On the Geometry of Diffusion Operators and Stochastic Flows

Springer

Contents

Introduction	3
1 Construction of connections	7
1.1 Construction of connections	7
1.2 Basic Classes of Examples	14
1.3 Adjoint connections, torsion skew symmetry, basic formulae . . .	18
1.4 Example: Homogeneous spaces continued	26
2 The infinitesimal generators and associated operators	30
2.1 The irrelevance of drift in dimension greater than 1	30
2.2 Torsion Skew Symmetry	35
2.3 The 'divergence operator' $\hat{\delta}$	37
2.4 Hörmander form generators on differential forms	42
2.5 On the infinitesimal generator	47
2.5.1 Example	47
2.5.2 Symmetricity of the generator A^q	49
3 Decomposition of noise and filtering	57
3.1 A canonical decomposition of the noise driving a stochastic differential equation	57
3.2 Canonical decomposition of the Gaussian field W_t	60
3.3 Filtering out redundant noise	63
3.3.1 When A does not belong to the image of X	69
3.3.2 The inverse derivative flow	72
3.3.3 Integrability of certain C^r norms for compact M	72
3.3.4 The semigroup on forms: Bochner type vanishing theorems	73
3.3.5 Bismut formulae	75
4 Application: Analysis on spaces of paths	76
4.1 Integration by parts and Clark-Ocone formulae	78
4.2 Logarithmic Sobolev Inequality	82
4.3 Analysis on $C_{id}(\text{Diff}M)$	83
5 Stability of stochastic dynamical systems	87

6	Appendices	95
A	Universal Connections as L-W connection	95
B	Creation and Annihilation operators (notation for section 2.4) . .	101
C	Basic formulae	103
D	List of notation	109
