LOCALIZATION OF PLUS-ONE GENERATED ARRANGEMENTS

ELISA PALEZZATO AND MICHELE TORIELLI

ABSTRACT. We study the classes of free and plus-one generated hyperplane arrangements. Specifically, we describe how to compute the associated prime ideals of the Jacobian ideal of such an arrangement from its lattice of intersection. Moreover, we prove that the localization of a plus-one generated arrangement is free or plus-one generated.

Keywords: Hyperplane arrangements, Freeness, Plus-one generated arrangement, Associated prime ideal, Localization of arrangements.
MSC10: 52C35, 32S22.

1. INTRODUCTION

Let V be a vector space of dimension l over a field \mathbb{K} . Fix a system of coordinates (x_1, \dots, x_l) of V^* . We denote by $S = S(V^*) = \mathbb{K}[x_1, \dots, x_l]$ the symmetric algebra of V^* . A hyperplane arrangement $\mathcal{A} = \{H_1, \dots, H_n\}$ is a finite collection of hyperplanes in V . We refer to [6] as main reference on the theory of arrangements.

In the theory of hyperplane arrangements, the freeness is a very important algebraic property. In fact, freeness implies several interesting geometric and combinatorial properties of the arrangement itself, see [6]. By definition, an arrangement is free if and only if its module of logarithmic derivations is a free module. A lot is known about free arrangements, however there is still some mystery around the notion of freeness. For example, Terao's conjecture asserting the dependence of freeness only on the combinatorics is the longstanding open problem in this area.

In order to study this conjecture, in [1] Abe introduced the notion of plus-one generated arrangement, where an arrangement is plus-one generated if and only if its module of logarithmic derivations is generated by $l + 1$ elements and we can "control" their first syzygy. Moreover, Abe described how free and plus-one generated arrangements are connected. In particular, he proved that the deletion of a free arrangement is free or plus-one

generated and vice versa, under certain additional hypothesis, if the deletion is plus-one generated then the original arrangement is free or plus-one generated.

The goal of this article is to study more in depth these two classes of arrangements. Specifically, given an arrangement \mathcal{A} , we describe how to compute the associated prime ideals of the module $S/J(\mathcal{A})$ from its lattice of intersection $L(\mathcal{A})$, where $J(\mathcal{A})$ is the Jacobian ideal of \mathcal{A} . Moreover, we prove that the localization of a plus-one generated arrangement is free or plus-one generated. Finally, we describe an example which demonstrates that the deletion of a plus-one generated arrangement is not necessarily free or plus-one generated.

All the computations in this article have been performed using the software CoCoA, see [9].

2. PRELIMINARES ON HYPERPLANE ARRANGEMENTS

In this section, we recall the terminology, the basic notations and some fundamental results related to hyperplane arrangements.

Let \mathbb{K} be a field of characteristic zero. A finite set of affine hyperplanes $\mathcal{A} = \{H_1, \dots, H_n\}$ in \mathbb{K}^l is called a **hyperplane arrangement**. For each hyperplane H_i we fix a defining polynomial $\alpha_i \in S = \mathbb{K}[x_1, \dots, x_l]$ such that $H_i = \alpha_i^{-1}(0)$, and let $Q(\mathcal{A}) = \prod_{i=1}^n \alpha_i$. An arrangement \mathcal{A} is called **central** if each H_i contains the origin of \mathbb{K}^l . In this case, each $\alpha_i \in S$ is a linear homogeneous polynomial, and hence $Q(\mathcal{A})$ is homogeneous of degree n . The operation of **coning** allows one to transform any arrangement \mathcal{A} in \mathbb{K}^l with n hyperplanes into a central arrangement $c\mathcal{A}$ with $n+1$ hyperplanes in \mathbb{K}^{l+1} , see [6]. Unless otherwise specified, we will only consider central hyperplane arrangements. For this reason every time we will study \mathcal{A} a central hyperplane arrangement, we will omit the word central.

Let $L(\mathcal{A}) = \{\bigcap_{H \in \mathcal{B}} H \mid \mathcal{B} \subseteq \mathcal{A}\}$ be the **lattice of intersection** of \mathcal{A} , ordered by reverse inclusion, i.e. $X \leq Y$ if and only if $Y \subseteq X$, for $X, Y \in L(\mathcal{A})$. Define a rank function on $L(\mathcal{A})$ by $\text{rk}(X) = \text{codim}(X)$. $L(\mathcal{A})$ plays a fundamental role in the study of hyperplane arrangements, in fact it determines the combinatorics of the arrangement. Let $L(\mathcal{A})_p = \{X \in L(\mathcal{A}) \mid \text{rk}(X) = p\}$. We call \mathcal{A} **essential** if $L(\mathcal{A})_l \neq \emptyset$.

