January 2010

This report was prepared for the National Center for Education Evaluation and Regional Assistance, Institute of Education Sciences, under contract no. ED-04-CO-0040/0007 with SRI International.

This report is in the public domain. Authorization to reproduce it in whole or in part is granted. While permission to reprint this publication is not necessary, the citation should read: Blackorby, J., Schiller, E., Mallik, S., Hebbeler, K., Huang, T., Javitz, H., Marder, C., Nagle, K., Shaver, D., Wagner, M., and Williamson, C. (2010). *Patterns in the Identification of and Outcomes for Children and Youth With Disabilities* (NCEE 2010-4005). Washington, DC: National Center for Education Evaluation and Regional Assistance, Institute of Education Sciences, U.S. Department of Education.

IES evaluation reports present objective information on the conditions of implementation and impacts of the programs being evaluated. IES evaluation reports do not include conclusions or recommendations or views with regard to actions policymakers or practitioners should take in light of the findings in the report.

To order copies of this report,

- Write to ED Pubs, Education Publications Center, U.S. Department of Education, P.O. Box 1398, Jessup, MD 20794-1398.
- Call in your request toll free to 1-877-4ED-Pubs. If 877 service is not yet available in your area, call 800-872-5327 (800-USA-LEARN). Those who use a telecommunications device for the deaf (TDD) or a teletypewriter (TTY) should call 800-437-0833.
- Fax your request to 301-470-1244 or order online at www.edpubs.org.

This report is also available on the IES website at <http://ncee.ed.gov>.

Alternate Formats

Upon request, this report is available in alternate formats, such as Braille, large print, audiotape, or computer diskette. For more information, call the Alternate Format Center at 202-205-8113.

Acknowledgments

This study was a collaboration among technical and support staff at SRI, technical experts, and Institute of Education Sciences staff. The range and complexity of the many different data sources relating to the research questions as well as student age levels created a study that was both technically and logistically complex. This study was made possible only by the collective contributions of a large group of people. The listed authors were a small part of the project team. The authors acknowledge the important contributions of the following individuals:

- The technical working group—Elaine Carlson, Mark Innocenti, Mary McClean, Martha Thurlow, and Jim Ysseldyke provided valuable insights and guidance on analytic strategies and on early versions of the report.
- SRI—Mary McCracken, Cyndi Williamson, Ethan Miller, and James Van Campen contributed invaluable programming, data analysis, and data display expertise throughout the study. The production team of Roxanne Jones, Doris Perkins, Bonnee Groover, Ascencion Villanueva, and Wanda Washington worked tirelessly to produce and coordinate the production of tables, graphs, and text formatting. Careful and thoughtful editing support was provided by Meredith Ittner, Mimi Campbell, and Kathryn Morrison.

DISCLOSURE OF POTENTIAL CONFLICTS OF INTEREST

The research team for this study consists of key staff from SRI International. The organization and the key staff members do not have financial interests that could be affected by findings from the study. None of the members of the Technical Working Group, convened by the research team to provide advice and guidance, have financial interests that could be affected by findings from the study.

2.17	National percentage of former EI participants and of the general population for whom kindergarten teachers and parents reported cognitive outcomes, by IEP status for former EI participants	2-28
2.18	National percentage of former EI participants and of the general population for whom kindergarten teachers reported mathematics and early literacy outcomes, by IEP status for former EI participants	2-29
2.19	National percentage of former EI participants for whom kindergarten teachers reported negative behaviors	2-30
2.20	National social-emotional development outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category	2-32
2.21	National percentage of former EI participants for whom kindergarten teachers and parents reported social-emotional outcomes, by IEP status	2-33
2.22	National percentage of former EI participants for whom kindergarten teachers reported negative behaviors, by IEP status	2-34
2.23	National physical development outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category	2-36
2.24	National percentage of former EI participants and of the general population reported to have activity levels at kindergarten, by IEP status for former EI participants .	2-37
2.25	National percentage of former EI participants and of the general population reported by parents to have “fair” or “poor” health at kindergarten, by IEP status for former EI participants	2-38
2.26	National adaptive development outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category	2-39
3.1	National number of preschool-age children identified for services under IDEA, by age (2005)	3-4
3.2	National number and percentage of preschool-age children identified for services under IDEA, by age (1997–2006)	3-5
3.3	Trends in national percentage of preschool-age children identified for services under IDEA, by age (1997–2006)	3-6
3.4	National number and percentage of 3- through 5-year-olds identified for services under IDEA, by race/ethnicity (1998–2006)	3-7
3.5	Trends in national percentage of 3- through 5-year-olds identified for services under IDEA, by race/ethnicity (1998–2006)	3-8
3.6	National percentage of preschool-age children identified for services under IDEA, by disability category (2004 and 2006)	3-10
3.7	Percentage of 3- through 5-year-olds identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2005 average, and 2006)	3-12
3.8	Mean literacy, numeracy, and preacademic skills scores of 3- through 5-year-olds identified for services under IDEA (2005)	3-15

Exhibit	Page
3.9 Mean social skills, problem behaviors, self-care, and self-direction scores of 3- through 5-year-olds identified for services under IDEA (2005)	3-17
3.10 Mean emerging academic skills, social skills, and problem behavior scores of 3- through 5-year-olds identified for services under IDEA, by disability category (2005)	3-19
4.1 National number of school-age children identified for services under IDEA, by age (2005)	4-5
4.2 National number and percentage of school-age children identified for services under IDEA, by age group (1997–2005)	4-6
4.3 Trends in national percentage of school-age children identified for services under IDEA, by age group (1997–2005)	4-7
4.4 National number and percentage of 6- through 21-year-olds identified for services under IDEA, by race/ethnicity (1998–2005)	4-8
4.5 Trends in national percentage of 6- through 21-year-olds identified for IDEA services, by race/ethnicity (1998–2005)	4-9
4.6 National percentage of school-age children identified for services under IDEA, by age group and disability category (1997 and 2005)	4-12
4.7 Percentage of 6- through 17-year-olds identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2004 average, and 2005)	4-16
4.8 Percentage of 6- through 12-year-olds identified for IDEA services in December 1999 who were declassified by spring 2002, by disability category	4-19
4.9 Mean WJ III reading and mathematics scores of 6- to 17-year-old children identified for IDEA services, by classification status (2002)	4-20
4.10 Mean reading and mathematics scale scores of fourth- and eighth-grade students identified and not identified for services under IDEA (2003, 2005, and 2007) ...	4-23
4.11 Mean reading scale scores of fourth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)	4-25
4.12 Mean reading scale scores of eighth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)	4-27
4.13 Mean mathematics scale scores of fourth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)	4-29
4.14 Mean mathematics scale scores of eighth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)	4-30
4.15 Percentage of fourth-grade students identified for IDEA services performing at “basic or above” and “proficient or above” in reading, by state (2003)	4-33
4.16 Percentage of eighth-grade students identified for services under IDEA performing at “basic or above” and “proficient or above” in reading, by state (2003)	4-34

Exhibit	Page
4.17 Percentage of fourth-grade students identified for services under IDEA performing at “basic or above” and “proficient or above” in mathematics, by state (2003) ..	4-36
4.18 Mean WJ III reading scores of school-age children identified for services under IDEA: ages 7 through 14 (2001) and 16 through 18 (2002 and 2004), by disability category	4-38
4.19 Mean WJ III mathematics scores of school-age children identified for services under IDEA: ages 7 through 14 (2001) and 16 through 18 (2002 and 2004), by disability category	4-40
4.20 National percentage of youth identified for services under IDEA no longer in high school, by exit type (1998–2005)	4-42
4.21 National percentage of school-age youth who had been identified for services under IDEA and were no longer in high school, by exit type and disability category (2005)	4-43
4.22 National percentage of school-age youth identified for services under IDEA exiting high school with a diploma, by disability cluster and category (2003 through 2005)	4-45
4.23 National percentage of school-age youth identified for services under IDEA exiting high school by dropping out, by disability cluster (2003 through 2005)	4-47
4.24 National percentage of school-age youth identified for services under IDEA exiting high school by receiving a certificate of completion, by disability cluster (2003 through 2005)	4-48
4.25 National percentage of school-age youth identified for services under IDEA exiting high school by reaching the maximum age for service, by disability cluster (2003 through 2005)	4-49
4.26 Averaged freshman graduation rate of school-age youth identified for services under IDEA and total population, by state (2005 and 1998–2004 average)	4-51

Executive Summary

Patterns in the Identification of and Outcomes for Children and Youth With Disabilities

Reported here are the results of analyses to describe the patterns of identification and academic and developmental outcomes for children with disabilities, conducted as part of the 2004 National Assessment of the implementation of the Individuals with Disabilities Education Act (IDEA). This report provides background context for National Assessment studies on program implementation and effectiveness. It provides a national description of the outcomes of children identified for services under IDEA and, as appropriate, in comparison with the outcomes of samples including their nondisabled peers. The results are presented by the age groups that correspond with a federal and local emphasis on children younger than school age and in elementary, middle and high schools, ages 0–3, 3–5, 6–9, 10–13, and 14–17. Further, the findings are reported across a 10-year time frame as well as for a single time point, describing a comprehensive picture of identification patterns and outcomes for each age group. Finally, extant data sources were used for analysis rather than costly new data collection. This report objectively presents descriptive findings from these analyses and provides relevant contextual information, such as the legislative background on IDEA. This study was not designed to assess how outcomes presented in this report are affected by identification or declassification practices, nor is it designed to measure impacts of IDEA services on child outcomes.

Legislative Background

Since the 1960s, federal legislation has focused on educating children with disabilities, providing grants to improve education and services for the children and their families. In 1975, the Education of All Handicapped Children Act (EHA), also called Public Law 94-142, ensured that children and youth ages 3 through 21 with disabilities have equal access to an education. Through this law, the federal government offers grants to states to help support the direct services provided for children determined to be eligible under the law to receive a “free appropriate public education” (FAPE) in the general education environment “to the maximum extent appropriate.”

In a series of reauthorizations of this landmark legislation over the subsequent three decades, other provisions were added, including provision of federal funding to support services to 3- to 5-year-olds and infants and toddlers (ages birth through 2 years) with disabilities (P.L. 99-457). In 1990, P.L. 101-476 renamed the EHA as the Individuals with Disabilities Education Act (IDEA) and extended the law to support youth with disabilities in the transition to young adulthood. The reauthorization of IDEA in 1997 (P.L. 105-17) placed greater emphasis on improving students’ inclusion in accountability systems, giving them access to the general education curriculum, and improving their academic performance, including improving the developmental outcomes for infants and toddlers.

The most recent reauthorization of IDEA in 2004 (P.L.108-446) brought further evolution in the law. Although IDEA 2004 continues to ensure all children with disabilities receive a “free appropriate public education” (FAPE), amendments affected state and local policies by stipulating that children with disabilities *make progress* in the general education curriculum and *improve* their academic and developmental outcomes. The 2004 reauthorization was aligned

more clearly with the guiding federal legislation, the No Child Left Behind Act of 2001. Specifically, states are expected to align their performance goals and indicators for children with disabilities with their definition of adequate yearly progress (AYP) and report on graduation rates and drop-out rates. Children with disabilities are expected to participate in state assessment systems and demonstrate continued improvement and progress in their academic outcomes, including those students who take an alternate assessment. States publicly report on children with disabilities' participation and progress toward meeting state goals on the assessments with the same frequency and detail as for children without disabilities. For children receiving early intervention and preschool services under IDEA, greater emphasis is on targeting developmental and academic outcomes, including preliteracy and language skills, as specified in the Individualized Family Service Plan (IFSP) or Individualized Education Program (IEP).

IDEA 2004 also made changes affecting who could be served with IDEA funds. First, local education agencies can use a portion of the IDEA funds to provide early intervening services in grades K through 12 for students struggling with and needing additional academic and behavioral supports to succeed in the general education environment. Second, states are required to establish policies to prevent inappropriate overidentification by race and ethnicity of children with disabilities and to collect and examine data to determine whether significant disproportionality on the basis of race and ethnicity exists in the state and districts.

To implement the law, federal funds supplement state and local funds. Part C of IDEA provides states with grants to support early intervention services for infants and toddlers from birth through age 2 and their families. Part B, Section 619, provides states with funding specifically to support special education and related services for preschool-age children, ages 3 through 5. Part B, Section 611, provides grants to support states' special education services for school-age students, ages 3 through 21.¹ The total formula grants to states have increased in current-year dollars from \$3.78 billion in fiscal year (FY) 1997 to \$11.76 billion in FY 2008. In addition to the FY2009 annual formula grants, \$12.20 billion in IDEA funding was provided to States through the American Recovery and Reinvestment Act of 2009 (P.L. 111-5, also known as ARRA or the Recovery Act). To obtain these resources, states submit to the U.S. Department of Education (ED) their applications, which include assurances regarding how the State identifies children who are eligible for IDEA services, and ensures the provision of appropriate services to children with disabilities. States vary in the ways that they implement both the identification of eligible children with disabilities and the provision of IDEA services.

