Abstract: This article assesses the opportunities and challenges for different categories of FinTechs in the SAARC and ASEAN regions. We consider the global financial inclusion data released by the World Bank and map the responses to gain insights into the opportunities and challenges for FinTechs in the respective regions. We develop a new index, termed the FinTech Opportunity Index (FOI), to conceptualise the opportunities and barriers based on individual savings, borrowings, purchasing behaviour, and payment preferences. We note that FinTech services have potential opportunities for expansion in the ASEAN regions but less so in the SAARC regions. The need for different types of FinTech services varies between regions. Services such as crowdfunding, neobanks, and InsurTech have potential in the ASEAN regions, especially with the positive attitude towards entrepreneurship and asset investments. In the SAARC regions, InsurTechs linked to health care has potential along with LendTechs and neobanks. We further note that males, and the young are more likely adopters of FinTechs in both regions. The analysis suggests the need for innovative promotions and education to motivate the more sceptical, especially women and the elderly population, to adopt FinTech services.

Keywords: FinTech; SAARC; ASEAN; technology adoption

1. Introduction

FinTechs (financial technologies) have expanded the financial services digital ecosystem across countries, particularly during the COVID-19 crisis (Abdillah 2020; Rahman et al. 2018). However, FinTech adoption in different developing countries has been slow, despite them having different opportunities for growth and expansion of the digital economy, as is vital for future economic sustainable growth (Iman 2018; Zhang et al. 2020).

In this research, we consider two regions with similar economic, political, and social structures—the SAARC (South Asian Association for Regional Cooperation) region and the ASEAN (Association of South East Asian Nations) region (Rahman et al. 2018). The South Asian Association of Regional Cooperation (SAARC) region, currently comprises eight countries (India, Pakistan, Bangladesh, Sri Lanka, Nepal, Bhutan and the Maldives, and Afghanistan) and came into effect in 1985 with a view to encourage socio-cultural development and interregional cooperation and collaborations (South Asian Association for Regional Cooperation 2020). The total population of SAARC countries approximates the total population of China, South Korea, and Japan (Dey et al. 2019). Although most SAARC countries have a strong historical connection with the late British/Indian Empire, South East Asian countries have a high diversity in ethnicity, religion, and language (Dey et al. 2019) and have a median age of 27 (Prasad and Aravindakshan 2021). The political and social systems of these countries have incorporated “the English language, standard English spelling, Westminster-style Parliamentary democracy, the common law legal system, driving on the left, etc.” (Dey et al. 2019, p. 1020). The region hosts a culture

that is strongly familial and collectivist in ethos and practices, and exists under an economic context that is highly reliant on banking systems, and where digital services are evolving (Dey et al. 2019; Pandey et al. 2019; Prasad and Aravindakshan 2021). The Association of South East Asian Nations (ASEAN), represents 10 countries (Brunei, Cambodia, Indonesia, Lao PDR (or Laos), Malaysia, Myanmar, Philippines, Singapore, Thailand, and Vietnam), and was established in 1967 (Association of South East Asian Nations 2020). The region is the seventh largest economy in the world with a combined GDP of \$US2.5 trillion, and is expected to be the fourth largest economy by 2030 (Aujirapongpan et al. 2020). The region hosts an economic context that encourages digitisation (Avirutha 2021) and has a focus on developing communities respecting equity, freedom, and a collective spirit (Ullah and Ming Yit Ho 2021).

In 2016 ASEAN and SAARC countries comprised 8.8% and 23.75% respectively of the world's population and contributed a combined 5.81% to the world's GDP (Rahman et al. 2018). Economic conditions in ASEAN and SAARC countries are quite distinct, with GDP per capita in ASEAN countries considerably higher than SAARC countries (Akhter 2019), and income convergence among member countries being more evident in the ASEAN regions than in the SAARC regions (Zia and Mahmood 2019). Compared to OECD (Organization for Economic Cooperation and Development) countries, which generally have a larger aging population, the SAARC and ASEAN regions have a larger younger population (Rahman et al. 2018). Their contributions to the world economy cannot be ignored.

Thus, it is interesting to explore the extent that FinTech services, including those offered by traditional banks, can develop in these regions, and potentially contribute towards reducing the financial inclusion gap. Today, smartphone devices and their applications have become an integral part of people's daily lives, particularly in the SAARC and ASEAN regions, where the underlying context and social media have led to the high growth of smartphone adoptions (Babu 2016; Dey et al. 2019; Prasad and Aravindakshan 2021; Widyastuti 2017). Different categories of FinTechs have the opportunity to benefit these regions, especially by making financial services accessible to rural and remote populations where banking services are not available (GSMA 2019; Gupta and Xia 2018; Jain and Gabor 2020; Mohammad 2020; Patil et al. 2018; Schatt 2014). Indeed, in SAARC countries, given the deficiencies in financial infrastructure, the opportunities of expanding mobile banking services has expanded to those who cannot access traditional banking facilities (Lenka and Barik 2018). In the ASEAN regions, digital financial services also hold potential to stimulate economic growth, banking and financial stability (Banna and Alam 2021). Furthermore, FinTech services are not all the same. Different FinTech services bring different benefits to a user, and the available services will not necessarily appeal to everyone in each of these regions. Thus, an insight into the potential of different FinTech services in the area could be of interest to FinTech providers, especially from a business development and expansion perspective. To the best of our knowledge, such an exploration that comprehensively covers the SAARC and ASEAN regions is missing. There is, furthermore, a lack of literature that compares FinTech opportunities and barriers in the SAARC and ASEAN regions. This research article fills these gaps.

In this respect, it is worth referring to the Global Findex Database (GFD), which periodically stores different financial inclusion information, such as mobile phone and internet usage for financial transactions. While there are academic articles (Demirguc-Kunt et al. 2018; GSMA 2019; OECD 2020) that incorporate the GFD to help explore the financial inclusion gaps and determinants across regions, there is a deficiency in the literature exploring the dataset from the perspective of FinTech opportunities and barriers, especially with regards to the potential use of mobile financial services and the financial inclusion barriers in the surveyed countries. There are articles that have reviewed the mobile payment literature (Dahlberg et al. 2008, 2015) and the factors that influence their acceptance (Schierz et al. 2010) and assumed risks (Yang et al. 2015). Other articles have examined the way FinTech adoption can influence consumers' use of credits (Carlin et al. 2017), examine

the perceived risks and benefits that influence FinTech adoptions at different stages (Ryu 2018), and examine the determinants influencing FinTech usage (Singh et al. 2020). Many existing articles have principally focused on specific regions with small-sized samples, and drawn conclusions on Fintech adoption based on theoretical models such as the technology acceptance model (TAM) (Davis 1993; Davis et al. 1989). To the best of our knowledge, however, there is no research that focuses on individuals' buying, savings, and borrowing behaviour, and use of financial services as captured by the GFD. Nor does any research maps this behaviour and usage to conceptualise the opportunities and barriers for FinTech services. This article bridges this gap.

The following research questions (RQs) are addressed:

- What are the opportunities and barriers for different FinTech services in the SAARC and ASEAN regions?
- Is there any notable difference between the SAARC and ASEAN regions concerning digital financial services adoption and potential developments?

In addressing these RQs, we make the following contributions:

- The GFD has typically been assessed to conceptualise banking and financial inclusion gaps, and opportunities for digital payment services (Demirguc-Kunt et al. 2018). We go beyond this practice and conceptualise the GFD information to assess opportunities and barriers to FinTech developments across countries for payment services and other different categories of FinTech services.
- We compare the relative opportunities and barriers of FinTechs across the SAARC and ASEAN regions. To the best of our knowledge, this is pioneering work.
- We propose a new index, named the FinTech Opportunity Index (FOI), to conceptualise the opportunities and barriers across the SAARC and ASEAN regions, based on individuals' savings, borrowing, purchasing behaviour, and payment preferences. It is anticipated that this new index will guide further research in this space.
- We explore the association between the demographic attributes of the two regions and opportunities for FinTech development—another area where the literature has remained largely silent.

Overall, we make an academic contribution that can guide further similar research across locations. Simultaneously, we make a practical contribution. The outcomes of this research will be particularly useful to FinTech providers and economic policy makers, especially in the current context, where social distancing and public health protection have become the new norm, leading to an increasing acceptance of digital systems for shopping, payments, and financial services.

2. Literature Review

Although providing financial services via technology is not a new concept, attention towards FinTechs from a broad group of stakeholders has been quite recent (Arner et al. 2016). Thus, research in this space is still at a very early stage and is gradually evolving. So, too, is the development and expansion of FinTechs in both developed and developing countries (Arner et al. 2016; Patil et al. 2018). To clarify the position of the article, this literature review will focus on the evolution and characteristics of different digital financial services, FinTech adoptions, barriers, and opportunities for adoption in the context of the ASEAN and SAARC regions.