For any flat $X \in L(\mathcal{A})$ define the **localization** of \mathcal{A} to X as the subarrangement \mathcal{A}_X of \mathcal{A} by

$$\mathcal{A}_X = \{H \in \mathcal{A} \mid X \subseteq H\}.$$

The **restriction** of \mathcal{A} to $H \in \mathcal{A}$ is the arrangement \mathcal{A}^H in $H \cong \mathbb{K}^{l-1}$ defined by

$$\mathcal{A}^H = \{H \cap H' \mid H' \in \mathcal{A} \setminus \{H\} \text{ and } H \cap H' \neq \emptyset\}.$$

We denote by $\text{Der}_{\mathbb{K}^l} = \{\sum_{i=1}^l f_i \partial_{x_i} \mid f_i \in S\}$ the S -module of **polynomial vector fields** on \mathbb{K}^l (or S -derivations). Let $\delta = \sum_{i=1}^l f_i \partial_{x_i} \in \text{Der}_{\mathbb{K}^l}$. Then δ is said to be **homogeneous of polynomial degree d** if f_1, \dots, f_l are homogeneous polynomials of degree d in S . In this case, we write $\text{pdeg}(\delta) = d$.

Definition 2.1. *Let \mathcal{A} be an arrangement in \mathbb{K}^l . Define the **module of vector fields logarithmic tangent** to \mathcal{A} (or **logarithmic vector fields**) by*

$$D(\mathcal{A}) = \{\delta \in \text{Der}_{\mathbb{K}^l} \mid \delta(\alpha_i) \in \langle \alpha_i \rangle S, \forall i\}.$$

The module $D(\mathcal{A})$ is obviously a graded S -module and we have that

$$D(\mathcal{A}) = \{\delta \in \text{Der}_{\mathbb{K}^l} \mid \delta(Q(\mathcal{A})) \in \langle Q(\mathcal{A}) \rangle S\}.$$

In particular, since the arrangement \mathcal{A} is central, then the Euler vector field $\delta_E = \sum_{i=1}^l x_i \partial_{x_i}$ belongs to $D(\mathcal{A})$, in fact $\delta_E(Q(\mathcal{A})) = nQ(\mathcal{A})$. In this case, we can write $D(\mathcal{A}) \cong S \cdot \delta_E \oplus D_0(\mathcal{A})$, where

$$D_0(\mathcal{A}) = \{\delta \in \text{Der}_{\mathbb{K}^l} \mid \delta(Q(\mathcal{A})) = 0\}.$$

Definition 2.2. *An arrangement \mathcal{A} in \mathbb{K}^l is said to be **free with exponents** (e_1, \dots, e_l) if and only if $D(\mathcal{A})$ is a free S -module and there exists a basis $\delta_1, \dots, \delta_l \in D(\mathcal{A})$ such that $\text{pdeg}(\delta_i) = e_i$, or equivalently $D(\mathcal{A}) \cong \bigoplus_{i=1}^l S(-e_i)$.*

In the rest of the paper, given a tuple of integers (e_1, \dots, e_l) , we will write $(e_1, \dots, e_l)_{\leq}$, if we assume that $e_1 \leq e_2 \leq \dots \leq e_l$.

One of the most famous characterizations of freeness is due to Saito [10] and it uses the determinant of the coefficient matrix of $\delta_1, \dots, \delta_l$ to check if the arrangement \mathcal{A} is free or not.

Theorem 2.3 (Saito's criterion). *Let \mathcal{A} be an arrangement in \mathbb{K}^l and $\delta_1, \dots, \delta_l \in D(\mathcal{A})$. Then the following facts are equivalent*

- (1) $D(\mathcal{A})$ is free with basis $\delta_1, \dots, \delta_l$, i. e. $D(\mathcal{A}) = S \cdot \delta_1 \oplus \dots \oplus S \cdot \delta_l$.
- (2) $\det(\delta_i(x_j))_{i,j} = cQ(\mathcal{A})$, where $c \in \mathbb{K} \setminus \{0\}$.
- (3) $\delta_1, \dots, \delta_l$ are linearly independent over S and $\sum_{i=1}^l \text{pdeg}(\delta_i) = n$.

Using Saito's criterion one can prove the following result that will play an important role in Sections 4 and 5. Moreover, we will generalize it in Theorem 5.6 to the case of plus-one generated arrangements.

Theorem 2.4 ([6, Theorem 4.37]). *If \mathcal{A} is free, then \mathcal{A}_X is free for any $X \in L(\mathcal{A})$.*

Given an arrangement \mathcal{A} in \mathbb{K}^l , the **Jacobian ideal** of \mathcal{A} is the ideal of S generated by $Q(\mathcal{A})$ and all its partial derivatives, and it is denoted by $J(\mathcal{A})$.