National Assessment of IDEA

Since its inception in 1975, IDEA has included provisions for collecting information on the implementation and impact of the law and reporting findings annually to the U.S. Congress. In subsequent reauthorizations of IDEA, Congress added provisions to conduct national assessments to evaluate service implementation and outcomes for children. For example, in response to the call for a National Assessment in the 1997 reauthorization, the U.S. Department

¹ Of the two remaining subparts of the law, Part A states the purposes of IDEA, including definitions of key concepts. Part D authorizes a discretionary program, the *National Activities to Improve Education of Children With Disabilities*, designed to support the implementation of IDEA, including research, technical assistance and dissemination, state improvement grants, and training personnel to educate students with disabilities.

of Education funded a portfolio of special studies including four longitudinal child-based studies² on specific age groups and three topical studies addressing key issues in special education.³

The 2004 reauthorization of IDEA also called for a National Assessment to measure the implementation progress of IDEA and the relative effectiveness of the law in achieving its purpose (Section 664(b)). The 2004 National Assessment was intended to build on work conducted under the National Assessment required by IDEA 1997 and to conduct new studies as appropriate. In response, the National Center for Education Evaluation at the Institute of Education Sciences (IES) initiated a design study advised by practitioners, researchers, and evaluation experts to develop research questions and approaches to address the goals for the 2004 National Assessment (Fiore et al. 2007). The design study translated the topics identified in the law into specific research questions. Information generated from answering the research questions through this National Assessment was intended to help federal policymakers and state and local administrators implement the law more effectively and to help federal policymakers shape future legislation regarding infants, toddlers, preschoolers, children, and youth with disabilities.

By December 2009, IES initiated six studies as part of the 2004 National Assessment: (1) analyses of extant data to provide descriptive information on the patterns in the identification of and outcomes for children with disabilities as background for subsequent studies on program implementation and effectiveness of services, (2) a study on state and district implementation of policies and practices for children with disabilities, (3) an evaluation study of the Personnel Development Program, (4) an evaluation of Response to Intervention strategies in elementary reading, (5) a study of school improvement status as it relates to students with disabilities, and (6) an evaluation of the Technical Assistance and Dissemination Program. SRI International was charged with conducting the first study, and findings from it are the subject of this report.

Patterns in the Identification of and Outcomes for Children and Youth With Disabilities

The topics of this study were (1) identification of children for early intervention and special education, (2) declassification of children who were no longer eligible for early intervention and special education services, and (3) outcomes for children identified for services under IDEA. Under an earlier contract, a design team had reviewed sources of national data already collected on special education and early intervention through other studies or as part of ongoing data collection systems, identified the sources that could be useful in addressing these three topics, and determined which topics were likely to be addressed with the available data and which would require collecting new data (Abt Associates and Westat 2007). Building on the work of the design team, this study addressed the following research questions using the extant data—

² These were the National Early Intervention Longitudinal Study (NEILS), examining children birth through age 2 and their families who received early intervention services; the Pre-Elementary Education Longitudinal Study (PEELS), addressing children receiving preschool special education services; and the Special Education Elementary Longitudinal Study (SEELS) and the National Longitudinal Transition Study-2 (NLTS2), which focused on 6- through 12-year-olds and 13- through 16-year-olds, respectively, who were receiving special education services when the studies began. (Details on these studies are in the Methodological Approach section of chapter 1 and appendix A.1).

³ These were the Study of State and Local Implementation of IDEA (SLIIDEA), the Study of Personnel Needs in Special Education (SPeNSE), and the Special Education Expenditure Study (SEEP).

that is, data already collected through other studies or as part of ongoing data collection systems—as a cost-effective means of addressing the following descriptive research questions for the National Assessment:

Key questions related to *identification*:

- What is the percentage of children identified for early intervention and special education services under IDEA? What is the variation in the percentage identified over time and by age, gender, race/ethnicity, and disability categories?
- What is the variation across states and over time in the percentage of children identified for early intervention or special education services under IDEA?

Key questions related to *declassification*:

- What percentage of children identified for early intervention and special education services lose eligibility (are declassified)?
- How do the developmental and academic outcomes for children who are declassified compare with those for children with disabilities who continue receiving services under IDEA?

Key questions related to *outcomes*:

- How do developmental and academic outcomes for children with disabilities identified for services under IDEA compare with those for children not identified for services under IDEA?
- How do developmental and academic outcomes for children with disabilities vary by disability categories within age groups and over time?

The research questions were examined for the three age groups covered under IDEA: infants and toddlers (birth through age 2), preschool-age (ages 3 through 5), and school-age children and youth with disabilities (ages 6 through 21).

In addition, the research questions addressed both one point in time and trends over time. The time frame most relevant for addressing research questions at one point in time was the most recent year of data available. For analyses of changes over time, 1997 was chosen as the starting point because it was the year of the last IDEA reauthorization before the 2004 reauthorization.

Two sets of analytic activities were conducted to address the research questions. A review of relevant literature was conducted to identify published sources of data and analyses of pertinent data sources from which findings were drawn. On the basis of this initial review, extant databases were selected to conduct new analyses addressing the research questions for this study. As a result, the following 14 datasets were selected that targeted the age ranges of interest and the time frame most relevant for this study:

Population data on children identified for services under IDEA:

- Data Analysis System (DANS)
- State Annual Performance Reports (APR)

Population data used for identification and graduation ratios:

- Common Core of Data (CCD)

- U.S. Census (2000)
- National Vital Statistics System (NVSS)

Sample data from four longitudinal studies that followed nationally representative samples of children of different age groups identified for services under IDEA:⁴

- National Early Intervention Longitudinal Study (NEILS) of infants and toddlers
- Pre-Elementary Education Longitudinal Study (PEELS), of children ages 3 through 5
- Special Education Elementary Longitudinal Study (SEELS) of children ages 6 through 12
- National Longitudinal Transition Study-2 (NLTS2) of children ages 13 through 21.

Sample data on the outcomes of the general population for comparison with the outcomes of children identified for services under IDEA:

- Early Childhood Longitudinal Study, Kindergarten Cohort (ECLS-K)
- National Health Interview Survey (NHIS)
- National Household Education Surveys (NHES) (1999), used to compare outcomes for infants and toddlers
- National Assessment of Educational Progress (NAEP), used to compare outcomes of school-age children.

Analyses using population data were considered to be descriptive, and no statistical testing was conducted. When analyses included sample data, statistical testing was conducted. When sample data were used for comparison of outcomes, *t* tests for differences in mean values were applied to calculate the statistical significance of the comparison, and when appropriate the Benjamini-Hochberg (1995) procedure was used to control the false discovery rate. The alpha level was set to .05 for each family of comparisons.

For the research questions concerning identification, data include the number of children identified for services under IDEA; the percentage of children from the total population who were identified for services under IDEA are presented by age, race/ethnicity, and state; and the gender composition of children identified for services under IDEA Part B. Declassification data are presented on the percentage of children no longer eligible for early intervention or special education services and their outcomes as compared with children who continue to receive services. Data on outcomes for children identified for services under IDEA include academic and developmental outcomes and trends over time. Analysis results include comparisons over time between children identified for and not identified for services under IDEA, between state results and national averages, with the general population means, across IDEA eligibility categories, and across ages. A description of school completion by disability category and cluster is also presented.

All comparisons of outcomes between children identified for services under IDEA and other children and between children identified for services under IDEA across states and over time are

⁴ Although these data sources include outcome data that predate the 2004 reauthorization of IDEA, they are the only data sources available to address the study question on the variation by disability category in the outcomes for children with disabilities. Detailed descriptions of these data sources are included in appendix A.1.

presented for descriptive purposes only. These comparisons were not designed and are not suitable, to measure the impacts of IDEA on child outcomes.

The following sections highlight results for each of the three age groups—infants and toddlers, ages birth through 2, who were served under Part C of the law; preschool-age children, ages 3 through 5, served in Part B preschool programs; and school-age children and youth ages 6 through 21 served in Part B programs. For each age group, the patterns of identification and the academic and developmental outcomes for children with disabilities are addressed. Declassification information (the loss of eligibility for services) is presented for infants and toddlers and school-age children and youth.

Population of Children Identified for Services Under IDEA

In 2005, states reported that 7,013,238 children ages birth through 21 years had been identified for early intervention and special education services under IDEA, including both children newly identified in the year represented by the count and children identified in earlier years who continued to receive services. The total number of children identified for each age group is presented in exhibit ES.1 and summarized as follows:

- 294,714 infants and toddlers (ages 0 through 2) were reported by states as having been identified for early intervention services under Part C of IDEA.
- 698,928 preschool-age children (ages 3 through 5) were reported by states as having been identified for preschool-age services under Part B of IDEA.
- 6,019,596 school-age children and youth (ages 6 through 21) were reported by states as having been identified for school-age services under Part B of IDEA.

Data on the gender of children identified for services under IDEA were collected by DANS for the first time in 2006. In each age group, more males than females were identified for services under IDEA. For infants and toddlers, 59.46 percent were male. The composition of males and females identified for services under IDEA was comparable for preschool and school-age children—69.29 percent of children ages 3 through 5 were male, and 66.91 percent of children ages 6 through 21 were male.

Exhibit ES.1. National number of children identified for services under IDEA, by age (2005)

Exhibit reads: Nationwide, 41,865 children less than 1 year old were identified for services under Part C of IDEA in 2005.

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA, based on enrollment numbers at a single time point between October 1, 2005, and December 1, 2005. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. This exhibit displays the number of children identified for services under IDEA from birth through age 21.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part C Child Count, 1997–2006, retrieved December 7, 2007, from <http://www.ideadata.org/PartCChildCount.asp>.

Key Findings for Infants and Toddlers Identified for Early Intervention Services Under IDEA

This section presents the main findings for infants and toddlers (ages birth through 2) who were identified for early intervention (EI) services under IDEA Part C.⁵ Results include the identification patterns, rates of loss of eligibility for EI services through declassification, and academic and developmental outcomes. Results on identification patterns are based on data from DANS and NVSS. Declassification information is based on data from NEILS and DANS. Outcomes analyses are based on data from NEILS, ECLS-K, NHIS, and NHES, and from NEILS reports.

⁵ Identification percentages in this section were computed for each year using the number of infants and toddlers identified under Part C (DANS) as a percentage of the total population of infants and toddlers (NVSS). NVSS birth data were used to create a proxy for the total number of infants and toddlers birth through age 2 in the population. Percentages were computed for each age year and race/ethnicity category using the same data sources.

Identification of Infants and Toddlers for Early Intervention Services Under IDEA

- **In 2006, the percentage of infants and toddlers identified for services under IDEA was 2.40 percent (n = 299,848), an increase from 1.65 percent (n = 192,469) in 1997.**
- **Between 1997 and 2006, changes in the percentage of infants and toddlers served under IDEA varied by year of age.** The percentage of children from birth through age 2 who were receiving early intervention nationally declined from 1997 to 1998 (1.65 percent to 1.57 percent) but then increased every year thereafter, reaching 2.40 percent in 2006. The greatest increase, from 2.42 percent in 1998 to 3.91 percent in 2006, was for 2-year-olds (see exhibit ES.2).
- **In 2005, the percentage of infants and toddlers identified for EI services under IDEA varied by race/ethnicity.** Percentages ranged from 1.95 percent (Asian infants and toddlers) to 2.55 percent (White infants and toddlers). The percentages for American Indian, Black, and Hispanic infants and toddlers were 2.45 percent, 2.32 percent, and 2.09 percent, respectively.
- **From 1998 to 2005, the percentage of infants and toddlers identified for EI services under IDEA for all five race/ethnicity categories increased.** The percentage of Black (1.66 percent to 2.32 percent), Hispanic (1.11 percent to 2.09 percent), Asian (1.18 percent to 1.95 percent), White (1.41 percent to 2.55 percent), and American Indian (1.81 percent to 2.45 percent) infants and toddlers identified for EI services nationally increased from 1998 to 2005 (percentage changes of 0.66, 0.98, 0.77, 1.14, and .64, respectively), with the percentages for White infants and toddlers showing the greatest change.
- **In 2006, states varied in the percentage of infants and toddlers identified for services under IDEA.** The percentage of children identified for services ranged from 7.19 percent in Hawaii to 1.18 percent in Mississippi. In 2006, the percentage of children identified was higher than in 1997 for 47 states (the exceptions were Delaware, Florida, Mississippi, and Ohio). Fourteen of the 22 states with broad eligibility criteria had higher identification percentages than the national percentage, and 12 of the 16 states with narrow criteria had lower percentages than the national percentage.⁶

⁶ Eligibility varies throughout the country for Part C services, with states identified by the Office of Special Education Programs (OSEP) as having “broad,” “moderate,” and “narrow” eligibility criteria. The criteria is based upon averaging descriptors (percent delay, age/month delay, standard deviation, and undefined variable related to if a state serves at-risk) in states’ eligibility definitions (Mackey Andrews and Taylor 2007).

