#### Abstract

We consider the time evolution of a system of $N$ identical bosons whose interaction potential is rescaled by $N^{-1}$. We choose the initial wave function to describe a condensate in which all particles are in the same one-particle state. It is well known that in the mean-field limit $N \rightarrow \infty$ the quantum $N$-body dynamics is governed by the nonlinear Hartree equation. Using a nonperturbative method, we extend previous results on the mean-field limit in two directions. First, we allow a large class of singular interaction potentials as well as strong, possibly time-dependent external potentials. Second, we derive bounds on the rate of convergence of the quantum N -body dynamics to the Hartree dynamics.

## 1. Introduction

We consider a system of $N$ identical bosons in $d$ dimensions, described by a wave function $\Psi_{N} \in \mathcal{H}^{(N)}$. Here

$$
\mathcal{H}^{(N)}:=L_{+}^{2}\left(\mathbb{R}^{N d}, \mathrm{~d} x_{1} \cdots \mathrm{~d} x_{N}\right)
$$

is the subspace of $L^{2}\left(\mathbb{R}^{N d}, \mathrm{~d} x_{1} \cdots \mathrm{~d} x_{N}\right)$ consisting of wave functions $\Psi_{N}\left(x_{1}, \ldots, x_{N}\right)$ that are symmetric under permutation of their arguments $x_{1}, \ldots, x_{N} \in \mathbb{R}^{d}$. The Hamiltonian is given by

$$
\begin{equation*}
H_{N}=\sum_{i=1}^{N} h_{i}+\frac{1}{N} \sum_{1 \leqslant i<j \leqslant N} w\left(x_{i}-x_{j}\right), \tag{1.1}
\end{equation*}
$$

where $h_{i}$ denotes a one-particle Hamiltonian $h$ (to be specified later) acting on the coordinate $x_{i}$, and $w$ is an interaction potential. Note the mean-field scaling $1 / N$ in front of the interaction potential, which ensures that the free and interacting parts of $H_{N}$ are of the same order.

The time evolution of $\Psi_{N}$ is governed by the $N$-body Schrödinger equation

$$
\begin{equation*}
\mathrm{i} \partial_{t} \Psi_{N}(t)=H_{N} \Psi_{N}(t), \quad \Psi_{N}(0)=\Psi_{N, 0} \tag{1.2}
\end{equation*}
$$

For definiteness, let us consider factorized initial data $\Psi_{N, 0}=\varphi_{0}^{\otimes N}$ for some $\varphi_{0} \in$ $L^{2}\left(\mathbb{R}^{d}\right)$ satisfying the normalization condition $\left\|\varphi_{0}\right\|_{L^{2}\left(\mathbb{R}^{d}\right)}=1$. Clearly, because of the interaction between the particles, the factorization of the wave function is not preserved by the time evolution. However, it turns out that for large $N$ the interaction potential experienced by any single particle may be approximated by an effective mean-field potential, so that the wave function $\Psi_{N}(t)$ remains approximately factorized for all times. In other words we have that, in a sense to be made precise, $\Psi_{N}(t) \approx \varphi(t)^{\otimes N}$ for some appropriate $\varphi(t)$. A simple argument shows that in a product state $\varphi(t)^{\otimes N}$ the interaction potential experienced by a particle is approximately $w *|\varphi(t)|^{2}$, where $*$ denotes convolution. This implies that $\varphi(t)$ is a solution of the nonlinear Hartree equation

$$
\begin{equation*}
\mathrm{i}_{t} \varphi(t)=h \varphi(t)+\left(w *|\varphi(t)|^{2}\right) \varphi(t), \quad \varphi(0)=\varphi_{0} \tag{1.3}
\end{equation*}
$$

Let us be a little more precise about what one means with $\Psi_{N} \approx \varphi^{\otimes N}$ (we omit the irrelevant time argument). One does not expect the $L^{2}$-distance $\left\|\Psi_{N}-\varphi^{\otimes N}\right\|_{L^{2}\left(\mathbb{R}^{N d}\right)}$ to become small as $N \rightarrow \infty$. A more useful, weaker, indicator of convergence should depend only on a finite, fixed ${ }^{1}$ number, $k$, of particles. To this end we define the reduced $k$-particle density matrix

$$
\gamma_{N}^{(k)}:=\operatorname{Tr}_{k+1, \ldots, N}\left|\Psi_{N}\right\rangle\left\langle\Psi_{N}\right|,
$$

where $\operatorname{Tr}_{k+1, \ldots, N}$ denotes the partial trace over the coordinates $x_{k+1}, \ldots, x_{N}$, and $\left|\Psi_{N}\right\rangle\left\langle\Psi_{N}\right|$ denotes (in accordance with the usual Dirac notation) the orthogonal projector onto $\Psi_{N}$. In other words, $\gamma_{N}^{(k)}$ is the positive trace class operator on $L_{+}^{2}\left(\mathbb{R}^{k d}, \mathrm{~d} x_{1} \cdots \mathrm{~d} x_{k}\right)$ with operator kernel

$$
\begin{aligned}
& \gamma_{N}^{(k)}\left(x_{1}, \ldots, x_{k} ; y_{1}, \ldots, y_{k}\right) \\
& \quad=\int \mathrm{d} x_{k+1} \cdots \mathrm{~d} x_{N} \Psi_{N}\left(x_{1}, \ldots, x_{N}\right) \overline{\Psi_{N}\left(y_{1}, \ldots, y_{k}, x_{k+1}, \ldots, x_{N}\right)}
\end{aligned}
$$

The reduced $k$-particle density matrix $\gamma_{N}^{(k)}$ embodies all the information contained in the full $N$-particle wave function that pertains to at most $k$ particles. There are two commonly used indicators of the closeness $\gamma_{N}^{(k)} \approx(|\varphi\rangle\langle\varphi|)^{\otimes k}$ : the projection

$$
E_{N}^{(k)}:=1-\left\langle\varphi^{\otimes k}, \gamma_{N}^{(k)} \varphi^{\otimes k}\right\rangle
$$

and the trace norm distance

$$
\begin{equation*}
R_{N}^{(k)}:=\operatorname{Tr}\left|\gamma_{N}^{(k)}-(|\varphi\rangle\langle\varphi|)^{\otimes k}\right| \tag{1.4}
\end{equation*}
$$

It is well known (see e.g. [9]) that all of these indicators are equivalent in the sense that the vanishing of either $R_{N}^{(k)}$ or $E_{N}^{(k)}$ for some $k$ in the limit $N \rightarrow \infty$ implies that $\lim _{N} R_{N}^{\left(k^{\prime}\right)}=\lim _{N} E_{N}^{\left(k^{\prime}\right)}=0$ for all $k^{\prime}$. However, the rate of convergence may differ

[^0]from one indicator to another. Thus, when studying rates of convergence, they are not equivalent (see Sect. 2 below for a full discussion).

The study of the convergence of $\gamma_{N}^{(k)}(t)$ in the mean-field limit towards $(|\varphi(t)\rangle$ $\langle\varphi(t)|)^{\otimes k}$ for all $t$ has a history going back almost thirty years. The first result is due to Spohn [13], who showed that $\lim _{N} R_{N}^{(k)}(t)=0$ for all $t$ provided that $w$ is bounded. His method is based on the BBGKY hierarchy,

$$
\begin{align*}
\mathrm{i} \partial_{t} \gamma_{N}^{(k)}(t)= & \sum_{i=1}^{k}\left[h_{i}, \gamma_{N}^{(k)}(t)\right]+\frac{1}{N} \sum_{1 \leqslant i<j \leqslant k}\left[w\left(x_{i}-x_{j}\right), \gamma_{N}^{(k)}(t)\right] \\
& +\frac{N-k}{N} \sum_{i=1}^{k} \operatorname{Tr}_{k+1}\left[w\left(x_{i}-x_{k+1}\right), \gamma_{N}^{(k+1)}(t)\right] \tag{1.5}
\end{align*}
$$

an equation of motion for the family $\left(\gamma_{N}^{(k)}(t)\right)_{k \in \mathbb{N}}$ of reduced density matrices. It is a simple computation to check that the BBGKY hierarchy is equivalent to the Schrödinger equation (1.2) for $\Psi_{N}(t)$. Using a perturbative expansion of the BBGKY hierarchy, Spohn showed that in the limit $N \rightarrow \infty$ the family $\left(\gamma_{N}^{(k)}(t)\right)_{k \in \mathbb{N}}$ converges to a family $\left(\gamma_{\infty}^{(k)}(t)\right)_{k \in \mathbb{N}}$ that satisfies the limiting BBGKY obtained by formally setting $N=\infty$ in (1.5). This limiting hierarchy is easily seen to be equivalent to the Hartree equation (1.3) via the identification $\gamma_{\infty}^{(k)}(t)=(|\varphi(t)\rangle\langle\varphi(t)|)^{\otimes k}$. We refer to [3] for a short discussion of some subsequent developments.

In the past few years considerable progress has been made in strengthening such results in mainly two directions. First, the convergence $\lim _{N} R_{N}^{(k)}(t)=0$ for all $t$ has been proven for singular interaction potentials $w$. It is for instance of special physical interest to understand the case of a Coulomb potential, $w(x)=\lambda|x|^{-1}$, where $\lambda \in \mathbb{R}$. The proofs for singular interaction potentials are considerably more involved than for bounded interaction potentials. The first result for the case $h=-\Delta$ and $w(x)=\lambda|x|^{-1}$ is due to Erdős and Yau [3]. Their proof uses the BBGKY hierarchy and a weak compactness argument. In [1], Schlein and Elgart extended this result to the technically more demanding case of a semirelativistic kinetic energy, $h=\sqrt{\mathbb{1}-\Delta}$ and $w(x)=\lambda|x|^{-1}$. This is a critical case in the sense that the kinetic energy has the same scaling behaviour as the Coulomb potential energy, thus requiring quite refined estimates. A different approach, based on operator methods, was developed by Fröhlich et al. in [4], where the authors treat the case $h=-\Delta$ and $w(x)=\lambda|x|^{-1}$. Their proof relies on dispersive estimates and counting of Feynman graphs. Yet another approach was adopted by Rodnianski and Schlein in [12]. Using methods inspired by a semiclassical argument of Hepp [6] focusing on the dynamics of coherent states in Fock space, they show convergence to the mean-field limit in the case $h=-\Delta$ and $w(x)=\lambda|x|^{-1}$.

The second area of recent progress in understanding the mean-field limit is deriving estimates on the rate of convergence to the mean-field limit. Methods based on expansions, as used in [13 and 4], give very weak bounds on the error $R_{N}^{(1)}(t)$, while weak compactness arguments, as used in [3 and 1], yield no information on the rate of convergence. From a physical point of view, where $N$ is large but finite, it is of some interest to have tight error bounds in order to be able to address the question whether the mean-field approximation may be regarded as valid. The first reasonable estimates on the error were derived for the case $h=-\Delta$ and $w(x)=\lambda|x|^{-1}$ by Rodnianski and Schlein in their work [12] mentioned above. In fact they derive an explicit estimate on
the error of the form

$$
R_{N}^{(k)}(t) \leqslant \frac{C_{1}(k)}{\sqrt{N}} \mathrm{e}^{C_{2}(k) t}
$$

for some constants $C_{1}(k), C_{2}(k)>0$. Using a novel approach inspired by Lieb-Robinson bounds, Erdős and Schlein [2] further improved this estimate under the more restrictive assumption that $w$ is bounded and its Fourier transform integrable. Their result is

$$
R_{N}^{(k)}(t) \leqslant \frac{C_{1}}{N} \mathrm{e}^{C_{2} k} \mathrm{e}^{C_{3} t}
$$

for some constants $C_{1}, C_{2}, C_{3}>0$.
In the present article we adopt yet another approach based on a method of Pickl [10]. We strengthen and generalize many of the results listed above, by treating more singular interaction potentials as well as deriving estimates on the rate of convergence. Moreover, our approach allows for a large class of (possibly time-dependent) external potentials, which might for instance describe a trap confining the particles to a small volume. We also show that if the solution $\varphi(\cdot)$ of the Hartree equation satisfies a scattering condition, all of the error estimates are uniform in time.

The outline of the article is as follows. Section 2 is devoted to a short discussion of the indicators of convergence $E_{N}^{(k)}$ and $R_{N}^{(k)}$, in which we derive estimates relating them to each other. In Sect. 3 we state and prove our first main result, which concerns the mean-field limit in the case of $L^{2}$-type singularities in $w$; see Theorem 3.1 and Corollary 3.2. In Sect. 4 we state and prove our second main result, which allows for a larger class of singularities such as the nonrelativistic critical case $h=-\Delta$ and $w(x)=\lambda|x|^{-2}$; see Theorem 4.1. For an outline of the methods underlying our proofs, see the beginnings of Sects. 3 and 4.

Notation. Except in definitions, in statements of results and where confusion is possible, we refrain from indicating the explicit dependence of a quantity $a_{N}(t)$ on the time $t$ and the particle number $N$. When needed, we use the notations $a(t)$ and $\left.a\right|_{t}$ interchangeably to denote the value of the quantity $a$ at time $t$. The symbol $C$ is reserved for a generic positive constant that may depend on some fixed parameters. We abbreviate $a \leqslant C b$ with $a \lesssim b$. To simplify notation, we assume that $t \geqslant 0$.

We abbreviate $L^{p}\left(\mathbb{R}^{d}, \mathrm{~d} x\right) \equiv L^{p}$ and $\|\cdot\|_{L^{p}} \equiv\|\cdot\|_{p}$. We also set $\|\cdot\|_{L^{2}\left(\mathbb{R}^{N d}\right)}=\|\cdot\|$. For $s \in \mathbb{R}$ we use $H^{s} \equiv H^{s}\left(\mathbb{R}^{d}\right)$ to denote the Sobolev space with norm $\|f\|_{H^{s}}=$ $\left\|\left(1+|k|^{2}\right)^{s / 2} \hat{f}\right\|_{2}$, where $\hat{f}$ is the Fourier transform of $f$.

Integer indices on operators denote particle number: A $k$-particle operator $A$ (i.e. an operator on $\mathcal{H}^{(k)}$ ) acting on the coordinates $x_{i_{1}}, \ldots, x_{i_{k}}$, where $i_{1}<\cdots<i_{k}$, is denoted by $A_{i_{1} \ldots i_{k}}$. Also, by a slight abuse of notation, we identify $k$-particle functions $f\left(x_{1}, \ldots, x_{k}\right)$ with their associated multiplication operators on $\mathcal{H}^{(k)}$. The operator norm of the multiplication operator $f$ is equal to, and will always be denoted by, $\|f\|_{\infty}$.

We use the symbol $\mathcal{Q}(\cdot)$ to denote the form domain of a semibounded operator. We denote the space of bounded linear maps from $X_{1}$ to $X_{2}$ by $\mathcal{L}\left(X_{1} ; X_{2}\right)$, and abbreviate $\mathcal{L}(X)=\mathcal{L}(X ; X)$. We abbreviate the operator norm of $\mathcal{L}\left(L^{2}\left(\mathbb{R}^{N d}\right)\right)$ by $\|\cdot\|$. For two Banach spaces, $X_{1}$ and $X_{2}$, contained in some larger space, we set

$$
\begin{aligned}
\|f\|_{X_{1}+X_{2}} & =\inf _{f=f_{1}+f_{2}}\left(\left\|f_{1}\right\|_{X_{1}}+\left\|f_{2}\right\|_{X_{2}}\right), \\
\|f\|_{X_{1} \cap X_{2}} & =\|f\|_{X_{1}}+\|f\|_{X_{2}},
\end{aligned}
$$

and denote by $X_{1}+X_{2}$ and $X_{1} \cap X_{2}$ the corresponding Banach spaces.

## 2. Indicators of Convergence

This section is devoted to a discussion, which might also be of independent interest, of quantitative relationships between the indicators $E_{N}^{(k)}$ and $R_{N}^{(k)}$. Throughout this section we suppress the irrelevant index $N$.

Take a $k$-particle density matrix $\gamma^{(k)} \in \mathcal{L}\left(\mathcal{H}^{(k)}\right)$ and a one-particle condensate wave function $\varphi \in L^{2}$. The following lemma gives the relationship between different elements of the sequence $E^{(1)}, E^{(2)}, \ldots$, where, we recall,

$$
\begin{equation*}
E^{(k)}=1-\left\langle\varphi^{\otimes k}, \gamma^{(k)} \varphi^{\otimes k}\right\rangle \tag{2.1}
\end{equation*}
$$

Lemma 2.1. Let $\gamma^{(k)} \in \mathcal{L}\left(\mathcal{H}^{(k)}\right)$ satisfy

$$
\gamma^{(k)} \geqslant 0, \quad \operatorname{Tr} \gamma^{(k)}=1
$$

Let $\varphi \in L^{2}$ satisfy $\|\varphi\|=1$. Then

$$
\begin{equation*}
E^{(k)} \leqslant k E^{(1)} \tag{2.2}
\end{equation*}
$$

Proof. Let $\left(\Phi_{i}^{(k)}\right)_{i \geqslant 1}$ be an orthonormal basis of $\mathcal{H}^{(k)}$ with $\Phi_{1}^{(k)}=\varphi^{\otimes k}$. Then

$$
\begin{aligned}
\left\langle\varphi^{\otimes k}, \gamma^{(k)} \varphi^{\otimes k}\right\rangle= & \sum_{i \geqslant 1}\left\langle\varphi \otimes \Phi_{i}^{(k-1)}, \gamma^{(k)} \varphi \otimes \Phi_{i}^{(k-1)}\right\rangle \\
& -\sum_{i \geqslant 2}\left\langle\varphi \otimes \Phi_{i}^{(k-1)}, \gamma^{(k)} \varphi \otimes \Phi_{i}^{(k-1)}\right\rangle \\
= & \left\langle\varphi, \gamma^{(1)} \varphi\right\rangle-\sum_{i \geqslant 2}\left\langle\varphi \otimes \Phi_{i}^{(k-1)}, \gamma^{(k)} \varphi \otimes \Phi_{i}^{(k-1)}\right\rangle .
\end{aligned}
$$

Therefore,

$$
\begin{aligned}
\langle\varphi & \left., \gamma^{(1)} \varphi\right\rangle-\left\langle\varphi^{\otimes k}, \gamma^{(k)} \varphi^{\otimes k}\right\rangle \\
& =\sum_{i \geqslant 2}\left\langle\varphi \otimes \Phi_{i}^{(k-1)}, \gamma^{(k)} \varphi \otimes \Phi_{i}^{(k-1)}\right\rangle \\
\quad \leqslant & \sum_{i \geqslant 2} \sum_{j \geqslant 1}\left\langle\Phi_{j}^{(1)} \otimes \Phi_{i}^{(k-1)}, \gamma^{(k)} \Phi_{j}^{(1)} \otimes \Phi_{i}^{(k-1)}\right\rangle \\
= & \sum_{i \geqslant 1} \sum_{j \geqslant 1}\left\langle\Phi_{j}^{(1)} \otimes \Phi_{i}^{(k-1)}, \gamma^{(k)} \Phi_{j}^{(1)} \otimes \Phi_{i}^{(k-1)}\right\rangle \\
& -\sum_{j \geqslant 1}\left\langle\Phi_{j}^{(1)} \otimes \varphi^{\otimes(k-1)}, \gamma^{(k)} \Phi_{j}^{(1)} \otimes \varphi^{\otimes(k-1)}\right\rangle \\
= & 1-\left\langle\varphi^{\otimes(k-1)}, \gamma^{(k-1)} \varphi^{\otimes(k-1)}\right\rangle .
\end{aligned}
$$

This yields

$$
E^{(k)} \leqslant E^{(k-1)}+E^{(1)},
$$

and the claim follows.