$D_0(\mathcal{A})$ can be identified with the first syzygies of $J(\mathcal{A})$. In particular we have the following exact sequence

$$0 \rightarrow D_0(\mathcal{A}) \rightarrow S(-n+1)^l \rightarrow J(\mathcal{A}) \rightarrow 0.$$

The Jacobian ideal has a central role in the study of free arrangements, see [6], [2] and [8] for more details. In fact, we can also characterize freeness by looking at $J(\mathcal{A})$ via the Terao's criterion. Notice that Terao described this result for characteristic 0, but the statement holds true for any characteristic as shown in [7].

Theorem 2.5 ([11]). *An arrangement \mathcal{A} in \mathbb{K}^l is free if and only if $S/J(\mathcal{A})$ is 0 or $(l-2)$ -dimensional Cohen–Macaulay.*

3. PLUS-ONE GENERATED ARRANGEMENTS

In [1], the author generalized the notions of free and nearly free (see [4]) to central and essential arrangements in any dimension. However, the definition can be given also for non-essential arrangements.

Definition 3.1. *Let $\mathcal{A} = \{H_1, \dots, H_n\}$ be an arrangement in \mathbb{K}^l . We say that \mathcal{A} is **plus-one generated** with **exponents** $\text{POexp}(\mathcal{A}) = (d_1, \dots, d_l)$ and **level** d if $D(\mathcal{A})$ has a minimal free resolution of the following form*

$$0 \longrightarrow S(-d-1) \xrightarrow{(\alpha, f_1, \dots, f_l)} S(-d) \oplus \left(\bigoplus_{i=1}^l S(-d_i) \right) \longrightarrow D(\mathcal{A}) \longrightarrow 0 \quad (1)$$

Remark 3.2. *Let \mathcal{A} be a plus-one generated arrangement in \mathbb{K}^l with exponents $\text{POexp}(\mathcal{A}) = (d_1, \dots, d_l)_\leq$ and level d . Since \mathcal{A} is central, then there exists $k \geq 2$ such that $(d_1, \dots, d_l)_\leq = (0, \dots, 0, 1, d_k, \dots, d_l)_\leq$. If \mathcal{A} is essential, then $k = 2$. If \mathcal{A} is non-essential, then $k \geq 3$.*

Directly from the definition, we can show the following

Lemma 3.3. *Let $\mathcal{A} = \{H_1, \dots, H_n\}$ be an arrangement in \mathbb{K}^l . \mathcal{A} is plus-one generated with exponents $\text{POexp}(\mathcal{A}) = (d_1, \dots, d_l)_\leq$ and level d if and only if $S/J(\mathcal{A})$ has a minimal free resolution of the form*

$$0 \rightarrow S(-n-d) \rightarrow S(-n-d+1) \oplus \left(\bigoplus_{i=k}^l S(-n-d_i+1) \right) \rightarrow S(-n+1)^{l-k+2} \rightarrow S. \quad (2)$$

Moreover, the map

$$\partial_3: S(-n-d) \rightarrow S(-n-d+1) \oplus \left(\bigoplus_{i=k}^l S(-n-d_i+1) \right)$$

is defined by a matrix of the form $(\alpha, f_{i_1}, \dots, f_{i_{l-k+1}})$, where $1 \leq i_1 < \dots < i_{l-k+1} \leq l$. Notice that $l - k + 2$ coincides with the codimension of the center of \mathcal{A} or, equivalently, the rank of \mathcal{A} .

Proof. This equivalence follows from the fact that $D(\mathcal{A}) \cong S \cdot \delta_E \oplus D_0(\mathcal{A})$, and the fact that if $\delta_1, \dots, \delta_l \in D_0(\mathcal{A})$ and there is a relation of the form $g_0 \delta_E + \sum_{i=1}^l g_i \delta_i = 0$, with $g_i \in S$, then $g_0 = 0$. \square

Example 3.4. Consider the arrangement \mathcal{A} in \mathbb{C}^4 with defining polynomial $x(x-y)(x-t)(y-z)(z-t)$. It is plus-one generated with $\text{POexp}(\mathcal{A}) = (1, 1, 2, 2)$ and level 2. In fact $D(\mathcal{A})$ has a minimal resolution of the form

$$0 \rightarrow S(-3) \rightarrow S(-1)^2 \oplus S(-2)^3 \rightarrow D(\mathcal{A}).$$

On the other hand, the minimal resolution of $S/J(\mathcal{A})$ is

$$0 \rightarrow S(-7) \rightarrow S(-5) \oplus S(-6)^3 \rightarrow S(-4)^4 \rightarrow S.$$

