CONTENTS

PREFACE	xi
1 INTRODUCTION	1
2 MATHEMATICAL PRELIMINARIES	13
2.1 Notation and Basic Properties	13
2.1.1 Notation and Definitions	13
2.1.2 Set-Valued Maps, the Cartesian Product	16
2.1.3 Supporting Hyperplane Theorem and Separation Theorems of Convex Sets	18
2.2 Some Classes and Properties of Nondifferentiable Functions	22
2.2.1 Differentiability and Directional Derivatives	22
2.2.2 Directional Derivatives and Subgradients of Convex Functions	23
2.2.3 Generalized Directional Derivatives and Generalized Gradients of Locally Lipschitz Functions	26
2.2.4 Quasidifferentiable Functions	30
2.2.5 Subdifferential and Superdifferential Regularities	32
2.3 Alternative Theorems	32
2.3.1 Alternative Theorems for Linear Inequality Systems	33
2.3.2 Alternative Theorems for Positively Homogeneous Convex Inequality Systems	36
2.3.3 Alternative Theorems for Positively Homogeneous Nonconvex Inequality Systems	41
2.4 Implicit Function Theorems	51
2.5 Chain Rules of Directional Derivatives and Generalized Gradients	54
3 DIFFERENTIABLE NONLINEAR PROGRAMMING	59
3.1 Introduction	59

3.2	Optimality Conditions (The Kuhn-Tucker Theorem)	62
3.2.1	Unconstrained Nonlinear Programming Problems	62
3.2.2	Constrained Nonlinear Programming Problems	64
3.3	Duality Theory	75
3.4	Computational Methods	79
3.4.1	Steepest Descent Method	80
3.4.2	Conjugate Gradient Method	81
3.4.3	Newton Method	85
3.4.4	Quasi-Newton Method	87
3.4.5	Penalty Methods	93
3.4.6	Feasible Direction Method	98
3.4.7	Constrained Quasi-Newton Method	101
3.5	Extension to the Multi-Objective Case	107
3.5.1	Efficiency	107
3.5.2	Necessary and Sufficient Conditions for Efficient Solutions	109
4	NONDIFFERENTIABLE NONLINEAR PROGRAMMING	113
4.1	Introduction	113
4.2	Optimality Conditions in Terms of Directional Derivatives	114
4.3	Kuhn-Tucker Type Optimality Conditions for the Locally Lipschitz Case	117
4.4	Kuhn-Tucker Type Optimality Conditions for the Quasidifferentiable Case	120
4.5	Computational Methods	123
4.5.1	Brief Overview	123
4.5.2	Bundle Methods	124
5	LINEAR PROGRAMMING	128
5.1	Introduction	128
5.1.1	Basic Solutions	132
5.1.2	Fundamental Theorem	134
5.1.3	Convex Properties	136
5.2	Simplex Method	140
5.2.1	Pivoting	141
5.2.2	Determining the Leaving Variable	143
5.2.3	Moving toward Optimality	144
5.2.4	Degeneracy and Cycling	149
5.3	Geometry of Simplex Method	152

5.3.1	Finiteness of Algorithm	153
5.3.2	Adjacency and Bounded Edges	153
5.3.3	Unboundedness	155
5.3.4	Finding Adjacent Extreme Points	158
5.3.5	Main Geometric Argument	159
5.3.6	Alternative Optima and Uniqueness	159
5.3.7	Ranking Extreme Points	160
5.4	Additional Features	163
5.4.1	Phase 1 and Artificial Variables	163
5.4.2	Bounded Variables	166
5.4.3	Kuhn-Tucker Conditions and the Linear Complementarity Problem	169
5.5	Duality	171
5.5.1	Primal-Dual Relationship	172
5.5.2	Dual Theorems	173
5.5.3	Economic Interpretation	178
5.5.4	Sensitivity Analysis	179
5.5.5	Dual Simplex Method	185
6	OPTIMAL-VALUE FUNCTIONS	188
6.1	Introduction	188
6.2	Definitions	190
6.3	Continuity of Constraint Map, Optimal-Value Function and Optimal Solution Map	191
6.3.1	Continuity of Constraint Map $S(\mathbf{x})$	191
6.3.2	Continuity of Optimal-Value Function $w(\mathbf{x})$	193
6.3.3	Properties of Optimal Solution Map $P(\mathbf{x})$	196
6.4	Properties of the Kuhn-Tucker Vector Set $K(\mathbf{x}, \mathbf{y})$	197
6.5	Directional Derivatives of Optimal-Value Functions	199
6.5.1	Case with No Equality Constraints	199
6.5.2	Case with Inequality and Equality Constraints	204
6.5.3	Case where the Linear Independence Constraint Qualification Holds	211
6.5.4	Convex Programming Case	211
6.6	Generalized Gradients of Optimal-Value Functions	213
6.6.1	Case where the Mangasarian-Fromovitz Constraint Qualification Holds	214
6.6.2	Case where the Linear Independence Constraint Qualification Holds	216

