Java for High Performance Computing Java for HPC: Current Research Performance Evaluation Conclusions

Java for HPC

Java is an Alternative for HPC in the Multi-core Era

Interesting features:

- Built-in networking
- Built-in multi-threading
- Portable, platform independent
- Object Oriented
- Main training language

Many productive parallel/distributed programming libs:

- Java shared memory programming (high level facilities: Concurrency framework)
- Java Sockets
- Java RMI
- Message-Passing in Java (MPJ) libraries

Java for High Performance Computing Java for HPC: Current Research Performance Evaluation Conclusions

Java for HPC

Java Adoption in HPC

- HPC developers and users usually want to use Java in their projects.
- Java code is no longer slow (Just-In-Time compilation)!
- But still performance penalties in Java communications:

Pros and Cons:

- high programming productivity.
- but they are highly concerned about performance.

Java for High Performance Computing Java for HPC: Current Research Performance Evaluation Conclusions

Java for HPC

Java Adoption in HPC

- HPC developers and users usually want to use Java in their projects.
- Java code is no longer slow (Just-In-Time compilation)!
- But still performance penalties in Java communications:

JIT Performance:

- Like native performance.
- Java can even outperform native languages thanks to the dynamic compilation.

Java for High Performance Computing Java for HPC: Current Research Performance Evaluation Conclusions

Java for HPC

Java Adoption in HPC

- HPC developers and users usually want to use Java in their projects.
- Java code is no longer slow (Just-In-Time compilation)!
- But still performance penalties in Java communications:

High Java Communications Overhead:

- Poor high-speed networks support.
- The data copies between the Java heap and native code through JNI.
- Costly data serialization.
- The use of communication protocols unsuitable for HPC.

Java for High Performance Computing Java for HPC: Current Research Performance Evaluation Conclusions

Java for HPC

G. L. Taboada*, J. Touriño, R. Doallo Java for HPC: Assessment of Current Research and Practice

Current options in Java for HPC:

- Java Shared Memory Programming
- Java Sockets
- Java RMI
- Message-Passing in Java (MPJ)

Java Shared Memory Programming:

- Java Threads
- Concurrency Framework (ThreadPools, Tasks ...)
- Parallel Java (PJ)
- Java OpenMP (JOMP and JaMP)

Listing 1: JOMP example

```
public static void main (String argv[]) {
    int myid;
    //omp parallel private(myid)
    {
        myid = OMP.getThreadNum();
        System.out.println(''Hello from'' + myid);
    }
    //omp parallel for
    for (i=1;i<n;i++) {
        b[i] = (a[i] + a[i-1]) * 0.5;
    }
}</pre>
```

Java Communication Libraries Overview

Java HPC Applications

Java Message-passing libraries

Java RMI / Low-level messaging libraries

Java Sockets libraries

HPC Communications Hardware

G. L. Taboada*, J. Touriño, R. Doallo Java for HPC: Assessment of Current Research and Practice

HPC Communications Hardware

Performance of current HPC networks (Theoretical/C/Java):

	Startup latency	Bandwidth
	(microseconds)	(Mbps)
Gig. Ethernet	50/55/60	1000/920/900
10G Ethernet	5/10/50	10000/9000/5000
10G Myrinet	1/2/30	10000/9300/4000
InfiniBand	1/2/20	16000/12000/6000
SCI	1.4/3/50	5333/2400/800

<ロ> <同> <同> < 回> < 回> < 回> < 回</p>

Standard and widely extended low-level programming interface for networked communications.

Current implementations:

- IO sockets
- NIO sockets
- Ibis sockets
- Java Fast Sockets

Pros and Cons:

- easy to use.
- but only TCP/IP support.
- lack non-blocking communication.

◆□ ▶ ◆□ ▶ ◆三 ▶ ◆□ ▶ ○ ● ● ●

Iack HPC tailoring.

Standard and widely extended low-level programming interface for networked communications.

Current implementations:

- IO sockets
- NIO sockets
- Ibis sockets
- Java Fast Sockets

Pros and Cons:

- provides non-blocking communication.
- but only TCP/IP support.
- Iack HPC tailoring.
- o difficult use.

- efficient shared memory protocol.
- with HPC tailoring.
- but lack non-blocking support.

Remote Method Invocation

RMI (Remote Method Invocation)

- Widely extended
- RMI-based middleware (e.g., ProActive)
- RMI Optimizations:
 - KaRMI
 - Manta
 - Ibis RMI
 - Opt RMI

Java Message-Passing Libraries

Message-passing is the main HPC programming model.

 Implementation approaches in Java message-passing libraries.

Implementation approaches

- RMI-based.
- Wrapping a native library (e.g., MPI libraries: OpenMPI, MPICH).

Sockets-based.

Listing 2: MPJ example

```
import mpi.* ;
public class Hello {
  public static void main (String argv[]) {
    MPI. Init(args);
    int rank = MPI.COMM WORLD.Rank();
    if (rank == 0)
      String[] msg = new String[1];
      msa[0] = new String("Hello"):
      MPLCOMM WORLD, Send (msg. 0, 1, MPLOBJECT, 1, 13);
    } else if (rank == 1) {
      String[] message = new String[1];
      MPI.COMM WORLD. Recv (message, 0, 1, MPI.OBJECT, 0, 13);
      System.out.println(message[0]);
    MPL. Finalize() :
```

Java Fast Sockets (JFS)

High Performance Java Fast Sockets (JFS):

- Provides efficient high-speed cluster interconnects support (SCI, Myrinet and InfiniBand).
- Optimizes Java IO sockets, more popular and extended than NIO sockets.
- Avoids the need for primitive data type array serialization.
- Significantly reduces buffering and unnecessary copies.
- Implements an optimized shared memory protocol.
- It is user and application transparent, no source code modification is necessary to use JFS.