Example 3.5. Consider the arrangement \mathcal{A} in \mathbb{C}^4 with defining polynomial $(x+y)(x-z)(x+z)(y-z)(y+z)(x-y-t)(x+y-t)(x-z-t)(x+z-t)(y-z-t)(y+z-t)t$. This arrangement is plus-one generated with $\text{POexp}(\mathcal{A}) = (1, 4, 4, 4)$ and level 5 since the minimal resolution of $S/J(\mathcal{A})$ is

$$0 \rightarrow S(-17) \rightarrow S(-15)^3 \oplus S(-16) \rightarrow S(-11)^4 \rightarrow S.$$

Notice that for an arrangement \mathcal{A} to be plus-one generated it is not enough that $D(\mathcal{A})$ has projective dimension 1 or equivalently that $S/J(\mathcal{A})$ has projective dimension 3.

Example 3.6. Consider the arrangement \mathcal{A} in \mathbb{C}^4 with defining polynomial $xyzt(x+y-2z)(x-3y+z)(-5x+y+z)(x+y+z)$. It is not a plus-one generated arrangement since the minimal resolution of $S/J(\mathcal{A})$ is

$$0 \rightarrow S(-13) \rightarrow S(-8) \oplus S(-11)^3 \rightarrow S(-7)^4 \rightarrow S.$$

In [1], Abe also described how free and plus-one generated arrangements are connected.

Theorem 3.7 ([1, Theorem 1.4]). *Let \mathcal{A} be an essential free hyperplane arrangement with exponents (e_1, \dots, e_l) and $H \in \mathcal{A}$. Then $\mathcal{A} \setminus \{H\}$ is free, or plus-one generated with exponents (e_1, \dots, e_l) and level $|\mathcal{A} \setminus \{H\}| - |\mathcal{A}^H|$.*

Theorem 3.8 ([1, Theorem 1.9]). *Let \mathcal{A} be an essential arrangement and $H \in \mathcal{A}$. Assume that $\mathcal{A} \setminus \{H\}$ is free with exponents $(e_1, \dots, e_l)_\leq$. If $|\mathcal{A} \setminus \{H\}| - |\mathcal{A}^H| \geq e_{l-2}$, then \mathcal{A} is free, or plus-one generated with $\text{POexp}(\mathcal{A}) = (e_1, \dots, e_{l-2}, e_{l-1} + 1, e_l + 1)$ and level $e_{l-1} + e_l - |\mathcal{A}| + |\mathcal{A}^H| + 1$.*

4. ASSOCIATED PRIME IDEALS OF $S/J(\mathcal{A})$

Let \mathcal{A} be an arrangement in \mathbb{K}^l and $k \geq 2$. To each $X \in L(\mathcal{A})_k$ corresponds a prime ideal $I(X) = \langle \alpha_{i_1}, \dots, \alpha_{i_k} \rangle$ of codimension k of $S = \mathbb{K}[x_1, \dots, x_l]$ that contains $J(\mathcal{A})$, where $X = H_{i_1} \cap \dots \cap H_{i_k}$.

Remark 4.1. *Let \mathcal{A} be an arrangement in \mathbb{K}^l . There is a bijection between $L(\mathcal{A})_2$ and the set of associated prime ideals of $S/J(\mathcal{A})$ of codimension 2. This is because each associated prime ideal of $S/J(\mathcal{A})$ of codimension 2 corresponds to an irreducible component of the singular locus of \mathcal{A} . Moreover, any associated prime ideal of $S/J(\mathcal{A})$ of codimension k corresponds to an element of $L(\mathcal{A})_k$. (For details see Section 3.8 of [5]). This gives us the following inclusions*

$$\{I(X) \mid X \in L(\mathcal{A})_2\} \subseteq \text{Ass}_S(S/J(\mathcal{A})) \subseteq \{I(X) \mid X \in L(\mathcal{A})_{\geq 2}\}.$$

Theorem 4.2. *Let \mathcal{A} be an arrangement in \mathbb{K}^l , and $X, Y \in L(\mathcal{A})$ such that $X \subseteq Y$.*

$$I(Y) \in \text{Ass}_S(S/J(\mathcal{A})) \iff I(Y) \in \text{Ass}_S(S/J(\mathcal{A}_X)).$$

Proof. Consider $S_{I(X)}$ the localization of the ring S by the ideal $I(X)$. We have that $J(\mathcal{A})S_{I(X)} = J(\mathcal{A}_X)S_{I(X)}$. Since the ideals of $S_{I(X)}$ are in bijection with the ideal of S contained in $I(X)$, by [5, Theorem 3.1], $I(Y) \in \text{Ass}_S(S/J(\mathcal{A}))$ if and only if $I(Y)S_{I(X)} \in \text{Ass}_{S_{I(X)}}(S_{I(X)}/J(\mathcal{A})S_{I(X)}) = \text{Ass}_{S_{I(X)}}(S_{I(X)}/J(\mathcal{A}_X)S_{I(X)})$ if and only if $I(Y) \in \text{Ass}_S(S/J(\mathcal{A}_X))$. \square