2.1. Different Types of FinTech

FinTech is an umbrella term that covers different financial services offered as technological solutions via the internet and/or via mobile apps, and its historical evolution can be traced to the early 1990s (Arner et al. 2016). There are several categories of Fintech services that can enhance the financial service experience of consumers by digitising financing, investment, money, insurances, and financial advice (Chinnasamy et al. 2021; Gomber et al. 2017; Pollari and Teper 2021). Some of the common FinTech services include:

- PayTech—(payment technologies) offering digital payment services;
- LendTech—(lending technologies) offering streamlined accurate digital lending solutions;
- Crowdfunding/equity financing—offering opportunities to raise funds through the sale of securities online or via some incentive promises to the funders;
- Neobanks—offering digital financial and banking services;
- RegTech (regulatory technologies)—offering the delivery of regulatory compliance securely and cost-effectively within a standardised, integrated, transparent ecosystem;
- InsurTech (insurance technologies)—offering insurance solutions within a digital financial ecosystem; and
- Personal finance/robo-advisers/WealthTech—offering personal digital financial planning or management services using robotic technology involved in portfolio construction and stock trading.

Mobile payment services (a form of PayTech) facilitate payments for purchases or bills using mobile devices such as smartphones, tablets, or other computing and mobile technologies (Dahlberg et al. 2008; de Luna et al. 2019). The services have expanded across regions, including developing countries with an increased usage of mobile devices and supportive socioeconomic conditions and other determinants facilitating such growth (Iman 2018; Kang 2018). Peer-to-peer payments, and mobile payment services have expanded to cover government payments to individuals (Iman 2018).

LendTech and crowdfunding have evolved, especially as alternatives to traditional financing sources such as banks, venture capitalists, angel investors, and government fundings (Gomber et al. 2017). LendTech can provide borrowing solutions to consumers with weak credit ratings or consumers who may be refused mortgage loans by traditional credit entities (Jagtiani et al. 2021). The use of technology has benefited credit entities by allowing assessments of extended information and prediction of default risks (Jagtiani and Lemieux 2019).

Crowdfunding platforms facilitate entrepreneurial financing and business ventures, and, contrary to traditional sources, connect entrepreneurs and investors from diverse geographical locations (Agrawal et al. 2011; Mollick 2014). There are many different crowdfunding models (Meyskens and Bird 2015). Of these the most common is the equity crowdfunding model, which can make entrepreneurial investment opportunities available to inexperienced investors and where investors expect compensation from the ventures' cash inflows (Hornuf and Schwienbacher 2018; Ralcheva and Roosenboom 2016).

Neobanks provide banking functions fully online, and are gaining popularity among millennials and consumers expecting enhanced banking experiences (El-Gohary et al. 2021; Temelkov 2020). They often operate at a low cost, offering consumers banking services at a low fee and investors a higher return (Maiti et al. 2021).

In a context of high-volume information, changing regulations, and the need for protection of consumers' rights, RegTechs assist businesses with regulatory compliance, controlling risks, and reporting (Butler and O'Brien 2019). With the development of different FinTech services, RegTechs are expected to play a significant role in monitoring information and the prevention of financial crimes (Dubey et al. 2020).

InsurTech is another recent FinTech development, that automates data collection, helps manage risks, and offers digital and integrated insurance solutions (Stoekli et al. 2018). With significant investments in the InsurTech industry, it is expected that InsurTechs will increasingly disrupt traditional insurance providers in the aftermath of COVID-19 (Neale et al. 2020).

Personal financial management services and WealthTech have seen a spike in growth recently, especially with the increased digitisation of financial markets and technological advancements facilitating functions such as automated trading, micro-investments at a low commission, automated asset management, and retail investments (Dziawgo 2021). WealthTechs can make available wealth management opportunities which were traditionally accessible only to high-worth individuals and middle-class cohorts (Arslanian 2018; Li et al. 2020).

Thus, recent developments in the information technologies space, including machine learning, big data analytics, cloud computing, blockchain, distributed database systems, and virtualisations have paved the way to a variety of FinTechs that target financial services.

2.2. FinTechs in SAARC and ASEAN Country Context

It is informative to note the differences in the adoption and development of FinTechs in SAARC and ASEAN regions.

2.2.1. SAARC Countries

India is the leading country among the SAARC nations in adopting digital technologies. The Indian government is digitising services and educating citizens under the “Digital India” outreach programme. India has also introduced policies that demonetise currency notes (Government of India, Ministry of Electronics & Information Technology n.d.; Kumar and Puttanna 2018). Currently, India is facing a difficult regulatory and operating environment and a slowing of growth in the adoption of mobile money, compared to the ASEAN region (GSMA 2019). Additional challenges for FinTech development in India include the preference towards cash transactions, fraudulent online activities, and the lack of sufficient support and incentives (Priya and Kanagala 2019).

Pakistan is another SAARC country where FinTech services are growing, even though very few FinTech firms operate outside the major cities (Ali et al. 2021; Saleem 2021). With a young, technology-savvy population and high smartphone usage, Pakistan has all the attributes that are conducive to FinTech adoption (Saleem 2021). However, perceptions associated with risk and the lack of partnerships between local firms and FinTech companies are seen as barriers for the rapid development of FinTech services in Pakistan (Ali et al. 2021; Saleem 2021).

In Bangladesh, the government has an explicit focus on digitalisation, including supporting FinTech initiatives (Ayoungman et al. 2021). While different FinTech services, especially mobile banking, have expanded in Bangladesh, there are FinTech categories such as crowdfunding, cryptocurrency, and InsurTech that have a limited penetration or are not allowed by law (Ayoungman et al. 2021). Users’ perceived risks and trust are noted as critical determinants of FinTech adoption (Hasan 2021). Issues associated with data storage, and insufficient development of human resources remain as barriers in FinTech development (Rahman et al. 2021).

In Nepal, the growth in mobile banking is strong, especially among the young who are aware of technological developments and are willing to accept mobile banking services and the benefits they bring (Kunwar and Thakur 2019). Indeed, several payment companies have received approval to operate in Nepal and have been adopted by the Nepalese population for bill and invoice payments (Bazarbash 2020).

FinTechs, especially peer-to-peer lending and cryptocurrency, have achieved considerable success in Sri Lanka, but uncertainties and risks associated with this form of innovation remain (Dharmadasa 2021). Additionally, regulatory barriers and the lack of a central structure for identity verification have hindered FinTechs’ progression in Sri Lanka (Samarasinghe 2021).

Research on the prospects of mobile money in Afghanistan have noted mixed views concerning acceptance (Blumenstock et al. 2015). There are further concerns about internet costs and available infrastructure, which have the potential to hinder the adoption of sophisticated technologies (Lukonga 2021).

Bhutan has strategies encouraging FinTech developments (FIS of Royal Monetary Authority of Bhutan 2020), and has recently adopted an innovative Indian FinTech payment service that is expected to benefit both its citizens and tourists (Vidyashree 2021).

Research on internet banking in the Maldives reflects the influence that trust, social context, and performance expectations can have on its adoption (Zahir and Gharlegghi 2014), and there is a view that offering Islamic FinTech services holds promise in the country (Alam and Zamani 2021).

Overall, FinTech initiatives involving SAARC countries have generally focused on mobile money and payment services, but there also remain opportunities for other services such as crowdfunding, which have made limited penetration in the SAARC region (Nepali 2021).

2.2.2. ASEAN Countries

In the ASEAN region, there are concerns about low financial and digital literacy rates in the Philippines, Indonesia, and Thailand (Banna and Alam 2021). Even so, FinTech services have emerged in each of the countries across the ASEAN region.

Mobile phones have led to mobile payment apps in Indonesia, such as TCASH (Iman 2018) and “Go-Pay” via the Gojek start-up application (Abdillah 2020, p. 265). Focusing on the user experience of Indonesian computer science students belonging to the Millennial and Z generations, Abdillah (2020) claims that despite its efficiency and clarity, the Go-Pay service needs to develop a unique footprint. Research also points to user trust, rather than perceived risks, as a key factor influencing FinTech adoption in Indonesia (Meyliana et al. 2019). There are calls for establishing laws regulating the fast-growing FinTech services in Indonesia (Kharisma 2020). Research additionally points to the potential for FinTech services to assist micro, small, and medium-sized businesses to expand and develop (Darma et al. 2020).

Malaysia has seen the growth of Islamic FinTech organisations, including those providing crowdfunding and data analytics services (Hasan et al. 2020). Research suggests that Islamic FinTech services have the potential for further development in Malaysia, and there are calls to establish regulations to govern the services on offer (Ab et al. 2020; Miskam et al. 2019). Research also notes that Malaysian males have a greater intention to adopt FinTech services than females (Tun-Pin et al. 2019).