Remark 2.2. The bound in (2.2) is sharp. Indeed, let us suppose that $E^{(k)} \leqslant k f(k) E^{(1)}$ for some function $f$. Then

$$
f(k) \geqslant \sup _{\gamma^{(k)}} \frac{E^{(k)}}{k E^{(1)}} \geqslant \sup _{0<\alpha<1} \frac{1-(1-\alpha)^{k}}{k \alpha} \geqslant \lim _{\alpha \rightarrow 0} \frac{1-(1-\alpha)^{k}}{k \alpha}=1
$$

where the second inequality follows by restricting the supremum to product states $\gamma^{(k)}=$ $(|\psi\rangle\langle\psi|)^{\otimes k}$ and writing $\alpha=E^{(1)}$.

The next lemma describes the relationship between $E^{(k)}$ and $R^{(k)}$, where, we recall,

$$
R^{(k)}=\operatorname{Tr}\left|\gamma^{(k)}-(|\varphi\rangle\langle\varphi|)^{\otimes k}\right|
$$

Lemma 2.3. Let $\gamma^{(k)} \in \mathcal{L}\left(\mathcal{H}^{(k)}\right)$ be a density matrix and $\varphi \in L^{2}$ satisfy $\|\varphi\|=1$. Then

$$
\begin{align*}
& E^{(k)} \leqslant R^{(k)}  \tag{2.3a}\\
& R^{(k)} \leqslant \sqrt{8 E^{(k)}} \tag{2.3b}
\end{align*}
$$

Proof. It is convenient to introduce the shorthand

$$
p^{(k)}:=(|\varphi\rangle\langle\varphi|)^{\otimes k}
$$

Thus,
$E^{(k)}=1-\left\langle\varphi^{\otimes k}, \gamma^{(k)} \varphi^{\otimes k}\right\rangle=\operatorname{Tr}\left(p^{(k)}-p^{(k)} \gamma^{(k)}\right) \leqslant\left\|p^{(k)}\right\| \operatorname{Tr}\left|p^{(k)}-\gamma^{(k)}\right|=R^{(k)}$,
which is (2.3a). In order to prove (2.3b) it is easiest to use the identity

$$
\begin{equation*}
\operatorname{Tr}\left|p^{(k)}-\gamma^{(k)}\right|=2\left\|p^{(k)}-\gamma^{(k)}\right\| \tag{2.4}
\end{equation*}
$$

valid for any one-dimensional projector $p^{(k)}$ and nonnegative density matrix $\gamma^{(k)}$. This was first observed by Seiringer; see [12]. For the convenience of the reader we recall the proof of (2.4). Let $\left(\lambda_{n}\right)_{n \in \mathbb{N}}$ be the sequence of eigenvalues of the trace class operator $A:=\gamma^{(k)}-p^{(k)}$. Since $p^{(k)}$ is a rank one projection, $A$ has at most one negative eigenvalue, say $\lambda_{0}$. Also, $\operatorname{Tr} A=0$ implies that $\sum_{n} \lambda_{n}=0$. Thus, $\sum_{n}\left|\lambda_{n}\right|=2\left|\lambda_{0}\right|$, which is (2.4).

Now (2.4) yields

$$
R^{(k)}=\operatorname{Tr}\left|p^{(k)}-\gamma^{(k)}\right|=2\left\|p^{(k)}-\gamma^{(k)}\right\| \leqslant 2 \sqrt{\operatorname{Tr}\left(p^{(k)}-\gamma^{(k)}\right)^{2}}
$$

Then (2.3b) follows from

$$
\operatorname{Tr}\left(p^{(k)}-\gamma^{(k)}\right)^{2}=1-2 \operatorname{Tr}\left(p^{(k)} \gamma^{(k)}\right)+\operatorname{Tr}\left(\gamma^{(k)}\right)^{2} \leqslant E^{(k)}-\operatorname{Tr}\left(p^{(k)} \gamma^{(k)}\right)+1=2 E^{(k)} .
$$

Alternatively, one may prove (2.3b) without (2.4) by using the polar decomposition and the Cauchy-Schwarz inequality for Hilbert-Schmidt operators.

Remark 2.4. Up to constant factors the bounds (2.3) are sharp, as the following examples show. Here we drop the irrelevant index $k$. Consider first

$$
\varphi=\binom{1}{0}, \quad \gamma=\left(\begin{array}{cc}
1-a & 0 \\
0 & a
\end{array}\right)
$$

where $0 \leqslant a \leqslant 1$. As above we set $p:=|\varphi\rangle\langle\varphi|$. One finds

$$
E=1-\langle\varphi, \gamma \varphi\rangle=a, \quad R=\operatorname{Tr}|p-\gamma|=2 a
$$

so that (2.3a) is sharp up to a constant factor.
It is not hard to see that if $\gamma$ and $p$ commute then (2.3b) can be replaced with the stronger bound $R \lesssim E$. In order to show that in general (2.3b) is sharp up to a constant factor, consider

$$
\varphi=\binom{1}{0}, \quad \gamma=\left(\begin{array}{cc}
1-a & \sqrt{a-a^{2}} \\
\sqrt{a-a^{2}} & a
\end{array}\right)
$$

where $0 \leqslant a \leqslant 1$. One readily sees that $\gamma$ is a density matrix (in fact, a one-dimensional projector). A short calculation yields

$$
E=1-\langle\varphi, \gamma \varphi\rangle=a
$$

as well as

$$
\operatorname{Tr}|\gamma(1-p)|=\sqrt{a}
$$

Using

$$
\operatorname{Tr}|\gamma(1-p)|=\operatorname{Tr}|\gamma-p+p-\gamma p| \leqslant 2 \operatorname{Tr}|p-\gamma|
$$

we therefore find

$$
R=\operatorname{Tr}|p-\gamma| \geqslant \frac{\sqrt{a}}{2}=\frac{\sqrt{E}}{2}
$$

as desired.

## 3. Convergence for $L^{2}$-type Singularities

This section is devoted to the case $w \in L^{2}+L^{\infty}$.
3.1. Outline and main result. Our method relies on controlling the quantity

$$
\begin{equation*}
\alpha_{N}(t):=E_{N}^{(1)}(t) . \tag{3.1}
\end{equation*}
$$

To this end, we derive an estimate of the form

$$
\begin{equation*}
\dot{\alpha}_{N}(t) \leqslant A_{N}(t)+B_{N}(t) \alpha_{N}(t) \tag{3.2}
\end{equation*}
$$

which, by Grönwall's Lemma, implies

$$
\begin{equation*}
\alpha_{N}(t) \leqslant \alpha_{N}(0) \mathrm{e}^{\int_{0}^{t} B_{N}}+\int_{0}^{t} A_{N}(s) \mathrm{e}^{\int_{s}^{t} B_{N}} \mathrm{~d} s \tag{3.3}
\end{equation*}
$$

In order to show (3.2), we differentiate $\alpha_{N}(t)$ and note that all terms arising from the one-particle Hamiltonian vanish. We control the remaining terms by introducing the time-dependent orthogonal projections

$$
p(t):=|\varphi(t)\rangle\langle\varphi(t)|, \quad q(t):=\mathbb{1}-p(t)
$$

We then partition $\mathbb{1}=p(t)+q(t)$ appropriately and use the following heuristics for controlling the terms that arise in this manner. Factors $p(t)$ are used to control singularities of $w$ by exploiting the smoothness of the Hartree wave function $\varphi(t)$. Factors $q(t)$ are expected to yield something small, i.e. proportional to $\alpha_{N}(t)$, in accordance with the identity $\alpha_{N}(t)=\left\langle\Psi_{N}(t), q_{1}(t) \Psi_{N}(t)\right\rangle$.

For the following it is convenient to rewrite the Hamiltonian (1.1) as

$$
\begin{equation*}
H_{N}=\sum_{i=1}^{N} h_{i}+\frac{1}{N} \sum_{1 \leqslant i<j \leqslant N} W_{i j}=: H_{N}^{0}+H_{N}^{W} \tag{3.4}
\end{equation*}
$$

where $W_{i j}:=w\left(x_{i}-x_{j}\right)$. We may now list our assumptions.
(A1) The one-particle Hamiltonian $h$ is self-adjoint and bounded from below. Without loss of generality we assume that $h \geqslant 0$. We define the Hilbert space $X_{N}=$ $\mathcal{Q}\left(H_{N}^{0}\right)$ as the form domain of $H_{N}^{0}$ with norm

$$
\|\Psi\|_{X_{N}}:=\left\|\left(1+H_{N}^{0}\right)^{1 / 2} \Psi\right\| .
$$

(A2) The Hamiltonian (3.4) is self-adjoint and bounded from below. We also assume that $\mathcal{Q}\left(H_{N}\right) \subset X_{N}$.
(A3) The interaction potential $w$ is a real and even function satisfying $w \in L^{p_{1}}+L^{p_{2}}$, where $2 \leqslant p_{1} \leqslant p_{2} \leqslant \infty$.
(A4) The solution $\varphi(\cdot)$ of (1.3) satisfies

$$
\varphi(\cdot) \in C\left(\mathbb{R} ; X_{1} \cap L^{q_{1}}\right) \cap C^{1}\left(\mathbb{R} ; X_{1}^{*}\right)
$$

where $2 \leqslant q_{2} \leqslant q_{1} \leqslant \infty$ are defined through

$$
\begin{equation*}
\frac{1}{2}=\frac{1}{p_{i}}+\frac{1}{q_{i}}, \quad i=1,2 \tag{3.5}
\end{equation*}
$$

Here $X_{1}^{*}$ denotes the dual space of $X_{1}$, i.e. the closure of $L^{2}$ under the norm $\|\varphi\|_{X_{1}^{*}}:=\left\|(\mathbb{1}+h)^{-1 / 2} \varphi\right\|$.
We now state our main result.

Theorem 3.1. Let $\Psi_{N, 0} \in \mathcal{Q}\left(H_{N}\right)$ satisfy $\left\|\Psi_{N, 0}\right\|=1$, and $\varphi_{0} \in X_{1} \cap L^{q_{1}}$ satisfy $\left\|\varphi_{0}\right\|=1$. Assume that Assumptions (A1) - (A4) hold. Then

$$
\alpha_{N}(t) \leqslant\left(\alpha_{N}(0)+\frac{1}{N}\right) \mathrm{e}^{\phi(t)},
$$

where

$$
\phi(t):=32\|w\|_{L^{p_{1}}+L^{p_{2}}} \int_{0}^{t} \mathrm{~d} s\left(\|\varphi(s)\|_{q_{1}}+\|\varphi(s)\|_{q_{2}}\right)
$$

We may combine this result with the observations of Sect. 2.
Corollary 3.2. Let the sequence $\Psi_{N, 0} \in \mathcal{Q}\left(H_{N}\right), N \in \mathbb{N}$, satisfy the assumptions of Theorem 3.1 as well as

$$
E_{N}^{(1)}(0) \lesssim \frac{1}{N}
$$

Then we have

$$
E_{N}^{(k)}(t) \lesssim \frac{k}{N} \mathrm{e}^{\phi(t)}, \quad R_{N}^{(k)}(t) \lesssim \sqrt{\frac{k}{N}} \mathrm{e}^{\phi(t) / 2}
$$

Remark 3.3. Corollary 3.2 implies that we can control the condensation of $k=o(N)$ particles.

Remark 3.4. Assumption (A3) allows for singularities in $w$ up to, but not including, the type $|x|^{-3 / 2}$ in three dimensions. In the next section we treat a larger class of interaction potentials.

Remark 3.5. Assumption (A4) is typically verified by solving the Hartree equation in a Sobolev space of high index (see e.g. Sect. 3.2.2). Instead of requiring a global-in-time solution $\varphi(\cdot)$, it is enough to have a local-in-time solution on $[0, T)$ for some $T>0$.

Remark 3.6. If $\sup _{t} \phi(t)<\infty$, or in other words if $\|\varphi(t)\|_{q_{1}}$ and $\|\varphi(t)\|_{q_{2}}$ are integrable in $t$ over $\mathbb{R}$, then all estimates are uniform in time. This describes a scattering regime where the time evolution is asymptotically free for large times. Such an integrability condition requires large exponents $q_{i}$, which translates to small exponents $p_{i}$, i.e. an interaction potential with strong decay.

Remark 3.7. The result easily extends to time-dependent one-particle Hamiltonians $h \equiv h(t)$. Replace (A1) and (A2) with
(A1') The Hamiltonian $h(t)$ is self-adjoint and bounded from below. We assume that there is an operator $h_{0} \geqslant 0$ that such that $0 \leqslant h(t) \leqslant h_{0}$ for all $t$. Define the Hilbert space $X_{N}=\mathcal{Q}\left(\sum_{i}\left(h_{0}\right)_{i}\right)$ as in (A1).
(A2') The Hamiltonian $H_{N}(t)$ is self-adjoint and bounded from below. We assume that $\mathcal{Q}\left(H_{N}(t)\right) \subset X_{N}$ for all $t$. We also assume that the $N$-body propagator $U_{N}(t, s)$, defined by

$$
\mathrm{i} \partial_{t} U_{N}(t, s)=H_{N}(t) U_{N}(t, s), \quad U_{N}(s, s)=\mathbb{1}
$$ exists and satisfies $U_{N}(t, 0) \Psi_{N, 0} \in \mathcal{Q}\left(H_{N}(t)\right)$ for all $t$.

It is then straightforward that Theorem 3.1 holds with the same proof.

Remark 3.8. In some cases (see e.g. Sect. 3.2.1 below) it is convenient to modify the assumptions as follows. Replace (A3) and (A4) with
(A3') The interaction potential $w$ is a real and even function satisfying

$$
\begin{equation*}
\left\|w^{2} *|\varphi|^{2}\right\|_{\infty} \leqslant K\|\varphi\|_{X_{1}}^{2} \tag{3.6}
\end{equation*}
$$

for some constant $K>0$. Without loss of generality we assume that $K \geqslant 1$.
(A4') The solution $\varphi(\cdot)$ of (1.3) satisfies

$$
\varphi(\cdot) \in C\left(\mathbb{R} ; X_{1}\right) \cap C^{1}\left(\mathbb{R} ; X_{1}^{*}\right)
$$

Then Theorem 3.1 and Corollary 3.2 hold with

$$
\phi(t)=32 K \int_{0}^{t} \mathrm{~d} s\|\varphi(s)\|_{X_{1}}^{2}
$$

The proof remains virtually unchanged. One replaces (3.24) with (3.6), as well as (3.20) with

$$
\left\|w *|\varphi|^{2}\right\|_{\infty} \leqslant 2 K\|\varphi\|_{X_{1}}^{2}
$$

which is an easy consequence of (3.6).
3.2. Examples. We list two examples of systems satisfying the assumptions of Theorem 3.1.
3.2.1. Particles in a trap. Consider nonrelativistic particles in $\mathbb{R}^{3}$ confined by a strong trapping potential. The particles interact by means of the Coulomb potential: $w(x)=$ $\lambda|x|^{-1}$, where $\lambda \in \mathbb{R}$. The one-particle Hamiltonian is of the form $h=-\Delta+v$, where $v$ is a measurable function on $\mathbb{R}^{3}$. Decompose $v$ into its positive and negative parts: $v=v_{+}-v_{-}$, where $v_{+}, v_{-} \geqslant 0$. We assume that $v_{+} \in L_{\text {loc }}^{1}$ and that $v_{-}$is $-\Delta$-form bounded with relative bound less than one, i.e. there are constants $0 \leqslant a<1$ and $0 \leqslant b<\infty$ such that

$$
\begin{equation*}
\left\langle\varphi, v_{-} \varphi\right\rangle \leqslant a\langle\varphi,-\Delta \varphi\rangle+b\langle\varphi, \varphi\rangle \tag{3.7}
\end{equation*}
$$

Thus $h+b \mathbb{1}$ is positive, and it is not hard to see that $h$ is essentially self-adjoint on $C_{c}^{\infty}\left(\mathbb{R}^{3}\right)$. This follows by density and a standard argument using Riesz's representation theorem to show that the equation $(h+(b+1) \mathbb{1}) \varphi=f$ has a unique solution $\varphi \in\left\{\varphi \in L^{2}: h \varphi \in L^{2}\right\}$ for each $f \in L^{2}$.

It is now easy to see that Assumptions (A1) and (A2) hold with the one-particle Hamiltonian $h+c \mathbb{1}$ for some $c>0$. Let us assume without loss of generality that $c=0$. Next, we verify Assumptions (A3') and (A4') (see Remark 3.8). We find

$$
\begin{aligned}
\left\|w^{2} *|\varphi|^{2}\right\|_{\infty} & \left.=\left.\sup _{x}\left|\int \mathrm{~d} y \frac{\lambda^{2}}{|x-y|^{2}}\right| \varphi(y)\right|^{2} \right\rvert\, \lesssim\langle\varphi,-\Delta \varphi\rangle \\
& \lesssim\langle\varphi, h \varphi\rangle+\langle\varphi, \varphi\rangle=\|\varphi\|_{X_{1}}^{2}
\end{aligned}
$$

where the second step follows from Hardy's inequality and translation invariance of $\Delta$, and the third step is a simple consequence of (3.7). This proves (A3').