Corollary 4.3. *Let \mathcal{A} be an arrangement in \mathbb{K}^l . Then*

$$\text{Ass}_S(S/J(\mathcal{A})) \subseteq \{I(X) \mid X \in L(\mathcal{A})_2\} \cup \{I(X) \mid X \in L(\mathcal{A})_{\geq 3}, \mathcal{A}_X \text{ non-free}\}.$$

Proof. From Remark 4.1, every ideal in $\text{Ass}_S(S/J(\mathcal{A}))$ is of the form $I(X)$ for some $X \in L(\mathcal{A})_{\geq 2}$. If $X \in L(\mathcal{A})_{\geq 3}$, then by Theorem 4.2 $I(X) \in \text{Ass}_S(S/J(\mathcal{A}_X))$. This implies that $S/J(\mathcal{A}_X)$ is not Cohen–Macaulay and hence \mathcal{A}_X is non-free. \square

The previous inclusion might not be an equality in general.

Example 4.4 (c.f. [3, Example 8.5]). *Consider the arrangement \mathcal{A} in \mathbb{C}^4 with defining polynomial $Q(\mathcal{A}) = \prod_{a=(a_0, a_1, a_2, a_3)} (a_0x_0 + a_1x_1 + a_2x_2 + a_3x_3)$, where $a \in \{0, 1\}^4$ and $a \neq (0, 0, 0, 0)$. This is plus-one generated with $\text{POexp}(\mathcal{A}) = (1, 5, 5, 5)$ and level 5. In fact, $S/J(\mathcal{A})$ has minimal resolution*

$$0 \rightarrow S(-20) \rightarrow S(-19)^4 \rightarrow S(-14)^4 \rightarrow S.$$

A direct computation shows that $\text{Ass}_S(S/J(\mathcal{A})) = \{I(X) \mid X \in L(\mathcal{A})_2\}$. However, if we consider $X \in L(\mathcal{A})_4$ the intersection of the hyperplanes $x_1 = 0, x_2 = 0, x_3 = 0, x_4 = 0$, then $\mathcal{A}_X = \mathcal{A}$, and hence \mathcal{A}_X is not free.

Since it is known by Theorem 2.4 that if \mathcal{A} is a free arrangement then the localization \mathcal{A}_X is free for any $X \in L(\mathcal{A})$, by Theorem 4.2 and Remark 4.1, we have the following.

Corollary 4.5. *Let \mathcal{A} be a free arrangement. Then*

$$\text{Ass}_S(S/J(\mathcal{A})) = \{I(X) \mid X \in L(\mathcal{A})_2\}.$$

Remark 4.6. *By Example 4.4, the statement of Corollary 4.5 is not an equivalence.*

We are now ready to state the main result of this section.

Theorem 4.7. *Let \mathcal{A} be an arrangement in \mathbb{K}^l such that $S/J(\mathcal{A})$ has projective dimension 3. Then*

$$\text{Ass}_S(S/J(\mathcal{A})) = \{I(X) \mid X \in L(\mathcal{A})_2\} \cup \{I(X) \mid X \in L(\mathcal{A})_3, \mathcal{A}_X \text{ non-free}\}.$$

In particular, this holds if \mathcal{A} is a plus-one generated arrangement.

Proof. By Auslander–Buchsbaum formula ([5, Theorem 19.9]), we have that $\text{depth}(S/J(\mathcal{A})) = l - 3$. Since the depth of a module is bounded above by the dimension of its associated prime ideals, we have that $S/J(\mathcal{A})$ cannot have associated prime ideals of codimension k with $k \geq 4$. From Corollary 4.3, we have the inclusion “ \subseteq ”. Let $X \in L(\mathcal{A})_3$ be such that \mathcal{A}_X is non-free. Since \mathcal{A}_X is an arrangement of rank 3, $J(\mathcal{A}_X)$ coincides with its saturation with respect to the ideal $I(X)$ if and only if \mathcal{A}_X is free, as described in the introduction of [4]. Since we assume that \mathcal{A}_X is non-free, this implies that $I(X)$ is an associated prime ideal of $S/J(\mathcal{A}_X)$. By Theorem 4.2, $I(X) \in \text{Ass}_S(S/J(\mathcal{A}))$. \square

Example 4.8. *Consider the hyperplane arrangement in Example 3.4. Then the associated prime ideals of $S/J(\mathcal{A})$ correspond to all rank 2 flats in $L(\mathcal{A})$ and the rank 3 flat corresponding to the intersection of the hyperplanes with equation $y = z$, $x = t$ and $z = t$.*