Singapore is a leader in the ASEAN region with respect to hosting FinTech services, and attracting funding for relevant initiatives (Lin 2019). Singapore is regarded as “a regional financial capital” (Lin 2019) with a financial ecosystem and policies conducive to FinTech services (Tao and Azhgaliyeva 2018). A particularly unique initiative in Singapore is a well-established regulatory sandbox that facilitates experimentation in fintech products, while also considering public perceptions, stereotypes and protection of consumer rights (Fan 2018; Lin 2019; Ng 2018). Indeed, the impact of such a regulatory sandbox is evident in research. A study comparing peer-to-peer lending services in Singapore and Indonesia notes that while FinTech start-ups enjoy a very supportive context in Singapore from a broad range of consumers, the development of such services in Indonesia is affected by conflicting regulations, and the user base is made up of Millennials (Yunus 2019).

FinTech is gradually developing in the Philippines, although relatively low financial literacy and difficulties in accessing funds and expertise have acted as barriers to such development (Schellhase and Garcia 2019). Research, however, suggests that FinTechs can act as complementary service and be beneficial to incumbent formal financial institutions (Low and Wong 2021).

FinTech payment services are expanding rapidly in Thailand and the expansion has been energised by public–private entity partnerships (Moenjak et al. 2020). The country hosts a central platform for the verification of individual identity, and this platform is likely to facilitate the further expansion of different FinTech services (Moenjak et al. 2020). Research has also explored the acceptability of artificial intelligence (AI)-based financial services in Thailand (Noonpakdee 2020).

In Myanmar, users’ perception of credibility and compatibility appear to drive the adoption of FinTech lending services, while perceptions about costs have a negative influence (Aye 2021). Myanmar has recently introduced several reforms in the financial services sector, including those giving permission to foreign banks to operate FinTech services. It is worth noting that a number of microfinance and nonbank financial institutions have emerged in Myanmar in recent times (Aye 2021). An interesting aspect in Myanmar is what Laik and Wei (2019) refer to as the “leapfrog nature” of its society. While mobile phone penetration in the country was low just a few years ago, the penetration of mobile

and smartphones in recent years has been very significant—an indication of the growth potential for mobile banking services in the country (Laik and Wei 2019).

There has been sound growth of FinTech organisations in Vietnam as well; however, the services covered are limited mainly to payments and associated services, with a few firms facilitating robo-advice (Morgan and Trinh 2020). There are also a number of foreign owned FinTech services in the country (Tapanainen 2020). Research suggests that there is potential for the development of microfinancing via FinTechs in Vietnam (Dang and Vu 2020).

FinTech services are in the very early stages of development in Lao PDR, with deposit services dominating and a few mobile add-on services facilitating card payments. (Morgan and Long 2019). Inadequate access to the internet and low financial literacy are noted as the main barriers to FinTech adoption (Morgan and Long 2019).

FinTechs, particularly payment services, are growing in Cambodia due to high smartphone usage, especially among the Millennial generation, which seeks efficient and convenient financial transactions (Cheng et al. 2018). Interestingly, social influence may not be effective in convincing the Cambodian Millennials to adopt FinTechs (Cheng et al. 2018).

Research suggests that Islamic financial institutions can assist the unbanked or underbanked people of Brunei Darussalam to adopt FinTech services (Ali et al. 2019). It is claimed that FinTechs can assist Brunei to fulfil its development pursuits (Haqqi 2020). However, the lack of proper regulation governing FinTech services pose risks to its expansion and there is a call for innovation in the authentication space (Haqqi 2020). Another study explored the potential of biometric authentication in Brunei and suggests that ease of use and trust are two notable factors that can impact innovation acceptance (Sulaiman and Almunawar 2021).

Overall, ASEAN countries and their road to FinTech adoption have featured in the literature at various levels. It appears that payment services have received acceptance in most ASEAN countries. The regulatory context however differs, with some countries yet to establish any meaningful regulation while other countries already have a supportive regulatory and policy regime in place.

2.3. Drivers and Barriers for FinTechs

The literature notes different drivers and barriers for FinTechs across countries. A particular driver in SAARC and ASEAN regions is the encouragement from national governments, who are attempting to foster an ecosystem of cyberspace, mobile phones and blockchain to empower individuals to gain access to technologies that enable them to transact from anywhere. For example, in Indonesia, the adoption of FinTech has been high among women, the Y generation, and high-school equivalents. In India, demonetisation policies have encouraged the acceptance of digital platforms (Abdillah 2020; Banna and Alam 2021; Demircuc-Kunt et al. 2018; Huwaydi and Persada 2018; Prasad and Aravindakshan 2021).

Drivers for FinTech services can also include the perceived benefits of these services by their users or the potential positive implications of their use. The literature, in this regard, points to consumer benefits associated with the use of FinTech, including making financial transactions affordable, transparent, accessible, inclusive, convenient and secure (Abdillah 2020; Patil et al. 2018; Puschmann 2017; Zhang et al. 2020). There are also explorations related to the benefits of FinTech for small and medium-sized enterprises (SMEs). Research, for instance, notes that FinTechs can play a positive role in enhancing exports (Ragimun and Yosepha 2018). It is also argued that the low costs associated with FinTech payment services to consumers can boost their spending, which in turn can enhance the growth of businesses (Agarwal et al. 2020). Fintech platforms can help reduce the cost of borrowing by assisting financial institution to be more efficient (Mardiana and Kembauw 2021). The broader implications of FinTechs are also noted and can act as drivers of these services at a national level. FinTech development can enhance job creation, entrepreneurship opportunities, and reduce the digital divide (Zhang et al. 2020). Under COVID-19-like situations, there is also

the added advantage of avoiding the threat to health and life, because contactless payments facilitate transactions without physical contact (Srivastava et al. 2021).

Conversely, the literature also identifies various barriers to FinTech developments. The access to financial services remains a challenge in the developing economies of the world (Demirguc-Kunt et al. 2018; Mohammad 2020). Growth in FinTech in the Asia Pacific region is made all the more difficult (Aujirapongpan et al. 2020; Patil et al. 2018) because of:

- slower IT spending by the traditional banks; and
- concerns about security, privacy, and risks.

Other FinTech adoption challenges include regulatory barriers, a less-sophisticated population, information asymmetries, and constraints placed on FinTech companies (Arner et al. 2016; Dhar and Stein 2017; Moradi et al. 2020; OECD 2020). Consumer expectations concerning performance, perceived benefits, usefulness, usability, and associated risks can influence a person's intention to adopt FinTech services (Patil et al. 2017). Mohammad (2020) reported that social norms can have a more significant influence on the adoption of FinTech applications than perceived technology risks. However, trust mediates the relationship between perceived risks and FinTech application adoption (Mohammad 2020). Security breaches can lead to mistrust about mobile apps and detrimentally affect the intention to use FinTech services (Kang 2018). Developing confidence in new FinTech services takes time. The respective regulatory environment, such as government-initiated measures concerning cryptocurrencies in some countries, can potentially impact the cost of adoption and early adoptions (Luther 2016).

Overall, there are adoption opportunities and barriers for FinTechs across different regions. Thus, it is interesting to note the extent various contextual circumstances affect the potential of FinTech developments in the different SAARC and ASEAN countries and how the regions compare in this regard.

2.4. Research Gaps and the Position of This Article

Despite a rich level of literature covering both SAARC and ASEAN countries, research gaps exist. Most of the existing research has focused on a limited number of participants to draw conclusions. The GFD information (Demirguc-Kunt et al. 2018) we use in this research uses a large number of participants across the two regions. The GFD includes multiple questions covering various aspects of borrowing, savings behaviour, digital payment usage, and financial inclusion. Such information can, in turn, point to opportunities to develop FinTechs services in these two regions. To the best of the authors' knowledge, the literature is yet to explore the GFD from this angle and therefore this article has a very different perspective to the existing literature concerning FinTech adoption in SAARC and ASEAN countries.

Also, there is a limited focus on quantifying the opportunities (and barriers) faced by FinTech organisations in SAARC and ASEAN countries. Interestingly, Huong et al. (Huong et al. 2021) recently developed an index, named the "FinTech adoption index for ASEAN countries (AFAI)", which considered various indicators such as the transaction values of mobile payments, crowdfunding, crowdlending, e-commerce, marketplace lending, electronic remittance, and other macrolevel information in the ASEAN region. It is noteworthy that the AFAI (Huong et al. 2021) looked only at ASEAN countries and considered consumers' adoption of FinTech services at a macro-level, though did not explicitly score opportunities for FinTech expansion. The current article fills the above-mentioned gap by developing a new index, termed the "FinTech Opportunity Index" (FOI), to conceptualise the opportunities and barriers based on individual savings, borrowings, purchasing behaviour, and payment preferences. It is a unique index that scores potential barriers to FinTech expansion opportunities in both the ASEAN and SAARC regions. In effect, it is an index that focuses on micro-level information, such as individualistic savings and borrowing behaviour, and quantifies opportunities for the expansion of FinTechs in both the SAARC and ASEAN regions. To the best of the authors' knowledge, an index at this level of sophistication has not been developed. Also, while macro-level information, as

considered in the AFAI, can provide useful information, micro-level information arguably provides additional insights. The current article bridges this research gap vacuum.