Next, take $\varphi_{0} \in X_{1}$. By standard methods (see e.g. the presentation of [7]) one finds that (A4') holds. Moreover, the mass $\|\varphi(t)\|^{2}$ and the energy

$$
E^{\varphi}(t)=\left.\left[\langle\varphi, h \varphi\rangle+\frac{1}{2} \int \mathrm{~d} x \mathrm{~d} y w(x-y)|\varphi(x)|^{2}|\varphi(y)|^{2}\right]\right|_{t}
$$

are conserved under time evolution. Using the identity $|x|^{-1} \leqslant \mathbb{1}_{\{|x| \leqslant \varepsilon\}} \varepsilon|x|^{-2}+$ $\mathbb{1}_{\{|x|>\varepsilon\}} \varepsilon^{-1}$ and Hardy's inequality one sees that

$$
\|\varphi(t)\|_{X_{1}}^{2} \lesssim E^{\varphi}(t)+\|\varphi(t)\|^{2}
$$

and therefore $\|\varphi(t)\|_{X_{1}} \leqslant C$ for all $t$. We conclude: Theorem 3.1 holds with $\phi(t)=C t$. More generally, the preceding discussion holds for interaction potentials $w \in L_{w}^{3}+L^{\infty}$, where $L_{w}^{p}$ denotes the weak $L^{p}$ space (see e.g. [11]). This follows from a short computation using symmetric-decreasing rearrangements; we omit further details. This example generalizes the results of [3,12 and 4].
3.2.2. A boson star. Consider semirelativistic particles in $\mathbb{R}^{3}$ whose one-particle Hamiltonian is given by $h=\sqrt{\mathbb{1}-\Delta}$. The particles interact by means of a Coulomb potential: $w(x)=\lambda|x|^{-1}$. We impose the condition $\lambda>-4 / \pi$. This condition is necessary for both the stability of the $N$-body problem (i.e. Assumption (A2)) and the global well-posedness of the Hartree equation. See $[7,8]$ for details. It is well known that Assumptions (A1) and (A2) hold in this case.

In order to show (A4) we need some regularity of $\varphi(\cdot)$. To this end, let $s>1$ and take $\varphi_{0} \in H^{s}$. Theorem 3 of [7] implies that (1.3) has a unique global solution in $H^{s}$. Therefore Sobolev's inequality implies that (A4) holds with

$$
\frac{1}{q_{1}}=\frac{1}{2}-\frac{s}{3} .
$$

Thus $q_{1}>6$, and (A3) holds with appropriately chosen values of $p_{1}, p_{2}$. We conclude: Theorem 3.1 holds for some continuous function $\phi(t)$. (In fact, as shown in [7], one has the bound $\phi(t) \lesssim \mathrm{e}^{C t}$.) This example generalizes the result of [1].

### 3.3. Proof of Theorem 3.1.

3.3.1. A family of projectors. Define the time-dependent projectors

$$
p(t):=|\varphi(t)\rangle\langle\varphi(t)|, \quad q(t):=\mathbb{1}-p(t) .
$$

Write

$$
\begin{equation*}
\mathbb{1}=\left(p_{1}+q_{1}\right) \cdots\left(p_{N}+q_{N}\right) \tag{3.8}
\end{equation*}
$$

and define $P_{k}$, for $k=0, \ldots, N$, as the term obtained by multiplying out (3.8) and selecting all summands containing $k$ factors $q$. In other words,

$$
\begin{equation*}
P_{k}=\sum_{\substack{a \in\{0,1\}^{N} \\ \sum_{i} a_{i}=k}} \prod_{i=1}^{N} p_{i}^{1-a_{i}} q_{i}^{a_{i}} . \tag{3.9}
\end{equation*}
$$

If $k \neq\{0, \ldots, N\}$ we set $P_{k}=0$. It is easy to see that the following properties hold:
(i) $P_{k}$ is an orthogonal projector,
(ii) $P_{k} P_{l}=\delta_{k l} P_{k}$,
(iii) $\sum_{k} P_{k}=\mathbb{1}$.

Next, for any function $f:\{0, \ldots, N\} \rightarrow \mathbb{C}$ we define the operator

$$
\begin{equation*}
\widehat{f}:=\sum_{k} f(k) P_{k} \tag{3.10}
\end{equation*}
$$

It follows immediately that

$$
\widehat{f} \widehat{g}=\widehat{f g},
$$

and that $\widehat{f}$ commutes with $p_{i}$ and $P_{k}$. We shall often make use of the functions

$$
m(k):=\frac{k}{N}, \quad n(k):=\sqrt{\frac{k}{N}}
$$

We have the relation

$$
\begin{equation*}
\frac{1}{N} \sum_{i} q_{i}=\frac{1}{N} \sum_{k} \sum_{i} q_{i} P_{k}=\frac{1}{N} \sum_{k} k P_{k}=\widehat{m} \tag{3.11}
\end{equation*}
$$

Thus, by symmetry of $\Psi$, we get

$$
\begin{equation*}
\alpha=\left\langle\Psi, q_{1} \Psi\right\rangle=\langle\Psi, \widehat{m} \Psi\rangle . \tag{3.12}
\end{equation*}
$$

The correspondence $q_{1} \sim \widehat{m}$ of (3.11) yields the following useful bounds.
Lemma 3.9. For any nonnegative function $f:\{0, \ldots, N\} \rightarrow[0, \infty)$ we have

$$
\begin{align*}
\left\langle\Psi, \widehat{f} q_{1} \Psi\right\rangle & =\langle\Psi, \widehat{f} \widehat{m} \Psi\rangle  \tag{3.13}\\
\left\langle\Psi, \widehat{f} q_{1} q_{2} \Psi\right\rangle & \leqslant \frac{N}{N-1}\left\langle\Psi, \widehat{f} \widehat{m}^{2} \Psi\right\rangle \tag{3.14}
\end{align*}
$$

Proof. The proof of (3.13) is an immediate consequence of (3.11). In order to prove (3.14) we write, using symmetry of $\Psi$ as well as (3.11),

$$
\begin{aligned}
\left\langle\Psi, \widehat{f} q_{1} q_{2} \Psi\right\rangle & =\frac{1}{N(N-1)} \sum_{i \neq j}\left\langle\Psi, \widehat{f} q_{i} q_{j} \Psi\right\rangle \\
& \leqslant \frac{1}{N(N-1)} \sum_{i, j}\left\langle\Psi, \widehat{f} q_{i} q_{j} \Psi\right\rangle=\frac{N}{N-1}\left\langle\Psi, \widehat{f} \widehat{m}^{2} \Psi\right\rangle
\end{aligned}
$$

which is the claim.
Next, we introduce the shift operation $\tau_{n}, n \in \mathbb{Z}$, defined on functions $f$ through

$$
\begin{equation*}
\left(\tau_{n} f\right)(k):=f(k+n) \tag{3.15}
\end{equation*}
$$

Its usefulness for our purposes is encapsulated by the following lemma.

Lemma 3.10. Let $r \geqslant 1$ and $A$ be an operator on $\mathcal{H}^{(r)}$. Let $Q_{i}, i=1,2$, be two projectors of the form

$$
Q_{i}=\#_{1} \cdots \#_{r},
$$

where each \# stands for either p or $q$. Then

$$
Q_{1} A_{1 \ldots r} \widehat{f} Q_{2}=\widehat{Q_{1}} \widehat{\tau_{n} f} A_{1 \ldots r} Q_{2}
$$

where $n=n_{2}-n_{1}$ and $n_{i}$ is the number of factors $q$ in $Q_{i}$.
Proof. Define

$$
P_{k}^{r}:=\sum_{\substack{a \in\{0,1\}^{N-r} \\ \sum_{i} a_{i}=k}} \prod_{i=r+1}^{N} p_{i}^{1-a_{i}} q_{i}^{a_{i}} .
$$

Then,

$$
Q_{i} \widehat{f}=\sum_{k} f(k) Q_{i} P_{k}=\sum_{k} f(k) Q_{i} P_{k-n_{i}}^{r}=\sum_{k} f\left(k+n_{i}\right) Q_{i} P_{k}^{r}
$$

The claim follows from the fact that $P_{k}^{r}$ commutes with $A_{1 \ldots r}$.

### 3.3.2. A bound on $\dot{\alpha}$. Let us abbreviate

$$
W^{\varphi}:=w *|\varphi|^{2} .
$$

From (A3) and (A4) we find $W^{\varphi} \in L^{\infty}$ (see (3.20) below). Then $\mathrm{i}_{t} \varphi=\left(h+W^{\varphi}\right) \varphi$, where $h+W^{\varphi} \in \mathcal{L}\left(X_{1} ; X_{1}^{*}\right)$. Thus, for any $\psi \in X_{1}$ independent of $t$ we have

$$
\mathrm{i} \partial_{t}\langle\psi, p \psi\rangle=\left\langle\psi,\left[h+W^{\varphi}, p\right] \psi\right\rangle .
$$

On the other hand, it is easy to see from (A3) and (A4) that $\widehat{m} \Psi \in \mathcal{Q}(H)$. Combining these observations, and noting that $\Psi \in \mathcal{Q}(H) \subset X$ by (A2), we see that $\alpha$ is differentiable in $t$ with derivative

$$
\dot{\alpha}=\mathrm{i}\left|\Psi,\left[H-H^{\varphi}, \widehat{m}\right] \Psi\right\rangle,
$$

where $H^{\varphi}:=\sum_{i}\left(h_{i}+W_{i}^{\varphi}\right)$. Thus,

$$
\dot{\alpha}=\mathrm{i}\left\langle\Psi,\left[\frac{1}{N} \sum_{i<j} W_{i j}-\sum_{i} W_{i}^{\varphi}, \widehat{m}\right] \Psi\right\rangle .
$$

By symmetry of $\Psi$ and $\widehat{m}$ we get

$$
\begin{equation*}
\dot{\alpha}=\frac{\mathrm{i}}{2}\left\langle\Psi,\left[(N-1) W_{12}-N W_{1}^{\varphi}-N W_{2}^{\varphi}, \widehat{m}\right] \Psi\right\rangle . \tag{3.16}
\end{equation*}
$$

In order to estimate the right-hand side, we introduce

$$
\mathbb{1}=\left(p_{1}+q_{1}\right)\left(p_{2}+q_{2}\right)
$$

on both sides of the commutator in (3.16). Of the sixteen resulting terms only three different types survive:

$$
\begin{align*}
& \frac{\mathrm{i}}{2}\left\langle\Psi, p_{1} p_{2}\left[(N-1) W_{12}-N W_{1}^{\varphi}-N W_{2}^{\varphi}, \widehat{m}\right] q_{1} p_{2} \Psi\right\rangle,  \tag{I}\\
& \frac{\mathrm{i}}{2}\left\langle\Psi, q_{1} p_{2}\left[(N-1) W_{12}-N W_{1}^{\varphi}-N W_{2}^{\varphi}, \widehat{m}\right] q_{1} q_{2} \Psi\right\rangle,  \tag{II}\\
& \frac{\mathrm{i}}{2}\left\langle\Psi, p_{1} p_{2}\left[(N-1) W_{12}-N W_{1}^{\varphi}-N W_{2}^{\varphi}, \widehat{m}\right] q_{1} q_{2} \Psi\right\rangle . \tag{III}
\end{align*}
$$

Indeed, Lemma 3.10 implies that terms with the same number of factors $q$ on the left and on the right vanish. What remains is

$$
\dot{\alpha}=2(\mathrm{I})+2(\mathrm{II})+(\mathrm{III})+\text { complex conjugate } .
$$

The remainder of the proof consists in estimating each term.
Term (I). First, we remark that

$$
\begin{equation*}
p_{2} W_{12} p_{2}=p_{2} W_{1}^{\varphi} \tag{3.17}
\end{equation*}
$$

This is easiest to see using operator kernels (we drop the trivial indices $x_{3}, y_{3}, \ldots$, $\left.x_{N}, y_{N}\right)$ :

$$
\begin{aligned}
\left(p_{2} W_{12} p_{2}\right)\left(x_{1}, x_{2} ; y_{1}, y_{2}\right) & =\int \mathrm{d} z \varphi\left(x_{2}\right) \bar{\varphi}(z) w\left(x_{1}-z\right) \delta\left(x_{1}-y_{1}\right) \varphi(z) \bar{\varphi}\left(y_{2}\right) \\
& =\varphi\left(x_{2}\right) \bar{\varphi}\left(y_{2}\right) \delta\left(x_{1}-y_{1}\right)\left(w *|\varphi|^{2}\right)\left(x_{1}\right)
\end{aligned}
$$

Therefore,

$$
(\mathrm{I})=\frac{\mathrm{i}}{2}\left\langle\Psi, p_{1} p_{2}\left[(N-1) W_{1}^{\varphi}-N W_{1}^{\varphi}, \widehat{m}\right] q_{1} p_{2} \Psi\right\rangle=\frac{-\mathrm{i}}{2}\left\langle\Psi, p_{1} p_{2}\left[W_{1}^{\varphi}, \widehat{m}\right] q_{1} p_{2} \Psi\right\rangle
$$

Using Lemma 3.10 we find

$$
(\mathrm{I})=\frac{-\mathrm{i}}{2}\left\langle\Psi, p_{1} p_{2} W_{1}^{\varphi}\left(\widehat{m}-\widehat{\tau_{-1} m}\right) q_{1} p_{2} \Psi\right\rangle=\frac{-\mathrm{i}}{2 N}\left\langle\Psi, p_{1} p_{2} W_{1}^{\varphi} q_{1} p_{2} \Psi\right\rangle
$$

This gives

$$
|(\mathrm{I})| \leqslant \frac{1}{2 N}\left\|W^{\varphi}\right\|_{\infty}=\frac{1}{2 N}\left\|w *|\varphi|^{2}\right\|_{\infty}
$$

By (A3), we may write

$$
\begin{equation*}
w=w^{(1)}+w^{(2)}, \quad w^{(i)} \in L^{p_{i}} . \tag{3.18}
\end{equation*}
$$

By Young's inequality,

$$
\left\|w^{(i)} *|\varphi|^{2}\right\|_{\infty} \leqslant\left\|w^{(i)}\right\|_{p_{i}}\|\varphi\|_{r_{i}}^{2}
$$

where $r_{1}, r_{2}$ are defined through

$$
\begin{equation*}
1=\frac{1}{p_{i}}+\frac{2}{r_{i}} . \tag{3.19}
\end{equation*}
$$

Therefore,

$$
\begin{aligned}
\left\|w *|\varphi|^{2}\right\|_{\infty} & \leqslant\left\|w^{(1)}\right\|_{p_{1}}\|\varphi\|_{r_{1}}^{2}+\left\|w^{(1)}\right\|_{p_{2}}\|\varphi\|_{r_{2}}^{2} \\
& \leqslant\left(\left\|w^{(1)}\right\|_{p_{1}}+\left\|w^{(2)}\right\|_{p_{2}}\right)\left(\|\varphi\|_{r_{1}}+\|\varphi\|_{r_{2}}\right)^{2} .
\end{aligned}
$$

Taking the infimum over all decompositions (3.18) yields

$$
\begin{equation*}
\left\|W^{\varphi}\right\|_{\infty}=\left\|w *|\varphi|^{2}\right\|_{\infty} \leqslant\|w\|_{L^{p_{1}+L^{p_{2}}}}\left(\|\varphi\|_{r_{1}}+\|\varphi\|_{r_{2}}\right)^{2} \tag{3.20}
\end{equation*}
$$

Note that (A3) and (A4) imply

$$
\begin{equation*}
2 \leqslant r_{i} \leqslant q_{1} \tag{3.21}
\end{equation*}
$$

so that the right-hand side of (3.20) is finite. Summarizing,

$$
\begin{equation*}
|(\mathrm{I})| \leqslant \frac{1}{2 N}\|w\|_{L^{p_{1}+L^{p_{2}}}}\left(\|\varphi\|_{r_{1}}+\|\varphi\|_{r_{2}}\right)^{2} \tag{3.22}
\end{equation*}
$$

Term (II). Applying Lemma 3.10 to (II) yields

$$
\begin{aligned}
(\mathrm{II}) & =\frac{\mathrm{i}}{2}\left\langle\Psi, q_{1} p_{2}\left((N-1) W_{12}-N W_{2}^{\varphi}\right)\left(\widehat{m}-\widehat{\tau_{-1} m}\right) q_{1} q_{2} \Psi\right\rangle \\
& =\frac{\mathrm{i}}{2}\left\langle\Psi, q_{1} p_{2}\left(\frac{N-1}{N} W_{12}-W_{2}^{\varphi}\right) q_{1} q_{2} \Psi\right\rangle,
\end{aligned}
$$

so that

$$
\begin{equation*}
|(\mathrm{II})| \leqslant \frac{1}{2}\left|\left\langle\Psi, q_{1} p_{2} W_{12} q_{1} q_{2} \Psi\right\rangle\right|+\frac{1}{2}\left|\left\langle\Psi, q_{1} p_{2} W_{2}^{\varphi} q_{1} q_{2} \Psi\right\rangle\right| . \tag{3.23}
\end{equation*}
$$

The second term of (3.23) is bounded by

$$
\frac{1}{2}\left\|W^{\varphi}\right\|_{\infty}\left\|q_{1} \Psi\right\|^{2} \leqslant \frac{1}{2}\|w\|_{L^{p_{1}+L^{p_{2}}}}\left(\|\varphi\|_{r_{1}}+\|\varphi\|_{r_{2}}\right)^{2} \alpha
$$

where we used the bound (3.20) as well as (3.12).
The first term of (3.23) is bounded using Cauchy-Schwarz by

$$
\begin{aligned}
& \frac{1}{2} \sqrt{\left\langle\Psi, q_{1} p_{2} W_{12}^{2} p_{2} q_{1} \Psi\right\rangle} \sqrt{\left\langle\Psi, q_{1} q_{2} \Psi\right\rangle} \\
& \quad=\frac{1}{2} \sqrt{\left\langle\Psi, q_{1} p_{2}\left(w^{2} *|\varphi|^{2}\right)_{1} p_{2} q_{1} \Psi\right\rangle} \sqrt{\left\langle\Psi, q_{1} q_{2} \Psi\right\rangle}
\end{aligned}
$$

This follows by applying (3.17) to $W^{2}$. Thus we get the bound

$$
\frac{1}{2}\left\|q_{1} \Psi\right\|^{2} \sqrt{\left\|w^{2} *|\varphi|^{2}\right\|_{\infty}}=\frac{1}{2} \alpha \sqrt{\left\|w^{2} *|\varphi|^{2}\right\|_{\infty}}
$$

We now proceed as above. Using the decomposition (3.18) we get

$$
\left\|w^{2} *|\varphi|^{2}\right\|_{\infty} \leqslant 2\left\|\left(w^{(1)}\right)^{2} *|\varphi|^{2}\right\|_{\infty}+2\left\|\left(w^{(2)}\right)^{2} *|\varphi|^{2}\right\|_{\infty}
$$