Example 4.9. *Consider the hyperplane arrangement in Example 3.5. Then the associated prime ideals of $S/J(\mathcal{A})$ correspond to all rank 2 flats in $L(\mathcal{A})$ and the ideals $\langle y + z, x + z, t \rangle$, $\langle y - z, x - z, t \rangle$, and $\langle y - t, x - t, z \rangle$.*

Example 4.10. *Consider the arrangement \mathcal{A} in \mathbb{C}^4 with defining polynomial $t(x + y + z)(2x + 4y + 5z)(x + 4y - 5z)(-3x + 5y + z)(2x + 7y + 2z)(3x - 4y + 9z)$. This is not plus-one generated because $S/J(\mathcal{A})$ has a minimal free resolution*

$$0 \rightarrow S(-11)^3 \rightarrow S(-7) \oplus S(-10)^5 \rightarrow S(-6)^4 \rightarrow S.$$

However, $S/J(\mathcal{A})$ has only $\langle x, y, z \rangle$ as embedded prime ideal.

5. LOCALIZATION OF PLUS-ONE GENERATED ARRANGEMENTS

The goal of this section is to describe the localization of plus-one generated arrangements. The first step is to relate the algebraic total Betti numbers of an arrangement and the ones of its localization.

Proposition 5.1. *Let \mathcal{A} be an arrangement in \mathbb{K}^l and $X \in L(\mathcal{A})$. Then for all $i \geq 0$, we have*

$$b_i(S/J(\mathcal{A}_X)) \leq b_i(S/J(\mathcal{A})) \text{ and} \\ b_i(D(\mathcal{A}_X)) \leq b_i(D(\mathcal{A})),$$

where $b_i(-)$ are the algebraic total Betti numbers.

Proof. If $X \in L(\mathcal{A})$ is such that $\mathcal{A} = \mathcal{A}_X$, the statement is obviously true. Assume $\mathcal{A}_X \subsetneq \mathcal{A}$. Without loss of generalities, we can make a change of coordinates and assume that $I(X) = (x_1, \dots, x_s)$ for some $1 \leq s \leq l-1$. Consider $\mathcal{F}_{\mathcal{A}}$ a minimal free resolution of $S/J(\mathcal{A})$. As in the proof of Theorem 4.2, $J(\mathcal{A})S_{I(X)} = J(\mathcal{A}_X)S_{I(X)}$, and hence $(S/J(\mathcal{A}))_{I(X)} \cong S_{I(X)}/J(\mathcal{A})S_{I(X)} \cong S_{I(X)}/J(\mathcal{A}_X)S_{I(X)}$. Since the localization preserves freeness, if we localize $\mathcal{F}_{\mathcal{A}}$ at the prime ideal $I(X)$ we obtain the exact sequence $(\mathcal{F}_{\mathcal{A}})_{I(X)}$. In general, $(\mathcal{F}_{\mathcal{A}})_{I(X)}$ is a free resolution of $S_{I(X)}/J(\mathcal{A}_X)S_{I(X)}$, but it is not minimal. This implies that for all $i \geq 0$

$$b_i(S_{I(X)}/J(\mathcal{A}_X)S_{I(X)}) \leq b_i(S/J(\mathcal{A})).$$

Let $\mathcal{F}_{\mathcal{A}_X}$ be a minimal free resolution of $S/J(\mathcal{A}_X)$. Similarly to the case of $S/J(\mathcal{A})$, we have that $(\mathcal{F}_{\mathcal{A}_X})_{I(X)}$ is a free resolution of $S_{I(X)}/J(\mathcal{A}_X)S_{I(X)}$. Since $I(X) = (x_1, \dots, x_s)$, we have that $Q(\mathcal{A}_X) \in \mathbb{K}[x_1, \dots, x_s]$. This implies that all of the matrix entries of $\mathcal{F}_{\mathcal{A}_X}$ belong to the ideal $I(X) = (x_1, \dots, x_s)$, and hence $(\mathcal{F}_{\mathcal{A}_X})_{I(X)}$ is also minimal. This implies that for all $i \geq 0$

$$b_i(S/J(\mathcal{A}_X)) = b_i(S_{I(X)}/J(\mathcal{A}_X)S_{I(X)}) \leq b_i(S/J(\mathcal{A})).$$

The second inequality follows directly from the first one and Lemma 3.3. \square

As a direct consequence of Proposition 5.1, we have the following result

Corollary 5.2. *Let \mathcal{A} be an arrangement in \mathbb{K}^l and $X \in L(\mathcal{A})$. Then*

$$\text{projdim}(S/J(\mathcal{A}_X)) \leq \text{projdim}(S/J(\mathcal{A})).$$

This is equivalent to

$$\text{projdim}(D(\mathcal{A}_X)) \leq \text{projdim}(D(\mathcal{A})).$$

Remark 5.3. *Corollary 5.2 gives a different proof of Theorem 2.4, i.e. the fact that if \mathcal{A} is free, then \mathcal{A}_X is free for any $X \in L(\mathcal{A})$, with respect to the one that appears in [6].*