6.6.3	Convex Programming Case	217
6.6.4	Completely Convex Case	221
6.7	Nonparametric Constraint Case	223
7	TWO-LEVEL MATHEMATICAL PROGRAMMING PROBLEM	229
7.1	Introduction	229
7.2	Optimality Conditions for Two-Level Nonlinear Program	233
7.2.1	Nonparametric Constraint Case	234
7.2.2	Parametric Constraint Case	239
7.3	Optimality Conditions for the Stackelberg Problem	242
7.3.1	Case where the Lower-Level Optimal Solution Map is Differentiable	243
7.3.2	Case where the Lower-Level Optimal Solution Map is not Differentiable	246
7.4	Computational Approach	250
7.5	Applied Two-Level Mathematical Programming Problems	251
8	LARGE-SCALE NONLINEAR PROGRAMMING: DECOMPOSITION METHODS	259
8.1	Introduction	259
8.2	Primal Decomposition Method	259
8.3	Dual Decomposition Method	265
9	MIN-MAX PROBLEM	271
9.1	Problem Formulation	271
9.2	Optimality Conditions	272
9.2.1	Nonparametric Constraint Case	273
9.2.2	Parametric Constraint Case	275
9.3	Computational Approach	279
10	SATISFACTION OPTIMIZATION PROBLEM	280
10.1	Problem Formulation	280
10.2	Optimality Conditions	282
10.2.1	Nonparametric Constraint Case	283
10.2.2	Parametric Constraint Case	285
10.3	Computational Approach	290

11	TWO-LEVEL DESIGN PROBLEM (MATHEMATICAL PROGRAMMING WITH OPTIMAL-VALUE FUNCTIONS)	292
	11.1 Problem Formulation	292
	11.2 Optimality Conditions	293
	11.2.1 Nonparametric Constraint Case	293
	11.2.2 Parametric Constraint Case	298
	11.3 Computational Approach	308
12	GENERAL RESOURCE ALLOCATION PROBLEM FOR DECENTRALIZED SYSTEMS	312
	12.1 Problem Formulation	312
	12.2 Optimality Conditions	313
	12.3 Computational Approach	317
13	MIN-MAX TYPE MULTI-OBJECTIVE PROGRAMMING PROBLEM	318
	13.1 Problem Formulation	318
	13.2 Outline of Nondifferentiable Multi-Objective Programming	319
	13.2.1 Optimality Conditions for Weak Efficiency in Terms of Directional Derivatives	319
	13.2.2 Optimality Conditions in the Locally Lipschitz Case	322
	13.2.3 Optimality Conditions in the Quasi- differentiable Case	325
	13.3 Optimality Conditions	328
	13.3.1 Nonparametric Constraint case	328
	13.3.2 Parametric Constraint Case	330
	13.4 Computational Approach	332
14	BEST APPROXIMATION PROBLEM BY CHEBYSHEV NORM	334
	14.1 Problem Formulation	334
	14.2 Optimality Conditions	336
	14.3 Computational Approach	340
	14.4 Optimal Design of Two-Dimensional Recursive Digital Filters	340
15	THE STACKELBERG PROBLEM: GENERAL CASE	347
	15.1 Introduction	347
	15.2 Double Penalty Function Method	353

15.3	Problem Transformation Method to Concave Program	361
15.4	Branch and Bound Algorithm	371
15.5	Rectangular Partitioning	380
15.6	Applications versus Algorithms	386
16	THE STACKELBERG PROBLEM: LINEAR AND CONVEX CASE	
16.1	Introduction	391
16.2	Theoretical Properties	394
16.3	Algorithms for the Linear Bilevel Programming Problem	398
16.3.1	<i>K</i> th-Best Algorithm	399
16.3.2	Kuhn-Tucker Approach	401
16.3.3	Complementarity Approach	405
16.3.4	Variable Elimination Algorithm	409
16.3.5	Penalty Function Approach	414
16.3.6	Computational Comparisons	419
16.4	Convex Two-Level Programming	428
16.4.1	Algorithm 1	430
16.4.2	Algorithm 2	434
16.5	Inclusion of Discrete Variables	441
16.5.1	Properties of the Mixed-Integer Linear BLPP	441
16.5.2	Branch and Bound Notation	444
16.5.3	Bounding Theorems	445
16.5.4	Algorithm for Mixed-Integer Linear BLPP	447
