Abstract

Background

Mental disorders in the workplace are a major public health problem. Knowledge of the impact of the psychosocial work environment on mental and behavioral disorders can assist occupational physicians in the identification and description of occupational risk situations, and help to define priority actions. However, no classification for occupational exposure factors is currently available. We aimed to build a thesaurus of "Organizational, Relational, Ethical and other Contributing Factors" (FOREC) linked with the onset of mental and behavioral disorders.

Methods

The French Agency for Food, Environmental and Occupational Health and Safety (ANSES) initiated and supervised a multidisciplinary working group consisting of the representatives of the main French occupational and public health actors. All decisions were accepted on a

consensus basis. This collaborative work led to the classification of occupational exposure factors for mental and behavioral disorders in the workplace. To test this thesaurus in clinical practice, a French multicenter study was implemented. Patients were workers referred to the Occupational Disease Centers for mental health issues at work. Factors contributing to mental and behavioral disorders among workers were identified and coded retrospectively from the worker's point of view using the FOREC thesaurus.

Results

We recruited 323 workers, aged 44.9±9.2 years, of which 31.3% were men. The most commonly encountered disorders were generalized anxiety disorders (106 workers, 32.8%) and moderate depressive episodes (86 workers, 26.7%). We identified 1357 factors, i.e. an average of 4.2 factors per worker. Among them, 575 (42.4%) were relational and 515 (37.9%) were organizational. All factors identified during consultations were described in the thesaurus.

Conclusions

We built the first thesaurus of "Organizational, Relational, Ethical and other Contributing Factors" (FOREC) that may help to generate profiles of mental and behavioral disorders at work. Encoding and describing these exposure factors, as well as using a worldwide standardized and shared terminology, will help to identify specific workplace prevention programs.

Introduction

Mental disorders are major public health problems in the workplace [1]. Work stressors, such as psychological and organizational demands (e.g. work pace, time pressure, complexity of work and conflicting tasks [2]), have an impact on common mental disorders [3]. Mental disorders increase business and social costs due to losses in productivity [4,5,6,7], sick leave [8,9] and staff turnover (Ref. needed). Mental disorders are also associated with morbidity and mortality [10,11,12]. For these reasons, work-related mental disorders constitute an important public health challenge.

Since 2000, the French National Occupational Diseases Monitoring and Prevention Network (RNV3P) has been gradually expanded in metropolitan areas of France. This network collects data, in a sustainable and coordinated way, from Occupational Disease Centers in 32 university hospitals and about ten occupational health services. The initiative targets the improvement and harmonization of practices for the diagnosis of work-related diseases, the identification of emerging risks in occupational health, the identification and description of occupational risk situations, and helps to define priority actions [13,14,15,16].

Between 2001 and 2012, the RNV3P logged 294,243 consultations. Due to the size and importance of the RNV3P database, encoding data in a consistent manner is essential, especially for statistical analyses. The aim of using a standardized and shared terminology is to describe and characterize work situations related to occupational diseases, to develop prevention strategies for occupational risks, and to facilitate the exchange and sharing of information between different stakeholders. Thus, a common classification of occupational exposure factors was developed which is freely available for all healthcare professionals, including

physicians and public health specialists [14]. In 2012, the most frequently encountered health problems in occupational consultation centers were related to mental and behavioral disorders (19%). However, no classification of occupational exposure factors for mental and behavioral disorders at work is currently available. Knowledge of the impact of the psychosocial work environment on mental and behavioral disorders can assist occupational physicians in the identification and description of occupational risk situations, and helps to define priority actions.

The primary aim was to build a thesaurus of "Organizational, Relational, Ethical and other Contributing Factors" (FOREC) that contribute to the onset of mental and behavioral disorders. In this article we present the methodology that led to its creation. The secondary aim was to describe the results obtained after using the FOREC thesaurus in clinical practice during consultations for work-related mental disorders.

