Part 1 p. 239 (Dec. 1963).                                  |                               |                   |
| 2. E. Walker, C. T. Ewing, and R. R. Miller, J. Phys. Chem. <b>61</b> , 1682 (1957).   |                               |                   |
| 3. Southern Research Institute, Technical Documentary Report No. ASD-TDR-62-675 p. 253 (Jan. 1963).  |                               |                   |
| 4. R. Mezaki, M. S. Theiss, University of Wisconsin (1961).  |                               |                   |
| 5. H. Prophet, Annual Report for 1962 of the Dow Chemical Co. to ARPA under Contract AF 04(611)7554.   |                               |                   |
| 6. R. J. Barrigault et al., Thermodynamics of Certain Refractory Compounds, AVCO Corporation, report ASD-TDR-61-260, Part I, Vol. 1, (May 1962). |                               |                   |

The low temperature data of Westrum<sup>1</sup> and the medium range data of Walker et al.<sup>2</sup> were used to obtain the  $C_p$  of this tabulation. Their data were fitted to a Shomate plot and extrapolated to 4000°K.

$$S_{298.15}^0 = 6.808 \text{ cal. deg.}^{-1} \text{ mole}^{-1} \text{ was determined by Westrum}^1.$$

## Melting Data.

The melting point has been reported as 3063°, 3193°, and 3203°K. by F. W. Glaser, Trans. AIME **194**, 391 (1952), B. Post, F. W. Glaser, and D. Moskowitz, Acta. Met. **20** (1954), and by O. V. Samonov and O. V. Petrush, Metalloved. Obrabotka Metalov **30**, 4, 19 (1955) respectively. The heat of melting is derived from an estimated  $\Delta S_m = 2.5 \text{ cal. deg.}^{-1} \text{ g. atom}^{-1}$  at 3193°K. It should be pointed out that an error of 0.5 cal. deg.<sup>-1</sup> g. atom<sup>-1</sup> in the estimation of  $\Delta S_m$  is 5 kcal. mole<sup>-1</sup> in  $\Delta H_m^0$ .

TITANIUM DIBORIDE (TiB<sub>2</sub>) (LIQUID)

MOL. WT. = 69.522

S<sub>298.15</sub><sup>o</sup> = [13.455] cal. deg.<sup>-1</sup> mole<sup>-1</sup>

ΔH<sub>f</sub><sup>o</sup> 298.15 = [-44.99] kcal. mole<sup>-1</sup>

T<sub>m</sub> = 3193°K.

T<sub>d</sub> = [4250]°K.

Heat of Formation.

ΔH<sub>f</sub><sup>o</sup> 298.15(l) was calculated from ΔH<sub>f</sub><sup>o</sup> 298.15(c) by adding ΔH<sub>fm</sub><sup>o</sup> and the difference between ΔH<sub>fm</sub><sup>o</sup> - H<sub>fm</sub><sup>o</sup> 298.15 for crystal and liquid.

Heat Capacity and Entropy.

A glass transition is assumed at 2100°K. C<sub>p</sub>(l) at and below 2100°K. were assumed to be equal to those of TiB<sub>2</sub>(c). Above 2100°K. the heat capacities were estimated to be constant. S<sub>298.15</sub><sup>o</sup>(l) is calculated based on S<sub>298.15</sub><sup>o</sup>(c) and an estimated ΔS<sub>m</sub><sup>o</sup> = 2.5 cal. deg.<sup>-1</sup> gm. atom<sup>-1</sup>.

Melting Data.

See TiB<sub>2</sub>(c) table for details.

Decomposition Data.

T<sub>d</sub> estimated from ΔH<sub>fd</sub><sup>o</sup> = 0 for the reaction TiB<sub>2</sub>(l) = Ti(g) + 2B(g).

ZIRCONIUM DIBORIDE (ZrB<sub>2</sub>)

(CRYSTAL)

MOL. WT. = 112.842

ΔH<sub>f</sub><sup>o</sup> = -76.8 ± 1.6 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -77.1 ± 1.6 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> = [25] kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 3323°K.

S<sub>298.15</sub><sup>o</sup> = 8.59 ± 0.01 cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 3323°K.

Heat of Formation.