Exhibit ES.2. Trends in national percentage of infants and toddlers identified for early intervention services under IDEA, by age (1997–2006)

Exhibit reads: Nationwide, the percentage of 2-year-olds identified for services under IDEA increased from 2.49 percent in 1997 to 3.91 percent in 2006.

NOTE: The percentage of children who were identified was calculated by dividing the number of children identified for services under IDEA (DANS) in a given age group by the total number of children in the same age group as indicated by the NVSS-constructed population proxy. The numbers of children identified are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on the Indian reservations. Birth data for 2006 are preliminary.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part C, Child Count, 1997–2006, retrieved December 7, 2007, from <http://www.ideadata.org/PartCChildCount.asp>; U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System, 1990–2005, retrieved January 11, 2008, from <http://205.207.175.93/vitalstats/ReportFolders/ReportFolders.aspx>; birth data for 2006 are from table 6, p. 12, of Hamilton, Martin, and Ventura (2007).

Declassification of Infants and Toddlers Who Had Been Identified for Early Intervention Services Under IDEA

- A longitudinal study of infants and toddlers who were identified for the first time for EI services in 1997–1998 found that 18 percent exited, i.e. left the EI system, before reaching the age limit of 36 months for EI services. These children exited early intervention for various reasons, such as meeting all their developmental goals and losing eligibility because of developmental progress or parents’ choosing to withdraw from services.
- Nationally, of all infants and toddlers identified for services under IDEA who exited early intervention at 36 months from 2005 to 2006, 66 percent were reported by states to have been eligible for Part B, Section 619, preschool services (see exhibit ES.3). The percentage of children receiving EI services at 36 months who were then eligible for Part B services ranged from 100 percent in Minnesota to 10 percent in the District of Columbia.

Exhibit ES.3. National percentage of children no longer receiving early intervention services under IDEA at 36 months of age, by exit category (2005–2006)

Exhibit reads: Nationwide, of all children served under IDEA who left EI at 36 months from 2005 to 2006, 66 percent were eligible for Part B services.

NOTE: The DANS data represented in this exhibit reflect data on all children who exited EI programs at 36 months of age in fall 2005.

Outcomes for Infants and Toddlers Identified for Services under IDEA

The NEILS dataset can be used to describe outcomes for children who received EI services nationally. NEILS outcome data collection included parent-reported information at 36 months of age and parent- and teacher-reported information in kindergarten. Information was collected from both parents and teachers as to whether or not children had been identified for services under Part B IDEA in kindergarten. Overall, 55 percent of former EI participants were identified for special education services in kindergarten (i.e., had Individualized Education Programs). This

section highlights children’s outcomes at 36 months of age (based on parent report) and in kindergarten (based on teacher and parent reports) across five developmental domains (communication, cognition, social emotional, physical and adaptive development). Most of the findings are based on items in the NEILS parent interviews and teacher survey that were developed for the study, including items that asked parents and teachers to report on the child’s level of accomplishment across developmental milestones and the child’s skill level compared to other children the same age. Some items were taken from protocols developed for other studies so the information could be compared to the general population (defined as including both children receiving and not receiving EI or special education services).

Key findings highlight overall outcomes for children identified for EI services under IDEA. Where applicable, outcome data were compared with general population data on 3- and 5-year-olds from the public use datasets of the following sources: National Household Education Survey (NHES), Early Childhood Longitudinal Study, Kindergarten Cohort (ECLS-K), and the National Health Interview Survey (NHIS) datasets. Additional findings highlight outcomes by Part C eligibility category⁷ and comparisons of kindergarten outcomes for former EI participants with Individualized Education Plans (IEPs) and without IEPs.

- **On outcomes for all five domains (communication, cognitive, social-emotional, physical development, and adaptive skills), children identified for EI services demonstrated skills at lower levels than expected for their age at both 36 months and kindergarten.** For example, at age 36 months, 42 percent (standard error (SE) = 1.39) of EI participants were reported by parents to communicate their needs as well as other children their age. At kindergarten, 37 percent of former EI participants (SE = 2.02) were reported by their parents to have mastered all communication milestones expected of a 5-year-old (see exhibit ES.4).

⁷ IDEA Part C eligibility categories include developmental delay, diagnosed condition, at risk for delay. According to the federal regulations for IDEA, 34 C.F.R. §303.16(a), “...infants and toddlers with disabilities means individuals from birth through age two who need early intervention services because they--1) Are experiencing developmental delays, as measured by appropriate diagnostic instruments and procedures, in one or more of the following areas: (i) Cognitive development. (ii) Physical development, including vision and hearing. (iii) Communication development. (iv) Social or emotional development. (v) Adaptive development; or 2) Have a diagnosed physical or mental condition that has a high probability of resulting in developmental delay. (b) The term may also include, at a State's discretion, children from birth through age two who are at risk of having substantial developmental delays if early intervention services are not provided.”

Exhibit ES.4. Parent and teacher reported communication outcomes at 36 months of age and kindergarten for former EI participants

Outcome	Percent	SE	N
Parent report: 36 months of age			
Communicates needs as well as other children	41.7	1.39	2,670
When child talks to other people she/he doesn't know well, she/he is very easy to understand	18.8	1.29	2,644
All age-expected communication milestones mastered	29.0	0.99	2,651
Parent report: kindergarten			
Communicates needs as well as other children	59.9	1.49	2,280
When child talks to other people she/he doesn't know well, she/he is very easy to understand	39.7	1.10	2,165
All age-expected communication milestones mastered	36.9	2.02	2,095
Understands verbal and nonverbal communication as well as other children	63.0	1.37	2,275
Teacher report: kindergarten			
Understands others as expected for age	59.7	0.86	1,539
Communicates with others as expected for age	50.0	1.28	1,549

Exhibit reads: When former early intervention participants were 36 months of age, parents of 41.7 percent reported that the children communicated their needs as well as other children their age.

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007.

- For the parent-reported measures of early literacy and mathematics skills, former EI participants demonstrated significantly lower skills than the general population of 3-year-olds.** When children were 36 months of age, parents reported that 17 percent (SE = 1.13) of former EI participants could recognize most or all letters of the alphabet, whereas parents of 37 percent (SE = 1.41) of children in the general population⁸ reported that their children could do so ($p < .001$) (see exhibit ES.5). Thirteen percent (SE = 1.38) of former EI participants were reported to be able to count to 20 or higher, whereas 41 percent (SE = 1.43) of children in the general population were reported to be able to ($p < .001$).
- At both 36 months and kindergarten, children eligible because of a risk condition were reported by parents and teachers to have higher skills in all five domains—communication, cognitive, social-emotional, physical development, and adaptive skills—compared with children with a diagnosed condition.** For example, 33 percent (SE = 3.78) of children with a risk condition at entry to early intervention and 31 percent (SE = 7.01) of those with a developmental delay were reported by parents to have mastered all age-expected physical milestones at 36 months, compared with 15 percent (SE = 1.57) of those with a diagnosed condition ($p < .001$ for both comparisons). At kindergarten, the pattern was similar: 28 percent (SE = 4.55) of children with an at-risk classification at entry into early intervention and 24 percent (SE = 2.89) of those with developmental delays were reported to have mastered all their

⁸ General population statistics are based on data from the National Household Education Survey (NHES).

kindergarten milestones, compared with 10 percent (SE = 1.95) of children with a diagnosed condition ($p < .001$ for both comparisons).

Exhibit ES.5. National percentage of former EI participants and of the general population for whom parents reported cognitive outcomes at 36 months and in kindergarten

Exhibit reads: Nationwide, 17 percent of 3-year-olds who were former EI participants were reported by their parents to be able to recognize most or all letters of the alphabet.

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews (public use dataset), 2007; general population data from the National Household Education Survey (NHES) public use dataset, 1999 parent interview, available at <http://nces.ed.gov/nhes/dataproducts.asp>.

- Teachers' reports of seven mathematics and nine early literacy skills at kindergarten indicated that larger percentages of former EI participants without IEPs than those with IEPs performed at age-expected levels and at levels comparable to the general population.** For example, in mathematics, 16 percent (SE = 1.47) of former EI participants with IEPs were reported to use a variety of strategies to solve mathematics problems, compared with 49 percent (SE = 2.25) of children without IEPs ($p < .001$) and 46 percent (SE = 0.89) of children in the general population ($p < .001$). In early literacy, 11 percent (SE = 1.28) of former EI participants with IEPs were reported to be able to compose simple stories, according to their kindergarten teachers, compared with 31 percent (SE = 1.58) of children without IEPs ($p < .001$) and 32 percent (SE = 0.81) of children in the general population ($p < .001$).

Key Findings for Preschool-Age Children Identified for Services Under IDEA

This section highlights findings for children ages 3 through 5 identified for services under IDEA Part B preschool programs. Results reported include the identification of preschool children for services under IDEA and their academic and social outcomes. Information on identification is based on data from DANS and NVSS.⁹ Analyses on children's outcomes are based on data from PEELS.

Identification of Preschool-Age Children for Services Under IDEA

- **In 2006, the percentage of preschool-age children identified for services under IDEA was 5.82 percent (n = 706,242), an increase from 4.70 percent (n = 564,270) in 1997** (see exhibit ES.6). This overall increase from 1997 to 2006 was 1.12 percentage points, and the percentage of 3- through 5-year-olds increased every year from 1997 to 2006 for the overall preschool-age group.
- **In 2006, the percentage of preschool-age children identified for services under IDEA differed for children of each single year of age** (see exhibit ES.6). As shown in exhibit ES.6, the highest percentage was among 5-year-olds (7.41 percent), followed by 4-year-olds (6.07 percent) and 3-year-olds (4.01 percent).
- **The percentage of preschool-age children identified for services increased from 1997 to 2006 for each single year of age.** For 5-year-old children, the percentage increased from 6.27 percent to 7.41 percent (1.14 percentage increase); for 4-year-olds, it increased from 4.89 percent to 6.07 percent (1.18 percentage increase); and for 3-year-olds, it increased from 2.88 percent to 4.01 percent (1.13 percentage increase).
- **In 2006, the percentage of 3- through 5-year-olds identified for services under IDEA differed by children's race/ethnicity category.** Percentages ranged from 3.59 percent (Asian preschool-age children) to 8.14 percent (American Indian preschool-age children). The percentages for White, Black, and Hispanic preschool-age children were 6.45 percent, 5.93 percent, and 4.52 percent, respectively.
- **Between 1998 and 2006, the relative position of preschool-age children by race/ethnicity category remained the same for those identified for services under IDEA.** For each year from 1998 to 2006, American Indian preschool-age children had the highest identification percentages (ranging from 6.31 percent in 1998 to 8.14 percent in 2006) followed by White (4.86 percent to 6.45 percent), Black (4.43 percent to 5.93 percent), Hispanic (3.10 percent to 4.52 percent), and Asian preschool-age children (2.28 percent to 3.59 percent).

⁹ Identification percentages in this section were computed for each year using the number of preschool-age children identified under Part B (DANS) as a percentage of the total population of children ages 3 through 5 (NVSS). NVSS birth data, including births on Indian reservations, were used to create a proxy for the total number of children ages 3 through 5 in the population. Percentages were computed for each age year and race/ethnicity category using the same data sources.

Exhibit ES.6. Trends in national percentage of preschool-age children identified for services under IDEA, by age (1997–2006)

Exhibit reads: Nationwide, the percentage of 3-year-olds identified for services under IDEA increased from 2.88 percent in 1997 to 4.01 percent in 2006.

NOTE: The percentage of children who were identified was calculated by dividing the number of children identified for services under IDEA (DANS) in a given age group by the total number of children in the same age group as indicated by the NVSS-constructed population proxy. The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on Indian reservations.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part B, Child Count, 1997–2006, retrieved December 7, 2007, from <http://www.ideadata.org/PartBChildCount.asp>; U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System, 1990–2005, retrieved January 11, 2008, from <http://209.217.72.34/VitalStats/ReportFolders/ReportFolders.aspx>.

- **In 2006, the percentage of 3- through 5-year-olds identified for services under IDEA varied by disability category.**¹⁰ The largest percentages were for preschool-age children identified under the speech or language impairments and developmental delay categories of IDEA (2.73 percent and 2.06 percent, respectively).
- **Between 2004 and 2006, the percentage of 3- through 5-year-olds identified for services under IDEA increased for all but four of the disability categories.** Changes in the identification percentages for each disability category were examined relative to the identification percentage in 2004. The largest increase, relative to the percentage of children identified under each disability category in 2004, was for children with autism (34.87 percent), followed by children classified with other health impairments (24.64 percent). The largest relative decrease was for children with deaf-blindness (-19.05 percent).
- **States varied in the percentage of preschool-age children identified for services under IDEA in 2006.** The states, ordered by their identification percentage in 2006, ranged from 3.32 percent in the District of Columbia to 13.66 percent in Wyoming. Of the 50 states and the District of Columbia, 49 had higher identification percentages in 2006 than in 1997 (exceptions were Idaho and Texas).