Methods

Development of the FOREC thesaurus

The French agency for Food, Environmental and Occupational Health and Safety (ANSES) initiated and supervised a multidisciplinary working group to build the FOREC thesaurus. This working group was set up with the representatives of the main occupational and public health actors, such as the ANSES, the French National Health Insurance System (CNAM), Occupational Disease Centers, Occupational Health Services, the French Institute for Public Health Surveillance (InVS), the Interdepartmental Center of Health and Occupational Medicine in Factories (CISME), and the French Institute for Research and Security (INRS). This work was collaborative. The representatives of the main occupational and public health actors who attended the meetings for the creation of the FOREC thesaurus were nationally recognized experts in health, occupational medicine, mental disorders, and work-related stressors (organization, relation, or ethics). Specialized physicians from Occupational Diseases Centers of university hospitals, who undertake mental health consultations in the workplace [17,18], participated in the meetings. For two years, they were asked to list all organizational, relational, ethical and other contributing occupational factors linked with mental and behavioral disorders that were identified during their mental health consultations. Other actors also proposed other putative contributing factors from their own personal experiences. Eleven national meetings were held over three years. Firstly, the occupational exposure factors that could promote mental health and prevent mental and behavioral disorders were listed. All decisions regarding the inclusion of factors within the FOREC thesaurus were approved on a consensus basis. They were then classified, which led to an updated FOREC thesaurus.

Presentation of the FOREC thesaurus

The classification was proposed by members of the multidisciplinary working group on a consensus basis. Occupational factors linked with mental and behavioral disorders were grouped into clinically relevant headings and sections based on ICD-10. The multidisciplinary working group proposed a FOREC thesaurus composed of six chapters: inherent demand of the work, functional organization of the business, relations at work and violence, personal ethics, ethics of the business, and other contributing factors. The first five chapters classify the professional situation inside the enterprise. The sixth chapter concerns the "contributing factors" that are related to the person's status or are totally external to the enterprise. These six chapters are divided into a total of 34 subchapters. Subchapters are coded with 3 digits and are divided into 186 items in total. Items are coded with 4, 5 or 6 digits. The FOREC thesaurus is presented in Table 1 in its entirety.

 $Table \ 1. \ Organizational, relational, ethical \ and \ other \ contributing \ factors-The saurus \ completed \ to \ 4, \ 5 \ or \ 6 \ digits.$

Code	Heading					
70	Inherent demand of the work					
700	Work schedule					
7000	Shift work (2x8, 3x8, 5x8)					
7001	Night work					
70010	Regular night work (>5 nights per month)					
70011	Occasional night work					
7002	On-call working					
7003	Working on Sundays and public holidays					
7004	Length of working day consistently in excess of 10 hours					
7005	Split shifts (divisible or split working day)					
7006	Weekly rest period regularly less than 48 hours					
7007	Unpredictability of working schedule					
7009	Other working schedule capable of causing disturbance to health					
701	Business travel					
7010	Business travel (mission) disturbing social life without sleeping out					
7011	Business travel (mission) disturbing social life with sleeping out					
7012	Business travel (mission) disturbing chronobiology (jet lag)					
7019	Other business travel capable of causing disturbance excluding chosen journeys/commuting cited					
, 015	in 7533.					
702	Other specific features imposed by the work					
7020	On call by telephone or email					
70200	On call by telephone (or SMS or email) only					
70201	On call by telephone (or SMS or email) with call out					
70209	Other on call					
7021	Involuntary part-time work					
7022	Imposed teleworking					
7023	Imposed working from home					
7024	Imposed temporary work					
7025	Imposed overtime					
7026	Requests at any time outside of working hours					
70260	Requests at any time outside of working hours by clients					
70261	Requests at any time outside of working hours by management or colleagues					
7029	Other specific imposed conditions capable of causing disturbance					
703	Distinctive feature of the work					
7030	Poor quality of work content					
70300	Monotonous work, little or no creativity					
70301	Versatility of tasks resulting in a lack of identity (stand in)					
70309	Other features of poor quality of work content					
7031	Specific demand of work content					
70310	Activities requiring alertness, concentration, very close attention					
70311	Function involving high human, financial or safety responsibilities (increase in responsibilities)					
70312	Regular contact with the public					
70313	Working alone (work with a lack of contact causing feelings of isolation)					
70314	Variability, unpredictability of workload					
70311	Work with strong emotional loading (e.g. empathy, contact with people who are suffering)					
70316	Work requiring continuous or excessive control of emotions (facticity, inauthenticity, hiding					
	emotions)

 $\underline{https:/\!/doi.org/10.1371/\!journal.pone.0198719.t001}$

The first chapter, "Inherent demand of the work", concerns all professional constraints that cannot be dissociated from the activity, but that may be the cause of various disorders. For example, being on call in a hospital can disturb social life or cause insomnia. This chapter is divided into 5 subchapters and consists of 44 items in total.