Then Young's inequality gives

$$
\left\|\left(w^{(i)}\right)^{2} *|\varphi|^{2}\right\|_{\infty} \leqslant\left\|w^{(i)}\right\|_{p_{i}}^{2}\|\varphi\|_{q_{i}}^{2}
$$

which implies that

$$
\begin{equation*}
\left\|w^{2} *|\varphi|^{2}\right\|_{\infty} \leqslant 2\|w\|_{L^{p_{1}+L^{p_{2}}}}^{2}\left(\|\varphi\|_{q_{1}}+\|\varphi\|_{q_{2}}\right)^{2} . \tag{3.24}
\end{equation*}
$$

Putting all of this together we get

$$
|(\mathrm{II})| \leqslant \frac{1}{2}\|w\|_{L^{p_{1}}+L^{p_{2}}}\left[\sqrt{2}\left(\|\varphi\|_{q_{1}}+\|\varphi\|_{q_{2}}\right)+\left(\|\varphi\|_{r_{1}}+\|\varphi\|_{r_{2}}\right)^{2}\right] \alpha .
$$

Term (III). The final term (III) is equal to

$$
\begin{aligned}
\frac{\mathrm{i}}{2}\left\langle\Psi, p_{1} p_{2}\left[(N-1) W_{12}, \widehat{m}\right] q_{1} q_{2} \Psi\right\rangle & =\frac{\mathrm{i}}{2}\left\langle\Psi, p_{1} p_{2}(N-1) W_{12}\left(\widehat{m}-\widehat{\tau_{-2} m}\right) q_{1} q_{2} \Psi\right\rangle \\
& =\mathrm{i} \frac{N-1}{N}\left\langle\Psi, p_{1} p_{2} W_{12} q_{1} q_{2} \Psi\right\rangle,
\end{aligned}
$$

where we used Lemma 3.10. Next, we note that, on the range of $q_{1}$, the operator $\widehat{n}^{1}$ is well-defined and bounded. Thus (III) is equal to

$$
\mathrm{i} \frac{N-1}{N}\left\langle\Psi, p_{1} p_{2} W_{12} \widehat{n} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\rangle=\mathrm{i} \frac{N-1}{N}\left\langle\Psi, p_{1} p_{2} \widehat{\tau_{2} n} W_{12} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\rangle,
$$

where we used Lemma 3.10 again. We now use Cauchy-Schwarz to get

$$
\begin{aligned}
|(\mathrm{III})| & \leqslant \sqrt{\left\langle\Psi, p_{1} p_{2} \widehat{\tau_{2} n} W_{12}^{2} \widehat{\tau_{2} n} p_{1} p_{2} \Psi\right\rangle} \sqrt{\left\langle\Psi, \widehat{n}^{-2} q_{1} q_{2} \Psi\right\rangle} \\
& =\sqrt{\left\langle\Psi, p_{1} p_{2} \widehat{\tau_{2} n}\left(w^{2} *|\varphi|^{2}\right)_{1} \widehat{\tau_{2} n} p_{1} p_{2} \Psi\right\rangle} \sqrt{\left\langle\Psi, \widehat{m}^{-1} q_{1} q_{2} \Psi\right\rangle} \\
& \leqslant \sqrt{\left\|w^{2} *|\varphi|^{2}\right\|_{\infty}}\left\|\widehat{\tau_{2} n} \Psi\right\| \sqrt{\frac{N}{N-1}} \sqrt{\langle\Psi, \widehat{m} \Psi\rangle} \\
& =\sqrt{\left\|w^{2} *|\varphi|^{2}\right\|_{\infty}} \sqrt{\frac{N}{N-1}} \sqrt{\left\langle\Psi, \widehat{\tau_{2} m} \Psi\right\rangle} \sqrt{\alpha} \\
& =\sqrt{\left\|w^{2} *|\varphi|^{2}\right\|_{\infty}} \sqrt{\frac{N}{N-1}} \sqrt{\langle\Psi, \widehat{m} \Psi\rangle+\frac{2}{N}} \sqrt{\alpha} \\
& \leqslant \sqrt{\left\|w^{2} *|\varphi|^{2}\right\|_{\infty}} \sqrt{\frac{N}{N-1}}\left(\alpha+\sqrt{\frac{2 \alpha}{N}}\right) \\
& \leqslant \sqrt{\left\|w^{2} *|\varphi|^{2}\right\|_{\infty}} \sqrt{\frac{N}{N-1}} 2\left(\alpha+\frac{1}{N}\right) .
\end{aligned}
$$

Using the estimate (3.24) we get finally

$$
|(\mathrm{III})| \leqslant 2 \sqrt{2}\|w\|_{L^{p_{1}+L^{p_{2}}}}\left(\|\varphi\|_{q_{1}}+\|\varphi\|_{q_{2}}\right) \sqrt{\frac{N}{N-1}}\left(\alpha+\frac{1}{N}\right) .
$$

Conclusion of the proof. We have shown that the estimate (3.2) holds with

$$
\begin{aligned}
& B_{N}(t)=2\|w\|_{L^{p_{1}}+L^{p_{2}}}\left[\left(\|\varphi(t)\|_{r_{1}}+\|\varphi(t)\|_{r_{2}}\right)^{2}+6\left(\|\varphi(t)\|_{q_{1}}+\|\varphi(t)\|_{q_{2}}\right)\right] \\
& A_{N}(t)=\frac{B_{N}(t)}{N}
\end{aligned}
$$

Using $L^{2}$-norm conservation $\|\varphi(t)\|=1$ and interpolation we find $\|\varphi(t)\|_{r_{i}}^{2} \leqslant\|\varphi(t)\|_{q_{i}}$. Thus,

$$
B_{N}(t) \leqslant 16\|w\|_{L^{p_{1}}+L^{p_{2}}}\left(\|\varphi(t)\|_{q_{1}}+\|\varphi(t)\|_{q_{2}}\right) .
$$

The claim now follows from the Grönwall estimate (3.3).

## 4. Convergence for Stronger Singularities

In this section we extend the results of the Sect. 3 to more singular interaction potentials. We consider the case $w \in L^{p_{0}}+L^{\infty}$, where

$$
\begin{equation*}
\frac{1}{p_{0}}=\frac{1}{2}+\frac{1}{d} . \tag{4.1}
\end{equation*}
$$

For example in three dimensions $p_{0}=6 / 5$, which corresponds to singularities up to, but not including, the type $|x|^{-5 / 2}$. Of course, there are other restrictions on the interaction potential which ensure the stability of the $N$-body Hamiltonian and the well-posedness of the Hartree equation. In practice, it is often these latter restrictions that determine the class of allowed singularities.

In the words of [11] (p. 169), it is "venerable physical folklore" that an $N$-body Hamiltonian of the form (3.4), with $h=-\Delta$ and $w(x)=|x|^{-\zeta}$ for $\zeta<2$, produces reasonable quantum dynamics in three dimensions. Mathematically, this means that such a Hamiltonian is self-adjoint; this is a well-known result (see e.g. [11]). The corresponding Hartree equation is known to be globally well-posed (see [5]). This section answers (affirmatively) the question whether, in the case of such singular interaction potentials, the mean-field limit of the $N$-body dynamics is governed by the Hartree equation.
4.1. Outline and main result. As in Sect. 3, we need to control expressions of the form $\left\|w^{2} *|\varphi|^{2}\right\|_{\infty}$. The situation is considerably more involved when $w^{2}$ is not locally integrable. An important step in dealing with such potentials in our proof is to express $w$ as the divergence of a vector field $\xi \in L^{2}$. This approach requires the control of not only $\alpha=\left\|q_{1} \Psi\right\|^{2}$ but also $\left\|\nabla_{1} q_{1} \Psi\right\|^{2}$, which arises from integrating by parts in expressions containing the factor $\nabla \cdot \xi$. As it turns out, $\beta$, defined through

$$
\begin{equation*}
\beta_{N}(t):=\left.\left\langle\Psi_{N}, \widehat{n} \Psi_{N}\right\rangle\right|_{t}, \tag{4.2}
\end{equation*}
$$

does the trick. This follows from an estimate exploiting conservation of energy (see Lemma 4.6 below). The inequality $m \leqslant n$ and the representation (3.12) yield

$$
\begin{equation*}
\alpha \leqslant \beta \tag{4.3}
\end{equation*}
$$

We consider a Hamiltonian of the form (3.4) and make the following assumptions.
(B1) The one-particle Hamiltonian $h$ is self-adjoint and bounded from below. Without loss of generality we assume that $h \geqslant 0$. We also assume that there are constants $\kappa_{1}, \kappa_{2}>0$ such that

$$
-\Delta \leqslant \kappa_{1} h+\kappa_{2}
$$

as an inequality of forms on $\mathcal{H}^{(1)}$.
(B2) The Hamiltonian (3.4) is self-adjoint and bounded from below. We also assume that $\mathcal{Q}\left(H_{N}\right) \subset X_{N}$, where $X_{N}$ is defined as in Assumption (A1).
(B3) There is a constant $\kappa_{3} \in(0,1)$ such that

$$
0 \leqslant\left(1-\kappa_{3}\right)\left(h_{1}+h_{2}\right)+W_{12},
$$

as an inequality of forms on $\mathcal{H}^{(2)}$.
(B4) The interaction potential $w$ is a real and even function satisfying $w \in L^{p}+L^{\infty}$, where $p_{0}<p \leqslant 2$.
(B5) The solution $\varphi(\cdot)$ of (1.3) satisfies

$$
\varphi(\cdot) \in C\left(\mathbb{R} ; X_{1}^{2} \cap L^{\infty}\right) \cap C^{1}\left(\mathbb{R} ; L^{2}\right)
$$

where $X_{1}^{2}:=\mathcal{Q}\left(h^{2}\right) \subset L^{2}$ is equipped with the norm

$$
\|\varphi\|_{X_{1}^{2}}:=\left\|\left(1+h^{2}\right)^{1 / 2} \varphi\right\| .
$$

Next, we define the microscopic energy per particle

$$
E_{N}^{\Psi}(t):=\left.\frac{1}{N}\left\langle\Psi_{N}, H_{N} \Psi_{N}\right\rangle\right|_{t}
$$

as well as the Hartree energy

$$
E^{\varphi}(t):=\left.\left[\langle\varphi, h \varphi\rangle+\frac{1}{2} \int \mathrm{~d} x \mathrm{~d} y w(x-y)|\varphi(x)|^{2}|\varphi(y)|^{2}\right]\right|_{t}
$$

By spectral calculus, $E_{N}^{\Psi}(t)$ is independent of $t$. Also, invoking Assumption (B5) to differentiate $E^{\varphi}(t)$ with respect to $t$ shows that $E^{\varphi}(t)$ is conserved as well. Summarizing,

$$
E_{N}^{\Psi}(t)=E_{N}^{\Psi}(0), \quad E^{\varphi}(t)=E^{\varphi}(0), \quad t \in \mathbb{R}
$$

We may now state the main result of this section.
Theorem 4.1. Let $\Psi_{N, 0} \in \mathcal{Q}\left(H_{N}\right)$ and assume that Assumptions (B1) - (B5) hold. Then there is a constant $K$, depending only on $d, h, w$ and $p$, such that

$$
\beta_{N}(t) \leqslant\left(\beta_{N}(0)+E_{N}^{\Psi}-E^{\varphi}+\frac{1}{N^{\eta}}\right) \mathrm{e}^{K \phi(t)}
$$

where

$$
\begin{equation*}
\eta:=\frac{p / p_{0}-1}{2 p / p_{0}-p / 2-1} \tag{4.4}
\end{equation*}
$$

and

$$
\phi(t):=\int_{0}^{t} \mathrm{~d} s\left(1+\|\varphi(s)\|_{X_{1}^{2} \cap L^{\infty}}^{3}\right)
$$

Remark 4.2. We have convergence to the mean-field limit whenever $\lim _{N} E_{N}^{\Psi}=E^{\varphi}$ and $\lim _{N} \beta_{N}(0)=0$. For instance if we start in a fully factorized state, $\Psi_{N, 0}=\varphi_{0}^{\otimes N}$, then $\beta_{N}(0)=0$ and

$$
E_{N}^{\Psi}-E^{\varphi}=\frac{1}{N}\left\langle\varphi_{0} \otimes \varphi_{0}, W_{12} \varphi_{0} \otimes \varphi_{0}\right\rangle
$$

so that Theorem 4.1 yields

$$
E_{N}^{(1)}(t) \lesssim \beta_{N}(t) \lesssim \frac{1}{N^{\eta}} \mathrm{e}^{K \phi(t)}
$$

and the analogue of Corollary 3.2 holds.
Remark 4.3. The following graph shows the dependence of $\eta$ on $p$ for $d=3$, i.e. $p_{0}=6 / 5$.

Remark 4.4. Theorem 4.1 remains valid for a large class of time-dependent one-particle Hamiltonians $h(t)$. See Sect. 4.4 below for a full discussion.

Remark 4.5. In three dimensions Assumption (B1) and Sobolev's inequality imply that $\|\varphi\|_{\infty} \lesssim\|\varphi\|_{X_{1}^{2}}$, so that Assumption (B5) is equivalent to $\varphi \in C\left(\mathbb{R} ; X_{1}^{2}\right) \cap C^{1}\left(\mathbb{R} ; L^{2}\right)$.
4.2. Example: nonrelativistic particles with interaction potential of critical type. Consider nonrelativistic particles in $\mathbb{R}^{3}$ with one-particle Hamiltonian $h=-\Delta$. The interaction potential is given by $w(x)=\lambda|x|^{-2}$. This corresponds to a critical nonlinearity of the Hartree equation. We require that $\lambda>-1 / 2$, which ensures that the $N$-body Hamiltonian is stable and the Hartree equation has global solutions. To see this, recall Hardy's inequality in three dimensions,

$$
\begin{equation*}
\left.\left.\langle\varphi,| x\right|^{-2} \varphi\right\rangle \leqslant 4\langle\varphi,-\Delta \varphi\rangle . \tag{4.5}
\end{equation*}
$$

One easily infers that Assumptions (B1) - (B3) hold. Moreover, Assumption (B4) holds for any $p<3 / 2$.

In order to verify Assumption (B5) we refer to [5], where local well-posedness is proven. Global existence follows by standard methods using conservation of the mass
$\|\varphi\|^{2}$, conservation of the energy $E^{\varphi}$, and Hardy's inequality (4.5). Together they yield an a-priori bound on $\|\varphi\|_{X_{1}}$, from which an a-priori bound for $\|\varphi\|_{X_{1}^{2}}$ may be inferred; see [5] for details.

We conclude: For any $\eta<1 / 3$ there is a continuous function $\phi(t)$ such that Theorem 4.1 holds.

### 4.3. Proof of Theorem 4.1.

4.3.1. An energy estimate. In the first step of our proof we exploit conservation of energy to derive an estimate on $\left\|\nabla_{1} q_{1} \Psi\right\|$.

Lemma 4.6. Assume that Assumptions (B1) - (B5) hold. Then

$$
\left\|\nabla_{1} q_{1} \Psi\right\|^{2} \lesssim E^{\Psi}-E^{\varphi}+\left(1+\|\varphi\|_{X_{1}^{2} \cap L^{\infty}}^{2}\right)\left(\beta+\frac{1}{\sqrt{N}}\right)
$$

Proof. Write

$$
\begin{equation*}
E^{\varphi}=\langle\varphi, h \varphi\rangle+\frac{1}{2}\left\langle\varphi, W^{\varphi} \varphi\right\rangle, \tag{4.6}
\end{equation*}
$$

as well as

$$
\begin{equation*}
E^{\Psi}=\left\langle\Psi, h_{1} \Psi\right\rangle+\frac{N-1}{2 N}\left\langle\Psi, W_{12} \Psi\right\rangle . \tag{4.7}
\end{equation*}
$$

Inserting

$$
\mathbb{1}=p_{1} p_{2}+\left(\mathbb{1}-p_{1} p_{2}\right)
$$

in front of every $\Psi$ in (4.7) and multiplying everything out yields

$$
\begin{aligned}
& \langle\Psi, \\
& \left.=\left(\mathbb{1}-p_{1} p_{2}\right) h_{1}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle \\
& \quad-\frac{N-1}{2 N}\left\langle\Psi, p_{1} p_{2} h_{1} p_{1} p_{2} \Psi\right\rangle \\
& \quad-\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) h_{12} p_{1} p_{1} p_{2} \Psi\right\rangle-\left\langle\Psi, p_{1} p_{2} h_{1}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle \\
& \quad-\frac{N-1}{2 N}\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) W_{12} p_{1} p_{2} \Psi\right\rangle-\frac{N-1}{2 N}\left\langle\Psi, p_{1} p_{2} W_{12}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle \\
& \quad-\frac{N-1}{2 N}\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) W_{12}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle .
\end{aligned}
$$

We want to find an upper bound for the left-hand side. In order to control the last term on the right-hand side for negative interaction potentials, we need to use some of the kinetic
energy on the left-hand side. To this end, we split the left-hand side by multiplying it with $1=\kappa_{3}+\left(1-\kappa_{3}\right)$. Thus, using (4.6), we get

$$
\begin{align*}
& \kappa_{3}\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) h_{1}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle \\
&= E^{\Psi}-E^{\varphi} \\
& \quad-\left\langle\Psi, p_{1} p_{2} h_{1} p_{1} p_{2} \Psi\right\rangle+\langle\varphi, h \varphi\rangle \\
& \quad-\frac{N-1}{2 N}\left\langle\Psi, p_{1} p_{2} W_{12} p_{1} p_{2} \Psi\right\rangle+\frac{1}{2}\left\langle\varphi, W^{\varphi} \varphi\right\rangle \\
&-\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) h_{1} p_{1} p_{2} \Psi\right\rangle-\left\langle\Psi, p_{1} p_{2} h_{1}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle \\
&-\frac{N-1}{2 N}\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) W_{12} p_{1} p_{2} \Psi\right\rangle-\frac{N-1}{2 N}\left\langle\Psi, p_{1} p_{2} W_{12}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle \\
&-\frac{N-1}{2 N}\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) W_{12}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle \\
&-\left(1-\kappa_{3}\right)\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) h_{1}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle . \tag{4.8}
\end{align*}
$$