Outcomes for Children Identified for Preschool Services Under IDEA

Data from PEELS were used to describe outcomes for preschool-age children. Outcomes are reported in the form of standard scores for children ages 3 through 5 and for each age year; the general population (based on norm samples including both children with and without disabilities) has a mean standard score of 100.0 and a standard deviation of 15.0.

- **In the Woodcock Johnson (WJ III) Letter-Word Identification test, the mean score for 5-year-olds identified for services (96.8; SE = 0.98) differed from that of their same-age peers in the general population, but the scores of the 3- and 4-year-olds did not (100.8 and 98.5, SE = 1.37 and SE = 0.98 respectively; see exhibit ES.7).** As a group, all children ages 3 through 5 identified for preschool services under IDEA had a mean standard score on the Letter-Word Identification subtest of 98.2 (SE = 0.78), which was not significantly different from the general population mean of 100.0 ($p < .001$, see exhibit ES.7).
- **Peabody Picture Vocabulary Test-Third Edition (PPVT-III) scores for preschool children identified for services under IDEA, both overall and for each age cohort, were significantly lower than those for the general population.** Children identified for preschool services under IDEA had significantly lower mean scores on the vocabulary test than preschool-age children in the general population for the group as a whole (90.1, SE = 0.59 vs. 100.0), as well as for children in each age-year cohort (88.6,

¹⁰ The 13 disability categories under which 3- through 21-year-old children may be identified for services under IDEA, Part B, are specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), and deaf-blindness (DB), and developmental delay (DD). States or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category.

89.7, and 91.1, and SE = 0.78, SE = 0.78 and SE = 0.88 for 3-, 4-, and 5-year-olds, respectively; $p < .001$ for all comparisons, see exhibit ES.7).

- **WJ III numeracy outcomes for preschool children identified for services under IDEA, both overall and for each age cohort, were significantly lower than those for the general population.** Preschool children with disabilities had a mean standard score on the WJ III Applied Problems subtest of 90.3 (SE = 0.98), which was significantly lower than the mean score of 100.0 for the general population. The significant difference from the general population was apparent for all three age cohorts, with mean scores of 88.2, 91.2, and 90.6, and SE = 1.27, SE = 1.57 and SE = 0.98 for 3-, 4-, and 5-year-olds, respectively ($p < .001$ for all comparisons, see exhibit ES.7).
- **Preacademic skills from the Adaptive Behavior Assessment System-Second Edition (ABAS-II) of preschool children identified for services under IDEA as a group and for all age groups individually were statistically lower than those of the general population.** For children identified for preschool services under IDEA who were not yet in kindergarten, the overall mean teacher/day care provider rating on the Functional Preacademics subtest was 89.5 (SE = 0.98), which was significantly different from the general population mean of 100.0. The difference from the general population was also statistically significant for all three age cohorts, with mean scores of 88.5, 90.0, and 93.5, and SE = 0.98, SE = 0.98 and SE = 1.47 for 3-, 4-, and 5-year-olds, respectively ($p < .001$ for all comparisons, see exhibit ES.7).
- **Social skills outcomes measured by the Preschool and Kindergarten Behavior Scales-Second Edition (PKBS-2) for preschool children identified for services under IDEA were significantly lower than those of the general population. Three- and 4-year-old preschoolers also had significantly lower social skills ratings than the general population and than 5-year-olds, but 5-year-olds did not differ from the general population.** Children identified for preschool services under IDEA, as a group, had a mean Social Skills standard score of 92.8 (SE = 0.88), which was significantly lower than the general population mean score of 100.0 ($p < .001$). The mean score for 3-year-old children identified for preschool services was 85.2 (SE = 1.08), for 4-year-olds it was 93.0 (SE = 1.08), and for 5-year-olds it was 96.5 (SE = 1.37).

Exhibit ES.7. Mean literacy, numeracy, and preacademic skills scores of 3- through 5-year-olds identified for services under IDEA (2005)

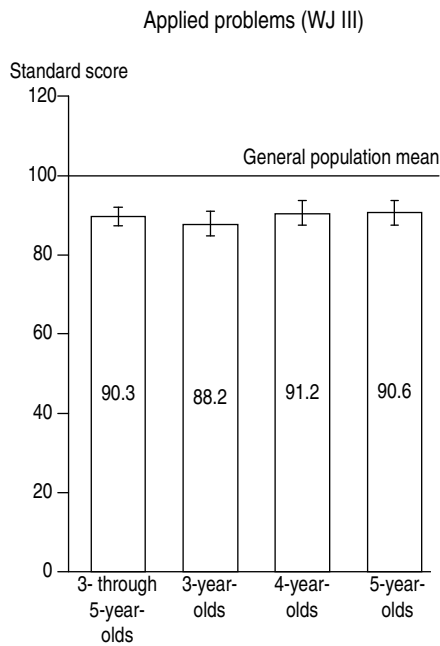

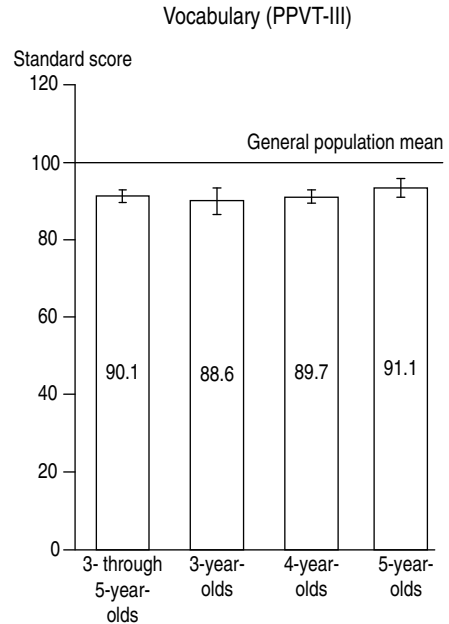

Exhibit reads: Preschool-age children identified for services under IDEA had a mean standard score of 98 on the letter-word identification subtest.

NOTE: Data were preliminary at the time of publication (2005). Findings reported in the exhibit are based on a direct assessment of individual students using Woodcock-Johnson III (WJ III) (Woodcock, McGrew, and Mather 2001), Peabody Picture Vocabulary Test-Third Edition (PPVT-III) (Dunn and Dunn 1997), and Adaptive Behavior Assessment System-Second Edition (ABAS-II) (Harrison and Oakland 2003). All measures are based on a general population mean of 100 and a standard deviation of 15. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

Key Findings for School-Age Students Identified for Services Under IDEA

This section presents main findings for children ages 6 through 21 who were identified for services under IDEA Part B. Results reported include the patterns of identification of school-age children for services under IDEA, rates of loss of eligibility for services under IDEA through declassification, and outcomes. Information on identification patterns is based on data from DANS and CCD.¹¹ Declassification information is based on reports from SEELS and NLTS2 and other literature review. Outcomes analyses are based on data and reports from NAEP, APRs, SEELS, NLTS2, DANS, and CCD.

Identification of School-Age Children for Services Under IDEA

- **In 2005, the percentage of 6- through 17-year-old children identified for services under IDEA was 12.92 percent (n = 5,707,712), an increase from 12.31 percent (n = 5,081,196) in 1997.**
- **Between 1997 and 2005, the patterns in the identification of school-age children identified for services under IDEA varied by age group.** As shown in exhibit ES.8, the highest percentage of students identified for each year from 1997 to 2005 were 10- through 13-year-olds. During the same period, the 14- through 17-year-olds had the largest percentage point change in receipt of services under IDEA (1.64 points).
- **In 2005, the percentages of 6- through 21-year-olds identified for services under IDEA differed by race/ethnicity category.** In 2005, percentages of students identified ranged from 6.34 percent (Asian school-age children) to 16.67 percent (Black school-age children). For American Indian, White, and Hispanic school-age children, 15.76 percent, 14.05 percent, and 11.83 percent, respectively, were identified for services.¹²
- **From 1998 to 2005, the relative position of all race/ethnicity categories remained the same for the percentage of school-age children identified for services under IDEA.** For each year from 1998 to 2005, Black school-age children had the highest identification percentages (ranging from 16.57 in 1998 to 16.67 in 2005), followed by American Indian (14.69 to 15.76), White (13.88 to 14.05), Hispanic (12.80 to 11.83), and Asian school-age children (6.01 to 6.34).

¹¹ Identification percentages in this section were computed for each year using the number of children ages 6 through 17 identified for services under Part B (DANS) as a percentage of the school enrollment in grades 1 through 12 (CCD). CCD school enrollment counts in grades 1 through 12 were used as a proxy for the total number of children ages 6 through 17 in elementary and secondary schools. For the identification percentages by race/ethnicity categories, CCD school enrollment counts in grades 1 through 12 were used as a proxy for the number of children ages 6 through 21 in elementary and secondary schools as DANS child count data by race/ethnicity category are only available in the aggregate 6–21 age group.

¹² This analytic approach was established by Donovan and Cross (2002) in the National Academy of Sciences report, *Minority Students in Special and Gifted Education*.

Exhibit ES.8. Trends in national percentage of school-age children identified for services under IDEA, by age group (1997–2005)

Exhibit reads: Nationwide, the percentage of 6- through 9-year-olds identified for services under IDEA increased from 11.63 percent in 1997 to 11.85 percent in 2005.

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The school enrollment numbers are aggregated counts of student enrollment in all public schools in the 50 states and the District of Columbia, including BIE schools. To compute the percentages, the number of students with disabilities, including children in BIE schools, for each age year was divided by the enrollment count for the corresponding grade level. The following age groups and grade levels are as follows: 6- through 9-year-olds (grades 1–4); 10- through 13-year-olds (grades 5–8); 14- through 17-year-olds (grades 9–12); and 6- through 17-year-olds (grades 1–12).

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part B, Child Count, 1997–2005, retrieved December 7, 2007, from <http://www.ideadata.org/PartBChildCount.asp>; U.S. Department of Education, National Center for Education Statistics, Common Core of Data, 1997–98 to 2005–06, retrieved December 10, 2007, from <http://www.nces.ed.gov/ccd/bat/>.

- In 2005, the disability category with the largest percentage of school-age children identified for IDEA services varied by age group.** For children ages 6 through 9, the largest percentage was children with speech and language impairments (5.46 percent). For children ages 10 through 13 and 14 through 17, the largest percentage was for children with specific learning disabilities (7.07 percent and 7.58 percent, respectively).

- **Between 1997 and 2005, the percentage of 6- through 17-year-olds identified for services under IDEA varied by disability category.**¹³ Between 1997 and 2005, the largest percentage change for 10- through 13- and 14- through 17-year-olds relative to identification percentages for the age group in 1997 was for children identified with autism under IDEA (410.67 percent and 409.72 percent, respectively). Developmental delay is a category included for the 3 through 5 and 6 through 9 age groups and showed the largest relative percentage change from 1997 to 2005 (1,988.85 percent).
- **States varied in the percentage of children identified for services under IDEA in 2005.** Across states in 2005, the percentage identified ranged from 9.87 percent in Colorado to 18.59 percent in Rhode Island. Forty-one states had higher identification percentages in 2005 than in 1997 (exceptions were Colorado, California, Texas, Connecticut, Alabama, Tennessee, Maryland, Alaska, New Mexico, and Massachusetts).

Declassification of School-Age Children With Disabilities

- **Across grade levels, declassification rates among children and youth identified for IDEA services varied: 49 percent of students who had received services in kindergarten (spring 1999) were no longer eligible by third grade (spring 2002) (Holt, McGrath, and Herring 2007), 17 percent of children ages 6 through 12 in 1999 were ineligible after 2 years, and 5 percent of youth ages 13 through 16 in 2000 were ineligible after 2 years (Wagner 2003).**
- **The proportions of 6- through 12-year-olds who had been declassified from special education services within approximately 2 years varied across disability categories.** As shown in exhibit ES.9, the declassification rates of students ages 6 through 12 ranged from 2 percent among children with traumatic brain injury to 34 percent for children identified under the speech or language impairments category, the highest percentage among all disability categories (SEELS 2005).
- **Children and youth ages 6- through 12- years-old declassified from IDEA services had significantly higher scores on literacy and mathematics outcomes than children and youth of the same age who continued to receive services.** The mean standard score on the research versions of WJ III Letter-Word Identification subtest was 96 (SE = 1.57) for declassified students and 82 (SE = 0.77) for students who continued to receive services. Similarly, Passage Comprehension mean standard scores for the two groups were 92 (SE = 1.46) and 83 (SE = 0.75), respectively; for Math Calculation, they were 104 (SE = 1.40) and 91 (SE = 0.71); and for Applied Problems, they were 101 (SE = 1.56) and 88 (SE = 0.74).

¹³ The 13 disability categories under which 3- through 21-year-old children may be identified for services under IDEA, Part B, are specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB) and developmental delay (DD). States or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category.

