

LECTURES ON
Geophysical Fluid Dynamics

RICK SALMON

*Scripps Institution of Oceanography
University of California, San Diego*

New York Oxford
OXFORD UNIVERSITY PRESS
1998

Contents

I Fundamentals	3
1. Eulerian and Lagrangian Descriptions	5
2. Mass Conservation	6
3. Functionals and Variational Principles	7
4. Hamilton's Principle for Point Masses	8
5. Hamilton's Principle for a Barotropic Fluid	9
6. Nonhomentropic Flow	11
7. Variable Composition	12
8. Equations of Motion for an Ideal Fluid	13
9. The Method of Averaging	16
10. Momentum Equation by the Method of Averaging	19
11. An Example of Kinetic Theory	23
12. Thermodynamic Constraints on Molecular Diffusion	26
13. Macroscopic Averages of the Equations of Motion	31
14. Stirring and Mixing	34
15. Static Stability	39
16. Potential Density and Potential Temperature	40
17. The Equation of State for Seawater	42
18. Statistical Mechanics: The Ideal Gas	45
2 Introduction to Geophysical Fluid Dynamics	50
1. Equations Of Motion in Rotating Coordinates	50
2. Geostrophic, Hydrostatic Flow	54
3. The Shallow-water Equations	57

4. Potential Vorticity	61
5. The Quasigeostrophic Equation	63
6. A Second Look at the Quasigeostrophic Equation	65
7. Plane-wave Solutions of the Linear Equations	68
8. A Practical Benefit Of Filtering Out Inertia-gravity Waves	73
9. Geostrophic Adjustment	76
10. A Third Look at the Quasigeostrophic Equation	81
11. Rigid-lid Approximation	83
12. Two-layer Equations	84
13. Two-layer Rossby Waves	87
14. Available Potential Energy	90
15. Baroclinic Instability	93
16. Primitive Equations for the Ocean	99
17. Primitive Equations for the Atmosphere	102
18. Primitive Equations in Isentropic Coordinates	105
19. Quasigeostrophic Equations for Continuously Stratified Flow	107
20. Two-level Quasigeostrophic Equations	110
21. Quasigeostrophic Flow over Topography	112

3 Noninertial Theory of Ocean Circulation 120

1. Overview	120
2. Rotating Sector Models	124
3. Boundary-layer Methods	127
4. Theory of the Depth-averaged Circulation	131
5. Ekman Layers	137
6. A Second Look at Ekman Layers	142
7. Spin-up in the Laboratory	146
8. Simplified Inertia-less Equations	150
9. Linear Solutions of the Simplified Equations	153
10. The Case of Homogeneous Fluid	157
11. The Case of Stratified Fluid	161
12. Spin-up in the Ocean	166
13. The Effect Of Bottom Topography	170
14. Stratified Flow over Bottom Topography	176
15. A Nonlinear Model	182
16. The Thermocline	188

4 Vorticity and Turbulence 197

1. The Vorticity Equation	197
2. Ertel's Theorem	199
3. A Deeper Look at Potential Vorticity	201
4. Alternative Statements of the Vorticity Law	203
5. Turbulence	207
6. Kolmogorov's Theory	208
7. Intermittency and the Beta-model	213

8. Two-dimensional Turbulence	217
9. More Two-dimensional Turbulence	221
10. Energy Transfer in Two and Three Dimensions	226
5 Statistical Fluid Dynamics	232
1. The Closure Problem of Turbulence	233
2. The Eddy-damped Markovian Model	235
3. Stochastic Model Representation	240
4. Entropy	242
5. The Entropy Principle	246
6. Equilibrium Statistical Mechanics	251
7. The Meaning of Absolute Equilibrium	256
6 Geostrophic Turbulence	263
1. Quasigeostrophic Flow over Topography	264
2. The Statistical Mechanics of Flow over Topography	269
3. Flow on the Beta-plane	273
4. Stratified Quasigeostrophic Flow	279
5. Two-layer Turbulence	286
7 Hamiltonian Fluid Dynamics	295
1. Symmetry and Conservation Laws	295
2. The Particle-relabeling Symmetry Property	299
3. Sound Waves in One Dimension: The Conservation of Wave Action	304
4. Sound Waves in One Dimension: The Equations for the Mean Flow	307
5. Sound Waves in Three Dimensions: Particle-relabeling and Nonacceleration	309
6. Approximations and Constraints	313
7. The Canonical Equations	318
8. Eulerian Forms of Hamilton's Principle	326
9. The Geometrical View of Dynamics	332
10. Noncanonical Hamiltonian Dynamics	336
11. Poisson Brackets for Fluids	339
12. Pseudoenergy, Stability, and Available Energy	344
13. Dynamical Approximations: The Semigeostrophic Equations	352
References	363