3. Methodology

For this research, we focus on a selection of questions from the 2017 GFD questionnaire as listed in Table 1 to help understand and reflect on the opportunities for FinTech development in SAARC and ASEAN countries. It is important to acknowledge that the World Bank report on the 2017 GFD mentions opportunities for digital banking and financial services in different countries (Demirguc-Kunt et al. 2018). The report, however, does not cover SAARC and ASEAN countries specifically and does not focus on a comparison of the opportunities relative to the respective economic context. Additionally, we conceptualise the opportunities across various types of FinTech technologies, not just banking and payment services. With that in consideration, we list in Table 1 our conceptualisation of the questions as barriers and opportunities relating to the different categories of FinTech. We follow a recent KPMG report (Pollari and Teper 2021) and categorise the potential FinTech services into seven groups: neobanks, lending services, personal financial (management) services, payment services, crowdfunding, RegTech (regulatory technologies), and InsurTech (insurance technologies).

Table 1. Questions and items conceptualised in this research to reflect opportunities and barriers for FinTech.

Item in the GFD 2017 Questionnaire (World Bank 2018a)	Relevant FinTech Technologies	Explanation
Has the participant used a mobile phone or the internet for payment, purchase, or money transfer from a bank or a formal institution in the prior year (i.e., prior 12 months?)	Payment services Associated services	The response to this question captures the use of digital payment, which conceptualises both opportunities for and barriers to payment services. Furthermore, using such services can lead to opportunities for associated services such as e-commerce platforms and digitisation of traditional businesses.
What is the reason that the participant does not have a bank or a formal financial institution account? The options are: <ul style="list-style-type: none"> - the institutions are very far away - the participant feels that financial services are very expensive - the participant lacks the documentations needed - the participant mistrusts the institutions - there are religious causes - the participant has insufficient funds - duplication in the sense that another family member already holds an account - the participant feels that such financial services are not needed 	FinTech in general	Many FinTech services have emerged to address the barriers in the question, such as financial institutions being far away or transactions being expensive. Thus, the barriers provide opportunities for all types of FinTech, while also indicating challenges to the services' expansion.
Has the participant saved any money for initiating, running, or growing a business in the prior year?	Crowdfunding RegTech InsurTech Neobanks	Saving for starting or operating a business corresponds to entrepreneurship and business management behaviour, and which in turn corresponds to opportunities for FinTech facilitating business fundraising, insurance, and regulatory compliances.
Has the participant saved any money for old age in the prior year?	Personal financial services Neobanks	Saving for old age reflects wealth and personal financial management behaviour, corresponding to opportunities for related FinTech services.

Table 1. *Cont.*

Item in the GFD 2017 Questionnaire (World Bank 2018a)	Relevant FinTech Technologies	Explanation
Did the participant save any money in the prior year using: <ul style="list-style-type: none"> - a formal financial institution or bank account? - an informal saving entity or an individual not in the family? 	Personal financial services Crowdfunding Neobanks	These items correspond to actual savings behaviour and in turn reflect the opportunities for FinTech, and barriers thereof, especially if individuals are not accustomed to using banking services for saving.
Has the participant singly or jointly borrowed any money from formal financial institutions for purchasing property or land in the prior year?	Lending services Personal financial services Neobanks	This item relates to the participant’s attitude towards borrowing for purchasing assets, and thus corresponds to the opportunities for lending services and relevant FinTech.
Has the participant borrowed, singly or jointly, any money from formal financial institutions for medical or health reasons in the prior year?	Lending services Personal financial services InsurTech Neobanks	This item relates to the participant’s attitude towards borrowing for medical purposes, and thus corresponds to the opportunities for lending and health insurance services and relevant FinTech.
Has the participant singly or jointly borrowed any money from formal financial institutions for initiating, running, or growing a business in the prior year?	Crowdfunding RegTech InsurTech Neobanks	Borrowing for starting or operating a business corresponds to entrepreneurship and business management behaviour, which in turn corresponds to opportunities for FinTech facilitating business fundraising, insurance, and regulatory compliance.
Has the participant singly or jointly borrowed in the prior year from: <ul style="list-style-type: none"> - a bank or a formal financial organisation? - family members, relatives, or friends? - Informal sources? 	Lending services Personal financial services InsurTech RegTech Neobanks	These items correspond to actual borrowing behaviour and in turn reflect the possibilities of FinTech and barriers thereof, especially if individuals are not accustomed to using banking services for borrowing.
Did the participant receive salary/wages from employers in the prior year in the ways outlined as options? Did the participant receive government payments in the prior year in the ways outlined as options? Did the participant receive money from agricultural activities in the prior year in the ways outlined as options? Did the participant receive money from self-employment activities in the prior year in the ways outlined as options? Options for each of the items are <ul style="list-style-type: none"> - as cash - in a card 	Payment services Neobanks	A receipt of payment via a card, in contrast to cash, suggests opportunities for FinTech such as payment services and neobanks.

The GFD asks participants why they may not have a bank account or an account with a financial institution and suggests reasons, including: distance to financial institutions, financial services being expensive, the lack of documentation to create an account, mistrust about financial institutions, religion, lack of sufficient money, other family members already having an account, and the participant having no need for a formal account. The survey items, in effect, also reflect opportunities for FinTech’s expansion as they represent a response to the above-mentioned barriers. The GFD asks participants whether they use cash or online payments to complete their purchases—another survey item that correlates with an opportunity for FinTech technologies. In a similar way, questions asking participants about their borrowing behaviour can be turned around and be considered as an opportunity to develop a FinTech lending service. Questions on borrowing and saving for businesses can be conceptualised as entrepreneurship and business management behaviour. The responses to the survey should be of interest to FinTechs such as crowdfunding services, which may assist raising finance for businesses; or InsurTech, which may be relevant from an insurance perspective; or RegTech, which may assist regulatory compliance.

In a subsequent step, we analyse and compare SAARC and ASEAN countries with respect to each of the considered questions, that in turn lead to our findings and discussions sections of the article. We use the R statistical software and relevant packages to conduct all analyses.

4. Findings

4.1. Demography

Figures 1 and 2 reflect the demographic attributes of the participants to the GFD survey (Demirguc-Kunt et al. 2018; World Bank 2018a) in SAARC and ASEAN countries, as determined from the respective microdata (World Bank 2018b). We note that while the sample size for most countries was approximately 1000, some countries were represented by a larger sample size. Considering this variation in sample size, the subsequent analyses are performed based on percentages of participants, and this allows a reasonable comparison across the relevant countries and regions.

Country	Total Participants
Afghanistan	1,000
Bangladesh	1,000
India	3,000
Nepal	1,000
Pakistan	1,600
Sri Lanka	1,104
SAARC	8,704

Figure 1. Demographic information of participants from SAARC countries.

Country	Total Participants
Cambodia	1,600
Indonesia	1,000
Lao PDR	1,000
Malaysia	1,004
Myanmar	1,600
Philippines	1,000
Singapore	1,000
Thailand	1,000
Vietnam	1,002
ASEAN	10,206

Figure 2. Demographic information of participants from ASEAN countries.

Further to sample size, the demographic attributes of participants across the countries and regions also varied notably (Figures 1 and 2). For SAARC countries, except for Nepal and Sri Lanka, there is a balanced representation of male and female participants. For ASEAN countries, however, most countries had more female than male participants. For countries from both regions, the majority of the participants fall within the [25, 55] age group—the age category that involves individuals in the prime of their working life (OECD 2021) (note: [X, Y] implies $X \leq Age < Y$). There is also a notable representation of the age group [15, 25]—the age group of new workers (OECD 2021). There are fewer representations of individuals in the retired age bracket or nearing retirement age [55, 65] (OECD 2021) and older people (65+). Age value for a few participants in the different countries is missing.

Of particular interest is the demographic distribution with respect to education level. The survey recorded participants’ education levels across the categories of completing primary education or less, secondary education, and tertiary education or more. A few participants across countries refused to answer the education question or responded as “don’t know” or the respective information is missing—these have been grouped in this article as the category “other education”. Participants with, at most a primary education level, and those with a secondary education level, constitute the majority across countries. However, multiple ASEAN countries have a higher percentage of participants with a secondary education level than those with an at-most primary education level, except for Bangladesh and Sri Lanka participants where an at-most primary education level exceeds those with secondary levels in SAARC countries. Among ASEAN countries, Malaysia and Singapore have a sizeable percentage of participants with at-least tertiary education levels.