Exhibit ES.9. Percentage of 6- through 12-year-olds identified for IDEA services in December 1999 who were declassified by spring 2002, by disability category

Exhibit reads: Nine percent of 6- through 12-year-olds who had been identified for IDEA services under the category of specific learning disabilities in December 1999 were reported by schools or parents not to be receiving special education services as of spring 2002.

Rounds to zero.

NOTE: Disability categories are: specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB). The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

Outcomes for School-Age Children Identified for Services Under IDEA

- Academic achievement trends from 2003 through 2007 measured by NAEP showed significant increases in average scale scores for both children identified and children not identified for services under IDEA in grade 4 reading and mathematics and in grade 8 mathematics (see exhibit ES.10).** In grade 4 reading, average scale scores for children identified for services under IDEA and children not identified for IDEA services increased by 5.8 (SE = 0.82, $p < .001$) and 3.0 (SE = 0.38, $p < .001$) scale points, respectively. Similar increases were observed in grade 4 mathematics of 6.1 (SE = 0.56, $p < .001$) and 5.0 (SE = 0.29, $p < .001$) scale points, respectively. In grade 8 mathematics, average scale scores for children identified for services under IDEA increased by 4.1 (SE = 0.91, $p < .001$) scale score points from 2003 to 2007. Average scale scores for children not identified for IDEA services increased by 3.2 (SE = 0.35, $p < .001$) scale score points.

- Children identified for services under IDEA had significantly lower scores on NAEP in reading and mathematics than children not identified at each time point (see exhibit ES.10).** For example, in grade 4 reading, the differences between children identified and not identified for services under IDEA were 35.4 (SE = 0.66, $p < .001$), 30.6 (SE = 0.58, $p < .001$), and 32.7 (SE = 0.62, $p < .001$) scale score points in 2003, 2005, and 2007, respectively. In grade 8 mathematics, the differences by IDEA service status were 38.6 (SE = 0.82, $p < .001$), 37.5 (SE = 0.51, $p < .001$), and 37.8 (SE = 0.73, $p < .001$) scale score points in 2003, 2005, and 2007, respectively.
- Across states, NAEP reading and mathematics scores varied for children identified for and not identified for services under IDEA.** For children identified for services under IDEA, the average scale scores in 2007 ranged from 162 (SE = 4.73) to 213 (SE = 2.86) on the NAEP fourth-grade reading test and from 203 (SE = 2.80) to 248 (SE = 2.44) on the eighth-grade test, resulting in differences across states of 51 points and 45 points, respectively. Average scale scores for children not identified for IDEA services were more homogeneous, ranging from 199 (SE = 0.84) to 239 (SE = 1.14) and 243 (SE = 0.79) to 278 (SE = 0.83) for the fourth- and eighth-grade reading tests, respectively, differences of 40 and 35 points.

Exhibit ES.10. Mean reading and mathematics scale scores of fourth- and eighth-grade students identified and not identified for services under IDEA (2003, 2005, and 2007)

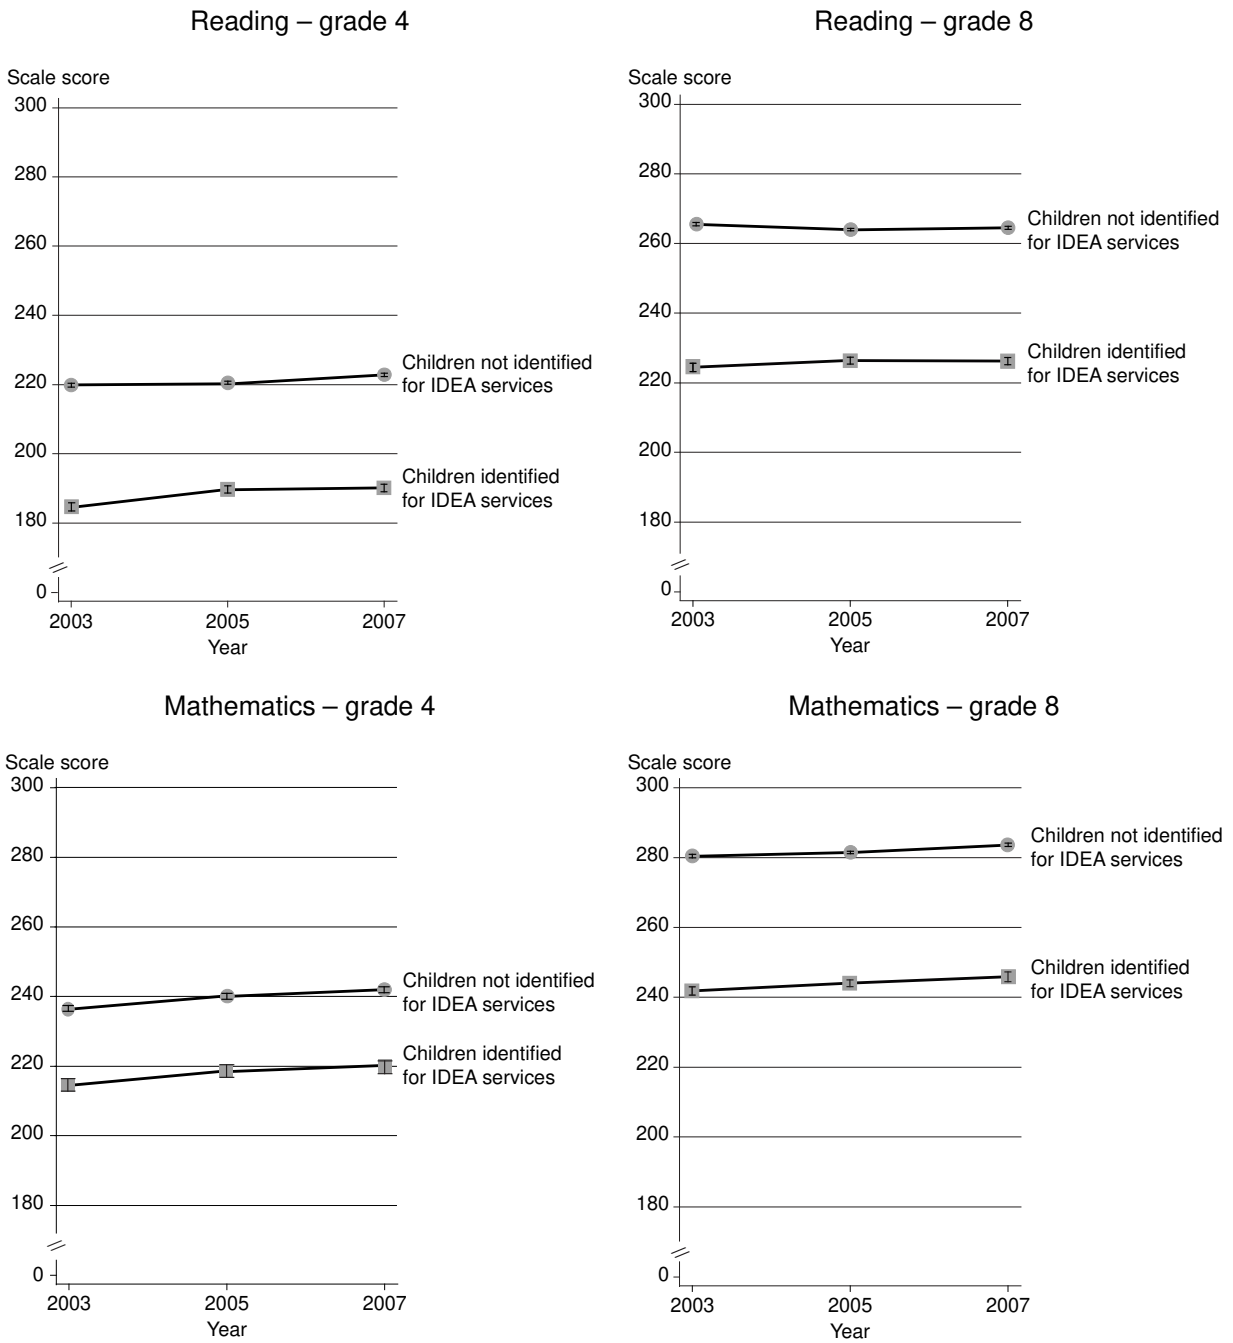

Exhibit reads: In 2007, the mean reading scale score of fourth-grade students not identified for IDEA was 223 compared with 190 for students identified.

NOTE: The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.
 SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003, 2005, and 2007, retrieved January 18, 2008, from NAEP Data Explorer, <http://nces.ed.gov/nationsreportcard/naepdata/>.

- The percentage of students identified for services under IDEA meeting achievement levels in reading in fourth grade on NAEP and state regular assessments varied across states.** The range of percentages of children identified for IDEA services at the NAEP *proficient or above* achievement level was from 2 percent (SE = 1.4) in the District of Columbia to 19 percent (SE = 2.8) in Virginia. The range of children identified for services under IDEA at the NAEP *basic or above* achievement level was from 9 percent (SE = 2.2) in the District of Columbia to 48 percent (SE = 4.5) in Delaware. The percentage of children identified for services under IDEA reported as *proficient or above* on regular state accountability tests ranged from 9 percent in South Carolina to 83 percent in Mississippi.
- The percentage of students identified for services under IDEA meeting achievement levels in mathematics in fourth grade on NAEP and state regular assessments varied across states.** The range of children identified for IDEA services at the NAEP *proficient or above* achievement level was from 2 percent (SE = 0.9) in the District of Columbia to 26 percent (SE = 2.8) in North Carolina. The range of children identified for IDEA services at the NAEP *basic or above* achievement level was from 9 percent (SE = 2.1) in the District of Columbia to 70 percent (SE = 2.7) in North Carolina. The percentage of children identified for IDEA services reported as *proficient or above* on regular state accountability tests ranged from 8 percent in Maine to 81 percent in North Carolina.
- Nationwide, 46 percent of children identified for services under IDEA and estimated to be enrolled as of 4 years prior completed secondary school with a regular diploma in 2005. This graduation rate is 29 percentage points below the rate for children in the total population nationwide who received a regular diploma that year (75 percent).**¹⁴ The Averaged Freshman Graduation Rate (AFGR) in 2005 for children identified for services under IDEA ranged from 17 percent in Louisiana to 78 percent in Pennsylvania (see exhibit ES.11). For the total population of children, the AFGR ranged from 56 percent in Nevada to 91 percent in New Jersey.

¹⁴ Comparisons between children identified for services under IDEA and the total population, as well as comparisons among states, should be treated with caution because of limitations of the data sources.

Exhibit ES.11. Averaged freshman graduation rate of school-age youth identified for services under IDEA and total population, by state (2005 and 1998–2004 average)

Exhibit reads: In Louisiana, 17 percent of the estimated enrollment of students identified for IDEA services 4 years prior to 2005 graduated with a regular diploma in 2005.

NOTE: States are ordered by the graduation rate of youth identified for services under IDEA in 2005. Vertical lines represent national rates. The Averaged Freshman Graduation Rate (AFGR) uses aggregate student enrollment data to estimate the size of an incoming freshman class and aggregate counts of the number of graduates 4 years later. For a given year, the freshman class size four years prior is estimated by summing the enrollment in 8th grade 4 years prior, 9th grade for the next year, and 10th grade for the year after and then dividing by 3. The averaging is intended to account for higher grade retentions in the 9th grade. To calculate the AFGR, the number of diplomas awarded in a year serves as the numerator, and the averaged freshmen class enrollment serves as the denominator (for more information about the use of the AFGR for the general population, go to: <http://nces.ed.gov/pubsearch/pubsinfo.asp?pubid=2008053>). Using data from the Common Core of Data (CCD), the formula for calculating the AFGR for youth in the total population is shown below.

AFGR formula for youth in the total population for 2005-06 school year:

Regular High School Diplomas Awarded at End of 2005-06 School Year

Enrollment in (Grade 8 in fall 2001 + Grade 9 in fall 2002 + Grade 10 in fall 2003)/3

1. Introduction

Legislative Background

Since the 1960s, federal legislation has focused on educating children with disabilities. The Elementary and Secondary Education Act (ESEA) passed in 1965 provided states with grants to improve the education of children with disabilities. In 1975, the Education for all Handicapped Children Act (EHA), also called Public Law 94-142, codified America's commitment to the rights of children and youth with disabilities to receive equal access to an education. It specified that 3- through 21-year-olds who were found eligible for services under the law would receive a "free appropriate public education (FAPE)" that was designed to meet their individual needs through an "Individualized Education Program" (IEP) to receive an education and related services in the general education environment "to the maximum extent appropriate."¹ EHA also made the commitment to protect the educational rights of these children and their families by establishing procedural safeguards. Through this law, the federal government offers grants to states to help support the direct services provided to children determined to be eligible under the law.