The rest of the proof consists in estimating each line on the right-hand side of (4.8) separately. There is nothing to be done with the first line.
Lines 6-7. The last two lines of (4.8) are equal to

$$
\begin{aligned}
- & \frac{N-1}{2 N}\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) W_{12}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle \\
& -\frac{1}{2}\left(1-\kappa_{3}\right)\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right)\left(h_{1}+h_{2}\right)\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle \\
\leqslant & -\frac{N-1}{2 N}\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right)\left[\left(1-\kappa_{3}\right)\left(h_{1}+h_{2}\right)+W_{12}\right]\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle \leqslant 0,
\end{aligned}
$$

where in the last step we used Assumption (B3).
Line 2. The second line on the right-hand side of (4.8) is bounded in absolute value by

$$
\begin{aligned}
\left|\langle\varphi, h \varphi\rangle-\left\langle\Psi, p_{1} p_{2} h_{1} p_{1} p_{2} \Psi\right\rangle\right| & =\langle\varphi, h \varphi\rangle\left|\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle\right| \\
& =\langle\varphi, h \varphi\rangle\left|\left\langle\Psi,\left(q_{1} p_{2}+p_{1} q_{2}+q_{1} q_{2}\right) \Psi\right\rangle\right| \\
& \leqslant 3 \alpha\langle\varphi, h \varphi\rangle \\
& \leqslant 3 \beta\langle\varphi, h \varphi\rangle,
\end{aligned}
$$

where in the last step we used (4.3).
Line 3. The third line on the right-hand side of (4.8) is bounded in absolute value by

$$
\begin{aligned}
& \left|\frac{1}{2}\left\langle\varphi, W^{\varphi} \varphi\right\rangle-\frac{N-1}{2 N}\left\langle\Psi, p_{1} p_{2} W_{12} p_{1} p_{2} \Psi\right\rangle\right| \\
& \quad=\frac{1}{2}\left|\left\langle\varphi, W^{\varphi} \varphi\right\rangle\right|\left|1-\frac{N-1}{N}\left\langle\Psi, p_{1} p_{2} \Psi\right\rangle\right| \\
& \quad \leqslant \frac{1}{2}\left\|W^{\varphi}\right\|_{\infty}\left|\left\langle\Psi,\left(q_{1} p_{2}+p_{1} q_{2}+q_{1} q_{2}\right) \Psi\right\rangle+\frac{1}{N}\left\langle\Psi, p_{1} p_{2} \Psi\right\rangle\right| \\
& \quad \leqslant \frac{3}{2}\left\|W^{\varphi}\right\|_{\infty}\left(\alpha+\frac{1}{N}\right) \\
& \quad \leqslant \frac{3}{2}\left\|W^{\varphi}\right\|_{\infty}\left(\beta+\frac{1}{N}\right) .
\end{aligned}
$$

As in (3.20), one finds that

$$
\left\|W^{\varphi}\right\|_{\infty} \leqslant\|w\|_{L^{1}+L^{\infty}}\|\varphi\|_{L^{2} \cap L^{\infty}}^{2}
$$

Line 4. The fourth line on the right-hand side of (4.8) is bounded in absolute value by

$$
\begin{aligned}
\left|\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) h_{1} p_{1} p_{2} \Psi\right\rangle\right| & =\left|\left\langle\Psi,\left(q_{1} p_{2}+p_{1} q_{2}+q_{1} q_{2}\right) h_{1} p_{1} p_{2} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, q_{1} h_{1} p_{1} p_{2} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, q_{1} \widehat{n}^{-1 / 2} \widehat{n}^{1 / 2} h_{1} p_{1} p_{2} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, q_{1} \widehat{n}^{-1 / 2} h_{1}{\widehat{\tau_{1} n}}^{1 / 2} p_{1} p_{2} \Psi\right\rangle\right|,
\end{aligned}
$$

where in the last step we used Lemma 3.10. Using Cauchy-Schwarz, we thus get

$$
\begin{aligned}
\left|\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) h_{1} p_{1} p_{2} \Psi\right\rangle\right| & \leqslant \sqrt{\left\langle\Psi, q_{1} \widehat{n}^{-1} \Psi\right\rangle} \sqrt{\left\langle\Psi, p_{1} p_{2}{\widehat{\tau_{1} n}}^{1 / 2} h_{1}^{2} \widehat{\tau_{1} n}\right.} 1 \\
& =\sqrt{\langle\Psi, \widehat{n} \Psi\rangle} \sqrt{\left\langle\varphi, h^{2} \varphi\right\rangle} \sqrt{\left\langle\Psi, \widehat{\tau_{1} n} p_{1} p_{2} \Psi\right\rangle}
\end{aligned}
$$

where in the second step we used Lemma 3.9. Using

$$
\left(\tau_{1} n\right)(k)=\sqrt{\frac{k+1}{N}} \leqslant n(k)+\frac{1}{\sqrt{N}}
$$

we find

$$
\begin{aligned}
\left|\left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) h_{1} p_{1} p_{2} \Psi\right\rangle\right| & \leqslant \sqrt{\beta} \sqrt{\left\langle\varphi, h^{2} \varphi\right\rangle} \sqrt{\langle\Psi, \widehat{n} \Psi\rangle+\frac{1}{\sqrt{N}}} \\
& =\sqrt{\left\langle\varphi, h^{2} \varphi\right\rangle} \sqrt{\beta}\left(\sqrt{\beta}+\frac{1}{N^{1 / 4}}\right) \\
& \leqslant 2 \sqrt{\left\langle\varphi, h^{2} \varphi\right\rangle}\left(\beta+\frac{1}{\sqrt{N}}\right) .
\end{aligned}
$$

Line 5. Finally, we turn our attention to the fifth line on the right-hand side of (4.8), which is bounded in absolute value by
$\left|\left\langle\Psi, p_{1} p_{2} W_{12}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle\right|=\mid\left\langle\Psi, p_{1} p_{2} W_{12}\left(p_{1} q_{2}+q_{1} p_{2}+q_{1} q_{2} \Psi\right\rangle\right| \leqslant 2(\mathrm{a})+(\mathrm{b})$,
where

$$
\text { (a) }:=\left|\left\langle\Psi, p_{1} p_{2} W_{12} q_{1} p_{2} \Psi\right\rangle\right|, \quad \text { (b) }:=\left|\left\langle\Psi, p_{1} p_{2} W_{12} q_{1} q_{2} \Psi\right\rangle\right| .
$$

One finds, using (3.17), Lemma 3.10 and Lemma 3.9,

$$
\begin{aligned}
(\mathrm{a}) & =\left|\left\langle\Psi, p_{1} p_{2} W_{1}^{\varphi} q_{1} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, p_{1} p_{2} W_{1}^{\varphi} \widehat{n}^{1 / 2} \widehat{n}^{-1 / 2} q_{1} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, p_{1} p_{2}{\widehat{\tau_{1} n}}^{1 / 2} W_{1}^{\varphi} \widehat{n}^{-1 / 2} q_{1} \Psi\right\rangle\right| \\
& \leqslant\left\|W^{\varphi}\right\|_{\infty} \sqrt{\left\langle\Psi, \widehat{\tau_{1} n} \Psi\right\rangle} \sqrt{\left\langle\Psi, \widehat{n}^{-1} q_{1} \Psi\right\rangle} \\
& \leqslant\left\|W^{\varphi}\right\|_{\infty} \sqrt{\langle\Psi, \widehat{n} \Psi\rangle+\frac{1}{\sqrt{N}}} \sqrt{\langle\Psi, \widehat{n} \Psi\rangle} \\
& \leqslant 2\left\|W^{\varphi}\right\|_{\infty}\left(\beta+\frac{1}{\sqrt{N}}\right) .
\end{aligned}
$$

The estimation of (b) requires a little more effort. We start by splitting

$$
w=w^{(p)}+w^{(\infty)}, \quad w^{(p)} \in L^{p}, w^{(\infty)} \in L^{\infty} .
$$

This yields $(\mathrm{b}) \leqslant(\mathrm{b})^{(p)}+(\mathrm{b})^{(\infty)}$ in self-explanatory notation. Let us first concentrate on (b) ${ }^{(\infty)}$ :

$$
\begin{aligned}
(\mathrm{b})^{(\infty)} & =\left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(\infty)} q_{1} q_{2} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(\infty)} \widehat{n} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, p_{1} p_{2} \widehat{\tau_{2} n} W_{12}^{(\infty)} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\rangle\right| \\
& \leqslant\left\|W^{(\infty)}\right\|_{\infty} \sqrt{\left\langle\Psi, \widehat{\tau}_{2} n^{2} \Psi\right\rangle} \sqrt{\left\langle\Psi, \widehat{n}^{-2} q_{1} q_{2} \Psi\right\rangle} \\
& \leqslant\left\|w^{(\infty)}\right\|_{\infty} \sqrt{\alpha+\frac{2}{N}} \sqrt{\alpha} \\
& \leqslant 2\left\|w^{(\infty)}\right\|_{\infty}\left(\beta+\frac{2}{N}\right) .
\end{aligned}
$$

Let us now consider $(\mathrm{b})^{(p)}$. In order to deal with the singularities in $w^{(p)}$, we write it as the divergence of a vector field $\xi$,

$$
\begin{equation*}
w^{(p)}=\nabla \cdot \xi \tag{4.9}
\end{equation*}
$$

This is nothing but a problem of electrostatics, which is solved by

$$
\xi=C \frac{x}{|x|^{d}} * w^{(p)}
$$

with some constant $C$ depending on $d$. By the Hardy-Littlewood-Sobolev inequality, we find

$$
\begin{equation*}
\|\xi\|_{q} \lesssim\left\|w^{(p)}\right\|_{p}, \quad \frac{1}{q}=\frac{1}{p}-\frac{1}{d} \tag{4.10}
\end{equation*}
$$

Thus if $p \geqslant p_{0}$ then $q \geqslant 2$. Denote by $X_{12}$ multiplication by $\xi\left(x_{1}-x_{2}\right)$. For the following it is convenient to write $\nabla \cdot \xi=\nabla^{\rho} \xi^{\rho}$, where a summation over $\rho=1, \ldots, d$ is implied.

Recalling Lemma 3.10, we therefore get

$$
\begin{aligned}
(\mathrm{b})^{(p)} & =\left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(p)} \widehat{n} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, p_{1} p_{2} \widehat{\tau_{2} n} W_{12}^{(p)} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, p_{1} p_{2} \widehat{\tau_{2} n}\left(\nabla_{1}^{\rho} X^{\rho}\right)_{12} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\rangle\right|
\end{aligned}
$$

Integrating by parts yields

$$
\text { (b) } \begin{align*}
(p) \leqslant & \left|\left\langle\nabla_{1}^{\rho} \widehat{\tau_{2} n} p_{1} p_{2} \Psi, X_{12}^{\rho} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\rangle\right| \\
& +\left|\left\langle\widehat{\tau_{2} n} p_{1} p_{2} \Psi, X_{12}^{\rho} \nabla_{1}^{\rho} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\rangle\right| . \tag{4.11}
\end{align*}
$$

Let us begin by estimating the first term. Recalling that $p=|\varphi\rangle\langle\varphi|$, we find that the first term on the right-hand side of (4.11) is equal to

$$
\begin{aligned}
& \left|\left\langle X_{12}^{\rho} p_{2}\left(\nabla^{\rho} p\right)_{1} \widehat{\tau_{2} n} \Psi, \widehat{n}^{-1} q_{1} q_{2} \Psi\right\rangle\right| \\
& \quad \leqslant \sqrt{\left\langle\left(\nabla^{\rho} p\right)_{1} \widehat{\tau_{2} n} \Psi, p_{2} X_{12}^{\rho} X_{12}^{\sigma} p_{2}\left(\nabla^{\sigma} p\right)_{1} \widehat{\tau_{2} n} \Psi\right\rangle}\left\|\widehat{n}^{-1} q_{1} q_{2} \Psi\right\| \\
& \quad \leqslant \sqrt{\left\||\varphi|^{2} * \xi^{2}\right\|_{\infty}\|\nabla \varphi\|\left\|\widehat{\tau_{2} n} \Psi\right\|\left\|\widehat{n}^{-1} q_{1} q_{2} \Psi\right\|} \\
& \quad \lesssim\|\xi\|_{q}\|\varphi\|_{L^{2} \cap L^{\infty}}\|\varphi\|_{X_{1}} \sqrt{\alpha+\frac{2}{N}} \sqrt{\alpha}
\end{aligned}
$$

where we used Young's inequality, Assumption (B1), and Lemma 3.9. Recalling that $\beta \leqslant \alpha$, we conclude that the first term on the right-hand side of (4.11) is bounded by

$$
C\|\varphi\|_{X_{1} \cap L^{\infty}}^{2}\left(\beta+\frac{1}{N}\right)
$$

Next, we estimate the second term on the right-hand side of (4.11). It is equal to

$$
\begin{aligned}
\left|\left\langle X_{12}^{\rho} p_{1} p_{2} \widehat{\tau_{2} n} \Psi, \nabla_{1}^{\rho} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\rangle\right| & \leqslant \sqrt{\left\langle\widehat{\tau_{2} n} \Psi, p_{1} p_{2} X_{12}^{2} p_{1} p_{2} \widehat{\tau_{2} n} \Psi\right\rangle}\left\|\nabla_{1} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\| \\
& \leqslant \sqrt{\left\||\varphi|^{2} * \xi^{2}\right\|_{\infty}}\left\|\widehat{\tau_{2} n} \Psi\right\|\left\|\nabla_{1} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\| \\
& \leqslant\|\xi\|_{q}\|\varphi\|_{L^{2} \cap L^{\infty}} \sqrt{\alpha+\frac{2}{N}}\left\|\nabla_{1} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\| .
\end{aligned}
$$

We estimate $\left\|\nabla_{1} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\|$ by introducing $\mathbb{1}=p_{1}+q_{1}$ on the left. The term arising from $p_{1}$ is bounded by

$$
\begin{aligned}
\left\|p_{1} \nabla_{1} \widehat{n}^{-1} q_{1} q_{2} \Psi\right\| & =\left\|p_{1} q_{2}{\widehat{\tau_{1} n}}^{-1} \nabla_{1} q_{1} \Psi\right\| \\
& \leqslant \sqrt{\left\langle\nabla_{1} q_{1} \Psi, q_{2} \widehat{\tau_{1} n}-2 \nabla_{1} q_{1} \Psi\right\rangle} \\
& =\sqrt{\left\langle\nabla_{1} q_{1} \Psi, \frac{1}{N-1} \sum_{i=2}^{N} q_{i}{\widehat{\tau_{1} n}}^{-2} \nabla_{1} q_{1} \Psi\right\rangle} \\
& \leqslant \sqrt{\left\langle\nabla_{1} q_{1} \Psi, \frac{1}{N} \sum_{i=1}^{N} q_{i}{\widehat{\tau_{1} n}}^{-2} \nabla_{1} q_{1} \Psi\right\rangle} \\
& =\sqrt{\left\langle\nabla_{1} q_{1} \Psi, \widehat{n}^{2} \widehat{\tau_{1} n}-2 \nabla_{1} q_{1} \Psi\right\rangle} \\
& \leqslant\left\|\nabla_{1} q_{1} \Psi\right\| .
\end{aligned}
$$

The term arising from $q_{1}$ in the above splitting is dealt with in exactly the same way. Thus we have proven that the second term on the right-hand side of (4.11) is bounded by

$$
C\|\varphi\|_{L^{2} \cap L^{\infty}} \sqrt{\beta+\frac{1}{N}}\left\|\nabla_{1} q_{1} \Psi\right\| .
$$

Summarizing, we have

$$
(\mathrm{b})^{(p)} \lesssim\|\varphi\|_{X_{1} \cap L^{\infty}}^{2}\left(\beta+\frac{1}{N}\right)+\|\varphi\|_{L^{2} \cap L^{\infty}} \sqrt{\beta+\frac{1}{N}}\left\|\nabla_{1} q_{1} \Psi\right\| .
$$

Conclusion of the proof. Putting all the estimates of the right-hand side of (4.8) together, we find

$$
\begin{align*}
& \left\langle\Psi,\left(\mathbb{1}-p_{1} p_{2}\right) h_{1}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\rangle  \tag{4.12}\\
& \quad \lesssim E^{\Psi}-E^{\varphi}+\left(1+\|\varphi\|_{X_{1}^{2} \cap L^{\infty}}^{2}\right)\left(\beta+\frac{1}{\sqrt{N}}\right)+\|\varphi\|_{L^{2} \cap L^{\infty}} \sqrt{\beta+\frac{1}{N}}\left\|\nabla_{1} q_{1} \Psi\right\| .
\end{align*}
$$

Next, from $\mathbb{1}-p_{1} p_{2}=p_{1} q_{2}+q_{1}$ we deduce

$$
\begin{aligned}
\left\|\sqrt{h_{1}} q_{1} \Psi\right\| & =\left\|\sqrt{h_{1}}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi-\sqrt{h_{1}} p_{1} q_{2} \Psi\right\| \\
& \leqslant\left\|\sqrt{h_{1}}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\|+\left\|\sqrt{h_{1}} p_{1} q_{2} \Psi\right\| .
\end{aligned}
$$

Now, recalling that $p=|\varphi\rangle\langle\varphi|$, we find

$$
\left\|\sqrt{h_{1}} p_{1} q_{2} \Psi\right\| \leqslant\left\|\sqrt{h_{1}} p_{1}\right\|\left\|q_{2} \Psi\right\| \leqslant\|\varphi\|_{X_{1}} \sqrt{\beta}
$$

Therefore,

$$
\left\|\sqrt{h_{1}} q_{1} \Psi\right\|^{2} \lesssim\left\|\sqrt{h_{1}}\left(\mathbb{1}-p_{1} p_{2}\right) \Psi\right\|^{2}+\|\varphi\|_{X_{1}}^{2} \beta
$$

Plugging in (4.13) yields

$$
\begin{aligned}
\left\|\sqrt{h_{1}} q_{1} \Psi\right\|^{2} \lesssim & E^{\Psi}-E^{\varphi}+\left(1+\|\varphi\|_{X_{1}^{2} \cap L^{\infty}}^{2}\right)\left(\beta+\frac{1}{\sqrt{N}}\right) \\
& +\|\varphi\|_{L^{2} \cap L^{\infty}} \sqrt{\beta+\frac{1}{N}}\left\|\nabla_{1} q_{1} \Psi\right\| .
\end{aligned}
$$

