# LATTICE POLYGONS AND GREEN'S THEOREM 

HAL SCHENCK

(Communicated by Michael Stillman)

#### Abstract

Associated to an $n$-dimensional integral convex polytope $P$ is a toric variety $X$ and divisor $D$, such that the integral points of $P$ represent $H^{0}\left(\mathcal{O}_{X}(D)\right)$. We study the free resolution of the homogeneous coordinate ring $\bigoplus_{m \in \mathbb{Z}} H^{0}(m D)$ as a module over $\operatorname{Sym}\left(H^{0}\left(\mathcal{O}_{X}(D)\right)\right)$. It turns out that a simple application of Green's theorem yields good bounds for the linear syzygies of a projective toric surface. In particular, for a planar polytope $P=H^{0}\left(\mathcal{O}_{X}(D)\right), D$ satisfies Green's condition $N_{p}$ if $\partial P$ contains at least $p+3$ lattice points.

## 1. Green's theorem and hyperplane sections

For a curve $C$ of genus $g$, a divisor $D$ of degree $d \geq 2 g+1$ is very ample, so gives an embedding of $C$ into projective space. In fact, when $d \geq 2 g+1$, work of Castelnuovo, Mattuck and Mumford shows that the embedding is projectively normal, which means that $S=\operatorname{Sym}\left(H^{0}\left(\mathcal{O}_{X}(D)\right)\right.$ ) surjects onto $\bigoplus_{m \in \mathbb{Z}} H^{0}(m D)=R$. When $d \geq 2 g+2$, results of Fujita and St. Donat show that the homogeneous ideal of $I_{C}$ is generated by quadrics. Let $F_{\bullet}$ be a minimal free resolution of $R$ over $S$. A very ample divisor is said to satisfy property $N_{p}$ if $F_{0}=S$ and $F_{q} \simeq \bigoplus S(-q-1)$ for all $q \in\{1, \ldots, p\}$. Thus, $N_{0}$ means projectively normal, $N_{1}$ means that the homogeneous ideal is generated by quadrics, $N_{2}$ means that the minimal syzygies on the quadrics are linear, and so on. In [7], Green used Koszul cohomology to give a beautiful generalization of the classical results above: if $\operatorname{deg}(D) \geq 2 g+p+1$, then $D$ satisfies $N_{p}$.

In this brief note, we investigate the $N_{p}$ property for toric varieties. For any divisor $D$ and variety $X$ such that $R$ is arithmetically Cohen-Macaulay, it is natural to slice with hyperplanes until $X$ has been reduced to a curve, and then apply Green's theorem. Results of Hochster [8] show that projectively normal toric varieties are always arithmetically Cohen-Macaulay. So it makes sense to apply the technique in this setting. In [4], Ewald and Wessels prove that if $D$ is an ample divisor on a toric variety of dimension $n$, then $(n-1) D$ is very ample and satisfies $N_{0}$. Bruns, Gubeladze and Trung [2] give another proof and also show that $n D$ satisfies property $N_{1}$. While it is often difficult to determine if a given divisor satisfies $N_{0}$, for a lattice polygon $P$ and corresponding divisor on a toric surface, the property $N_{0}$ holds "for free".

[^0]In [6] Gallego and Purnaprajna give criteria for the $N_{p}$ property for smooth rational surfaces. Toric varieties are rational, and in the case of smooth surfaces the result we obtain is a toric restatement of the result in [6]. However, the proof is simpler in the toric case, applies to singular surfaces, and extends several results in the toric literature. For example, in [10] Koelman proves that a toric surface defined by $P$ satisfies $N_{1}$ iff $\partial P$ contains at least four lattice points, and Ewald and Schmeink [3] prove that certain polytopes associated to smooth toric varieties with $\operatorname{Pic}(X)=2$ satisfy $N_{1}$.
Theorem 1.1. Let $P$ be an n-dimensional lattice polytope, and $X, D$ the associated projective toric variety and ample divisor; so $P=H^{0}\left(\mathcal{O}_{X}(D)\right)$. If $D$ satisfies $N_{0}$, then $D$ satisfies $N_{p}$ if $P$ satisfies

$$
\sum_{f a c e t s F_{i}} \operatorname{vol}\left(F_{i}\right) \geq n(n-2) \operatorname{vol}(P)+\frac{p+3}{(n-1)!}
$$

Proof. Hochster's results mentioned earlier show that $R$ is arithmetically CohenMacaulay. In [9], Khovanskii shows that a toric variety $X$ defined by a lattice polytope $P$ is normal iff the Hilbert polynomial of $X$ and the Ehrhart polynomial of $P$ agree. Projective normality implies normality, and so $X$ is normal. Hence, the singular locus of $X$ is of codimension at least two. So a general member of $|D|$ is smooth. Slicing with $n-1$ general hyperplanes, we obtain a smooth curve $C$ with the same minimal free resolution as $X$. By Khovanskii's result,

$$
\chi\left(\mathcal{O}_{X}(m D)\right)=\left|m P \cap \mathbb{Z}^{n}\right|=a m^{n}+b m^{n-1}+\cdots
$$