In a series of reauthorizations of this landmark legislation over the subsequent three decades, other provisions were added, including expansions of the rights of children with disabilities. Amendments in 1986 (P.L. 99-457) made the provision of a free appropriate public education to children ages 3 through 5 a requirement for receiving federal funding to support special education services. This same legislation provided grants to states to serve eligible infants and toddlers with disabilities (ages birth through 2 years) and their families through an "Individualized Family Service Plan" (IFSP) designed to meet the unique developmental needs of the eligible infant and toddler and the family. In 1990, P.L. 101-476 renamed the EHA as the Individuals With Disabilities Education Act (IDEA) and extended the law to include support for youth with disabilities in the transition to young adulthood and added new disability categories. The new classifications included children with autism and traumatic brain injury. In 1991, the U.S. Department of Education (ED) issued a joint policy memo² stating that children identified with an attention deficit hyperactivity disorder (ADHD) could be identified as eligible for special education services under the disability classification of other health impaired (Joint Policy Memo 1991). The subsequent reauthorization of IDEA in 1997 (P.L. 105-17) placed greater emphasis on improving students' inclusion in accountability systems, giving them access to the general education curriculum, and improving their academic performance, including improving the developmental outcomes for infants and toddlers.

The most recent reauthorization of IDEA in 2004 (P.L. 108-446) brought further evolution in the law. Although IDEA 2004 continues to ensure that all children with disabilities receive FAPE, amendments affected state and local policies by stipulating that children with disabilities *make progress* in the general education curriculum and *improve* their academic and developmental outcomes. The 2004 reauthorization aligned more clearly with the guiding federal

¹ Under P.L. 94-142, FAPE would be available for all handicapped children aged 3–21 no later than September 1, 1980, with an exception made for children ages 3, 4, and 5 if this legislative provision was inconsistent with state law.

² The Assistant Secretaries for the following offices in the U.S. Department of Education jointly signed this policy memo: Office of Special Education and Rehabilitative Services, Office of Elementary and Secondary Education, and Office of Civil Rights.

legislation, the No Child Left Behind Act of 2001 (NCLB). Under IDEA and NCLB, states are expected to align their performance goals and indicators for children with disabilities with their definition of adequate yearly progress (AYP) and report on graduation rates and drop-out rates. Children with disabilities are expected to participate in state assessment systems and demonstrate continued improvement and progress in their academic outcomes, including those students who take an alternate assessment. States publicly report on their participation and progress toward meeting state goals on the assessments with the same frequency and detail as for children without disabilities. For children receiving early intervention and preschool services under IDEA, greater emphasis is on targeting developmental and academic outcomes, including preliteracy and language skills, as specified in the IFSP or IEP.

IDEA 2004 also made changes affecting who could be served with IDEA funds. First, local education agencies can use a portion of the IDEA funds to provide early intervening services in grades K through 12 for students struggling with and needing additional academic and behavioral supports to succeed in the general education environment. The option of using funds to provide early intervention services provides new opportunities for schools to assess a child's response to scientific, research-based intervention as a way of determining eligibility for special education services under the classification of specific learning disability. Second, states are required to establish policies to prevent inappropriate overidentification by race and ethnicity of children with disabilities and to collect and examine data to determine whether significant disproportionality on the basis of race and ethnicity exists in the state and districts.

To implement the law, federal funds supplement state and local funds. Part C of IDEA provides states with grants to support early intervention services for infants and toddlers from birth through age 2 and their families. Part B, Section 619, provides states with funding specifically to support special education and related services for preschool-age children, ages 3 through 5. Part B, Section 611, provides grants to support states' special education and related services for school-age students, ages 3 through 21.³ The total formula grants to states have increased in current year dollars from \$3.78 billion in fiscal year (FY) 1997 to \$11.76 billion in FY 2008. In addition to the FY 2009 annual formula grants, \$12.20 billion in IDEA funding was provided to states through the American Recovery and Reinvestment Act of 2009 (P.L. 111-5, also known as ARRA or the Recovery Act). To obtain these resources, states submit to the U.S. Department of Education (ED) their applications, which include assurances regarding how the state identifies children who are eligible for IDEA services, and ensures the provision of appropriate services to children with disabilities. States vary in the ways that they implement both the identification of children with disabilities and the provision of IDEA services.

³ Of the two remaining subparts, Part A states the purposes of IDEA, including definitions of key concepts. Part D authorizes a discretionary program, the *National Activities to Improve Education of Children With Disabilities*, designed to support the implementation of IDEA, including research, technical assistance and dissemination, state improvement grants, and training personnel to educate students with disabilities.

Exhibit 1.1. Federal IDEA formula grants in FY 1997, FY 2004 and FY 2008, by funding category

Category	Funding in FY 1997	Funding in FY 2004	Funding in FY 2008
Total grants to states	\$3,783,685,000	\$10,900,168,152	\$11,757,264,653
Part B, 611 special education grants	\$3,107,522,000	\$10,068,106,452	\$10,947,511,571
Part B, 619 preschool special education grants	\$360,409,000	\$387,699,000	\$374,099,280
Part C	\$315,754,000	\$444,362,700	\$435,653,802

NOTE: Costs presented in this exhibit are in current year dollars.

The National Assessment of IDEA 2004

Since its inception in 1975, IDEA has included provisions for collecting information on the implementation and impact of the law and reporting findings annually to the U.S. Congress. The Office of Special Education Programs (OSEP) has prepared annual reports to Congress since 1977 to provide information on the extent to which all students with disabilities are receiving a free appropriate public education. In 1983, “special studies” were called for, such as the specification for the implementing agency, OSEP in the U.S. Department of Education, to conduct a longitudinal study of secondary school students receiving services under the law to document their characteristics, their school programs and achievements, and their experiences and outcomes in the transition to early adulthood. In response to the call for a national assessment in the 1997 reauthorization, the Department of Education funded a portfolio of special studies including four longitudinal child-based studies⁴ on specific age groups and three topical studies addressing key issues in special education.⁵

The 2004 reauthorization of IDEA also called for a national assessment to measure the implementation progress of IDEA and the relative effectiveness of the law in achieving its purpose (Section 664(b)). The 2004 National Assessment was intended to build on work conducted under the prior national assessment required by IDEA 1997 and to conduct new studies as appropriate. In response, the National Center for Education Evaluation (NCEE) at the Institute of Education Sciences (IES) initiated a design study advised by practitioners, researchers, and evaluation experts to develop key research questions and approaches to address the goals set forth for the 2004 National Assessment (Fiore et al. 2007). The design study translated the topics identified in the law into specific research questions to address across the various studies of the National Assessment. These research questions focus on the developmental and academic outcomes for children with disabilities, identification for early intervention and

⁴ These were the National Early Intervention Longitudinal Study (NEILS), examining children birth through age 2 and their families who received early intervention services; the Pre-Elementary Education Longitudinal Study (PEELS), addressing children receiving preschool special education services; and the Special Education Elementary Longitudinal Study (SEELS) and the National Longitudinal Transition Study-2 (NLTS2), which focused on 6- through 12-year-olds and 13- through 16-year-olds, respectively, who were receiving special education services when the studies began. (Details on these studies are in appendix A1.)

⁵ These were the Study of State and Local Implementation of IDEA (SLIIDEA), the Study of Personnel Needs in Special Education (SPeNSE), and the Special Education Expenditure Study (SEEP).

special education, early intervention, and special education services and personnel. As a part of the design study, existing sources of national data on special education were reviewed to identify sources that could be useful in answering the research questions and studies were recommended that could yield new data to answer the remaining questions. Information generated through this National Assessment was intended to help federal policymakers and state and local administrators implement the law more effectively and help federal policymakers shape future legislation regarding infants, toddlers, preschoolers, children, and youth with disabilities.

By December 2009, IES initiated six studies that contribute to the National Assessment: (1) analyses of extant data to provide descriptive information on the patterns of identification and outcomes for children with disabilities as background for subsequent studies on program implementation and effectiveness of services, (2) a study on state and district implementation of policies and practices for children with disabilities, (3) an evaluation study of the Personnel Development Program, (4) an evaluation of Response to Intervention strategies in elementary reading, (5) a study of school improvement status as it relates to students with disabilities, and (6) an evaluation of the Technical Assistance and Dissemination Program. SRI International was charged with conducting the first study, and findings from it are the subject of this report.

Patterns in the Identification of and Outcomes for Children and Youth With Disabilities

This study, as a part of the National Assessment, utilizes existing data to provide background information for studies on program implementation and effectiveness of services. The topics of this study are the identification of children for early intervention and special education, declassification of children who were no longer eligible for early intervention and special education services, and the outcomes for children identified for services under IDEA. To address the specific research questions developed under the design study (Fiore et al. 2007), the SRI researchers reviewed available data sources and conducted analyses of existing data to provide a national picture spanning across ages: infants, toddlers, preschool-age, and school-age children and youth. Where data are available, patterns across time and state-level findings are also presented. On the identification of children for services under IDEA, findings are presented nationally, over time, and at the state level. This report also presents descriptive findings on the status of the academic and developmental outcomes for children with disabilities compared with their nondisabled counterparts, as appropriate. The specific research questions and methodological approach for answering them under the IDEA analytic support study follow.

Research Questions

This study uses extant data—that is, data already collected through other studies or as part of ongoing data collection systems—as a cost-effective means of addressing the descriptive research questions on the three topical areas of this study: identification, declassification, and outcomes. The questions are as follows:

Key questions related to *identification*

- What is the percentage of children identified for early intervention and special education services under IDEA? What is the variation in the percentage identified over time and by age, gender, race/ethnicity, and disability categories?
- What is the variation across states and over time in the percentage of children who has been identified for early intervention or special education services under IDEA?

Key questions related to *declassification*

- What percentage of children identified for early intervention and special education services lose eligibility (are declassified)?
- How do the developmental and academic outcomes for children who are declassified compare with those for children with disabilities who continue receiving services under IDEA?

Key questions related to *outcomes*

- How do developmental and academic outcomes for children with disabilities identified for services under IDEA compare with those of children not identified for services under IDEA?
- How do developmental and academic outcomes for children with disabilities vary by disability categories within age groups and over time?

Methodological Approach

Two sets of analytic activities were conducted for this study. A review of relevant literature was conducted to identify published sources of data and analyses of pertinent data sources from which findings were drawn. Extant databases were selected on the basis of this initial review to conduct new analyses addressing the research questions for this study. As a result, 14 datasets were selected that targeted the age ranges of interest and the time frame most relevant for this study.

Three age ranges of children were used: infants and toddlers (birth through age 2), preschool-age (ages 3 through 5), and school-age children with disabilities (ages 6 through 21). Most analyses for the school-age children included only 6- through 17-year-olds, and in some instances targeted subgroups of 6- through 9-year-olds, 10- through 13-year-olds, and 14- through 17-year-olds. These age groups align with how districts serve children, with a particular emphasis at the federal level on improving the achievement of students in grades K through 3 (the 6 through 9 age group).

Study questions on the identification of children for IDEA services focused both on one point in time and trends over time. The time frame most relevant for addressing research questions at one point in time was the most recent year of data available. For analyses of changes in identification over time, 1997 was chosen as the starting point because it was the year of the last reauthorization of IDEA before the 2004 reauthorization. To address study questions related to outcomes, the most current data sources given priority were those that included data for both children with disabilities and their counterparts (i.e, children without disabilities, children without an IEP), data from both before and after the 2004 reauthorization of IDEA, and data that reflected both NCLB and IDEA. The only data sources available that included outcomes disaggregated by disability categories for each age group predated the 2004 reauthorization of IDEA.

The following data sources were used in the analyses reported. (A detailed description of each data source is included in appendix A1.)

Population data on children identified for services under IDEA:

- Data Analysis System (DANS)
- State Annual Performance Reports (APR)

Population data for identification and graduation ratios:

- Common Core of Data (CCD)
- U.S. Census (2000)
- National Vital Statistics System (NVSS)

Sample data from four longitudinal studies of different age groups that followed nationally representative samples of children identified for services under IDEA:⁶

- National Early Intervention Longitudinal Study (NEILS) of infants and toddlers
- Pre-Elementary Education Longitudinal Study (PEELS) of children ages 3 through 5
- Special Education Elementary Longitudinal Study (SEELS) of children ages 6 through 12
- National Longitudinal Transition Study-2 (NLTS2) of children ages 13 through 21

Sample data on the outcomes of the total population for comparison with the outcomes of children identified for services under IDEA:

- Early Childhood Longitudinal Study-Kindergarten Cohort (ECLS-K)
- National Health Interview Survey (NHIS)
- National Household Education Surveys (NHES 1999), used to compare outcomes for infants and toddlers
- National Assessment of Educational Progress (NAEP), used to compare outcomes of school age children.

Variables Used in Analyses

Specific variables from the data sources were used in analyses related to identification and outcomes for children identified for services under IDEA. Exhibit 1.2 summarizes the variables and the sources of extant data. More detailed information is available in appendix B.