G. K. Johnson, Argonne National Laboratory, private communication, May 1965, reported ΔH<sub>f</sub><sup>o</sup> 298 (ZrB<sub>2</sub>)<sub>999</sub> + 0.005 = -78.7 ± 1.5 kcal. mole<sup>-1</sup>. Their value was obtained by fluorine bomb calorimetry and was based on their recently redetermined value of ΔH<sub>f</sub><sup>o</sup> 298(BF<sub>3</sub>(g)) = -271.90 ± 0.20 kcal. mole<sup>-1</sup>.  
 G. M. Kibler, T. P. Lyon, M. J. Litnensky, and V. J. De Santis, General Electric Co., report No. WADP-TR-60-646, Part IV (August 1964) studied the vaporization of ZrB<sub>2</sub> 931 by the Knudsen effusion method. Over the range 2280 to 2500°K., log K<sub>v</sub> = 22.038 -  $\frac{20,118}{T} \times 10^3$  for the reaction ZrB<sub>2</sub> 931(c) = Zr(g) + 1.931 B(g). JANAF auxiliary data were used to calculate ΔH<sub>f</sub><sup>o</sup> 298 = 478.5 ± 1.5 kcal. mole<sup>-1</sup> by the 3rd law method and ΔH<sub>f</sub><sup>o</sup> 298 (ZrB<sub>2</sub> 931(c)) = -76.7 ± 3.2 kcal. mole<sup>-1</sup>.  
 O. C. Trulsson and H. M. Goldstein, Union Carbide Has. Inst., report No. C-25 (October 1964), investigated the decomposition vapor pressure of the reaction ZrB<sub>2</sub>(c) = Zr(g) + 2B(g) and reported ΔH<sub>f</sub><sup>o</sup> 298 (ZrB<sub>2</sub>(c)) = -72.1 ± 5.3 kcal. mole<sup>-1</sup>. They also reported ΔH<sub>f</sub><sup>o</sup> 298 (ZrB<sub>2</sub>(c)) = -47.0 ± 3 kcal. mole<sup>-1</sup>, ΔH<sub>f</sub><sup>o</sup> 298 (ZrB<sub>2</sub>(c)) = -76.1 ± 3 kcal. mole<sup>-1</sup> was calculated. JANAF values for ΔH<sub>f</sub><sup>o</sup> 298 B(g) and Zr(g) were not used since their independent determinations serve to cancel instrumental constants.  
 From oxygen bomb calorimetry, E. J. Huber, Jr., E. L. Head, and C. E. Hollay, Jr., J. Phys. Chem. 68, 3040 (1964) reported ΔH<sub>f</sub><sup>o</sup> 298 (ZrB<sub>2</sub>(c)) = -77.2 ± 1.2 kcal. mole<sup>-1</sup>.  
 ΔH<sub>f</sub><sup>o</sup> 298 (ZrB<sub>2</sub>(c)) = -77.1 ± 1.6 was chosen as a value representative of the above.

Heat Capacity and Entropy.

The heat capacity of ZrB<sub>2</sub>(c) has been determined by the following investigators:

| Investigator                             | Method                        | Temperature Range |
|--|-------------------------------|-------------------|
| Westrum and Feick <sup>1</sup>           | Adiabatic calorimetry         | 5-350°K.          |
| Valentine et al. <sup>2</sup>            | Copper-block drop calorimeter | 410-1125°K.       |
| Mezaki <sup>3</sup>                      | Copper-block drop calorimeter | 430-1170°K.       |
| Prophet <sup>4</sup>                     | Arc-Imaging furnace           | 1300-2150°K.      |
| Berriault et al. <sup>5</sup>            | Pulse-method                  | 1740-2520°K.      |
| Southern Research Institute <sup>6</sup> | Drop type ics calorimeter     | 500-2500°K.       |

E. F. Westrum, Jr. and G. Feick, J. Chem. Eng. Data 6(2), 183 (1963).  
 R. H. Valentine, T. P. Jembois, and J. L. Margrave, J. Chem. Eng. Data 9(2), 182 (1964).  
 R. Mezaki, M. S. Thesis, University of Wisconsin (1961).  
 H. Prophet, Annual Report for 1962 of the Dow Chemical Co. to ARPA under Contract AF 04(611)7554.  
 S. K. J. Berriault et al., Thermodynamics of Certain Refractory Compounds, AVCO Corporation, report ASD-TR-61-260, Part I, Vol. 1, (May 1962).  
 D. Neel, C. Peers, and S. Ogleys, Southern Research Institute, report ASD-TR-62-675 (August 1962).  
 Westrum and Feick's C<sub>p</sub> values were adopted to 350°K. The disparities in heat capacities above room temperatures seem too great to be errors in measurement and are probably due to sample differences. Since the samples used by Westrum and Feick<sup>1</sup> and by Valentine et al.<sup>2</sup> were from the same batch, Valentine's data were above 350°K. The two sets of data were fitted to a Shomate plot which was extrapolated to 4000°K. However, in consideration of the results of Mezaki<sup>3</sup>, Prophet<sup>4</sup> and Southern Research Institute<sup>6</sup>, the C<sub>p</sub> extrapolation ran somewhat higher than a direct extrapolation of Valentine's data would yield.