Next, we observe that Assumption (B1) implies

$$
\left\|\nabla_{1} q_{1} \Psi\right\| \lesssim\left\|\sqrt{h_{1}} q_{1} \Psi\right\|+\sqrt{\beta}
$$

so that we get

$$
\begin{aligned}
\left\|\sqrt{h_{1}} q_{1} \Psi\right\|^{2} \lesssim & E^{\Psi}-E^{\varphi}+\left(1+\|\varphi\|_{X_{1}^{2} \cap L^{\infty}}^{2}\right)\left(\beta+\frac{1}{\sqrt{N}}\right) \\
& +\|\varphi\|_{L^{2} \cap L^{\infty}} \sqrt{\beta+\frac{1}{N}}\left\|\sqrt{h_{1}} q_{1} \Psi\right\| .
\end{aligned}
$$

Now we claim that

$$
\begin{equation*}
\left\|\sqrt{h_{1}} q_{1} \Psi\right\|^{2} \lesssim E^{\Psi}-E^{\varphi}+\left(1+\|\varphi\|_{X_{1}^{2} \cap L^{\infty}}^{2}\right)\left(\beta+\frac{1}{\sqrt{N}}\right) \tag{4.13}
\end{equation*}
$$

This follows from the general estimate

$$
x^{2} \leqslant C(R+a x) \quad \Longrightarrow \quad x^{2} \leqslant 2 C R+C^{2} a^{2},
$$

which itself follows from the elementary inequality

$$
C(R+a x) \leqslant C R+\frac{1}{2} C^{2} a^{2}+\frac{1}{2} x^{2} .
$$

The claim of the lemma now follows from (4.13) by using Assumption (B1).
4.3.2. A bound on $\dot{\beta}$. We start exactly as in Sect. 3. Assumptions (B1) - (B5) imply that $\beta$ is differentiable in $t$ with derivative

$$
\begin{align*}
\dot{\beta} & =\frac{\mathrm{i}}{2}\left\langle\Psi,\left[(N-1) W_{12}-N W_{1}^{\varphi}-N W_{2}^{\varphi}, \widehat{n}\right] \Psi\right\rangle \\
& =2(\mathrm{I})+2(\mathrm{II})+(\mathrm{III})+\text { complex conjugate } \tag{4.14}
\end{align*}
$$

where

$$
\begin{aligned}
\text { (I) } & :=\frac{\mathrm{i}}{2}\left\langle\Psi, p_{1} p_{2}\left[(N-1) W_{12}-N W_{1}^{\varphi}-N W_{2}^{\varphi}, \widehat{n}\right] q_{1} p_{2} \Psi\right\rangle, \\
\text { (II) } & :=\frac{\mathrm{i}}{2}\left\langle\Psi, q_{1} p_{2}\left[(N-1) W_{12}-N W_{1}^{\varphi}-N W_{2}^{\varphi}, \widehat{n}\right] q_{1} q_{2} \Psi\right\rangle, \\
(\mathrm{III}) & :=\frac{\mathrm{i}}{2}\left\langle\Psi, p_{1} p_{2}\left[(N-1) W_{12}-N W_{1}^{\varphi}-N W_{2}^{\varphi}, \widehat{n}\right] q_{1} q_{2} \Psi\right\rangle .
\end{aligned}
$$

Term (I). Using (3.17) we find

$$
\begin{aligned}
2|(\mathrm{I})| & =\left|\left\langle\Psi, p_{1} p_{2}\left[(N-1) W_{12}-N W_{1}^{\varphi}-N W_{2}^{\varphi}, \widehat{n}\right] q_{1} p_{2} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, p_{1} p_{2}\left[W_{1}^{\varphi}, \widehat{n}\right] q_{1} p_{2} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, p_{1} p_{2} W_{1}^{\varphi}\left(\widehat{n}-\widehat{\tau_{-1} n}\right) q_{1} p_{2} \Psi\right\rangle\right|
\end{aligned}
$$

where we used Lemma 3.10. Define

$$
\begin{equation*}
\mu(k):=N\left(n(k)-\left(\tau_{-1} n\right)(k)\right)=\frac{\sqrt{N}}{\sqrt{k}+\sqrt{k-1}} \leqslant n^{-1}(k), \quad k=1, \ldots, N \tag{4.15}
\end{equation*}
$$

Thus,

$$
\begin{aligned}
|(\mathrm{I})| & =\frac{1}{N}\left|\left\langle\Psi, p_{1} p_{2} W_{1}^{\varphi} \widehat{\mu} q_{1} p_{2} \Psi\right\rangle\right| \\
& \leqslant \frac{1}{N}\left\|W^{\varphi}\right\|_{\infty} \sqrt{\left\langle\Psi, \widehat{\mu}^{2} q_{1} \Psi\right\rangle} \\
& \leqslant \frac{1}{N}\left\|W^{\varphi}\right\|_{\infty} \sqrt{\left\langle\Psi, \widehat{n}^{-2} q_{1} \Psi\right\rangle} \\
& \lesssim \frac{1}{N}\|\varphi\|_{L^{2} \cap L^{\infty}}^{2}
\end{aligned}
$$

by (3.13).
Term (II). Using Lemma 3.10 we find

$$
\begin{align*}
2|(\mathrm{II})| & =\left|\left\langle\Psi, q_{1} p_{2}\left[(N-1) W_{12}-N W_{2}^{\varphi}, \widehat{n}\right] q_{1} q_{2} \Psi\right\rangle\right|  \tag{4.16}\\
& =\left|\left\langle\Psi, q_{1} p_{2}\left(\frac{N-1}{N} W_{12}-W_{2}^{\varphi}\right) \widehat{\mu} q_{1} q_{2} \Psi\right\rangle\right|  \tag{4.17}\\
& \leqslant \underbrace{\left|\left\langle\Psi, q_{1} p_{2} W_{12} \widehat{\mu} q_{1} q_{2} \Psi\right\rangle\right|}_{=:(\mathrm{a})}+\underbrace{\left|\left\langle\Psi, q_{1} p_{2} W_{2}^{\varphi} \widehat{\mu} q_{1} q_{2} \Psi\right\rangle\right|}_{=:(\mathrm{b})} . \tag{4.18}
\end{align*}
$$

One immediately finds

$$
\text { (b) } \leqslant\left\|W^{\varphi}\right\|_{\infty}\left\|q_{1} \Psi\right\| \sqrt{\left\langle\Psi, \widehat{\mu}^{2} q_{1} q_{2} \Psi\right\rangle} \lesssim\|\varphi\|_{L^{2} \cap L^{\infty}}^{2} \beta
$$

In (a) we split

$$
w=w^{(p)}+w^{(\infty)}, \quad w^{(p)} \in L^{p}, w^{(\infty)} \in L^{\infty}
$$

with a resulting splitting $(\mathrm{a}) \leqslant(\mathrm{a})^{(p)}+(\mathrm{a})^{(\infty)}$. The easy part is

$$
(\mathrm{a})^{(\infty)} \leqslant\left\|w^{(\infty)}\right\|_{\infty}\left\|q_{1} \Psi\right\|^{2} \lesssim \beta
$$

In order to deal with $(\mathrm{a})^{(p)}$ we write $w^{(p)}=\nabla \cdot \xi$ as the divergence of a vector field $\xi$, exactly as in the proof of Lemma 4.6; see (4.9) and the remarks after it. We integrate by parts to find

$$
\begin{align*}
(\mathrm{a})^{(p)} & =\left|\left\langle\Psi, q_{1} p_{2}\left(\nabla_{1}^{\rho} X^{\rho}\right)_{12} \widehat{\mu} q_{1} q_{2} \Psi\right\rangle\right| \\
& \leqslant\left|\left\langle\nabla_{1}^{\rho} q_{1} p_{2} \Psi, X_{12}^{\rho} \widehat{\mu} q_{1} q_{2} \Psi\right\rangle\right|+\left|\left\langle q_{1} p_{2} \Psi, X_{12}^{\rho} \nabla_{1}^{\rho} \widehat{\mu} q_{1} q_{2} \Psi\right\rangle\right| \tag{4.19}
\end{align*}
$$

The first term of (4.19) is equal to

$$
\begin{aligned}
\left|\left\langle X_{12}^{\rho} p_{2} \nabla_{1}^{\rho} q_{1} \Psi, \widehat{\mu} q_{1} q_{2} \Psi\right\rangle\right| & \leqslant \sqrt{\left\langle\nabla_{1}^{\rho} q_{1} \Psi, p_{2} X_{12}^{\rho} X_{12}^{\sigma} p_{2} \nabla_{1}^{\sigma} q_{1} \Psi\right\rangle} \sqrt{\left\langle\Psi, \widehat{\mu}^{2} q_{1} q_{2} \Psi\right\rangle} \\
& \lesssim \sqrt{\left\|\xi^{2} *|\varphi|^{2}\right\|_{\infty}}\left\|\nabla_{1} q_{1} \Psi\right\| \sqrt{\left\langle\Psi, \widehat{n}^{-2} q_{1} q_{2} \Psi\right\rangle} \\
& \leqslant \sqrt{\left\|\xi^{2} *|\varphi|^{2}\right\|_{\infty}}\left\|\nabla_{1} q_{1} \Psi\right\| \sqrt{\frac{N}{N-1}}\left\langle\Psi, \widehat{n}^{2} \Psi\right\rangle \\
& \lesssim\|\xi\|_{q}\|\varphi\|_{L^{2} \cap L^{\infty}}\left\|\nabla_{1} q_{1} \Psi\right\| \sqrt{\beta} \\
& \lesssim\left\|\nabla_{1} q_{1} \Psi\right\|^{2}\|\varphi\|_{L^{2} \cap L^{\infty}}+\beta\|\varphi\|_{L^{2} \cap L^{\infty}}
\end{aligned}
$$

where in the second step we used (4.15), in the third Lemma 3.9, and in the last (4.3), Young's inequality, and (4.10). The second term of (4.19) is equal to

$$
\begin{align*}
& \left|\left\langle q_{1} p_{2} \Psi, X_{12}^{\rho}\left(p_{1}+q_{1}\right) \nabla_{1}^{\rho} \widehat{\mu} q_{1} q_{2} \Psi\right\rangle\right| \\
& \quad \leqslant\left|\left\langle q_{1} p_{2} \Psi, X_{12}^{\rho} p_{1} \widehat{\tau_{1} \mu} \nabla_{1}^{\rho} q_{1} q_{2} \Psi\right\rangle\right|+\left|\left\langle q_{1} p_{2} \Psi, X_{12}^{\rho} q_{1} \widehat{\mu} \nabla_{1}^{\rho} q_{1} q_{2} \Psi\right\rangle\right| \tag{4.20}
\end{align*}
$$

where we used Lemma 3.10. We estimate the first term of (4.20). The second term is dealt with in exactly the same way. We find

$$
\begin{aligned}
& \left|\left\langle p_{1} X_{12}^{\rho} q_{1} p_{2} \Psi, \widehat{\tau_{1} \mu} \nabla_{1}^{\rho} q_{1} q_{2} \Psi\right\rangle\right| \\
& \quad \leqslant \sqrt{\left\langle\Psi, q_{1} p_{2} X_{12}^{2} p_{2} q_{1} \Psi\right\rangle} \sqrt{\left\langle\nabla_{1} q_{1} \Psi, q_{2} \widehat{\tau_{1} \mu^{2}} q_{2} \nabla_{1} q_{1} \Psi\right\rangle} \\
& \quad \leqslant \sqrt{\left\|\xi^{2} *|\varphi|^{2}\right\|_{\infty}}\left\|q_{1} \Psi\right\| \sqrt{\left\langle\nabla_{1} q_{1} \Psi, \widehat{n}^{-2} q_{2} \nabla_{1} q_{1} \Psi\right\rangle} \\
& \\
& \lesssim\|\xi\|_{q}\|\varphi\|_{L^{2} \cap L^{\infty}} \sqrt{\alpha} \sqrt{\frac{1}{N-1} \sum_{i=2}^{N}\left\langle\nabla_{1} q_{1} \Psi, \widehat{n}^{-2} q_{i} \nabla_{1} q_{1} \Psi\right\rangle} \\
& \quad \lesssim\|\varphi\|_{L^{2} \cap L^{\infty}} \sqrt{\beta} \sqrt{\frac{1}{N-1} \sum_{i=1}^{N}\left\langle\nabla_{1} q_{1} \Psi, \widehat{n}^{-2} q_{i} \nabla_{1} q_{1} \Psi\right\rangle} \\
& \quad=\|\varphi\|_{L^{2} \cap L^{\infty}} \sqrt{\beta} \sqrt{\frac{N}{N-1}\left\langle\nabla_{1} q_{1} \Psi, \widehat{n}^{-2} \widehat{n}^{2} \nabla_{1} q_{1} \Psi\right\rangle} \\
& \quad \lesssim\|\varphi\|_{L^{2} \cap L^{\infty}} \sqrt{\beta}\left\|\nabla_{1} q_{1} \Psi\right\| \\
& \\
& \leqslant \beta\|\varphi\|_{L^{2} \cap L^{\infty}}+\left\|\nabla_{1} q_{1} \Psi\right\|^{2}\|\varphi\|_{L^{2} \cap L^{\infty}} .
\end{aligned}
$$

In summary, we have proven that

$$
|(\mathrm{II})| \lesssim \beta\|\varphi\|_{L^{2} \cap L^{\infty}}+\left\|\nabla_{1} q_{1} \Psi\right\|^{2}\|\varphi\|_{L^{2} \cap L^{\infty}}
$$

Term (III). Using Lemma 3.10 we find

$$
\begin{aligned}
2|(\mathrm{III})| & =(N-1)\left|\left\langle\Psi, p_{1} p_{2}\left[W_{12}, \widehat{n}\right] q_{1} q_{2} \Psi\right\rangle\right| \\
& =(N-1)\left|\left\langle\Psi, p_{1} p_{2} W_{12}\left(\widehat{n}-\widehat{\tau_{-2}}\right) q_{1} q_{2} \Psi\right\rangle\right|
\end{aligned}
$$

Defining

$$
\begin{equation*}
\nu(k):=N\left(n(k)-\left(\tau_{-2} n\right)(k)\right)=\frac{\sqrt{N}}{\sqrt{k}+\sqrt{k-2}} \leqslant n^{-1}(k), \quad k=2, \ldots, N \tag{4.21}
\end{equation*}
$$

we have

$$
2|(\mathrm{III})| \leqslant\left|\left\langle\Psi, p_{1} p_{2} W_{12} \widehat{v} q_{1} q_{2} \Psi\right\rangle\right| .
$$

As usual we start by splitting

$$
w=w^{(p)}+w^{(\infty)}, \quad w^{(p)} \in L^{p}, w^{(\infty)} \in L^{\infty}
$$

with the induced splitting $(\mathrm{III})=(\mathrm{III})^{(p)}+(\mathrm{III})^{(\infty)}$. Thus, using Lemma 3.10, we find

$$
\begin{aligned}
2\left|(\mathrm{III})^{(\infty)}\right| & =\left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(\infty)} \widehat{n}^{1 / 2} \widehat{n}^{-1 / 2} \widehat{v} q_{1} q_{2} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, p_{1} p_{2}{\widehat{\tau_{2} n}}^{1 / 2} W_{12}^{(\infty)} \widehat{n}^{-1 / 2} \widehat{v} q_{1} q_{2} \Psi\right\rangle\right| \\
& \lesssim\left\|w^{(\infty)}\right\| \infty \sqrt{\left\langle\Psi, \widehat{\tau_{2} n} \Psi\right\rangle} \sqrt{\left\langle\Psi, \widehat{n}^{-1} \widehat{v}^{2} q_{1} q_{2} \Psi\right\rangle} \\
& \lesssim \sqrt{\beta+\sqrt{\frac{2}{N}}} \sqrt{\left\langle\Psi, \widehat{n}^{-3} q_{1} q_{2} \Psi\right\rangle} \\
& \lesssim \sqrt{\beta+\sqrt{\frac{2}{N}}} \sqrt{\frac{N}{N-1} \beta} \\
& \lesssim \beta+\frac{1}{\sqrt{N}},
\end{aligned}
$$

where in the fifth step we used Lemma 3.9.
In order to estimate (III) ${ }^{(p)}$ we introduce a splitting of $w^{(p)}$ into "singular" and "regular" parts,

$$
\begin{equation*}
w^{(p)}=w^{(p, 1)}+w^{(p, 2)}:=w^{(p)} \mathbb{1}_{\left\{\left|w^{(p)}\right|>a\right\}}+w^{(p)} \mathbb{1}_{\left\{\left|w^{(p)}\right| \leqslant a\right\}}, \tag{4.22}
\end{equation*}
$$

where $a$ is a positive ( $N$-dependent) constant we choose later. For future reference we record the estimates

$$
\begin{align*}
\left\|w^{(p, 1)}\right\|_{p_{0}} & \leqslant a^{1-p / p_{0}}\left\|w^{(p)}\right\|_{p}^{p / p_{0}}  \tag{4.23a}\\
\left\|w^{(p, 2)}\right\|_{2} & \leqslant a^{1-p / 2}\left\|w^{(p)}\right\|_{p}^{p / 2} \tag{4.23b}
\end{align*}
$$

The proof of (4.23) is elementary; for instance (4.23a) follows from

$$
\begin{aligned}
\left\|w^{(p, 1)}\right\|_{p_{0}}^{p_{0}} & =\int \mathrm{d} x\left|w^{(p)}\right|^{p}\left|w^{(p)}\right|^{p_{0}-p} \mathbb{1}_{\left\{\left|w^{(p)}\right|>a\right\}} \\
& \leqslant a^{p_{0}-p} \int \mathrm{~d} x\left|w^{(p)}\right|^{p} \mathbb{1}_{\left\{\left|w^{(p)}\right|>a\right\}} \leqslant a^{p_{0}-p} \int \mathrm{~d} x\left|w^{(p)}\right|^{p}
\end{aligned}
$$

Let us start with (III) ${ }^{(p, 1)}$. As in (4.9), we use the representation

$$
w^{(p, 1)}=\nabla \cdot \xi
$$

Then (4.10) and (4.23a) imply that

$$
\begin{equation*}
\|\xi\|_{2} \lesssim\left\|w^{(p, 1)}\right\|_{p_{0}} \lesssim a^{1-p / p_{0}} \tag{4.24}
\end{equation*}
$$

Integrating by parts, we find

$$
\begin{align*}
2\left|(\mathrm{III})^{(p, 1)}\right| & =\left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(p, 1)} \widehat{v} q_{1} q_{2} \Psi\right\rangle\right| \\
& =\left|\left\langle\Psi, p_{1} p_{2}\left(\nabla_{1}^{\rho} X_{12}^{\rho}\right) \widehat{v} q_{1} q_{2} \Psi\right\rangle\right| \\
& \leqslant\left|\left\langle\nabla_{1}^{\rho} p_{1} p_{2} \Psi, X_{12}^{\rho} \widehat{v} q_{1} q_{2} \Psi\right\rangle\right|+\left|\left\langle p_{1} p_{2} \Psi, X_{12}^{\rho} \nabla_{1}^{\rho} \widehat{v} q_{1} q_{2} \Psi\right\rangle\right| \tag{4.25}
\end{align*}
$$