Analytic Procedures

Analyses conducted using population data were considered to be descriptive and no statistical testing was conducted. Population data were from the U.S. Census (for year 2000), the CCD, DANS, the State APRs, and the NVSS. When analyses included sample data, statistical testing was conducted. Sample data included the four child-based longitudinal studies from the national assessment of IDEA in 1997 (NEILS, PEELS, SEELS, and NLTS2); the Early Childhood Longitudinal Study, Kindergarten Cohort (ECLS-K); the National Assessment of Educational Progress (NAEP); and two recurring studies of the general population (NHIS and NHES).

Tests of difference between groups and over time were conducted to determine whether observed differences were greater than would be expected by chance. When the appropriate statistical significance value could not be obtained from the literature, *t* tests for differences in mean values were applied to calculate the statistical significance of the comparison. All *t* tests were two-sample *t* tests when the two samples were independent or were tests of hypothesis that

⁶ Although these data sources include outcome data that predate the 2004 reauthorization of IDEA, they are the only data sources available to address the study question on the variation by disability category in the outcomes for children with disabilities. Detailed descriptions of these data sources are included in appendix A.1.

a sample mean differed from a constant (e.g., the mean of a relevant population or norm groups). All statistical tests of change over time examined differences between specific years (for example, 2003 and 2005). Tests of differences across states examined the statewide mean versus the mean of the nation excluding the particular state.

The false discovery rate was controlled using the Benjamini-Hochberg (1995) procedure at $p < .05$. This test was applied to eight domains: grade 4 NAEP reading and math scores; grade 8 NAEP reading and math scores; and all tests from NEILS, PEELS, SEELS, and NLTS2. Additional information about this procedure and justification for its use can be found in appendix B. Standard errors tables are included in appendix A sections corresponding to each chapter.

For research questions related to identification of children for services under IDEA, data are presented for the number of children identified as receiving IDEA services, the percentage of children from the total population who were identified for services under IDEA, and the composition (by gender) of the population of children identified for services under IDEA Part B. Declassification data are presented for the percentage of children no longer eligible for early intervention or special education services and their outcomes as compared with children who continue to receive services. For outcomes of children receiving IDEA services, data presented in this report include academic and developmental outcomes and trends for children identified for services under IDEA. Analyses include comparisons over time, between children identified for and not identified for services under IDEA, between state results and national averages, with the total population means, across IDEA eligibility classifications, across ages, and across declassification status.

All comparisons in outcomes between children served under IDEA and other children, or between children served under IDEA across states and over time, are presented for descriptive purposes only. These comparisons were not designed and are not suited to measure the impacts of IDEA on child outcomes.

Exhibit 1.2. List of variables and extant data sources, by age group

Variable	Children's age in years		
	Birth through 2	3 through 5	6 through 21
Identification			
Number of children identified for services under Part C (birth through 2) or Part B (3- through 5-year-olds and 6- through 17-year-olds) of IDEA, by <ul style="list-style-type: none"> • year • age • ethnicity • gender • state • disability category 	DANS	DANS	DANS

NOTE: Abbreviations for data sources are: APRs: State Annual Performance Reports; CCD: Common Core of Data; DANS: Data Analysis System; ECLS-K: Early Childhood Longitudinal Study, Kindergarten Cohort; NCEO: National Center on Educational Outcomes; NEILS: National Early Intervention Longitudinal Study; NHES: National Household Education Surveys; NLTS2: National Longitudinal Transition Study-2; NVSS: National Vital Statistics System; PEELS: Pre-Elementary Education Longitudinal Study; SEELS: Special Educational Elementary Longitudinal Study. The outcome indicator, WJ III, refers to the Woodcock-Johnson III Tests of Achievement. Additional information for each data source is available in appendix A1.

Overview of the Report

This report provides background context for National Assessment studies on program implementation and effectiveness of services, making a contribution to policy and practice in the following important ways. First, it describes the academic and developmental outcomes for children across the age span and, as appropriate, compares their outcomes of samples including their nondisabled peers. For each age group, the report provides a national description of the children identified for services under IDEA—by their ages, gender, race/ethnicity, and disability.

Second, the age groupings of school-age children align with federal policy and district practices. Findings for children ages 6 through 9 align with the federal focus on improving achievement of students in grades K through 3 and enrolled in elementary school. Children ages 10 through 13 and 14 through 17 are typically enrolled in middle and high schools, respectively.

Third, the findings are reported across time, as well as for a single time point. The patterns in the identification of children identified for IDEA services across the age spans are reported for a 10-year time frame. For school-age children and youth, 4 years of data were available for reporting on the patterns in their outcomes. For infants and toddlers eligible for IDEA services, developmental comparisons are made.

Fourth, the research questions were answered by using the extant data sources listed earlier in this chapter in lieu of costly new data collection. New approaches were used to analyze data from these existing datasets, such as new data sources to calculate identification percentages on the basis of annual population data and new calculations for determining graduation rates among youth identified for IDEA services.

Finally, this report presents descriptive findings from the analyses objectively and provides relevant contextual information, such as the legislative background on IDEA. This study is not designed to assess how outcomes presented in the report are affected by identification or declassification practices, nor is it designed to measure impacts of IDEA services on child outcomes. IES is providing the information contained in this study as part of the National Assessment of IDEA 2004 for use by the U.S. Department of Education, the Congress, and the public.

With these contributions in mind, the chapters are organized by the age group of children identified for services under IDEA. Each chapter presents, for the age group, the patterns of identification, declassification, and outcomes for children identified for early intervention and special education under IDEA. This organization frames a more complete, unified picture of the age group than would result from a topical organization. Specifically,

- Chapter 2 summarizes information on the identification, declassification, and developmental and academic outcomes for infants and toddlers, birth through 2 years of age, receiving early intervention services supported with IDEA Part C federal grants and state and local funds.
- Chapter 3 focuses on identification for special education and developmental and academic outcomes for children ages 3 through 5 supported with IDEA Part B, Section 619, preschool special education federal grants and state and local funds.
- Chapter 4 presents information on the identification, declassification, and academic outcomes for children and youth ages 6 through 21 supported with IDEA Part B, Section 611, special education federal grants and state and local funds.

Key Findings Related to Infants and Toddlers Identified for Early Intervention Services Under IDEA

Who are infants and toddlers identified for services under IDEA and how has this changed over time?

In 2006, a total of 299,848 children ages birth through 2 years were reported by states as having been identified for early intervention (EI) services under IDEA. The percentage of infants and toddlers who were receiving early intervention nationally declined from 1997 to 1998 (1.65 percent to 1.57 percent) but then increased every year thereafter, reaching 2.40 percent in 2006. In 2006, 178,285 infants and toddlers identified for services (59 percent) were male and 121,563 (41 percent) were female. The percentage of infants and toddlers identified for EI services under IDEA varied by race/ethnicity. In 2005, the most recent year for which data are available, the percentages of the general population identified for services under IDEA within each racial/ethnic category were 1.95 percent for Asians, 2.09 percent for Hispanics, 2.32 percent for Blacks, 2.45 percent for American Indian, and 2.55 percent for Whites. From 1998 to 2005, the percentage of infants and toddlers identified for EI services under IDEA for all five racial/ethnic categories increased, with the percentages for White infants and toddlers showing the greatest change (1.41 percent to 2.55 percent).

States varied in the percentage of infants and toddlers identified for services under IDEA. The percentage of children identified for services ranged from 7.19 percent in Hawaii to 1.18 percent in Mississippi in 2006. The percentage of children identified was higher in 2006 than in 1997 for 47 states.

Who leaves early intervention services?

States reported that 66 percent of the infants and toddlers who exited early intervention from 2005 to 2006 at 36 months were eligible for Part B 619 preschool services. States also reported that 12 percent exited to other programs, 6 percent exited early intervention without referrals to other services, and 17 percent had not yet had their eligibility for Part B determined when they left early intervention. Across states, the percentage of children exiting EI services who were determined eligible for Part B services ranged from 100 percent in Minnesota to 10 percent in the District of Columbia.

What are the developmental outcomes of infants and toddlers identified for early intervention services under IDEA?

Findings from the National Early Intervention Longitudinal Study (NEILS) show that less than 40 percent of infants and toddlers who had participated in EI services under IDEA were reported as demonstrating skills expected for their age at both 36 months and kindergarten across all five skill areas—communication, cognitive development, social-emotional, physical, and adaptive development.¹ Children's skills at 36 months and at kindergarten differed for

¹ These data are based on items in the NEILS parent interview and teacher surveys. Items included parent reporting of the child's level of accomplishment across developmental milestones and asking parents and teachers to report on the child's skill level compared to other children the same age. Most of the items were developed for NEILS by the research team based on the study's conceptual framework. Some items were taken from protocols developed for other studies such as the National Household Education Survey (NHES); Early Childhood Longitudinal Study,

children who were eligible for early intervention because of a developmental delay, a risk condition, or a diagnosed condition. Children with a risk condition or a developmental delay showed higher levels of performance than children with a diagnosed condition. Parent and teachers' reports of skills across the five developmental domains indicated that former EI participants without Individualized Education Programs (IEPs) performed comparably to their same age peers in kindergarten whereas former EI participants with IEPs showed lower levels of performance. Forty-five percent of former EI participants did not have IEPs at kindergarten.

Kindergarten Cohort (ECLS-K); and National Health Interview Survey (NHIS). These items were included in the NEILS interviews and surveys so the information could be compared to the general population.

2. Infants and Toddlers Identified for Early Intervention Services Under IDEA

This chapter provides a summary of information on infants and toddlers identified for early intervention (EI) services in four sections: (1) the legislative background and research questions for examining the status of infants and toddlers identified for early intervention (EI) services under IDEA, (2) the identification of infants and toddlers for EI services under IDEA, (3) their rates of losing eligibility for EI services under IDEA through “declassification,” and (4) their academic and developmental outcomes. Outcomes are presented in this chapter for the five IDEA developmental areas. This study is not designed to assess how outcomes presented in this report are affected by identification or declassification practices, nor is it designed to measure impacts of IDEA services on child outcomes.

Legislative Background

Before 1986, early intervention (EI) services were provided only in some states and only to some children with disabilities or developmental delays and their families in those states. In 1986, P.L. 99-457 created a new program for infants and toddlers with disabilities, making the availability of EI services part of national policy. This law also introduced the requirement for an “Individualized Family Service Plan” (IFSP) designed to meet the unique developmental needs of each eligible infant or toddler and the family. This program, now Part C of IDEA, provides grants to states to make services available to infants and toddlers, from birth through age 2, who have developmental delays, diagnosed conditions, or, at state option, conditions that put them at risk for developmental delay, and to the families of such children. According to IDEA section 632(5), “...eligible children or infants and toddlers with disabilities means individuals from birth through age two who need early intervention services because they--(1) Are experiencing developmental delays, as measured by appropriate diagnostic instruments and procedures, in one or more of the following areas: (i) Cognitive development. (ii) Physical development, including vision and hearing. (iii) Communication development. (iv) Social or emotional development. (v) Adaptive development; (2) Have a diagnosed physical or mental condition that has a high probability of resulting in developmental delay; (3) May also include, at a State’s discretion, children from birth through age two who are at risk of having substantial developmental delays if early intervention services are not provided. Or children beyond age 3 if the State elects to make services available under IDEA section 635(c).”

In the decade that followed the passage of P.L. 99-457, states built or adapted EI systems, including eligibility determination procedures and criteria, in accordance with their understanding of the law’s vision.² The structure of each state system and the eligibility criteria vary across the states.³ There are also variations in the percentages of children served under IDEA Part C overall and in each eligibility category.

IDEA legislation requires that IFSPs be evaluated annually and a review of the plan at 6-month intervals (or more often when conditions warrant based on the needs of each eligible infant or toddler and his or her family). Declassification refers to the loss of eligibility for IDEA

² Spiker, D., Hebbeler, K., Wagner, M., Cameto, R., and McKenna, P. (2000). A Framework for Describing Variations in State Early Intervention Systems. *Topics in Early Childhood Special Education*, 20(4): 195–207.

³ See footnote 2.

services. It can occur for infants and toddlers who received EI services but (a) subsequently were found no longer to be eligible to receive EI services if they were less than 36 months of age or (b) were found not to be eligible for Part B preschool special education services at 36 months of age, the end of EI services. Declassification before reaching 36 months of age indicates that a child no longer qualifies for early intervention in the state. All children still receiving early intervention at 36 months of age leave the Part C system and, if eligible, continue under Part B of IDEA. Because the eligibility criteria for Part B preschool services differ from those for Part C services, eligibility for preschool special education and related services is generally determined before children turn 3 years old.

Identification of Infants and Toddlers for Early Intervention Services Under IDEA

The identification section of this chapter presents the following types of information:

- The number and percentage of infants and toddlers identified for early intervention services under IDEA nationally and by age, gender, race/ethnicity, and state. The percentages are also examined across time.
- The percentage of infants and toddlers identified for EI services by state and the Office of Special Education Programs' (OSEP) categorization of eligibility criteria.

