Operator algebras and their modules—an operator space approach

David P. Blecher
Department of Mathematics, University of Houston

Christian Le Merdy
Laboratoire de Mathématiques, Université de Besançon

CLARENDON PRESS • OXFORD 2004

Contents

1	**Operator spaces**	1
1.1	Notation and conventions	1
1.2	Basic facts, constructions, and examples	4
1.3	Completely positive maps	16
1.4	Operator space duality	22
1.5	Operator space tensor products	27
1.6	Duality and tensor products	38
1.7	Notes and historical remarks	45
2	**Basic theory of operator algebras**	49
2.1	Introducing operator algebras and unitizations	49
2.2	A few basic constructions	57
2.3	The abstract characterization of operator algebras	62
2.4	Universal constructions of operator algebras	68
2.5	The second dual algebra	78
2.6	Multiplier algebras and corners	82
2.7	Dual operator algebras	88
2.8	Notes and historical remarks	96
3	**Basic theory of operator modules**	102
3.1	Introduction to operator modules	102
3.2	Hilbert modules	109
3.3	Operator modules over operator algebras	115
3.4	Two module tensor products	119
3.5	Module maps	123
3.6	Module map extension theorems	128
3.7	Function modules	131
3.8	Dual operator modules	136
3.9	Notes and historical remarks	142
4	**Some 'extremal theory'**	147
4.1	The Choquet boundary and boundary representations	147
4.2	The injective envelope	152
4.3	The C^*-envelope	156
4.4	The injective envelope, the triple envelope, and TROs	161
4.5	The multiplier algebra of an operator space	167
4.6	Multipliers and the 'characterization theorems'	175
4.7	Multipliers and duality	180

4.8 Noncommutative M-ideals 183
4.9 Notes and historical remarks 188

5 Completely isomorphic theory of operator algebras 195
5.1 Homomorphisms of operator algebras 195
5.2 Completely bounded characterizations 200
5.3 Examples of operator algebra structures 209
5.4 Q-algebras 215
5.5 Applications to the isomorphic theory 224
5.6 Notes and historical remarks 228

6 Tensor products of operator algebras 232
6.1 The maximal and normal tensor products 232
6.2 Joint dilations and the disc algebra 239
6.3 Tensor products with triangular algebras 241
6.4 Pisier's delta norm 248
6.5 Factorization through matrix spaces 254
6.6 Nuclearity and semidiscreteness for linear operators 259
6.7 Notes and historical remarks 265

7 Selfadjointness criteria 269
7.1 OS-nuclear maps and the weak expectation property 269
7.2 Hilbert module characterizations 274
7.3 Tensor product characterizations 279
7.4 Amenability and virtual diagonals 282
7.5 Notes and historical remarks 292

8 C^*-modules and operator spaces 296
8.1 Hilbert C^*-modules—the basic theory 297
8.2 C^*-modules as operator spaces. 308
8.3 Triples, and the noncommutative Shilov boundary 322
8.4 C^*-module maps and operator space multipliers 328
8.5 W^*-modules 331
8.6 A sample application to operator spaces 348
8.7 Notes and historical remarks 350

Appendix 359
A.1 Operators on Hilbert space 359
A.2 Duality of Banach spaces 360
A.3 Tensor products of Banach spaces 361
A.4 Banach algebras 363
A.5 C^*-algebras 364
A.6 Modules and Cohen's factorization theorem 367