When assessed overall, the demographic patterns for the two country groups (i.e., regions) are comparable with similar percentage representations in terms of gender, age, and education levels.

4.2. Use of Digital Technologies

The GFD questionnaire inquired if participants have used a mobile phone or internet for payments, purchases, or cash transactions. This questionnaire item could be linked to the use of digital technology and the responses therefore could be of interest to FinTech services such as payments. The responses could also be of interest for e-commerce and businesses going digital, especially within the ongoing COVID-19 context, who could form partnerships with various FinTech providers such as payment services to ease customer acquisition and financial management. Figure 3 shows the results to this question for both groups of countries.

Figure 3. Percentage of participants who used a mobile phone or the internet for payment, purchase, or cash transactions.

Overall, in 2017, when the GFD survey was published, participants from ASEAN countries appeared to be higher users of digital technologies than those from SAARC countries. Arguably, this difference originates from the socio-economic difference and the education levels reflected by the differences in demographic patterns shown in Figures 1 and 2. Among the ASEAN countries, the main users of digital technologies were from Singapore and Malaysia. There were also notable digital technology users from Thailand, Vietnam, Indonesia, and Bangladesh, with over 5% of participants using mobile phones, internet payments, purchases, or cash transactions. Thus, for FinTech companies, as of 2017, these countries represent potential markets, especially ASEAN countries.

4.3. Barriers to Having a Bank Account

The GFD questionnaire asked participants what they considered to be the main barriers to having a bank account. Such barriers could also be interpreted as opportunities or challenges for FinTech expansion. For instance, a participant indicating financial institutions being far away from their place of residence or viewing such services as expensive may be interested in considering FinTech services as an alternative, especially since mobile money and other FinTech services have often emerged just to address these types of barriers across countries. By contrast, an individual having religious thoughts as a barrier or not feeling the need to have a formal bank account may also perceive the same barriers when considering FinTech services as an alternative. Thus, it is interesting to note how participants from SAARC and ASEAN countries view barriers to having a bank account, and which can then correspond to opportunities and challenges for FinTech expansion in the respective regions.

Figure 4 shows the percentage of participants who responded “yes” to each of the barriers to possessing a bank account. We note that having insufficient funds is indicated as a top barrier by participants from both regions. Unsurprisingly, participants from Singapore were least resistant to having a bank account, while participants from Malaysia, Thailand, and India also indicated having the lowest levels of resistance to possessing a bank account. By contrast, participants from Afghanistan, Cambodia, and the Philippines indicated resistance to having a bank account. The outcome is an indication of the variation in banking and financial context across these countries. From a larger regional perspective, the patterns of barriers have similarities for both the SAARC and ASEAN regions. In both regions, overall, having insufficient funds is the primary barrier. In SAARC regions, the next two most notable barriers relate to financial services being expensive and a view that such services are not needed. Barriers in the ASEAN regions related to missing documentation and financial institutions being too far away, and a perception that such a service were not needed.

4.4. Savings Behaviour

The GFD also captures the savings behaviour of participants, and the outcomes should be of interest to different FinTech services. Figure 5 shows the percentage of participants across countries who have saved money using a bank account or similar formal financial institution, and those who saved money by adopting informal approaches such as local saving facilities or people other than family members. Noticeably, participants from Singapore, Malaysia, and Thailand appear to be the higher users of formal bank accounts. This outcome corresponds to the low percentage of participants who indicated a reluctance to having a bank account in Figure 4. Differences were also noted between the two regions. Overall, participants from ASEAN regions appear more accustomed to using formal financial institutions for saving than those from the SAARC regions. From a FinTech expansion perspective, the outcome is interesting. An individual who already uses a formal bank account may feel motivated to consider FinTech alternatives such as personal financial service apps, and neobanks. Those who already use informal approaches, by contrast, may be less inclined to use such services unless the value propositions from FinTech services outweigh the informal offerings already used. From this respect, there

appears to be greater opportunities for FinTech services in the ASEAN regions than in the SAARC regions.

Figure 4. Cumulative percentage of participants indicating barriers to having a bank account.

The GFD survey also asked several savings behaviour questions that would be relevant to FinTech providers. Participants were asked the reasons why they saved money. The two reasons offered were to start or operate a business and to save for old age. Participants who save money for business purposes may be entrepreneurial in nature and therefore may be interested in alternative forms of finance such as crowdfunding. Businesses also need to take out insurance policies and comply with various rules and regulations. Individuals running businesses may consider using FinTechs such as InsurTech (insurance technologies)

and RegTech (regulatory technologies). Neobanks may also appear as viable alternatives for these individuals, as well as for those who save money for old age. Saving money for old age may open the possibility of providing personal financial services in the FinTech space.

Figure 5. Cumulative percentage of participants who saved money in a bank or a financial institution, and who used informal approaches, such as a group, or a club, or a person beyond the family.

Figures 6 and 7 show the percentage of participants from ASEAN and SAARC regions who saved money to help start a business or for old age. Again, differences in the two regions’ socioeconomic contexts influence opportunities and challenges for FinTech services. Participants from these regions generally appear to save money more for old age than business purposes—an indication that personal financial management holds notable potential for FinTech services in these regions. Participants from the Philippines, Thailand, and Vietnam appear to be notable savers of money for business purposes—implying good potential for neobanks, crowdfunding, InsurTech, and RegTech. In contrast, with a lesser percentage of participants saving money for business purposes in the SAARC regions, relevant FinTechs are likely to face greater challenges to expansion in these countries.

4.5. Borrowing Behaviour

The GFD also asked participants views on their borrowing behaviour, especially whether they had borrowed money from a formal financial institution such as a bank, informal sources, or from friends, family, and relatives. The questionnaire also gathered information regarding the purpose of borrowing. Figure 8 shows the source of borrowed funds for participants across countries. The pattern of results was like those for saving behaviour. Participants from ASEAN countries showed up as being higher borrowers of funds from banks and financial institutions than participants from SAARC countries. This suggests that potential expansion opportunities for FinTech lending services, such as peer-to-peer lending exist in ASEAN regions. Also, a large percentage of participants in both regions tend to borrow from friends, family, or relatives. This culturally influenced phenomenon could mean that FinTech services may face challenges to expand, especially with convincing people in these two regions to consider FinTech borrowing services. If Fin-

Tech services can be successfully introduced into some family units then it might convince others to follow suit, especially if this is followed up with word-of-mouth initiatives and various branding strategies.

Figure 6. Percentage of participants who saved money for starting or operating a business.

Figure 7. Percentage of participants who saved money for old age.

Figure 8. Percentage of participants who borrowed money from a bank or a financial institution, and who borrowed from informal sources, friends or family, or relatives.

Figures 9–11 reflect the percentage of participants who borrow for real estate purchases, health reasons, and business purposes. These results should be of interest to different FinTech organisations. Borrowing to purchase assets coincides with the business interests of neobanks, or other property-oriented FinTech organisations. Borrowing for health reasons should be of interest to InsurTech organisations, especially those offering health insurance services. Lastly, borrowing for business purposes should be of interest to FinTechs such as crowdfunding, RegTech, and InsurTech. Figures 9 and 11 highlight that participants in ASEAN countries are more inclined to borrow money to purchase property or to help start and operate a business than their SAARC counterparts. Figure 10 shows the opposite. That is, participants from SAARC countries are more inclined to borrow for health reasons than those from ASEAN countries. These results indicate that there is potential for FinTech services to be introduced into those markets where gaps exist.

Figure 9. Percentage of participants who borrowed money for purchasing property or land.

Figure 10. Percentage of participants who borrowed money for medical or health reasons.

Figure 11. Percentage of participants who borrowed money for starting or operating a business.

4.6. Receipt of Payments in Cash versus Cards

The GFD asks participants if they have received certain types of payments directly via cash or card. Using a card linked to a financial institution could imply a tendency to use cashless banking, which would be of interest to those FinTechs that are involved with cashless transactions. Figures 12–15, respectively, indicate the percentage of participants receiving salary, government payments, agricultural activity payments, and self-employment payments via card as opposed to cash. It should be noted that there are several missing values in response to these questions across countries—a reason why low percentages are noted for both mediums of payments. However, as is evident from those who did respond, participants in both regions largely rely on cash for transactions. This outcome is both an opportunity and a barrier for FinTech payment services. On the one hand, an attractive value offering could motivate individuals in the regions to move to cashless FinTech alternatives. On the other hand, shifting such behaviour at a mass scale could be a challenge.