Using $\|\nabla p\|=\|\nabla \varphi\|$ and Lemma 3.9 we find that the first term of (4.25) is bounded by

$$
\begin{aligned}
\sqrt{\left\langle\nabla_{1}^{\rho} p_{1} \Psi, p_{2} X_{12}^{\rho} X_{12}^{\sigma} p_{2} \nabla_{1}^{\sigma} p_{1} \Psi\right\rangle} \sqrt{\left\langle\Psi, \widehat{v}^{2} q_{1} q_{2} \Psi\right\rangle} & \lesssim\|\nabla p\|\|\varphi\|_{\infty}\|\xi\|_{2} \sqrt{\alpha} \\
& \leqslant\|\nabla \varphi\|\|\varphi\|_{\infty} a^{1-p / p_{0}} \sqrt{\beta} \\
& \leqslant\|\nabla \varphi\|\|\varphi\|_{\infty}\left(\beta+a^{2-2 p / p_{0}}\right)
\end{aligned}
$$

where in the second step we used the estimate (4.24). Next, using Lemma 3.10, we find that the second term of (4.25) is equal to

$$
\begin{aligned}
& \left|\left\langle p_{1} p_{2} \Psi, X_{12}^{\rho}\left(p_{1}+q_{1}\right) \nabla_{1}^{\rho} \widehat{v} q_{1} q_{2} \Psi\right\rangle\right| \\
& \quad \leqslant\left|\left\langle p_{1} p_{2} \Psi, X_{12}^{\rho} p_{1} \widehat{\tau_{1} v} \nabla_{1}^{\rho} q_{1} q_{2} \Psi\right\rangle\right|+\left|\left\langle p_{1} p_{2} \Psi, X_{12}^{\rho} q_{1} \widehat{v} \nabla_{1}^{\rho} q_{1} q_{2} \Psi\right\rangle\right| .
\end{aligned}
$$

We estimate the first term (the second is dealt with in exactly the same way):

$$
\begin{aligned}
\left|\left\langle p_{1} p_{2} \Psi, X_{12}^{\rho} p_{1} \widehat{\tau_{1} \nu} \nabla_{1}^{\rho} q_{1} q_{2} \Psi\right\rangle\right| & \leqslant \sqrt{\left\langle\Psi, p_{1} p_{2} X_{12}^{2} p_{1} p_{2} \Psi\right\rangle} \sqrt{\left\langle\nabla_{1} q_{1} \Psi, \widehat{\tau_{1} V^{2}} q_{2} \nabla_{1} q_{1} \Psi\right\rangle} \\
& \leqslant \sqrt{\left\|p_{2} X_{12}^{2} p_{2}\right\|} \sqrt{\frac{1}{N-1} \sum_{i=2}^{N}\left\langle\nabla_{1} q_{1} \Psi, \widehat{n}^{-2} q_{i} \nabla_{1} q_{1} \Psi\right\rangle} \\
& \leqslant\|\xi\|_{2}\|\varphi\|_{\infty} \sqrt{\frac{1}{N-1} \sum_{i=1}^{N}\left\langle\nabla_{1} q_{1} \Psi, \widehat{n}^{-2} q_{i} \nabla_{1} q_{1} \Psi\right\rangle} \\
& \lesssim a^{1-p / p_{0}\|\varphi\|_{\infty} \sqrt{\frac{N}{N-1}\left\langle\nabla_{1} q_{1} \Psi, \nabla_{1} q_{1} \Psi\right\rangle}} \\
& \leqslant\|\varphi\|_{\infty}\left(a^{2-2 p / p_{0}}+\left\|\nabla_{1} q_{1} \Psi\right\|^{2}\right) .
\end{aligned}
$$

Summarizing,

$$
\left|(\mathrm{III})^{(p, 1)}\right| \lesssim\|\varphi\|_{\infty}\left(\beta\|\varphi\|_{X_{1}}+\left\|\nabla_{1} q_{1} \Psi\right\|^{2}+a^{2-2 p / p_{0}}\|\varphi\|_{X_{1}}\right) .
$$

Finally, we estimate

$$
\begin{equation*}
(\mathrm{III})^{(p, 2)}=\left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(p, 2)} \widehat{v} q_{1} q_{2} \Psi\right\rangle\right|=\left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(p, 2)} \widehat{v} \widehat{\left(\chi^{(1)}\right.}+\widehat{\chi^{(2)}}\right) q_{1} q_{2} \Psi\right\rangle \mid \tag{4.26}
\end{equation*}
$$

where

$$
1=\chi^{(1)}+\chi^{(2)}, \quad \chi^{(1)}, \chi^{(2)} \in\{0,1\}^{\{0, \ldots, N\}}
$$

is some partition of the unity to be chosen later. The need for this partitioning will soon become clear. In order to bound the term with $\chi^{(1)}$, we note that the operator norm of $p_{1} p_{2} W_{12}^{(p, 2)} q_{1} q_{2}$ on the full space $L^{2}\left(\mathbb{R}^{d N}\right)$ is much larger than on its symmetric subspace. Thus, as a first step, we symmetrize the operator $p_{1} p_{2} W_{12}^{(p, 2)} q_{1} q_{2}$ in coordinate
2. We get the bound

$$
\begin{aligned}
& \left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(p, 2)} \widehat{v} \widehat{\chi^{(1)}} q_{1} q_{2} \Psi\right\rangle\right| \\
& \quad=\frac{1}{N-1}\left|\left\langle\Psi, \sum_{i=2}^{N} p_{1} p_{i} W_{1 i}^{(p, 2)} q_{i} q_{1} \widehat{\chi^{(1)}} \widehat{v} q_{1} \Psi\right\rangle\right| \\
& \quad \leqslant \frac{1}{N-1}\left\|\widehat{v} q_{1} \Psi\right\| \sqrt{\sum_{i, j=2}^{N}\left\langle\Psi, p_{1} p_{i} W_{1 i}^{(p, 2)} q_{1} q_{i} \widehat{\chi^{(1)}} q_{1} q_{j} W_{1 j}^{(p-2)} p_{j} p_{1} \Psi\right\rangle .}
\end{aligned}
$$

Using

$$
\left\|\widehat{v} q_{1} \Psi\right\| \leqslant\left\|\widehat{n}^{-1} q_{1} \Psi\right\| \leqslant 1
$$

we find

$$
\begin{equation*}
\left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(p, 2)} \widehat{v} \widehat{\chi^{(1)}} q_{1} q_{2} \Psi\right\rangle\right| \leqslant \frac{1}{N-1} \sqrt{A+B} \tag{4.27}
\end{equation*}
$$

where

$$
\begin{aligned}
A & :=\sum_{2 \leqslant i \neq j \leqslant N}\left\langle\Psi, p_{1} p_{i} W_{1 i}^{(p, 2)} q_{1} q_{i} \widehat{\chi^{(1)}} q_{j} W_{1 j}^{(p, 2)} p_{j} p_{1} \Psi\right\rangle, \\
B & :=\sum_{i=2}^{N}\left\langle\Psi, p_{1} p_{i} W_{1 i}^{(p, 2)} q_{1} q_{i} \widehat{\chi^{(1)}} W_{1 i}^{(p, 2)} p_{i} p_{1} \Psi\right\rangle .
\end{aligned}
$$

The easy part is

$$
\begin{aligned}
B & \leqslant \sum_{i=2}^{N}\left\langle\Psi, p_{1} p_{i}\left(W_{1 i}^{(p, 2)}\right)^{2} p_{i} p_{1} \Psi\right\rangle \\
& \leqslant \sum_{i=2}^{N}\left\|\left(w^{(p, 2)}\right)^{2} *|\varphi|^{2}\right\|_{\infty}\left\langle\Psi, p_{1} p_{i} \Psi\right\rangle \\
& \leqslant(N-1)\|\varphi\|_{\infty}^{2}\left\|w^{(p, 2)}\right\|_{2}^{2} \\
& \lesssim N a^{2-p}\|\varphi\|_{\infty}^{2}
\end{aligned}
$$

Let us therefore concentrate on

$$
\begin{aligned}
A & =\sum_{2 \leqslant i \neq j \leqslant N}\left\langle\Psi, p_{1} p_{i} W_{1 i}^{(p, 2)} q_{1} q_{i} \widehat{\chi^{(1)}} \widehat{\chi^{(1)}} q_{j} W_{1 j}^{(p, 2)} p_{j} p_{1} \Psi\right\rangle \\
& =\sum_{2 \leqslant i \neq j \leqslant N}\left\langle\Psi, p_{1} p_{i} q_{j} \widehat{\tau_{2} \chi^{(1)}} W_{1 i}^{(p, 2)} q_{1} W_{1 j}^{(p, 2)} \widehat{\tau_{2} \chi^{(1)}} q_{i} p_{j} p_{1} \Psi\right\rangle \\
& =A_{1}+A_{2},
\end{aligned}
$$

with $A=A_{1}+A_{2}$ arising from the splitting $q_{1}=\mathbb{1}-p_{1}$. We start with

$$
\begin{aligned}
\left|A_{1}\right| & \leqslant \sum_{2 \leqslant i \neq j \leqslant N}\left|\left\langle\Psi, p_{1} p_{i} q_{j} \widehat{\tau_{2} \chi^{(1)}} W_{1 i}^{(p, 2)} W_{1 j}^{(p, 2)} \widehat{\tau_{2} \chi^{(1)}} q_{i} p_{j} p_{1} \Psi\right\rangle\right| \\
& =\sum_{2 \leqslant i \neq j \leqslant N}\left|\left\langle\Psi, p_{1} p_{i} q_{j} \widehat{\tau_{2} \chi^{(1)}} \sqrt{W_{1 i}^{(p, 2)}} \sqrt{W_{1 j}^{(p, 2)}} \sqrt{W_{1 i}^{(p, 2)}} \sqrt{W_{1 j}^{(p, 2)}} \widehat{\tau_{2} \chi^{(1)}} q_{i} p_{j} p_{1} \Psi\right\rangle\right| \\
& \leqslant \sum_{2 \leqslant i \neq j \leqslant N}\left\langle\Psi, \widehat{\tau_{2} \chi^{(1)}} q_{j} p_{1} p_{i}\right| W_{1 i}^{(p, 2)}| | W_{1 j}^{(p, 2)}\left|p_{1} p_{i} q_{j} \widehat{\tau_{2} \chi^{(1)}} \Psi\right\rangle,
\end{aligned}
$$

by Cauchy-Schwarz and symmetry of $\Psi$. Here $\sqrt{ }$ is any complex square root.
In order to estimate this we claim that, for $i \neq j$,

$$
\begin{equation*}
\left\|p_{1} p_{i}\left|W_{1 i}^{(p, 2)}\right|\left|W_{1 j}^{(p, 2)}\right| p_{1} p_{i}\right\| \leqslant\left\|\left|w^{(p, 2)}\right| *|\varphi|^{2}\right\|_{\infty}^{2} \tag{4.28}
\end{equation*}
$$

Indeed, by (3.17), we have

$$
\begin{aligned}
p_{1} p_{i}\left|W_{1 i}^{(p, 2)} \| W_{1 j}^{(p, 2)}\right| p_{1} p_{i} & =p_{1} p_{i}\left|W_{1 i}^{(p, 2)}\right| p_{i}\left|W_{1 j}^{(p, 2)}\right| p_{1} \\
& =p_{1} p_{i}\left(\left|w^{(p, 2)}\right| *|\varphi|^{2}\right)_{1}\left|W_{1 j}^{(p, 2)}\right| p_{1}
\end{aligned}
$$

The operator $p_{1}\left(\left|w^{(p, 2)}\right| *|\varphi|^{2}\right)_{1}\left|W_{1 j}^{(p, 2)}\right| p_{1}$ is equal to $f_{j} p_{1}$, where

$$
f\left(x_{j}\right)=\int \mathrm{d} x_{1} \overline{\varphi\left(x_{1}\right)}\left(\left|w^{(p, 2)}\right| *|\varphi|^{2}\right)\left(x_{1}\right)\left|w^{(p, 2)}\left(x_{1}-x_{j}\right)\right| \varphi\left(x_{1}\right)
$$

Thus,

$$
\|f\|_{\infty} \leqslant\left\|\left|w^{(p, 2)}\right| *|\varphi|^{2}\right\|_{\infty}^{2},
$$

from which (4.28) follows immediately.
Using (4.28), we get

$$
\begin{aligned}
\left|A_{1}\right| & \leqslant \sum_{2 \leqslant i \neq j \leqslant N}\left\|\left|w^{(p, 2)}\right| *|\varphi|^{2}\right\|_{\infty}^{2}\left\|\widehat{\tau_{2} \chi^{(1)}} q_{1} \Psi\right\|^{2} \\
& \leqslant N^{2}\left\|w^{(p)}\right\|_{p}^{2}\|\varphi\|_{L^{2} \cap L^{\infty}}^{4}\left\langle\Psi, \widehat{\tau_{2} \chi^{(1)}} q_{1} \Psi\right\rangle \\
& \lesssim N^{2}\|\varphi\|_{L^{2} \cap L^{\infty}}^{4}\left\langle\Psi, \widehat{\tau_{2} \chi^{(1)}} \widehat{n}^{2} \Psi\right\rangle .
\end{aligned}
$$

Now let us choose

$$
\begin{equation*}
\chi^{(1)}(k):=\mathbb{1}_{\left\{k \leqslant N^{1-\delta}\right\}} \tag{4.29}
\end{equation*}
$$

for some $\delta \in(0,1)$. Then

$$
\left(\tau_{2} \chi^{(1)}\right) n^{2} \leqslant N^{-\delta}
$$

implies

$$
\left|A_{1}\right| \lesssim\|\varphi\|_{L^{2} \cap L^{\infty}}^{4} N^{2-\delta} .
$$

Similarly, we find

$$
\begin{aligned}
\left|A_{2}\right| & \leqslant \sum_{2 \leqslant i \neq j \leqslant N}\left|\left\langle\Psi, q_{j} \widehat{\tau_{2} \chi^{(1)}} p_{i} p_{1} W_{1 i}^{(p, 2)} p_{1} W_{1 j}^{(p, 2)} p_{1} p_{j} \widehat{\tau_{2} \chi^{(1)}} q_{i} \Psi\right\rangle\right| \\
& \leqslant \sum_{2 \leqslant i \neq j \leqslant N}\left\|w^{(p, 2)} *|\varphi|^{2}\right\|_{\infty}^{2}\left\langle\Psi, \widehat{\tau_{2} \chi^{(1)}} q_{1} \Psi\right\rangle \\
& \lesssim N^{2}\|\varphi\|_{L^{2} \cap L^{\infty}}^{4} N^{-\delta} \\
& =\|\varphi\|_{L^{2} \cap L^{\infty}}^{4} N^{2-\delta} .
\end{aligned}
$$

Thus we have proven

$$
|A| \lesssim\|\varphi\|_{L^{2} \cap L^{\infty}}^{4} N^{2-\delta}
$$

Going back to (4.27), we see that

$$
\left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(p, 2)} \widehat{v} \widehat{\chi^{(1)}} q_{1} q_{2} \Psi\right\rangle\right| \lesssim\|\varphi\|_{L^{2} \cap L^{\infty}}^{2} N^{-\delta / 2}+\|\varphi\|_{\infty} N^{-1 / 2} a^{1-p / 2}
$$

What remains is to estimate is the term of (III) ${ }^{(p, 2)}$ containing $\chi^{(2)}$,

$$
\begin{aligned}
& \left.\| \Psi, p_{1} p_{2} W_{12}^{(p, 2)} \widehat{v} \widehat{\chi^{(2)}} q_{1} q_{2} \Psi\right\rangle \mid \\
& \quad=\frac{1}{N-1}\left|\left\langle\Psi, \sum_{i=2}^{N} p_{1} p_{i} W_{1 i}^{(p, 2)} q_{i} q_{1} \widehat{\chi^{(2)}} \widehat{v}^{1 / 2} \widehat{v}^{1 / 2} q_{1} \Psi\right\rangle\right| \\
& \quad \leqslant \frac{1}{N-1}\left\|\widehat{v}^{1 / 2} q_{1} \Psi\right\| \sqrt{\sum_{i, j=2}^{N}\left\langle\Psi, p_{1} p_{i} W_{1 i}^{(p, 2)} q_{1} q_{i} \widehat{\chi^{(2)}} \widehat{v} q_{1} q_{j} W_{1 j}^{(p-2)} p_{j} p_{1} \Psi\right\rangle .}
\end{aligned}
$$

Using

$$
\left\|\widehat{v}^{1 / 2} q_{1} \Psi\right\| \leqslant \sqrt{\left\langle\Psi, \widehat{n}^{-1} \widehat{n}^{2} \Psi\right\rangle}=\sqrt{\beta}
$$

we find

$$
\begin{equation*}
\left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(p, 2)} \widehat{v} \widehat{\chi^{(2)}} q_{1} q_{2} \Psi\right\rangle\right| \leqslant \frac{\sqrt{\beta}}{N-1} \sqrt{A+B} \tag{4.30}
\end{equation*}
$$

where

$$
\begin{aligned}
A & :=\sum_{2 \leqslant i \neq j \leqslant N}\left\langle\Psi, p_{1} p_{i} W_{1 i}^{(p, 2)} q_{1} q_{i} \widehat{\chi^{(2)}} \widehat{v} q_{j} W_{1 j}^{(p, 2)} p_{j} p_{1} \Psi\right\rangle, \\
B & :=\sum_{i=2}^{N}\left\langle\Psi, p_{1} p_{i} W_{1 i}^{(p, 2)} q_{1} q_{i} \widehat{\chi^{(2)}} \widehat{v} W_{1 i}^{(p, 2)} p_{i} p_{1} \Psi\right\rangle .
\end{aligned}
$$