- Ongoing: smpdev (Shared memory) and ibdev (InfiniBand)

JFS Java Communication Devices MPJ Collectives Scalability HPC Benchmarking

Fast MPJ (F-MPJ)

Fast MPJ (F-MPJ) is the scalable and efficient Java message-passing library implemented on top of the low-level message-passing middleware iodev.

F-MPJ:

- shows efficient non-blocking communication (iodev) and high-speed multi-core clusters support (JFS).
- presents lower communication overhead through an extensive use of communications overlapping.
- achieves high scalability as it implements several algorithms per collective primitive, allowing their selection at runtime.

JFS Java Communication Devices MPJ Collectives Scalability HPC Benchmarking

Fast MPJ (F-MPJ)

Fast MPJ (F-MPJ) is the scalable and efficient Java message-passing library implemented on top of the low-level message-passing middleware iodev.

F-MPJ:

- shows efficient non-blocking communication (iodev) and high-speed multi-core clusters support (JFS).
- presents lower communication overhead through an extensive use of communications overlapping.
- achieves high scalability as it implements several algorithms per collective primitive, allowing their selection at runtime.

Fast MPJ (F-MPJ)

Fast MPJ (F-MPJ) is the scalable and efficient Java message-passing library implemented on top of the low-level message-passing middleware iodev.

F-MPJ:

- shows efficient non-blocking communication (iodev) and high-speed multi-core clusters support (JFS).
- presents lower communication overhead through an extensive use of communications overlapping.
- achieves high scalability as it implements several algorithms per collective primitive, allowing their selection at runtime.

JFS Java Communication Devices MPJ Collectives Scalability HPC Benchmarking

MPJ Collective Algorithms

The design, implementation and runtime selection of efficient collective communication operations have been extensively discussed in the context of native message-passing libraries, but not in MPJ.

F-MPJ focuses on developing scalable MPJ collective primitives.

MPJ Collective Algorithms

The design, implementation and runtime selection of efficient collective communication operations have been extensively discussed in the context of native message-passing libraries, but not in MPJ.

F-MPJ focuses on developing scalable MPJ collective primitives.

Collective Algorithms:

- Flat Tree (FT)
- Minimum-Spanning Tree (MST)
- Binomial Tree (BT)

- Four-ary Tree (Four-aryT)
- Bucket (BKT) or cyclic
- BiDirectional Exchange (BDE) or recursive doubling

JFS Java Communication Devices MPJ Collectives Scalability HPC Benchmarking

NPB-MPJ

NPB-MPJ Optimization:

- JVM JIT compilation of heavy and frequent methods with runtime information
- Structured programming is the best option
 - Small frequent methods are better.
 - mapping elements from multidimensional to one-dimensional arrays (array flattening technique: arr3D[x][y][z]→arr3D[pos3D(lenghtx,lengthy,x,y,z)])
 - NPB-MPJ code refactored, obtaining significant improvements (up to 2800% performance increase)

Experimental Configuration Java Performance for HPC

Experimental Configuration:

Departmental cluster (8 nodes)

- Intel Xeon 5060 dual dual-core CPU (4 cores with hyper-threading per node)
- 4 GB RAM
- InfiniBand network (16 Gbps)
- Linux, OFED-1.4, Intel MPI/C Compiler
- Sun JDK 1.6, ProActive, F-MPJ, MPJ Express, mpiJava

24-core machine

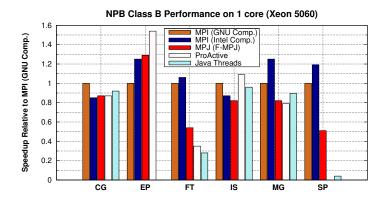

- Quad Intel Xeon 7450 hexa-core CPU (24 cores)
- 32 GB RAM
- Linux, Sun JDK 1.6, Intel Open Compiler

Finis Terrae Supercomputer Configuration

Finis Terrae (142 HP Integrity rx7640 nodes).

Hybrid shared/distributed memory (up to 8 cores per node and up to 32 nodes).

- 16 Montvale Itanium2 (IA64) cores at 1.6 GHz (used 8 cores per node).
- 128 GB RAM
- Interconnected via InfiniBand (16 Gbps)

Finis Terrae Integrity Superdome

Shared memory performance evaluation of up to 64 cores:

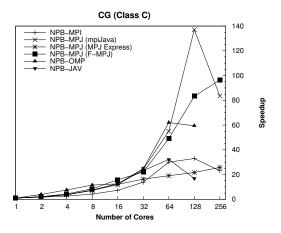

- 128 Montvale Itanium2 (IA64) cores at 1.6 GHz
- 1 TB RAM

Summary Questions

Summary

- Current state of Java for HPC (interesting/feasible alternative)
- Available programming models in Java for HPC:
 - Shared memory programming
 - Distributed memory programming
 - Distributed shared memory programming
- Active research on Java for HPC (>30 projects)
- ...but still not a mainstream language for HPC
- Adoption of Java for HPC:
 - It is an alternative for programming multi-core clusters (tradeoff some performance for appealing features)
 - Performance evaluations are highly important
 - Analysis of current projects (promotion of joint efforts)