After slicing with $n-1$ general hyperplanes, the resulting curve $C$ has

$$
\chi\left(\mathcal{O}_{C}(m)\right)=n!a m+(n-1)!b-(n-1)!\binom{n}{2} a
$$

The first two coefficients of the Ehrhart polynomial are

$$
\begin{aligned}
& a= \\
& b=\frac{1}{2} \sum_{\text {facets }_{i}} \operatorname{vol}(P) \\
& \operatorname{vol}\left(F_{i}\right) .
\end{aligned}
$$

Thus, applying Green's theorem, the divisor $D$ associated to $P$ satisfies $N_{p}$ if

$$
\sum_{\text {facets } F_{i}} \operatorname{vol}\left(F_{i}\right) \geq n(n-2) \operatorname{vol}(P)+\frac{p+3}{(n-1)!}
$$

## 2. Applications

In [12, Wills shows that an $n$-dimensional lattice polytope $P$ that contains an interior point satisfies $n \cdot \operatorname{vol}(P) \geq \sum_{f a c e t s} \operatorname{vol}\left(F_{i}\right)$. So at first glance the bound above seems useless. However, when $n=2$ the term $n(n-2) \operatorname{vol}(P)$ vanishes, and by [4] the divisor associated to a lattice polygon $P$ satisfies $N_{0}$. So we obtain:

Corollary 2.1. The divisor $D$ associated to a lattice polygon $P$ satisfies $N_{p}$ if

$$
\# \text { integral points in } \partial P \geq p+3
$$

Example 2.2. If $P$ is the unit lattice two-simplex, then $d P$ defines the $d$-uple Veronese embedding of $\mathbb{P}^{2}$. By Corollary $2.1, d P$ satisfies $N_{p}$ if $p \leq 3 d-3$, recovering a result of [1]. In fact, Ottaviani and Paoletti [11] show that this bound is tight.

Example 2.3. The ideal sheaf of a projective toric surface $X$ is two-regular iff $N_{p}$ holds for all $p \leq \operatorname{codim}(X)$. By Corollary 2.1, this is true if $P$ has no interior points. In this case $R$ is level with $a$-invariant -2 , which gives half of Theorem 1.27 of [2]. If $P$ has no interior points, then the corresponding divisor has arithmetic genus zero ([5], p. 91). Thus $X$ is a surface of minimal degree. So if $X$ is smooth, then it must be a rational normal scroll or the Veronese surface in $\mathbb{P}^{5}$.

If $P$ is three-dimensional, then $P$ satisfies $N_{p}$ if $2 \sum \operatorname{vol}\left(F_{i}\right)-6 \operatorname{vol}(P)-3 \geq p$ and $N_{0}$ holds. In order to obtain a useful bound, we require that $P$ have no interior points, so that the Ehrhart polynomial evaluated at -1 is zero. For such a polytope, this implies that $\sum \operatorname{vol}\left(F_{i}\right)=\#$ integral points in $P-2$, which yields:

Corollary 2.4. A lattice three-polytope $P$ with no interior points satisfies $N_{p}$ if $D$ is projectively normal and \# integral points in $P \geq 3 \operatorname{vol}(P)+\frac{p+7}{2}$.

Example 2.5. Polytopes corresponding to smooth torics with $\operatorname{Pic}(X)=2$ are studied in 3]; for threefolds there are only two families. Ewald and Schmeinck show that the polytopes below satisfy $N_{1}$ :

$$
\begin{aligned}
P_{1}(a) & =\operatorname{conv}\left\{\mathbf{0}, \mathbf{e}_{\mathbf{1}}, \mathbf{e}_{\mathbf{2}}, \mathbf{e}_{\mathbf{3}}, \mathbf{e}_{\mathbf{1}}+(a+1) \mathbf{e}_{\mathbf{3}}, \mathbf{e}_{\mathbf{1}}+(a+1) \mathbf{e}_{\mathbf{2}}\right\} \\
P_{2}(a, b) & =\operatorname{conv}\left\{\mathbf{0}, \mathbf{e}_{\mathbf{1}}, \mathbf{e}_{\mathbf{2}}, \mathbf{e}_{\mathbf{3}}, \mathbf{e}_{\mathbf{1}}+(a+1) \mathbf{e}_{\mathbf{3}}, \mathbf{e}_{\mathbf{2}}+(b+1) \mathbf{e}_{\mathbf{3}}\right\}
\end{aligned}
$$

A calculation shows that

$$
\begin{aligned}
\operatorname{vol}\left(P_{1}(a)\right) & =\frac{a^{2}+3 a+3}{6}, \quad \# \text { integral points in } P \\
\operatorname{vol}\left(P_{2}(a, b)\right) & =\frac{a+b+3}{6}, \quad \text { \# integral points in } P
\end{aligned}=\frac{a^{2}+5 a+12}{2}, ~ a+b+6 . ~ \$
$$

Thus, $P_{1}(a)$ satisfies $N_{p}$ if $p \leq 2 a+2$, and $P_{2}(a, b)$ satisfies $N_{p}$ if $p \leq a+b+2$.