S<sub>298.15</sub><sup>o</sup>(ZrB<sub>2</sub>) = 8.59 cal. mole<sup>-1</sup> deg.<sup>-1</sup> was determined by Westrum<sup>1</sup>.

Melting Data.

The melting point has been reported as 3313°, 3325°, and 3285°K. by F. Glaeser and B. Post, J. of Metals, 5, 1117 (1953), B. Post, F. Glaeser, and D. W. Moskowitz, Acta. Met. 2, 70 (1954) and H. Greenwood, Engineer 187, 349 (1949) respectively. The heat of melting is derived from an estimated ΔS<sub>m</sub> = 2.5 cal. deg.<sup>-1</sup> g. atom<sup>-1</sup> at 3323°K. It should be pointed out that an error of 0.5 cal. deg.<sup>-1</sup> g. atom<sup>-1</sup> in the estimation of ΔS<sub>m</sub> is 5 kcal. mole<sup>-1</sup> in ΔH<sub>m</sub>.

ΔH<sub>f</sub><sup>o</sup> 298.15 = [15.448] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 ΔH<sub>m</sub><sup>o</sup> = [25] kcal. mole<sup>-1</sup>  
 T<sub>m</sub> = 3323°K.  
 T<sub>d</sub> = [4466]°K.

S<sub>298.15</sub><sup>o</sup> = [15.448] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 Heat of Formation.  
 ΔH<sub>f</sub><sup>o</sup> 298.15(1) was calculated from ΔH<sub>f</sub><sup>o</sup> 298.15(c) by adding ΔH<sub>m</sub><sup>o</sup> and the difference between ΔH<sub>m</sub><sup>o</sup>-H<sub>298.15</sub><sup>o</sup> for crystal and liquid.

Heat Capacity and Entropy.

A glass transition is assumed at 2200°K. C<sub>p</sub>(1) at and below 2200°K. were assumed to be equal to those of ZrB<sub>2</sub>(c). Above 2200°K. the heat capacities were estimated to be constant. S<sub>298.15</sub><sup>o</sup>(c) and an estimated ΔS<sub>m</sub><sup>o</sup> = 2.5 cal. deg.<sup>-1</sup> gm. atom<sup>-1</sup>.

Melting Data.

See ZrB<sub>2</sub>(c) table for details.

Decomposition Data.

T<sub>d</sub> estimated from ΔF<sub>Td</sub><sup>o</sup> = 0 for the reaction ZrB<sub>2</sub>(l) = Zr(l) + 2B(g).

Heat of Formation.

The equilibrium constants for the reaction B<sub>2</sub>O<sub>3</sub>(l) + BCl<sub>3</sub>(g) = (BOCl)<sub>3</sub>(g) were determined in the temperature range 536-825°K. by a transpiration method by J. Blauer and M. Farber, J. Chem. Phys. **39**, 158 (1963) and in the temperature range 1234-1309°K. by an effusion method by the same investigators, Trans. Faraday Soc. **50**, 301 (1964). Using the reported equilibrium constants, the enthalpy changes for this reaction were evaluated by both the second and third law methods. The results obtained are given in the following table.

| Method Used   | Third Law Value | Second Law Value |
|---------------|-----------------|------------------|
| Transpiration | 5.33            | 5.07 ± 0.4       |
| Effusion      | 12.57           | 5.85 ± 3.3       |

Based on the third law values

ΔH<sub>f</sub><sup>298.15</sup> kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>298.15</sup> kcal. mole<sup>-1</sup>  
 -390 ± 2  
 -386 ± 3

By a mass spectroscopic method the enthalpy changes, ΔH<sub>f</sub><sup>0</sup> 1000 = 16.6 ± 2.5 kcal. mole<sup>-1</sup>, for the reaction BOCl<sub>3</sub>(g) + B<sub>2</sub>O<sub>3</sub>(l) = (BOCl)<sub>3</sub>(g) was determined by R. P. Porter and S. K. Gupta, J. Phys. Chem. **68**, 280 (1964). The ΔH<sub>f</sub><sup>298.15</sup> value for (BOCl)<sub>3</sub>(g) was derived as -377 ± 3 kcal. mole<sup>-1</sup>. However, it is possible that the intensity of B<sub>3</sub>O<sub>3</sub>Cl<sub>3</sub><sup>+</sup>, especially at the highest temperatures, due to changes in the fragmentation pattern with temperature.

