Contents

Preface	xi
Acknowledgements	xiii
Mathematical Notation	xv
1 Introduction	1
2 The Mathematics Behind Monte Carlo Methods	5
2.1 A Few Basic Terms in Probability and Statistics	5
2.2 Monte Carlo Simulations	7
2.2.1 Monte Carlo Supremacy	8
2.2.2 Multi-dimensional Integration	8
2.3 Some Common Distributions	9
2.4 Kolmogorov's Strong Law	18
2.5 The Central Limit Theorem	18
2.6 The Continuous Mapping Theorem	19
2.7 Error Estimation for Monte Carlo Methods	20
2.8 The Feynman–Kac Theorem	21
2.9 The Moore–Penrose Pseudo-inverse	21
3 Stochastic Dynamics	23
3.1 Brownian Motion	23
3.2 Itô's Lemma	24
3.3 Normal Processes	25
3.4 Lognormal Processes	26
3.5 The Markovian Wiener Process Embedding Dimension	26
3.6 Bessel Processes	27
3.7 Constant Elasticity Of Variance Processes	28
3.8 Displaced Diffusion	29
4 Process-driven Sampling	31
4.1 Strong versus Weak Convergence	31
4.2 Numerical Solutions	32

4.2.1	The Euler Scheme	32
4.2.2	The Milstein Scheme	33
4.2.3	Transformations	33
4.2.4	Predictor–Corrector	35
4.3	Spurious Paths	36
4.4	Strong Convergence for Euler and Milstein	37
5	Correlation and Co-movement	41
5.1	Measures for Co-dependence	42
5.2	Copulae	45
5.2.1	The Gaussian Copula	46
5.2.2	The t -Copula	49
5.2.3	Archimedean Copulae	51
6	Salvaging a Linear Correlation Matrix	59
6.1	Hypersphere Decomposition	60
6.2	Spectral Decomposition	61
6.3	Angular Decomposition of Lower Triangular Form	62
6.4	Examples	63
6.5	Angular Coordinates on a Hypersphere of Unit Radius	65
7	Pseudo-random Numbers	67
7.1	Chaos	68
7.2	The Mid-square Method	72
7.3	Congruential Generation	72
7.4	Ran0 To Ran3	74
7.5	The Mersenne Twister	74
7.6	Which One to Use?	75
8	Low-discrepancy Numbers	77
8.1	Discrepancy	78
8.2	Halton Numbers	79
8.3	Sobol' Numbers	80
8.3.1	Primitive Polynomials Modulo Two	81
8.3.2	The Construction of Sobol' Numbers	82
8.3.3	The Gray Code	83
8.3.4	The Initialisation of Sobol' Numbers	85
8.4	Niederreiter (1988) Numbers	88
8.5	Pairwise Projections	88
8.6	Empirical Discrepancies	91
8.7	The Number of Iterations	96
8.8	Appendix	96
8.8.1	Explicit Formula for the L_2 -norm Discrepancy on the Unit Hypercube	96
8.8.2	Expected L_2 -norm Discrepancy of Truly Random Numbers	97
9	Non-uniform Variates	99
9.1	Inversion of the Cumulative Probability Function	99
9.2	Using a Sampler Density	101

9.2.1	Importance Sampling	103
9.2.2	Rejection Sampling	104
9.3	Normal Variates	105
9.3.1	The Box–Muller Method	105
9.3.2	The Neave Effect	106
9.4	Simulating Multivariate Copula Draws	109
10	Variance Reduction Techniques	111
10.1	Antithetic Sampling	111
10.2	Variate Recycling	112
10.3	Control Variates	113
10.4	Stratified Sampling	114
10.5	Importance Sampling	115
10.6	Moment Matching	116
10.7	Latin Hypercube Sampling	119
10.8	Path Construction	120
10.8.1	Incremental	120
10.8.2	Spectral	122
10.8.3	The Brownian Bridge	124
10.8.4	A Comparison of Path Construction Methods	128
10.8.5	Multivariate Path Construction	131
10.9	Appendix	134
10.9.1	Eigenvalues and Eigenvectors of a Discrete-time Covariance Matrix	134
10.9.2	The Conditional Distribution of the Brownian Bridge	137
11	Greeks	139
11.1	Importance Of Greeks	139
11.2	An Up-Out-Call Option	139
11.3	Finite Differencing with Path Recycling	140
11.4	Finite Differencing with Importance Sampling	143
11.5	Pathwise Differentiation	144
11.6	The Likelihood Ratio Method	145
11.7	Comparative Figures	147
11.8	Summary	153
11.9	Appendix	153
11.9.1	The Likelihood Ratio Formula for Vega	153
11.9.2	The Likelihood Ratio Formula for Rho	156
12	Monte Carlo in the BGM/J Framework	159
12.1	The Brace–Gatarek–Musiela/Jamshidian Market Model	159
12.2	Factorisation	161
12.3	Bermudan Swaptions	163
12.4	Calibration to European Swaptions	163
12.5	The Predictor–Corrector Scheme	169
12.6	Heuristics of the Exercise Boundary	171
12.7	Exercise Boundary Parametrisation	174
12.8	The Algorithm	176

12.9	Numerical Results	177
12.10	Summary	182
13	Non-recombining Trees	183
13.1	Introduction	183
13.2	Evolving the Forward Rates	184
13.3	Optimal Simplex Alignment	187
13.4	Implementation	190
13.5	Convergence Performance	191
13.6	Variance Matching	192
13.7	Exact Martingale Conditioning	195
13.8	Clustering	196
13.9	A Simple Example	199
13.10	Summary	200
14	Miscellanea	201
14.1	Interpolation of the Term Structure of Implied Volatility	201
14.2	Watch Your CPU Usage	202
14.3	Numerical Overflow and Underflow	205
14.4	A Single Number or a Convergence Diagram?	205
14.5	Embedded Path Creation	206
14.6	How Slow is <code>Exp()</code> ?	207
14.7	Parallel Computing And Multi-threading	209
	Bibliography	213
	Index	219