4.7. Mobile Phone and Mobile Money Account Ownership

FinTech services are often provided as a mobile phone app, and thus mobile phone ownership can reflect opportunities for penetration into the market. The GFD questionnaire asked participants if they own a mobile phone. The questionnaire also asked participants if they have used a mobile money service, which in turn translates into the potential to initiate various FinTech services. Figure 16 shows that a large percentage of participants in both regions own mobile phones. However, except for Bangladesh, the percentage of participants using mobile money accounts was below 15%—an indication that while FinTechs have substantial potential for expansion in the regions, the expansion is nowhere near its full potential. Thus, there remain opportunities for FinTech services to plan growth in the respective markets while overcoming various barriers.

Figure 12. Percentage of participants who received money from employers in cash or via card.

Figure 15. Percentage of participants who received money from self-employment activities in cash, and via cards.

Figure 16. Percentage of participants who own a mobile phone, and who possess a mobile money account.

4.8. FinTech Opportunity Index

Further to the described statistical analysis, we have summarised the opportunities and barriers for FinTech expansion into the ASEAN and SARRC regions by developing a unique index, which we refer to as the “FinTech Opportunity Index” (FOI). In developing the index, we characterised the borrowing, saving, digital payment usage, payment–receipt behaviour, and the barriers to having a bank account as having either a positive or a negative impact on the expansion of FinTech. We then accumulated the effect in terms of a score. Table 2 shows the score calculation and accompanying explanation, as well as the variable names we used to represent the criteria. The first two and last two criteria, concerning, respectively, account and mobile phone ownership relate to the same GFD question, and, as such, they are both represented by the same criteria variable. In a later part of this subsection, we use the variables to conceptualise the robustness of the proposed index.

Literature in various fields of research refers to different methods of index construction (e.g., Kourlaba and Panagiotakos 2009; Li et al. 2012). Depending on its purpose, a researcher may allocate some scores to variables forming the index or sum scores across survey questions to provide an overview or undertake principal component analysis (PCA) and use the first PCA component to form a composite or index variable or adopt an appropriate multivariate analysis (Abeyasekera 2005). Indeed, a statistical approach was adopted by Huong et al. (2021) in constructing a FinTech adoption index for ASEAN countries. However, while Huong et al. (2021) formed an index based on macro-level or summary data such as total transaction values across different FinTech services and respective total users, we, in this research, have focused on micro-level (i.e., individual level) information concerning financial inclusion. Thus, the information we consider is of a different nature compared to that considered in Huong et al.’s (2021) study.

Table 2. FOI calculation and explanations.

Subjective Behaviour or Indicated Barrier to Financial Inclusion (the Symbol in the Bracket Represents a Variable Name for the Respective Criteria)	Effect on FOI	Explanation
Does not have a bank account (C1)	+0.5	Not having a bank account implies that FinTech services may be a viable alternative for an individual. Simultaneously, this may also mean the individual is not interested in using a formal financial service—implying that FinTech services may face challenges in attracting such a customer.
Has a bank account (C1)	+1.0	Having a bank account could imply that FinTech services may also attract the respective individual.
Does not have a bank account because:		
- Far away (C2)	+1.0	If financial institutions being far away is considered a barrier to having a bank account, FinTech services may appear as a viable alternative.
- Expensive (C3)	+1.0	FinTech services may offer a cheaper alternative.
- Missing documents (C4)	+1.0	FinTech services may involve fewer administrative steps.
- Mistrust (C5)	−1.0	Mistrust for formal financial institutional services may also impact penetration of the FinTech services.
- Religion (C6)	−1.0	Same as the barriers associated with mistrust.
- Insufficient funds (C7)	+0.5	FinTech services can often be obtained at a cheaper cost commitment; however, having insufficient funds may also lead to individuals not feeling the need to obtain such services.
- Duplication (C8)	−1.0	Not having a bank account because another family member has one may have a similar effect on FinTech expansion.
- Unneeded (C9)	−1.0	Same as the barriers associated with duplication.
Save money		
- in a financial institution (C10)	+1.0	Individuals who already use formal financial institutions for saving may be interested in FinTech alternatives.
- Informally (C11)	−1.0	FinTech services may face challenge to attract individuals who are not accustomed to using formal financial services.
Borrow money		
- from a financial institution (C12)	+1.0	Individuals already using formal financial institution for borrowing may be interested in FinTech alternatives
- family, friends, or relatives (C13)	−1.0	Individuals borrowing from informal sources or sources outside formal institutions may not be interested about relevant FinTech services.
- informal sources (C14)	−1.0	
Uses mobile phone or internet for payment, purchase, or cash transactions (C15)	+1.0	Individuals accustomed to online or mobile purchase, payments, and cash transaction facilities are likely to consider relevant FinTech services.
Mobile phone ownership (C16)	+1.0	FinTech services are very often provided as mobile apps and thus, having a mobile phone implies potential to use FinTech services.
Not owning a mobile phone (C16)	−1.0	Not having a mobile phone may create barriers to use FinTech services.

We faced another challenge in creating the index. The GFD survey (Demirguc-Kunt and Klapper 2012; World Bank 2018b) was not conducted specifically to assess FinTech development as it was more geared towards understanding the issues impacting financial inclusion at the individual and country levels. We, in this research, however, interpreted the survey items in terms of opportunities for and barriers to different FinTech services,

as was explained in the results presented in the prior subsections. In other words, we hold an epistemological orientation similar to interpretivism (Hiller 2016), which is often applied in a qualitative undertaking. Such an interpretivist epistemology expects theories to emerge from data and accommodates knowledge creation in terms of “contextual meanings” (Hiller 2016). Similarly, by working with the quantitative GFD data, we, in this research, interpret the GFD questionnaire in terms of how different FinTech services may appeal to an individual depending on his/her various financial inclusion status and the contextual implications thereof. We then assign the scores indicated in Table 2 based on this interpretation. Overall, our approach corresponds to the approach of assigning scores by a researcher when constructing an index (Abeyasekera 2005). Indeed, such arbitrary scoring based on some judgement for index construction is not uncommon, such as in the health field (Kourlaba and Panagiotakos 2009), and in this research we follow a similar approach.

As noted in Table 2, for each of the financial inclusion criterion, we consider three different scores: -1.0 , 0.5 , 1.0 . There is a rationale behind such choices. For example, an individual may not have a traditional bank account because the financial institution is far away, or he/she feels maintaining a bank account is expensive, or the individual may lack documents to open a bank account. We assume that these individual circumstances may impose a positive impact on our proposed index, since FinTech services have historically often evolved across countries to address these difficulties. Often FinTechs can bring financial services to consumers at a low cost and well within the reach of mobile phones. By contrast, if an individual does not have a bank account because of some subjective mistrust or religious reason(s), the individual may hold a similar belief about FinTech services. Thus, we assume that these financial inclusion criterion may have a negative impact on the index. There are some criteria which could be interpreted as having a neutral effect on FinTech adoption by an individual. For example, if an individual does not have a bank account at all, the individual may adopt FinTechs as an alternative to traditional banking services, provided that the value propositions of FinTech services appeal to him/her. Simultaneously, the lack of bank account may also mean that the individual is not interested in using a formal financial service. This, in turn, implies that FinTech services may face challenges in acquiring the respective individual as a customer. For these grey-area situations, we have assigned a score of 0.5 . With our focus on identifying opportunities for FinTech development in SAARC and ASEAN regions, and this positive score implies a bias towards the possibility of FinTech adoption, while also accommodating the potential barriers for such adoption.

Overall, while the scores assigned are arbitrary, they were chosen upon certain rationales. Our use of subjective interpretation and scores was motivated by the need to gain insights into the opportunities for FinTech services emerging from the GFD information for respective countries and economies. Thus, our epistemological stance is contrary to a positivist epistemological orientation, which is focused on proving a theory. We consider the outcomes of the FOI analysis as supplementary to the descriptive statistical analysis conducted in prior subsections, while also acknowledging the subjectivity in conceptualisation.

We also explore the statistical aspects of the proposed index to conceptualise its robustness. First, we recode the GFD information corresponding to the criteria indicated in Table 2 into binary variables where a value of 1 indicates that the respective criterion has been satisfied. We then determine the Cronbach’s alpha (Taber 2018) for the binary variables representing the criteria indicated in Table 2.

Table 3 shows the outcome of assessing Cronbach’s alpha. The criterion C15 is excluded due to many missing values not allowing its inclusion in the statistical process. Cronbach’s alpha is a reflection of whether a set of variables measure a similar thing, which then justifies their inclusion in designing a composite variable (i.e., an index) (Taber 2018). While there is a traditional view that the Cronbach’s alpha for a set of measurement variables should be high and a threshold of at least 0.7 is often recommended, an alternate view argues that a low alpha value does not discount the usefulness of the respective measures and there needs to be a focus on an interpretation of the measures (Taber 2018). We note

in Table 3 that the alpha value for the criteria composing the *FOI* is below 0.7, however the value of 0.54 falls within the “acceptable” or “sufficient” range outlined in some works (Taber 2018). We, therefore, undertook further analysis on the robustness of the *FOI*.