The second chapter, called "Functional organization of the business", also concerns strong professional constraints. It classifies occupational exposure factors, such as organizational changes, restructuring, insufficient or excessive workload, and workplace transfers. This chapter is divided into 10 subchapters and consists of 51 items in total.

The third chapter is entitled "*Relations at work and violence*" (referring to instances such as deleterious relationships experienced with management, verbal aggressions, and sidelining). In this chapter, the notions of individual experiences of a more subjective nature are presented. This chapter is divided into 4 subchapters and consists of 47 items in total.

Chapters four and five are respectively related to "*Personal ethics*" (e.g. performing an act going against one's principles) and "*Ethics of the business*" (e.g. lack of respect in verbal communications). These chapters provide justification of ethical issues based on case studies.

The sixth chapter, "Other contributing factors", regroups factors that may be viewed as directly related to a person (such as a return after parental leave) or totally external to the enterprise (such as an unfavorable socio-economic context). This chapter is divided into 6 subchapters and consists of 42 items in total.

Multicenter study

To check the exhaustiveness and clinical relevance of the FOREC thesaurus, we aimed to describe organizational, relational, ethical and other contributing occupational factors linked with mental and behavioral disorders identified during consultations for mental health issues at work. A French multicenter study (Clermont-Ferrand, Créteil, Toulouse, Bordeaux, Garches) was therefore implemented. The Occupational Disease Centers at these University Hospitals were chosen because they shared similar characteristics relating to the management of mental health consultations in the workplace. Included workers were addressed to those consultations by their general practitioner or their occupational physician because of a presumed diagnosis of mental health issues at work [17,18]. They were included over a period of twelve consecutive months. There were no exclusion criteria and all patients who attended a consultation for mental health issues at work were included. The protocol was approved by the ethics committee of the University Hospital of Clermont-Ferrand (approval number: n° 2015CE/69). Socio-demographic, occupational and clinical data were retrieved during two interviews, one with a psychologist and a nurse and a second with an occupational physician and a psychiatrist. The final diagnosis of a mental and behavioral disorder was made during this second, specialized, consultation for mental health issues at work, which also established a link between the issues and professional activity. The link was based on the specialist's judgment, during the medical examination. Mental and behavioral disorder were coded according to the International Classification of Diseases 10th Revision (ICD-10) and all physicians were trained in this coding by the same organization (ANSES). A detailed medical report was systematically written by the occupational physicians and the psychiatrists for each consultation. The medical report mentioned the diagnosis and the socio-demographic, occupational and clinical data, as well as occupational exposure factors linked with the mental health issues of the workers. The medical reports identifiers were coded prior to analysis. One author (CL) reviewed all coded medical reports from all centers. The author identified and retrospectively coded the data and factors contributing to the workers' health-related issues using the FOREC thesaurus from the perception of the worker.

Statistical analysis

Statistical analyses were performed using Stata software, version 13 (StataCorp, College Station, TX, US). Continuous data were expressed as mean \pm standard deviation and categorical parameters as frequencies (associated percentages).

Results

We recruited 323 workers (31.3% males) with an average age of 44.9±9.2. The most commonly encountered diagnoses in the consultations for mental health issues at work were 'generalized anxiety' (106 workers, 32.8%) and 'moderate depressive episodes' (86 workers, 26.7%) (Table 2).