The value of ΔH<sub>f</sub><sup>298.15</sup> adopted for (BOCl)<sub>3</sub>(g) is -390 ± 2 kcal. mole<sup>-1</sup> derived from transpiration data. The effusion data were measured in the temperature range where Porter and Gupta, loc. cit. found the presence of (BOCl)<sub>3</sub>(g). However, this point was not taken into consideration in the report. Hence, the corresponding ΔH<sub>f</sub><sup>298.15</sup> value was not adopted.

Heat Capacity and Entropy.

The vibrational frequencies were estimated by comparison with related molecules such as B<sub>3</sub>O<sub>3</sub>F<sub>3</sub>(g) and (BH<sub>2</sub>O)<sub>3</sub>(g). The B-Cl bond distance was assumed to be the same as that in BOCl<sub>3</sub>(g). The B-O bond distance and all bond angles were estimated. The three principal moments of inertia are: I<sub>A</sub> = I<sub>B</sub> = 9.7785 X 10<sup>-35</sup> g. cm.<sup>2</sup> and I<sub>C</sub> = 1.95517 X 10<sup>-31</sup> g. cm.<sup>2</sup>

Bond Distances: B-O = [1.36] Å    B-H = [1.18] Å    B-F = [1.41] Å  
 Bond Angle: B-O-B = [120°]    O-B-H = [120°]    O-B-F = [120°]  
 Product of the Moments of Inertia:  $I_A I_B I_C = [2.1654] \times 10^{-113}$  g.<sup>3</sup> cm.<sup>6</sup>

Heat of Formation.

The equilibrium constants (K), 1246-1326°K. for the two reactions  $2B_3O_3 \cdot P_2H(g) = B_3O_3 \cdot PH_2(g) + B_3O_3 \cdot P_2(g)$  and  $2B_3O_3 \cdot PH_2(g) = B_3O_3 \cdot H_2(g) + B_3O_3 \cdot P_2H(g)$  were reported by F. R. Porter and W. F. Sholette, J. Chem. Phys. 57, 198 (1962). The  $\Delta H_f^\circ$  298.15 for  $B_3O_3 \cdot P_2H(g)$  adopted was evaluated by use of K values slightly outside the ranges given by Porter and Sholette. See the table for  $B_3O_3 \cdot P_2H(g)$  for details.

Heat Capacity and Entropy.

The structure was assumed to be a planar six membered ring structure of  $C_{2v}$  symmetry, which has 21 vibrations of the type  $B_{1g}$ ,  $B_{2g}$ ,  $2A_{2g}$ , and  $4B_{2g}$ . These frequencies were estimated from the values for boroxin and trifluoroboroxin, the symmetry being reduced from  $D_{3h}$  as follows:  $3A_1 \rightarrow 3A_1$ ,  $2A_2 \rightarrow 2B_1$ ,  $5E_1 \rightarrow 5A_1 + 5B_1$ ,  $2A_2 \rightarrow 2B_2$  and  $2E_1 \rightarrow 2A_2 + 2B_2$ .  
 The B-F distance was taken as approximately equal to that in  $(CH_3)_2O \cdot BF_3$  reported by S. H. Bauer, O. R. Findley and A. W. Laubengayer, J. Am. Chem. Soc. 57, 339 (1945). The other bond lengths and angles were taken equal to those in boroxin. The individual moments of inertia were calculated to be  $I_A = 32.985 \times 10^{-39}$ ,  $I_B = 13.973 \times 10^{-39}$ , and  $I_C = 46.968 \times 10^{-39}$  g. cm.<sup>2</sup>

Product of the Moments of Inertia:  $I_A I_B I_C = [7.5869] \times 10^{-113} \text{ g}^3 \text{ cm}^6$

Heat of Formation.

The stabilities of gaseous boroxin ( $B_3O_3$ ) and its fluoro derivatives have been studied by R. P. Porter and W. P. Shollette, J. Chem. Phys. 37, 199 (1962). From the mass spectra of the gaseous reaction products generated by reaction of an  $H_2$ - $B_3O_3$  mixture on  $B_2O_3$  at 1250°K, the equilibrium constants (K) for the following proposed reactions were reported.

| Reaction  | Temperature, °K | K   | $\Delta H_f^0, \text{kcal. mole}^{-1}$ |
|---|-----------------|---|--|
| (1) $H_2(g) + B_3O_3(g) = HF(g) + B_3O_3FH(g)$      | 1246 - 1326     | $4.2 \times 10^{-3} - 2.3 \times 10^{-2}$ | 20.45 - 17.17                          |
| (2) $2B_3O_3FH(g) = B_3O_3H_2(g) + B_3O_3F_2(g)$    | 1246 - 1326     | 0.62 - 0.46                               | 1.28 - 2.15                            |
| (3) $2B_3O_3FH_2(g) = B_3O_3H_3(g) + B_3O_3F_2H(g)$ | 1246 - 1326     | 1.0 - 0.63                                | -2.56 - -1.51                          |