Since

$$
\chi^{(2)}(k)=\mathbb{1}_{\left\{k>N^{1-\delta}\right\}}
$$

we find

$$
\chi^{(2)} v \leqslant \chi^{(2)} n^{-1} \leqslant N^{\delta / 2}
$$

Thus, $\left\|q_{1} q_{i} \widehat{\chi^{(2)}} \widehat{v}\right\| \leqslant N^{\delta / 2}$ and we get

$$
\begin{aligned}
B & \leqslant N^{\delta / 2} \sum_{i=2}^{N}\left\langle\Psi, p_{1} p_{i}\left(W_{1 i}^{(p, 2)}\right)^{2} p_{i} p_{1} \Psi\right\rangle \leqslant N^{1+\delta / 2}\left\|\left(w^{(p, 2)}\right)^{2} *|\varphi|^{2}\right\|_{\infty} \\
& \leqslant N^{1+\delta / 2}\left\|w^{(p, 2)}\right\|_{2}^{2}\|\varphi\|_{\infty}^{2} \lesssim N^{1+\delta / 2} a^{2-p}\|\varphi\|_{\infty}^{2}
\end{aligned}
$$

by (4.23b).
Next, using Lemma 3.10, we find

$$
\begin{aligned}
A & =\sum_{2 \leqslant i \neq j \leqslant N}\left\langle\Psi, p_{1} p_{i} q_{j} W_{1 i}^{(p, 2)} \widehat{\chi^{(2)}} \widehat{v}^{1 / 2} q_{1} \widehat{\chi^{(2)}} \widehat{v}^{1 / 2} W_{1 j}^{(p, 2)} q_{i} p_{j} p_{1} \Psi\right\rangle \\
& =\sum_{2 \leqslant i \neq j \leqslant N}\left\langle\Psi, p_{1} p_{i} q_{j} \widehat{\tau_{2} \chi^{(2)}}{\widehat{\tau_{2} \nu}}^{1 / 2} W_{1 i}^{(p, 2)} q_{1} W_{1 j}^{(p, 2)} \widehat{\tau_{2} \chi^{(2)}}{\widehat{\tau_{2} \nu}}^{1 / 2} q_{i} p_{j} p_{1} \Psi\right\rangle \\
& =A_{1}+A_{2},
\end{aligned}
$$

where, as above, the splitting $A=A_{1}+A_{2}$ arises from writing $q_{1}=\mathbb{1}-p_{1}$. Thus,

$$
\begin{aligned}
\left|A_{1}\right| \leqslant & \sum_{2 \leqslant i \neq j \leqslant N}\left|\left\langle\Psi, p_{1} p_{i} q_{j} \widehat{\tau_{2} \chi^{(2)}}{\widehat{\tau_{2} v}}^{1 / 2} W_{1 i}^{(p, 2)} W_{1 j}^{(p, 2)} \widehat{\tau_{2} \chi^{(2)}}{\widehat{\tau_{2}}}^{1 / 2} q_{i} p_{j} p_{1} \Psi\right\rangle\right| \\
= & \sum_{2 \leqslant i \neq j \leqslant N} \mid\left\langle\Psi p_{1} p_{i} q_{j} \widehat{\tau_{2} \chi^{(2)}} \widehat{\tau_{2} \nu} 1 / 2 \sqrt{W_{1 i}^{(p, 2)}} \sqrt{W_{1 j}^{(p, 2)}} \sqrt{W_{1 i}^{(p, 2)}}\right. \\
& \left.\times \sqrt{W_{1 j}^{(p, 2)}} \widehat{\tau_{2} \chi^{(2)}}{\widehat{\tau_{2} \nu}}^{1 / 2} q_{i} p_{j} p_{1} \Psi\right\rangle \mid \\
\leqslant & \sum_{2 \leqslant i \neq j \leqslant N}\left\langle\Psi, q_{j} \widehat{\tau_{2} \chi^{(2)}}{\widehat{\tau_{2} v}}^{1 / 2} p_{1} p_{i}\right| W_{1 i}^{(p, 2)}| | W_{1 j}^{(p, 2)}\left|p_{i} p_{1} \widehat{\tau_{2} \chi^{(2)}}{\widehat{\tau_{2} \nu}}^{1 / 2} q_{j} \Psi\right\rangle,
\end{aligned}
$$

by Cauchy-Schwarz and symmetry of $\Psi$. Using (4.28) we get

$$
\begin{aligned}
\left|A_{1}\right| & \leqslant N^{2}\left\|\left|w^{(p, 2)}\right| *|\varphi|^{2}\right\|_{\infty}^{2}\left\langle\Psi, \widehat{\tau_{2} \nu} q_{1} \Psi\right\rangle \\
& \leqslant N^{2}\left\|w^{(p, 2)}\right\|_{p}^{2}\|\varphi\|_{L^{2} \cap L^{\infty}}^{4}\langle\Psi, \widehat{n} \Psi\rangle \\
& \lesssim N^{2}\|\varphi\|_{L^{2} \cap L^{\infty}}^{4} \beta .
\end{aligned}
$$

Similarly,

$$
\begin{aligned}
\left|A_{2}\right| & \leqslant \sum_{2 \leqslant i \neq j \leqslant N}\left|\left\langle\Psi, p_{i} q_{j} \widehat{\tau_{2} \chi^{(2)}}{\widehat{\tau_{2} v}}^{1 / 2} p_{1} W_{1 i}^{(p, 2)} p_{1} W_{1 j}^{(p, 2)} p_{1} \widehat{\tau_{2} \chi^{(2)}}{\widehat{\tau_{2} \nu}}^{1 / 2} q_{i} p_{j} \Psi\right\rangle\right| \\
& \leqslant \sum_{2 \leqslant i \neq j \leqslant N}\left\|w^{(p, 2)} *|\varphi|^{2}\right\|_{\infty}^{2}\left|\Psi, \widehat{\tau_{2} \nu} q_{1} \Psi\right\rangle \\
& \leqslant N^{2}\left\|w^{(p)}\right\|_{p}^{2}\|\varphi\|_{L^{2} \cap L^{\infty}}^{4}\langle\Psi, \widehat{n} \Psi\rangle \\
& \lesssim N^{2}\|\varphi\|_{L^{2} \cap L^{\infty}}^{4} \beta .
\end{aligned}
$$

Plugging all this back into (4.30), we find that

$$
\left|\left\langle\Psi, p_{1} p_{2} W_{12}^{(p, 2)} \widehat{v} \widehat{\chi^{(2)}} q_{1} q_{2} \Psi\right\rangle\right| \lesssim \beta\left(\|\varphi\|_{L^{2} \cap L^{\infty}}^{2}+\|\varphi\|_{\infty}\right)+\|\varphi\|_{\infty} a^{2-p} N^{\delta / 2-1} .
$$

Summarizing:

$$
\left|(\mathrm{III})^{(p, 2)}\right| \lesssim\left(1+\|\varphi\|_{L^{2} \cap L^{\infty}}^{2}\right)\left(\beta+a^{2-p} N^{\delta / 2-1}+N^{-\delta / 2}+N^{-1 / 2} a^{1-p / 2}\right)
$$

from which we deduce

$$
\begin{aligned}
& \left|(\mathrm{IIII})^{(p)}\right| \lesssim\|\varphi\|_{\infty}\left\|\nabla_{1} q_{1} \Psi\right\|^{2} \\
& \quad+\left(1+\|\varphi\|_{X_{1} \cap L^{\infty}}\right)\left(\beta+a^{2-p} N^{\delta / 2-1}+N^{-\delta / 2}+N^{-1 / 2} a^{1-p / 2}+a^{2-2 p / p_{0}}\right)
\end{aligned}
$$

Let us set $a \equiv a_{N}=N^{\zeta}$ and optimize in $\delta$ and $\zeta$. This yields the relations

$$
\zeta(2-p)+\delta=1, \quad-\frac{\delta}{2}=2 \zeta\left(1-\frac{p}{p_{0}}\right)
$$

which imply

$$
\frac{\delta}{2}=\frac{p / p_{0}-1}{2 p / p_{0}-p / 2-1},
$$

with $\delta \leqslant 1$. Thus,

$$
\left|(\mathrm{III})^{(p)}\right| \lesssim\|\varphi\|_{\infty}\left\|\nabla_{1} q_{1} \Psi\right\|^{2}+\left(1+\|\varphi\|_{X_{1} \cap L^{\infty}}\right)\left(\beta+N^{-\eta}\right),
$$

where $\eta=\delta / 2$ satisfies (4.4).
Conclusion of the proof. We have shown that

$$
\dot{\beta} \lesssim\|\varphi\|_{L^{2} \cap L^{\infty}}\left\|\nabla_{1} q_{1} \Psi\right\|^{2}+\left(1+\|\varphi\|_{X_{1} \cap L^{\infty}}\right)\left(\beta+N^{-\eta}\right) .
$$

Using Lemma 4.6 we find

$$
\begin{equation*}
\dot{\beta} \lesssim\left(1+\|\varphi\|_{X_{1}^{2} \cap L^{\infty}}^{3}\right)\left(\beta+E^{\Psi}-E^{\varphi}+\frac{1}{N^{\eta}}\right) . \tag{4.31}
\end{equation*}
$$

The claim then follows from the Grönwall estimate (3.3).
4.4. A remark on time-dependent external potentials. Theorem 4.1 can be extended to time-dependent external potentials $h(t)$ without too much sweat. The only complication is that energy is no longer conserved. We overcome this problem by observing that, while the energies $E^{\Psi}(t)$ and $E^{\varphi}(t)$ exhibit large variations in $t$, their difference remains small. In the following we estimate the quantity $E^{\Psi}(t)-E^{\varphi}(t)$ by controlling its time derivative.

We need the following assumptions, which replace Assumptions (B1) - (B3).
(B1') The Hamiltonian $h(t)$ is self-adjoint and bounded from below. We assume that there is an operator $h_{0} \geqslant 0$ that such that $0 \leqslant h(t) \leqslant h_{0}$ for all $t$. We define the Hilbert space $X_{N}=\mathcal{Q}\left(\sum_{i}\left(h_{0}\right)_{i}\right)$ as in (A1), and the space $X_{1}^{2}=\mathcal{Q}\left(h_{0}^{2}\right)$ as in (B5) using $h_{0}$. We also assume that there are time-independent constants $\kappa_{1}, \kappa_{2}>0$ such that

$$
-\Delta \leqslant \kappa_{1} h(t)+\kappa_{2}
$$

for all $t$.

We make the following assumptions on the differentiability of $h(t)$. The map $t \mapsto\langle\psi, h(t) \psi\rangle$ is continuously differentiable for all $\psi \in X_{1}$, with derivative $\langle\psi, \dot{h}(t) \psi\rangle$ for some self-adjoint operator $\dot{h}(t)$. Moreover, we assume that the quantities

$$
\left\langle\varphi(t), \dot{h}(t)^{2} \varphi(t)\right\rangle, \quad\left\|(\mathbb{1}+h(t))^{-1 / 2} \dot{h}(t)(\mathbb{1}+h(t))^{-1 / 2}\right\|
$$

are continuous and finite for all $t$.
(B2') The Hamiltonian $H_{N}(t)$ is self-adjoint and bounded from below. We assume that $\mathcal{Q}\left(H_{N}(t)\right) \subset X_{N}$ for all $t$. We also assume that the $N$-body propagator $U_{N}(t, s)$, defined by

$$
\mathrm{i} \partial_{t} U_{N}(t, s)=H_{N}(t) U_{N}(t, s), \quad U_{N}(s, s)=\mathbb{1}
$$

exists and satisfies $U_{N}(t, 0) \Psi_{N, 0} \in \mathcal{Q}\left(H_{N}(t)\right)$ for all $t$.
(B3') There is a time-independent constant $\kappa_{3} \in(0,1)$ such that

$$
0 \leqslant\left(1-\kappa_{3}\right)\left(h_{1}(t)+h_{2}(t)\right)+W_{12}
$$

for all $t$.
Theorem 4.7. Assume that Assumptions (B1') - (B3'), (B4), and (B5) hold. Then there is a continuous nonnegative function $\phi$, independent of $N$ and $\Psi_{N, 0}$, such that

$$
\beta_{N}(t) \leqslant \phi(t)\left(\beta_{N}(0)+E_{N}^{\Psi}(0)-E^{\varphi}(0)+\frac{1}{N^{\eta}}\right)
$$

with $\eta$ defined in (4.4).
Proof. We start by deriving an upper bound on the energy difference $\mathcal{E}(t):=E^{\Psi}(t)-$ $E^{\varphi}(t)$. Assumptions (B1') and (B2') and the fundamental theorem of calculus imply

$$
\mathcal{E}(t)=\mathcal{E}(0)+\int_{0}^{t} \mathrm{~d} s(\underbrace{\left\langle\Psi(s), \dot{h}_{1}(s) \Psi(s)\right\rangle-\langle\varphi(s), \dot{h}(s) \varphi(s)\rangle}_{=: G(s)})
$$

By inserting $\mathbb{1}=p_{1}(s)+q_{1}(s)$ on both sides of $\dot{h}_{1}(s)$ we get (omitting the time argument s)

$$
\begin{equation*}
G=\left\langle\Psi, p_{1} \dot{h}_{1} p_{1} \Psi\right\rangle-\langle\varphi, \dot{h} \varphi\rangle+2 \operatorname{Re}\left\langle\Psi, p_{1} \dot{h}_{1} q_{1} \Psi\right\rangle+\left\langle\Psi, q_{1} \dot{h}_{1} q_{1} \Psi\right\rangle \tag{4.32}
\end{equation*}
$$

The first two terms of (4.32) are equal to

$$
\left(\left\langle\Psi, p_{1} \Psi\right\rangle-1\right)\langle\varphi, \dot{h} \varphi\rangle=\alpha\langle\varphi, \dot{h} \varphi\rangle \leqslant \beta|\langle\varphi, \dot{h} \varphi\rangle| .
$$

The third term of (4.32) is bounded, using Lemmas 3.9 and 3.10, by

$$
\begin{aligned}
2\left|\left\langle\Psi, p_{1} \dot{h}_{1} \widehat{n}^{1 / 2} \widehat{n}^{-1 / 2} q_{1} \Psi\right\rangle\right| & =2\left|\left\langle\dot{h}_{1} p_{1}{\widehat{\tau_{1} n}}^{1 / 2} \Psi, \widehat{n}^{-1 / 2} q_{1} \Psi\right\rangle\right| \\
& \leqslant \sqrt{\left|\widehat{\tau}_{1} n^{1 / 2} \Psi, p_{1} \dot{h}_{1}^{2} p_{1}{\widehat{\tau_{1} n}}^{1 / 2} \Psi\right\rangle}\left\|\widehat{n}^{-1 / 2} q_{1} \Psi\right\| \\
& \leqslant \sqrt{\left|\left\langle\varphi, \dot{h}^{2} \varphi\right\rangle\right|} \sqrt{\left\langle\Psi, \widehat{\tau_{1} n} \Psi\right\rangle} \sqrt{\left\langle\Psi, \widehat{n}^{-1} q_{1} \Psi\right\rangle} \\
& \leqslant \sqrt{\left|\left\langle\varphi, \dot{h}^{2} \varphi\right\rangle\right|} \sqrt{\beta+\frac{1}{\sqrt{N}} \sqrt{\beta}}, \\
& \lesssim \sqrt{\left|\left\langle\varphi, \dot{h}^{2} \varphi\right\rangle\right|}\left(\beta+\frac{1}{\sqrt{N}}\right) .
\end{aligned}
$$

The last term of (4.32) is equal to

$$
\begin{aligned}
& \left\langle\Psi, q_{1}\left(\mathbb{1}+h_{1}\right)^{1 / 2}(\mathbb{1}+h)^{-1 / 2} \dot{h}_{1}\left(\mathbb{1}+h_{1}\right)^{-1 / 2}(\mathbb{1}+h)^{1 / 2} q_{1} \Psi\right\rangle \\
& \quad \leqslant\left\|(\mathbb{1}+h)^{-1 / 2} \dot{h}(\mathbb{1}+h)^{-1 / 2}\right\|\left\|\left(\mathbb{1}+h_{1}\right)^{1 / 2} q_{1} \Psi\right\|^{2} .
\end{aligned}
$$

Thus, using Assumption (B1') we conclude that

$$
\begin{equation*}
G(t) \leqslant C(t)\left(\beta(t)+\frac{1}{\sqrt{N}}+\left\|h_{1}(t)^{1 / 2} q_{1}(t) \Psi(t)\right\|^{2}\right) \tag{4.33}
\end{equation*}
$$

for all $t$. Here, and in the following, $C(t)$ denotes some continuous nonnegative function that does not depend on $N$.

Next, we observe that, under Assumptions (B1') - (B3'), the proof of Lemma 4.6 remains valid for time-dependent one-particle Hamiltonians. Thus, (4.13) implies

$$
\left\|h_{1}(t)^{1 / 2} q_{1}(t) \Psi(t)\right\|^{2} \lesssim \mathcal{E}(t)+\left(1+\|\varphi(t)\|_{X_{1}^{2} \cap L^{\infty}}^{2}\right)\left(\beta(t)+\frac{1}{\sqrt{N}}\right)
$$

Plugging this into (4.33) yields

$$
G(t) \leqslant C(t)\left(\beta(t)+\frac{1}{\sqrt{N}}+\mathcal{E}(t)\right)
$$

Therefore,

$$
\begin{equation*}
\mathcal{E}(t) \leqslant \mathcal{E}(0)+\int_{0}^{t} \mathrm{~d} s C(s)\left(\beta(s)+\mathcal{E}(s)+\frac{1}{\sqrt{N}}\right) \tag{4.34}
\end{equation*}
$$

Next, we observe that, under Assumptions (B1') - (B3'), the derivation of the estimate (4.31) in the proof of Theorem 4.1 remains valid for time-dependent one-particle Hamiltonians. Therefore,

$$
\begin{equation*}
\beta(t) \leqslant \beta(0)+\int_{0}^{t} \mathrm{~d} s C(s)\left(\beta(s)+\mathcal{E}(s)+\frac{1}{N^{\eta}}\right) \tag{4.35}
\end{equation*}
$$

Applying Grönwall's lemma to the sum of (4.34) and (4.35) yields

$$
\beta(t)+\mathcal{E}(t) \leqslant(\beta(0)+\mathcal{E}(0)) \mathrm{e}^{\int_{0}^{t} C}+\frac{1}{N^{\eta}} \int_{0}^{t} \mathrm{~d} s C(s) \mathrm{e}^{\int_{0}^{t} C}
$$

Plugging this back into (4.35) yields

$$
\beta(t) \leqslant C(t)\left(\beta(0)+\mathcal{E}(0)+\frac{1}{N^{\eta}}\right),
$$

which is the claim.

Acknowledgements. We would like to thank J. Fröhlich and E. Lenzmann for helpful and stimulating discussions. We also gratefully acknowledge discussions with A. Michelangeli which led to Lemma 2.1.