During the study period, 1357 occupational factors linked with mental and behavioral disorders were identified, i.e. an average of 4.2 factors per worker. Among them, 575 (42.4%) were relational, 515 (37.9%) were organizational and the remaining 12.2% represented other contributing factors (<u>Table 3</u>). All identified factors were successfully encoded using the thesaurus. Two subchapters were not found in medical reports: "Other general inherent demands of the work capable of causing disturbance" (subchapter 709) and "General level of hygiene or poor hygiene culture" (subchapter 741).

Relational factors were the most common in cases of depressive episodes (41.7%) and anxiety disorders (44.4%), followed by managerial factors (<u>Table 4</u>). Managerial factors were most frequently identified in cases of post-traumatic stress disorder (62.5%) and burn-out (59.6%).

Discussion

This study presents the first thesaurus of occupational exposure factors responsible for mental health issues at work, grouped into clinically relevant headings and sections.

Table 2. Characteristics of the workers.

	n = 323
Demographic characteristics	
Gender (male)	101 (31.3)
Age (years)	44.9 ± 9.2
Disorders encountered	
F320 -Mild depressive episode	9 (2.8)
F321 –Moderate depressive episode	86 (26.7)
F322 –Severe depressive episode without psychotic symptoms	39 (12.1)
F410 -Panic disorder	3 (0.9)
F411 –Generalized anxiety	106 (32.8)
F412 -Mixed anxiety and depressive disorder	47 (14.6)
F419 –Unspecified anxiety disorder	13 (4.0)
F431 –Post-traumatic stress disorder	2 (0.6)
Z730 -Burn-out	11 (3.4)
Z03 –No pathology	3 (0.9)
Other pathology	2 (0.6)
No answer	2 (0.6)

Data are presented as frequencies (associated percentages) or as mean \pm standard deviation.

Encountered diseases are presented with their ICD-10 corresponding code.

Other pathology: lateral epicondylitis (M77 1) and irritability and anger (R454).

Table 3. Number of factors identified for each chapter and subchapter.

		n = 1357
70	Inherent demand of the work	27 (2.0)
700	Work schedule	8 (0.6)
701	Business travel	2 (0.1)
702	Other specific features imposed by the work	2 (0.1)
703	Distinctive feature of the work	15 (1.1)
709	Other general inherent demand of the work capable of causing disturbance	0 (0.0)
71	Functional organization of the business	515
		(37.9)
710	Change in the organization and specific approach of management	148 (10.9)
711	Insufficient or excessive workload experienced	67 (4.9)
712	Excessive procedures and supervision	22 (1.6)
713	Low decision latitude in the organization of their work	17 (1.3)
714	Few opportunities to learn or develop their skills	4 (0.3)
715	Lack of recognition (encouragement, congratulations etc.) or reward (e.g. salary, promotion, annual appraisal)	101 (7.5)
716	Insufficiency of resources	66 (4.9)
717	Dysfunctions in the instructions of management	61 (4.5)
718	Transfer to another position or another site (or announced in the 3 months preceding the first signs)	25 (1.9)
719	Other general features of the functional organization of the business capable of causing disturbance	4 (0.3)
72	Relations at work and violence	575 (42.4)
720	Quality of relations at work	306 (22.6)
721	External violence (persons outside of the workplace)	17 (1.3)
722	Internal violence (another company employee)	250 (18.4)
729	Other general features of relations at work capable of causing disturbance	2 (0.1)
73	Personal ethics-conflict of values	57 (4.2)
730	Performing an act going against their principles (miss-selling, making redundancies)	12 (0.9)
731	Being a powerless witness to acts going against their principles	19 (1.4)
732	Lacking resources or time to do quality work	11 (0.8)
739	Other conflict of values relating to personal ethics	15 (1.1)
74	Ethics of the business	17 (1.3)
740	General level of safety or a low safety culture	8 (0.6)
741	General level of hygiene or poor hygiene culture	0 (0.0)
742		4 (0.3)
743	Lack of respect in verbal communications	3 (0.2)
749	Other ethical failing of the business capable of causing disturbance	2 (0.1)
75	Other contributing factors	166 (12.2)
750	Particular medical or social status capable of altering relationships	45 (3.3)
751	Claims for entitlements including: claims concerning leave, training, bonuses not being received, payment of overtime, signing a petition	11 (0.8)
752	Taking a personal stance or action challenging the company	73 (5.4)
753	Specific chosen working conditions	3 (0.2)
754	Contributing factor linked to the business (social context, economic context)	32 (2.4)
759	Other general feature constituting a contributing factor	2 (0.1)
	0 0	(3.7)

Data are presented as frequencies (associated percentages).

