Contents

Glossary of symbols	xi
Foreword	xiii
1. Introduction	1
2. Mathematical modelling of physical phenomena	4
2.1. General remarks	4
2.2. Some models described by differential equations	6
3. Mathematical background	12
3.1. Basic definitions and theorems from functional analysis	12
3.2. The spaces $L^p(\Omega)$ and $C^k(\overline{\Omega})$	15
3.3. Sobolev spaces $H^k(\Omega)$ and $W_p^k(\Omega)$	17
3.4. Classical and variational formulation of a 2 nd order elliptic problem	27
3.5. On the abstract Neumann problem	35
3.6. The space $H(\text{div})$	40
3.7. Dual variational formulation	41
3.8. The space $H(\text{rot})$	43
3.9. Least squares formulation	46
4. Finite elements	54
4.1. The main idea of the finite element method	54
4.2. Finite element spaces	58
4.3. A posteriori error estimates	61
4.4. Convergence of the finite element method	66
4.5. Linear interpolation on polyhedra	77
4.6. Affine curved elements	89
5. Conjugate gradients	98
5.1. Preliminary remarks	98
5.2. Biconjugate gradient method	100
5.3. Preconditioned biconjugate gradient method	106
5.4. Rate of convergence of the conjugate gradient method	111
6. Magnetic potential of transformer window	121
6.1. Dimensional reduction	121
6.2. Example	127
7. Calculation of nonlinear stationary magnetic fields	130
7.1. Introduction to theory of monotone operators	130
7.2. An application	133
7.3. The main theorem on monotone operators	139
8. Steady-state radiation heat transfer problem	148
8.1. Gâteaux and Fréchet differential	148
8.2. Classical and variational formulation	150

8.3. Convergence of finite element approximations	154
8.4. Three-dimensional radiation problem	157
9. Nonlinear anisotropic heat conduction in a transformer magnetic core .	162
9.1. Non-monotonicity and non-potentiality of the problem	162
9.2. Existence of the weak and discrete solutions	167
9.3. Uniqueness and nonuniqueness	170
9.4. Convergence of finite element approximations	173
9.5. An application	176
9.6. Effect of numerical integration	178
9.7. Variational crimes	188
10. Stationary semiconductor equations	197
10.1. Classical formulation	197
10.2. Existence of a weak solution	198
10.3. Uniqueness and nonuniqueness	203
10.4. Finite element approximation	204
11. Nonstationary heat conduction in a stator	209
11.1. Classical and weak formulations	209
11.2. Finite element analysis	211
11.3. Numerical example	220
12. The time-harmonic Maxwell equations	223
12.1. Problem with inhomogeneous conductivities	223
12.2. FE-approximation of the three-dimensional problem	228
12.3. Magnetic potential of transformer shieldings	231
13. Approximation of the Maxwell equations in anisotropic inhomogeneous media	236
13.1. The initial-boundary value problem and its semidiscrete approximation	236
13.2. FE-approximation of the time-harmonic problem	240
13.3. Maxwell problem in polygonal domains	246
14. Methods for optimal shape design of electrical devices	251
14.1. Background	251
14.2. Formulation of the problem	252
14.3. Design sensitivity analysis	256
14.4. Implementation of optimal shape design procedures	264
14.5. Industrial applications	264