If we also assume that \mathcal{A} is a plus-one generated arrangement, Proposition 5.1 gives us the following result

Corollary 5.4. *Let \mathcal{A} be a plus-one generated arrangement in \mathbb{K}^l and $X \in L(\mathcal{A})$. Then \mathcal{A}_X is free or $D(\mathcal{A}_X)$ is generated by $l + 1$ vector fields.*

Proof. If $\text{rk}(X) = 1$, then $\mathcal{A}_X = \{H\}$, for some $H \in \mathcal{A}$, and hence it is free. Assume $\text{rk}(X) \geq 2$. Since $\dim(S/J(\mathcal{A}_X)) = 2$, this implies that $\text{projdim}(S/J(\mathcal{A}_X)) \geq 2$. On the other hand, by Corollary 5.2, $\text{projdim}(S/J(\mathcal{A}_X)) \leq \text{projdim}(S/J(\mathcal{A})) = 3$. This implies that, $2 \leq \text{projdim}(S/J(\mathcal{A}_X)) \leq 3$. If $\text{projdim}(S/J(\mathcal{A}_X)) = 2$, then \mathcal{A}_X is free. Assume that $\text{projdim}(S/J(\mathcal{A}_X)) = 3$. By Proposition 5.1, $1 \leq b_3(S/J(\mathcal{A}_X)) \leq b_3(S/J(\mathcal{A})) = 1$. Moreover, by [5, Corollary 20.13], the alternating sum of the Betti numbers of $S/J(\mathcal{A}_X)$ is zero, and hence $S/J(\mathcal{A}_X)$ has a minimal free resolution of the form

$$0 \rightarrow S \rightarrow S^\beta \rightarrow S^\beta \rightarrow S \rightarrow S/J(\mathcal{A}_X) \rightarrow 0,$$

where $\beta = \text{codim}(S/I(X))$. Similarly to Lemma 3.3, this implies that $D(\mathcal{A}_X)$ has a minimal free resolution of the form

$$0 \rightarrow S \rightarrow S^{l+1} \rightarrow D(\mathcal{A}_X) \rightarrow 0,$$

and hence, $D(\mathcal{A}_X)$ is generated by $l + 1$ vector fields. \square

Lemma 5.5. *Let \mathcal{A} be a plus-one generated arrangement in \mathbb{K}^l , $X \in L(\mathcal{A})$ and $\alpha \in S$ the linear form in the resolution (1). If $\alpha \notin I(X)$, then \mathcal{A}_X is free.*

Proof. Let $\mathcal{F}_{D(\mathcal{A})}$ be a minimal free resolution of $D(\mathcal{A})$ of the form (1). Since the localization preserves freeness, if we localize $\mathcal{F}_{D(\mathcal{A})}$ at the prime ideal $I(X)$ we obtain $(\mathcal{F}_{D(\mathcal{A})})_{I(X)}$ a resolution of $D(\mathcal{A})_{I(X)}$. This implies that $b_0(D(\mathcal{A})_{I(X)}) \leq l + 1$ and hence $D(\mathcal{A})_{I(X)}$ can be generated by $l + 1$ elements. Since $\alpha \notin I(X)$, the localization of the map $(\alpha, f_1, \dots, f_l)$ contains an invertible element (i.e. the localization of α), and hence $D(\mathcal{A})_{I(X)}$ can be generated by l elements. This implies that $b_0(D(\mathcal{A})_{I(X)}) = l$.

By the proof of Proposition 5.1, $b_i(S_{I(X)}/J(\mathcal{A})S_{I(X)}) = b_i(S/J(\mathcal{A}_X))$. This implies that $b_i(D(\mathcal{A})_{I(X)}) = b_i(D(\mathcal{A}_X))$. In particular, if we consider $i = 0$, we obtain that $b_0(D(\mathcal{A}_X)) = l$, and hence \mathcal{A}_X is free. \square

We are now ready to prove the main result of this section.

Theorem 5.6. *Let \mathcal{A} be a plus-one generated arrangement in \mathbb{K}^l and $X \in L(\mathcal{A})$. Then \mathcal{A}_X is free or plus-one generated.*

Proof. Let $\mathcal{F}_{\mathcal{A}}$ be a minimal free resolution of $S/J(\mathcal{A})$ of the form (2).