Using these reported K values the corresponding enthalpy changes ( $\Delta H_f^0, 298.15$ ) were evaluated by the third law method. The results obtained are listed in the above table. Based on  $\Delta H_f^0, 298.15 = -565.3$  and  $-64.8 \text{ kcal. mole}^{-1}$  for  $B_3O_3(g)$  and  $HF(g)$  and  $HF(g)$ , respectively, the value of  $\Delta H_f^0, 298.15$  for  $B_3O_3FH(g)$  was calculated from Reaction (1) as  $-482 \text{ kcal. mole}^{-1}$ . From Reaction (2), the  $\Delta H_f^0, 298.15$  value for  $B_3O_3FH_2(g)$  was calculated as  $-397 \text{ kcal. mole}^{-1}$ . However, employing  $\Delta H_f^0, 298.15(B_3O_3H_3, g) = -591 \text{ kcal. mole}^{-1}$ , the values of  $\Delta H_f^0, 298.15$  for  $B_3O_3FH_2(g)$  and  $B_3O_3F_2H(g)$  thus obtained do not fit properly for Reaction (3). Therefore the  $\Delta H_f^0, 298.15$  for  $B_3O_3FH_2(g)$  and  $B_3O_3F_2H(g)$  adopted were evaluated by use of K values slightly outside the ranges given by Porter and Shollette.

Heat Capacity and Entropy.

The vibrational frequencies were obtained by comparison with  $B_3O_3F_3(g)$  and  $B_3H_3O_3(g)$ . The type of vibration and symmetry are identical to those given for  $B_3O_3FH_2(g)$ . The bond lengths and lengths were taken equal to those for  $B_3O_3FH_2(g)$ . The individual moments of inertia were calculated to be  $I_A = 22.051 \times 10^{-39}$ ,  $I_B = 46.659 \times 10^{-39}$  and  $I_C = 70.710 \times 10^{-39} \text{ g. cm}^2$ .

ΔH<sub>f</sub><sup>o</sup> 0 = Unknown  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = -586.5 ± 3.0 kcal. mole<sup>-1</sup>  
 ΔH<sub>f</sub><sup>o</sup> = Unknown  
 ΔH<sub>f</sub><sup>o</sup> 298.15 = 21.2 ± 3.2 kcal. mole<sup>-1</sup>

S<sub>298.15</sub><sup>o</sup> = [52] cal. deg.<sup>-1</sup> mole<sup>-1</sup>  
 T<sub>m</sub> = 353°K.

Heat of Formation.

The heats of solution of the compounds: B<sub>2</sub>O<sub>3</sub>(gl.), BF<sub>3</sub>(g) and (BOP)<sub>3</sub>(c) in water and methanol, respectively, were reported by E. M. Magee, J. Inorg. Nucl. Chem. 22, 156 (1961). The corresponding enthalpy changes for the reaction B<sub>2</sub>O<sub>3</sub>(gl.) + BF<sub>3</sub>(g) = (BOP)<sub>3</sub>(c) were derived as -19.8 and -14.4 kcal. mole<sup>-1</sup>, yielding ΔH<sub>f</sub><sup>o</sup> 298.15 for (BOP)<sub>3</sub>(c) -589.18 and -585.78 kcal. mole<sup>-1</sup>, respectively. The adopted value of ΔH<sub>f</sub><sup>o</sup> 298.15 for (BOP)<sub>3</sub>(c) is the average of these two values obtained.

Heat Capacity and Entropy.

The heat capacities (C<sub>p</sub>) for (BOP)<sub>3</sub>(c) were estimated from the C<sub>p</sub> values for B<sub>2</sub>O<sub>3</sub>(c) and BF<sub>3</sub>(g), according to the method suggested by O. Kubaschewski and E. L. Evans, "Metallurgical Thermochemistry", Pergamon Press, New York, 1958. S<sub>298.15</sub><sup>o</sup> for (BOP)<sub>3</sub>(c) was estimated by E. M. Magee, loc. cit.

Melting Data.

The value of T<sub>m</sub> was reported by E. M. Magee, loc. cit.

Heat of Sublimation.

The heat of sublimation (ΔH<sub>g</sub><sup>o</sup> 298.15) for (BOP)<sub>3</sub>(c) is calculated as the difference between ΔH<sub>f</sub><sup>o</sup> 298.15 for crystal and gas.