Table 3. Cronbach’s alpha for the variables characterising *FOI*.

Standardised Alpha When Considering All Criteria	Average Inter-Correlation between Criteria	Criteria	Standardised Alpha If the Criteria Are Dropped
0.54	0.07	C1	0.51
		C2	0.50
		C3	0.49
		C4	0.51
		C5	0.51
		C6	0.52
		C7	0.54
		C8	0.53
		C9	0.52
		C10	0.52
		C11	0.52
		C12	0.53
		C13	0.53
		C14	0.50
		C16	0.53

Table 4 shows the correlation matrix for the binary coded criteria variables and the *FOI*. Of particular interest are the correlation coefficients of between *FOI* and the criteria variables. We note that the coefficients are all statistically significant. As explained earlier, the *FOI* was developed using composite assigned scores based on the criteria and not upon the binary criteria variables themselves. Thus, the outcome that the *FOI* is statistically related to all criteria is an indication of the subjective scores’ suitability in developing the index. Furthermore, the interpretation of the coefficients makes sense. For example, the coefficient between the *FOI* and *C16* (mobile phone ownership) is 0.60—implying that there is a reasonably strong positive relationship between an individual having mobile phones and adopting FinTech services. On the same note, we observed a statistically negative relationship between the *FOI* and *C14* (an individual prefers to borrow from informal sources rather than formal financial services)—which also makes sense, since such individuals may not feel comfortable adopting FinTech services. The other coefficients can be interpreted similarly. Moreover, as noted in Tables 3 and 4, the correlation coefficient between the criteria variable is low on average. This is an indication that the proposed composite variable (i.e., *FOI*) is not significantly affected by intercorrelations between the constituent criteria variables, and therefore supports the notion that the *FOI* could act as a potential measure to characterise the adoption opportunities of FinTech services in all regions.

Figure 17 shows the distribution of the *FOI* across the countries by boxplots, with the middle bar indicating the median. We note that, except for Sri Lanka, the *FOI* in SAARC countries has tended to remain at similar median levels. The median *FOI* for ASEAN countries overall exceeds that of SAARC countries, an indication that FinTech services appear to have a higher opportunity in the ASEAN regions as compared to the SAARC regions. We gain further insights concerning the *FOI* in the next section.

Table 4. Correlation matrix between criterion variables and the *FOI*. The bolded values are statistically significant at 95% confidence level.

Figure 17. Distribution of the FinTech Opportunity Index (*FOI*).

4.9. Regression Analysis

We conducted a regression analysis to understand the impact of demographic factors on opportunities for FinTech services, conceptualised by the *FOI*, in SAARC and ASEAN countries. We considered the following model:

$$FOI_{ij} = Gender_{ij} + Age_{ij} + Education_{ij} + \varepsilon_{ij} \tag{1}$$

Thus, for an individual *i* from country *j*, we assume that the individual’s gender, age group, and education level have an impact on the *FOI* for that individual. As discussed in the previous section, the *FOI* inherently considers individualistic saving and borrowing behaviour, perceptions about barriers to financial inclusion, and ownership of mobile phone and bank accounts to capture the opportunities for FinTech services. Thus, Equation (1) extends the previous analysis by also capturing the demographic impact on FinTech opportunities. We conducted a regression analysis based on Equation (1) for both SAARC and ASEAN countries separately, as well as a pooled regression combining information from both groups of countries.

Additionally, we consider that the country an individual is from will also have an impact on the business context of FinTech services. Consequently, further to Equation (1), we consider a fixed-effect panel data model as shown in Equation (2) which inherently captures the effects of country level variables such as GDP, innovation, labour market status, inflation, interest rate, and other macro and micro-economic variables.

$$FOI_{ij} = Gender_{ij} + Age_{ij} + Education_{ij} + Country_j + \varepsilon_{ij} \tag{2}$$

Table 5 shows the regression outcome. We note that the models are statistically significant, as evident from the F-scores. Also, while the R² values are low, the residual standard error is within ±1.52, implying that the model deviates from the true *FOI* only by a small margin.

Table 5. Regression outcomes for SAARC, ASEAN, and combined-data (Equation (1)), and fixed-effect models (Equation (2)).

	Dependent Variable			
	FOI			
	SAARC	ASEAN	Combined	Fixed Effect
Gender: Male	0.353 *** (0.032)	0.144 *** (0.031)	0.195 *** (0.022)	0.273 *** (0.021)
Age: [25, 55)	0.209 *** (0.039)	0.145 *** (0.041)	0.209 *** (0.029)	0.122 *** (0.027)
Age: [55, 65)	0.107 * (0.061)	0.160 *** (0.054)	0.265 *** (0.041)	−0.033 (0.039)
Age: [65, 99]	−0.012 (0.070)	−0.295 *** (0.060)	−0.059 (0.046)	−0.431 *** (0.044)
Education: Primary	0.139 (0.421)	0.463 *** (0.123)	0.184 (0.117)	0.577 *** (0.114)
Education: Secondary	0.731 * (0.422)	0.966 *** (0.124)	0.795 *** (0.118)	0.965 *** (0.114)
Education: Tertiary	1.179 *** (0.426)	1.767 *** (0.129)	1.572 *** (0.123)	1.530 *** (0.117)
Constant	0.305 (0.423)	0.710 *** (0.126)	0.588 *** (0.119)

Residual Std. Error	1.458	1.519	1.518	
F Statistic	94.214 *** (df = 7; 8694)	140.931 *** (df = 7; 10,196)	249.804 *** (df = 7; 18,898)	178.652 *** (df = 7; 18,884)

Note: * *p* < 0.1; ** *p* < 0.05; *** *p* < 0.01.

We also consider the influence that demographic attributes have on the *FOI*. We note that gender has a statistically significant positive impact on the *FOI*, irrespective of the country group and regression and fixed-effect analysis (Table 3). This is an indication that, in the regions considered in this research, males are more likely to adopt FinTech services than females. Furthermore, the analysis notes that the age group between 25 and 55 has a statistically significant positive impact on the *FOI*—an indication that individuals aged within the established working career age group are more likely to adopt FinTech services. Of particular interest is the statistically significant negative impact on the *FOI* for the age group between 65 and 99—an indication that elderly individuals in the regions may not be as open to FinTech expansion when compared with the younger age groups. Also, there is a statistically significant positive impact of the age group [55, 65) on the *FOI* in both country groups, even though a statistically significant effect is not noted for fixed-effect analysis. We further find that having tertiary education or above has a statistically significant positive impact on the *FOI* for both SAARC and ASEAN countries. Additionally, having secondary education has a statistically significant positive impact for ASEAN countries. This is an indication that more highly educated individuals are more receptive to FinTech expansion in the regions. Also, individuals from ASEAN countries appear more likely to be FinTech adopters.

5. Discussion

Assessment of the GFD reveals some interesting insights that are particularly relevant to the expansion of FinTech services across markets, including those from the SAARC and ASEAN regions. First, it is notable that the opportunities for FinTech services in the two regions vary. With a higher percentage of participants already using a mobile phone or internet for payment, purchase, or cash transactions in countries such as Singapore, Malaysia, Thailand, Vietnam, Indonesia, and Bangladesh, it could be argued that FinTechs, and associated services hold potential opportunities in these countries, while the opportunity for development in other countries is less evident. Indeed, research suggests that users' trust that smartphones meet usage expectations, and their familiarity with smartphones, will positively influence the continued use of technology (Idemudia and Raisinghani 2014). A recent study noted that users' experience with mobile payments and transfers were significant factors that influenced their adoption of mobile investment technologies (Fan 2021). Thus, individuals not accustomed to digital technologies such as the internet or mobile phones for payment, purchase, or cash transactions may not be interested in adopting innovative services such as FinTechs. For these reasons, irrespective of the service provided, FinTechs companies may face obstacles in some ASEAN and especially SAARC countries. The FinTech services that are in use in SAARC countries mainly relate to mobile money and payment services. By contrast, in ASEAN countries such as Singapore, Malaysia, and Thailand, where there are supportive regulatory sandboxes and policies (Laik and Wei 2019), and where the GFD shows a notable interest in technology usage, a variety of FinTech services have grown and prospered in recent years.