Consequences to mental health following exposure to occupational factors

Mental health issues at work are a public health concern. More interestingly, some factors related to work, such as organizational, relational, ethical and other contributing factors were directly linked with some health-related issues. For example, it has been shown that cardiovascular diseases were associated with job strain [19], low decision latitude [20], low reward [21] and low social support [22,23]. It has also been reported that low social support positively predicts depression [24]. Similarly, changes in organization (10.9% of the 1357 identified factors) and conflict of loyalties resulting from workplace changes may also lead to suicide [25]. Moreover, it has long been recognized that depression and anxiety share similarities in their pathogenesis [26]. Among the mental disorders identified in the present study, anxiety and depression seem to share the same exposure profile, i.e. relational (~40%) [27], whereas burnout was mainly linked with organizational factors (~60%), as previously reported [28,29,30].

Occupational factors linked with mental and behavioral disorders

In our study, identified factors were mainly relational (42.4%). Relational regulation theory has previously been proposed as a novel way to improve mental and behavioral disorders [31]. On the other hand, inherent work demands were infrequently cited (2%), which consequently may not be a major source of mental health issues at work. In our study, the inherent work demands that cannot be dissociated from the professional activity seem to be accepted and well tolerated by workers, which might appear contradictory to some previous literature [20]. We demonstrated that 1.3% of the factors identified were related to low decision latitude, 7.5% to lack of recognition or reward and 4.9% to perceptions of a deficiency of support. Supervisor support has previously been shown to buffer the impact of excessive work demands [31]. One hundred and sixty-six contributing and contextual factors (12.2%) showed some new insights into particular medical or social status (such as perceived limitations of ability, return after absence) that may be capable of altering relationships or altering work-related self-efficacy. Studying those factors could provide possibilities for changing practices in the workplace.

Recommendation

The FOREC thesaurus has a worldwide application as the use of a standardized and shared terminology is needed to describe at-risk occupational factors that generate mental and behavioral disorders. Identifying those factors is essential for effective prevention in the workplace and must be based on useful evidence-based information in order to help to define priority

actions. At-risk workers should receive follow-ups from occupational physician [32,33], and may benefit from a targeted intervention on the occupational factors that have been identified as generating mental and behavioral disorders [34].

Limitations

There are limitations to this study. Some subchapters of the thesaurus may seem less relevant because they were less common. However, a detailed thesaurus is required for exhaustively encoding exposures. This thesaurus can be improved, as are other thesauruses which are continuously enriched by the French National Occupational Diseases Monitoring and Prevention Network (RNV3P) [35,36,37], which also guarantees that they will remain current. The sample size used for describing results from the FOREC thesaurus may seem low, however workers were recruited at the Occupational Diseases Centers of the University Hospitals' during specialized consultations for mental health issues at work [17,18]. Moreover, a relevant number of occupational factors linked with mental and behavioral disorders were identified (over one thousand), providing substantial data. Variability between independent coders also needs to be assessed. Comparing encoding between a physician and an administrative employee would be of interest. Furthermore, personality traits of the coder may influence data encoding and should be evaluated. Further studies are needed to assess the profile of occupational exposure factors with regard to socio-professional occupations and workers' demographic characteristics.

Conclusion

We built the first thesaurus of "Organizational, Relational, Ethical and other Contributing Factors" (FOREC) that may help to generate profiles of mental and behavioral disorders at work. Using the FOREC thesaurus in clinical practice during consultations for work-related mental health issues has shown that the factors identified during previous consultations were successfully encoded (all factors were described in the thesaurus). The FOREC thesaurus may provide a worldwide standardized and shared terminology, which will help to understand the impact of the psychosocial work environment on the onset of mental and behavioral disorders related to work. The identification and description of occupational risk situations can assist occupational physicians in defining priority actions in the workplace to address mental health issues.