If $X \in L(\mathcal{A})$ is such that $\mathcal{A} = \mathcal{A}_X$ or if \mathcal{A}_X is free, the statement is obviously true. Assume $\mathcal{A}_X \subsetneq \mathcal{A}$ and that \mathcal{A}_X is non-free. By Corollary 5.2,

$\text{projdim}(S/J(\mathcal{A}_X)) = 3$. In this situation, similarly to the proof of Corollary 5.4, we have that $S/J(\mathcal{A}_X)$ has a minimal graded free resolution $\mathcal{F}_{\mathcal{A}_X}$ of the form

$$0 \rightarrow S(-m-e) \rightarrow S(-m-d'+1) \oplus \left(\bigoplus_{i=r}^l S(-m-d'_i+1) \right) \rightarrow S(-m+1)^{l-r+2} \rightarrow S,$$

where $m = |\mathcal{A}_X|$, $d' \leq e$ and $k \leq r$. To conclude we need to show that $d' = e$. Notice that this is equivalent to prove that the map

$$\partial'_3: S(-m-e) \rightarrow S(-m-d'+1) \oplus \left(\bigoplus_{i=r}^l S(-m-d'_i+1) \right)$$

is defined by a matrix of the form $(\alpha', f'_1, \dots, f'_{l-r+1})$, where $\alpha', f'_i \in S$ and α' is zero or a homogenous polynomial of degree 1.

By the proof of Proposition 5.1, $b_i(S_{I(X)}/J(\mathcal{A}_X)S_{I(X)}) = b_i(S/J(\mathcal{A}_X))$. Hence,

$$\text{projdim}(S/J(\mathcal{A})) = \text{projdim}(S/J(\mathcal{A}_X)) = \text{projdim}(S_{I(X)}/J(\mathcal{A}_X)S_{I(X)}).$$

This implies that the localization of the map ∂_3 in $\mathcal{F}_{\mathcal{A}}$ is not the zero map and it is defined by the localization of the matrix $(\alpha, f_{i_1}, \dots, f_{i_{l-k+1}})$.

By Lemma 5.5, we can assume that $\alpha \in I(X)$. The localization of the map ∂_3 is defined by a matrix of the form $(\tilde{\alpha}, \tilde{f}_{i_1}, \dots, \tilde{f}_{i_{l-k+1}})$, with $\tilde{\alpha}$ not invertible. This implies that the localization of the map ∂'_3 is represented by a matrix of the form $(\tilde{\alpha}, \tilde{f}_{j_1}, \dots, \tilde{f}_{j_{l-r+1}})$, that is a submatrix of the matrix $(\tilde{\alpha}, \tilde{f}_{i_1}, \dots, \tilde{f}_{i_{l-k+1}})$ obtained by deleting some invertible entries. As described in the proof of Proposition 5.1, we can assume that all of the matrix entries of $\mathcal{F}_{\mathcal{A}_X}$ belong to the ideal $I(X)$. This implies that the map ∂'_3 is defined by a matrix of the form $(\alpha', f'_1, \dots, f'_{l-r+1})$, where $\alpha', f'_i \in S$ and α' is zero or a homogenous polynomial of degree 1. \square

One of the possible next step in this study would be to understand if we can generalize Theorem 3.7 to plus-one generated arrangements. At the moment this is still an open problem. The next example shows that in general the deletion of a plus-one generated arrangement can be free, plus-one generated or none of them.

Example 5.7. Consider the arrangement \mathcal{A} in \mathbb{C}^5 defined by $xyztw(x+y+z)(x-w)(y+2t)$. \mathcal{A} is plus-one generated, in fact $S/J(\mathcal{A})$ has resolution

$$0 \rightarrow S(-10) \rightarrow S(-9)^5 \rightarrow S(-7)^5 \rightarrow S.$$

Consider $\mathcal{A}_1 = \mathcal{A} \setminus \{x+y+z=0\}$. Then \mathcal{A}_1 is free, in fact $S/J(\mathcal{A}_1)$ has resolution

$$0 \rightarrow S(-8)^2 \oplus S(-7)^2 \rightarrow S(-6)^5 \rightarrow S.$$

Consider $\mathcal{A}_2 = \mathcal{A} \setminus \{y + 2t = 0\}$. Then \mathcal{A}_2 is plus-one generated, in fact $S/J(\mathcal{A}_2)$ has resolution

$$0 \rightarrow S(-9) \rightarrow S(-8)^4 \oplus S(-7) \rightarrow S(-6)^5 \rightarrow S.$$

Consider $\mathcal{A}_3 = \mathcal{A} \setminus \{x = 0\}$. Then \mathcal{A}_3 is not free nor plus-one generated, in fact $S/J(\mathcal{A}_3)$ has resolution

$$0 \rightarrow S(-10) \rightarrow S(-9)^4 \rightarrow S(-8)^7 \rightarrow S(-6)^5 \rightarrow S.$$