The diversity of barriers faced in the different SAARC and ASEAN countries, particularly those related to having a bank account, is informative and provides the basis for further insights. In particular, having insufficient funds is a principal barrier across most regions, but especially in SAARC countries. This finding corroborates with the way FinTech expansion has occurred in the regions. As indicated earlier, in countries such as Afghanistan and Myanmar, costs associated with infrastructure and services have hindered FinTech adoptions (Aye 2021; Lukonga 2021). FinTechs can reduce operational, transaction, and intermediation costs (Miskam et al. 2019). Therefore, for FinTech services to develop in these regions, it is imperative that FinTechs consider and promote the cost benefits their services bring to consumers (Tapanainen 2020). As research points out, FinTech companies often collect customer data but it is unclear to what extent the data is used to achieve efficiencies and reduce costs as opposed to achieving profit (Tapanainen 2020). Arguably, opportunities for FinTech expansion in SAARC and ASEAN regions (where insufficient

funds can be a principal barrier to having a bank account) will largely depend on market research and highlighting the cost advantages to end users.

Also, while some studies have emphasised the availability of special services such as Islamic FinTechs (e.g., [Ahmad and Mamun 2020](#); [Haqqi 2020](#); [Miskam et al. 2019](#)), religion of itself does not appear to be a notable barrier to having bank accounts in either region. Rather, analysis reveals there are more significant barriers to financial inclusion that FinTech services will need to address if they are hopeful of gaining further inroads into these two regions. In the ASEAN region, for example, missing documentation is seen as a significant barrier in enabling potential customers to open a bank account. To achieve feasible growth in the ASEAN region it is important for FinTech services such as RegTechs to develop more accessible and user-friendly authentication procedures, which would enable the less technology-savvy consumers to access FinTech services. Research already points to the need for innovative authentication processes in Brunei ([Haqqi 2020](#)). Thailand's central platform for verification of individual identity is viewed as supportive to the development of different FinTech services ([Moenjak et al. 2020](#)). It should also be noted that insufficient funds and user mistrust is noted as a considerable barrier to having a bank account in both the SAARC and ASEAN regions, and such mistrust is likely to hinder FinTech developments in the absence of a robust regulatory framework. Arguably, the expansion of FinTechs in both regions will depend on the extent of RegTech developments within the respective framework environment of each country.

One aspect this article focuses on, and which stands out compared to the focus in the extant literature, is the saving, borrowing, and payment–receipt behaviours of individuals in the regions. Overall, participants from the ASEAN regions appear to be higher savers and borrowers of money for business activities than those from SAARC regions. Business entrepreneurship and growth require funds. Crowdfunding and peer-to-peer lending can be viable sources for raising such funds ([Nepali 2021](#); [Yunus 2019](#)). There is high growth potential for business-associated FinTechs such as crowdfunding, peer-to-peer lending, InsurTech, and RegTech in ASEAN regions. Conversely, each of these FinTech services face difficulties when expanding, especially in SAARC countries. We argue that supportive policies and regulation that encourage entrepreneurship and business financing would considerably improve the likelihood of FinTech development in these two regions.

Participants from ASEAN regions, on average, are higher savers of money for old-age security and are higher borrowers of money for purchasing assets than those from SAARC countries. This implies a positive attitude towards investments in the ASEAN region, which in turn corresponds to opportunities for FinTech development in the form of personal financial management, and WealthTechs.

Participants from SAARC regions, on average, however, appear to be higher borrowers of money for health purposes than those from ASEAN regions. Arguably, this reflects the diversity of health care systems in these regions. There is a push for a universal health care system in many ASEAN countries ([Van Minh et al. 2015](#)), and despite some inequalities, health care services cover much of the ASEAN population ([Van Minh et al. 2015](#)). Although there are some publically-funded health services, health care costs in many of the SAARC regions can be very high ([Hassan et al. 2014](#)). Thus, there lies opportunities for the development for FinTechs such as InsurTechs covering health insurance, as well as low-cost borrowing services such as LendTechs and neobanks in SAARC countries.

Research notes that mobile payments can be viewed by users as providing additional convenience compared to bank card payments ([Dorotic and Pauwels 2020](#)). Arguably, this implies that people are used to using bank cards, which can pave the way for advanced FinTechs linked to payment services. However, since most of the population in both the ASEAN and SAARC regions still prefer cash over bank cards when receiving different types of money, FinTech expansions in these regions face the challenge of attracting new consumers, especially within the population who remain outside the formal banking sector and who are not accustomed to using bank cards. Indeed, this challenge becomes evident from the noticeable gap in both regions between the percentage of participants using mobile

phones and those having mobile money accounts. Marketing literature suggests that, in the modern era, educating customers about the process and benefits of using technological products will influence their usage decisions (Lewnes and Keller 2019). There is also a view that market penetration by a single technology product can be difficult in the modern era, and there is a need for collaboration and partnership (Lewnes and Keller 2019). Considering this, the expansion of FinTechs in the SAARC and ASEAN regions depends not only on providing cheaper services and bringing convenience or efficiency to the end users, but also on how providers collaboratively promote their service and educate end users to make best use of the technologies.

The regression analysis, along with the newly developed index revealed some interesting insights. A study involving Malaysian participants (Tun-Pin et al. 2019), concluded that males were the more likely adopters of FinTech services than were females. Our analysis of both the SAARC and ASEAN regions is consistent with the findings of Tun-Pin (Tun-Pin et al. 2019). Additionally, the elderly population beyond retirement age (i.e., those aged 65 and over) appear less likely to adopt or use FinTech services as compared to the younger-aged population. Thus, it seems that the elderly and women represent untapped markets. Research suggests that women in SAARC countries have low awareness of mobile money awareness (GSMA 2019). Another study, also involving the same data as this article (World Bank 2018a), points to the gender divide in financial inclusion in ASEAN countries, especially with women more likely than men to use cash for payments (Cheah et al. 2021). Research among elderly people suggests that they are less likely to adopt technologies if they feel stressed by such use and if their expectations are not met (Golant 2017). According to modern marketing literature, there is an argument to promote FinTech services to the least receptive cohorts in SAARC and ASEAN regions (Lewnes and Keller 2019), by highlighting their potential benefits. Indeed, the positive impact of secondary and tertiary education levels on FinTech opportunities corroborate the importance of education in promoting FinTech adoptions in the regions.

Overall, in SAARC and ASEAN regions, just promoting and branding FinTech services as alternatives to formal services may not achieve sufficient traction. There is a need to plan value propositions according to the savings, borrowing, and payment practices in the respective markets. An obstacle for SAARC initiatives in achieving the desired outcomes of integration of technology into financial services offerings, and hence economic development, has been the lack of an essential agreement between SAARC nations (Pandey et al. 2019). ASEAN countries, in contrast, demonstrate a moderate level of financial and banking integration (Fry-McKibbin et al. 2018; Zhang and Matthews 2019). This divergence might help explain regional variations between SAARC and ASEAN countries in terms of the opportunities and challenges of FinTech expansion, with ASEAN countries appearing more conducive in this respect.

6. Conclusions

This article explores the opportunities and barriers of FinTech developments in the SAARC and ASEAN regions. We use the GFD data collected in 2017 to conduct a comprehensive analysis of responses to the GFD questionnaire from various angles. Overall, it is noted that FinTech services hold potential opportunities for expansions in the ASEAN region, while expansion in the SAARC region is more problematic. There also lies different levels of opportunities for different categories of FinTechs in the regions. Services such as crowdfunding, neobanks, and InsurTech have sound growth potential in the ASEAN region, especially with the positive attitude towards entrepreneurship and asset investments. In the SAARC regions, InsurTechs linked to health care, LendTechs, and neobanks have growth potential. Additionally, we note the need for innovative promotions and the education of users about the benefits of technologies in both regions to motivate cohorts that are less likely to adopt FinTech services. We also develop an opportunity index that helps facilitate further insights into the opportunities and barriers to FinTech expansion.

As with most studies, this research also has certain limitations. A limitation of this research relates to the fact that the GFD data was collected in 2017, and the results are dependent on participants that featured in the GFD. Although we assume that the context, despite some changes in recent years, has not shifted significantly, future research could explore FinTech in the regions further with recent information and potentially a larger participant base. Another limitation of the research is that we have assumed that the opportunities for FinTech may also translate into profitable developments in the region. Such may or may not be the case, depending on context. However, with a notable interest concerning FinTech in each region and a lack of research that explores this issue, the outcomes derived can still be of interest to relevant business leaders and policy makers and guide further research in the field. Lastly, as explained earlier in this article, the scores assigned in index development are subjective and the outcomes are to be considered with such subjectivity. Even so, as also reflected in the article, the index has both a rationale and statistical basis concerning its suitability. Future research will explore the index development further by including other data and considering other scoring approaches. Any future undertaking could also address another relevant issue, which could not be covered in this research due to lack of relevant data—how the index adapts when considering any change over time. Overall, despite some limitations, we are confident that we have contributed to the body of literature in this research domain with a unique analysis of FinTech opportunities and challenges in SAARC and ASEAN countries. The index and research findings should prove useful to different stakeholders and pioneer further relevant studies.