Currently, states report to OSEP the number of infants and toddlers receiving Part C services as a part of their annual Section 618 report. Data from 1997 to 2006 were obtained from OSEP's Data Analysis System (DANS), which compiles data reported by states. As of December 1 of each year, each state reports to OSEP the number of children, ages birth to 21, in the state who were identified for services under IDEA, including both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. A proxy for the total population count for each age was created using birth data from the National Vital Statistics System (NVSS). Identification percentages⁴ were computed for each year using the number of infants and toddlers served under Part C (DANS) as a percentage of the population of infants and toddlers (NVSS). To report on the identification of infants and toddlers for EI services under IDEA, both the identification counts and percentages are reported below.

Number and Percentage of Infants and Toddlers Identified for Services Under IDEA from 1997 to 2006

Of the 7,013,238 children birth to 21 years old identified for services under IDEA in 2005, a total of 294,714 children ages birth through 2 years were reported by states as having been identified for EI services under IDEA including both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA (see shaded ages in exhibit 2.1). More 2-year-olds (158,404 children) than 1-year-olds (94,445 children) were identified, and more 1-year-olds were identified than children younger than 1 year old (41,865 children).

In 2006, the number and percentages of children served under IDEA differed by age (see exhibit 2.2). In 2006, there were 43,048 children identified who were less than 1 year of age, 95,993 children between ages 1 to less than 2, and 160,807 children ages 2 to less than 3. Of

⁴ See appendix B for a definition of "percentage" and details regarding its calculation.

the population for each age in 2006, children 2 to less than 3 years of age had the highest percentage identified (3.91 percent), followed by children 1 to less than 2 (2.32 percent) and children who were less than 1 year old (1.01 percent).

Exhibit 2.1. National number of infants and toddlers identified for services under IDEA, by age (2005)

Exhibit reads: Nationwide, 41,865 children less than 1 year old were identified for services under Part C of IDEA in 2005.

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA, based on enrollment numbers at a single time point between October 1, 2005, and December 1, 2005. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The ages of children eligible to receive early intervention services under Part C of IDEA are birth through 2. The shaded portion represents the data for these children.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part C Child Count, 1997–2006, retrieved December 7, 2007, from <http://www.ideadata.org/PartCChildCount.asp>.

Between 1997 and 2006, the changes in the percentage of children served under IDEA varied by age group. The percentage of infants and toddlers who were receiving early intervention nationally declined from 1997 to 1998 (1.65 percent to 1.57 percent) but then increased every year thereafter, reaching 2.40 percent in 2006 (see exhibit 2.3). The greatest increase in the percentage of children identified was for children 2 to less than 3 years of age reaching 3.91 percent in 2006 (from 2.42 percent in 1998). For children ages birth to less than 1, the trend is the same as the overall pattern for infants and toddlers until 2002 when there was a decrease from 1.03 in 2002 to 0.95 percent in 2003. Percentages increased from 2003 reaching 1.01 percent in 2006.

Exhibit 2.2. National number and percentage of infants and toddlers identified for early intervention services under IDEA, by age (1997–2006)

Year	Children identified for services							
	Number				Percentage of all children			
	Age birth through 2	Age birth to less than 1	Age 1 to less than 2	Age 2 to less than 3	Age birth through 2	Age birth to less than 1	Age 1 to less than 2	Age 2 to less than 3
1997	192,469	33,792	61,401	97,276	1.65	0.87	1.58	2.49
1998	184,362	30,681	59,617	94,064	1.57	0.78	1.54	2.42
1999	202,718	35,307	65,810	101,601	1.72	0.89	1.67	2.62
2000	229,150	35,989	72,998	120,163	1.92	0.89	1.84	3.05
2001	242,255	37,962	77,169	127,124	2.01	0.94	1.90	3.21
2002	265,549	41,326	83,405	140,818	2.19	1.03	2.07	3.47
2003	271,889	38,914	86,108	146,867	2.24	0.95	2.14	3.65
2004	280,957	40,575	89,833	150,549	2.30	0.99	2.20	3.74
2005	294,714	41,865	94,445	158,404	2.39	1.01	2.30	3.87
2006	299,848	43,048	95,993	160,807	2.40	1.01	2.32	3.91

Exhibit reads: Nationwide, 192,469 children ages birth through 2 were identified for early intervention services under IDEA in 1997. These represented 1.65 percent of all children ages birth through 2.

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on Indian reservations. Birth data for 2006 are preliminary. The percentage of children who were identified was calculated by dividing the number of children identified for services under IDEA (DANS) in a given age group by the total number of children in the same age group as indicated by the population proxy constructed with NVSS birth data.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part C, Child Count, 1997–2006, retrieved December 7, 2007, from <http://www.ideadata.org/PartCChildCount.asp>; U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System, 1990–2005, retrieved January 11, 2008, from <http://205.207.175.93/vitalstats/ReportFolders/ReportFolders.aspx>; birth data for 2006 are from table 6, p. 12, of Hamilton, Martin, and Ventura (2007).

Exhibit 2.3. Trends in national percentage of infants and toddlers identified for early intervention services under IDEA, by age (1997–2006)

Exhibit reads: Nationwide, the percentage of 2-year-olds identified for services under IDEA increased from 2.49 percent in 1997 to 3.91 percent in 2006.

NOTE: The percentage of children who were identified was calculated by dividing the number of children identified for services under IDEA (DANS) in a given age group by the total number of children in the same age group as indicated by the NVSS-constructed population proxy. The numbers of children identified are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on the Indian reservations. Birth data for 2006 are preliminary.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part C, Child Count, 1997–2006, retrieved December 7, 2007, from <http://www.ideadata.org/PartCChildCount.asp>; U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System, 1990–2005, retrieved January 11, 2008, from <http://205.207.175.93/vitalstats/ReportFolders/ReportFolders.aspx>; birth data for 2006 are from table 6, p. 12, of Hamilton, Martin, and Ventura (2007).

Percentage of Infants and Toddlers Identified for Services, by Race/Ethnicity (1998 through 2005)

To examine differences in the rates of identification for EI services by children's racial/ethnic category, percentages for each of five racial/ethnic categories were calculated. Data on the racial/ethnic category of children served in early intervention was available from 1998 through 2005.

In 2005, the percentage of infants and toddlers identified for EI services under IDEA varied by race/ethnicity (see exhibit 2.4). In the most recent year for which data are available (2005), 1.95 percent of Asian infants and toddlers, 2.09 percent of Hispanic infants and toddlers, 2.32 percent of Black infants and toddlers, 2.45 percent of American Indian infants and toddlers, and 2.55 percent of White infants and toddlers were identified for services under IDEA.

From 1998 to 2005, the percentage of infants and toddlers identified for EI services under IDEA for all five racial/ethnic categories increased from 1998 to 2005 (see exhibits 2.4 and 2.5). The percentage of Black, White, and American Indian infants and toddlers identified for early intervention services nationally increased from 1998 to 2005 (percentage changes of 0.66, 1.14, and 0.64, respectively), with the percentages for White infants and toddlers showing the greatest change. While there was an overall percentage increase from 1998 to 2005 for Hispanic and Asian children (0.98 percent and 0.77 percent, respectively), the pattern of identification was different. For Hispanic children, the percentage declined between 2002 and 2003 (1.96 percent to 1.95 percent), and increased every year after, reaching 2.09 in 2005. The percentage for Asian children declined between 2002 to 2004 (1.97 percent to 1.84 percent), then increased thereafter reaching 1.95 percent in 2005.

Number of Infants and Toddlers Identified for EI Services Under IDEA, by Gender (2006)

Data on the gender of children served in early intervention were collected for the first time by DANS in 2006. These data indicate that in 2006, 178,285 infants and toddlers identified for services (59 percent) were male and 121,563 (41 percent) were female.

Percentage of Infants and Toddlers Identified for EI Services, by State (1997 to 2006)

Exhibit 2.6 displays the overall national and state percentages for the identification of infants and toddlers served under IDEA in 1997 and 2006 and the average percentages across the intervening years. The states are ordered by their percentages in 2006.

Exhibit 2.4. National number and percentage of children ages birth through 2 identified for early intervention services under IDEA, by race/ethnicity (1998–2006)

Year	Children identified for services									
	Number					Percentage of all children				
	White	Black	Hispanic	Asian	American Indian	White	Black	Hispanic	Asian	American Indian
1998	100,884	29,252	24,255	5,884	1,988	1.41	1.66	1.11	1.18	1.81
1999	111,213	32,752	27,298	6,369	2,178	1.56	1.85	1.22	1.24	1.95
2000	132,792	34,392	32,604	7,485	2,300	1.85	1.91	1.39	1.38	2.01
2001	150,870	36,872	42,089	9,654	2,318	2.12	2.06	1.71	1.70	2.01
2002	160,550	40,148	50,266	11,812	2,521	2.28	2.26	1.96	1.97	2.16
2003	165,623	39,861	51,789	11,716	2,626	2.37	2.27	1.95	1.90	2.23
2004	169,241	40,131	54,877	11,785	2,764	2.43	2.30	1.99	1.84	2.33
2005	177,153	40,579	59,815	12,781	2,947	2.55	2.32	2.09	1.95	2.45
2006	177,379	40,894	64,699	13,625	3,098	—	—	—	—	—

Exhibit reads: Nationwide, 100,884 White children ages birth through 2 years were identified for early intervention services under IDEA in 1998. These represented 1.41 percent of all White infants and toddlers.

— Percentages for 2006 could not be calculated because birth data for 2006 by race/ethnicity were not available.

NOTE: Black includes African American, Hispanic includes Latino, Asian includes Native Hawaiian or Other Pacific Islander, and American Indian includes Alaska Native. The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on the Indian reservations. Birth data for 2006 are preliminary. The percentages of children identified were calculated by dividing the number of children identified for services under IDEA (birth through 2) in a given racial/ethnic category by the total number of children (birth through 2) in the same racial/ethnic category as indicated by the NVSS-constructed population proxy.

Exhibit 2.5. Trends in national percentage of children ages birth through 2 identified for early intervention services under IDEA, by race/ethnicity (1998–2005)

Exhibit reads: Nationwide, the percentage of American Indian children ages birth through 2 identified for services under IDEA increased from 1.81 percent in 1998 to 2.45 percent in 2005.

NOTE: Black includes African American, Hispanic includes Latino, Asian includes Native Hawaiian or Other Pacific Islander, and American Indian includes Alaska Native. The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on Indian reservations. The percentages of children identified were calculated by dividing the number of children identified for services under IDEA (birth through 2) in a given racial/ethnic category by the total number of children (birth through 2) in the same racial/ethnic category as indicated by the NVSS-constructed population proxy.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part C Child Count, 1997–2006, retrieved December 7, 2007, from <http://www.ideadata.org/docs%5CPartCTrendData%5CC3.xls>; U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System, 1990–2005, retrieved January 11, 2008, from <http://209.217.72.34/VitalStats/ReportFolders/ReportFolders.aspx>.

Exhibit 2.6. Percentage of children ages birth through 2 identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2005 average, and 2006)

Exhibit reads: Nationwide, 2.40 percent of all children ages birth through 2 were identified for Part C services under IDEA in 2006; 1.65 percent were identified in 1997; and, on average, 2.05 percent were identified in 1998 through 2005.

NOTE: States are ordered by the percentage of children identified for services in 2006. Vertical lines represent the average percentages for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The numbers used to calculate the percentages of children identified are (1) counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year and (2) population proxy constructed with data from the National Vital Statistics System (NVSS) birth data, including births on Indian reservations. The annual state counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. The percentages were calculated by dividing the number of children identified for services under IDEA (birth through 2) in a state (or nationally) by the number of children in the same state (or nationally) as indicated by the NVSS-constructed population proxy. NVSS birth data for 2006 are preliminary.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part C Child Count, 1997–2006, retrieved December 7, 2007, from https://www.ideadata.org/tables30th%5Car_1-1.xls; U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System, 1990–2005, retrieved January 11, 2008, from <http://209.217.72.34/VitalStats/ReportFolders/ReportFolders.aspx>; birth data for 2006 are from table 6, p. 12, of Hamilton, Martin, and Ventura (2007).

In 2006, states varied in the percentage of infants and toddlers identified for services under IDEA. Nationally, the percentage of children identified was 2.4 percent in 2006, the most recent year for which information is available. This is more than the percentage of children identified in 1997 (1.65 percent) and the average of 1998 through 2005 (2.05 percent). Across states in 2006, the percentage of children identified for services ranged from 7.19 percent in Hawaii to 1.18 percent in Mississippi. In 2006, the percentage of children identified was higher than in 1997 for 47 states (the exceptions were Delaware, Florida, Mississippi, and Ohio).

Percentage of Infants and Toddlers Identified for Services, by State and OSEP Categorization of Eligibility Criteria

OSEP developed a categorization system that classifies states on the basis of the breadth of their eligibility criteria for early intervention into one of three categories: broad, moderate, and narrow. The criteria are based upon averaging descriptors (percent delay, age/month delay, standard deviation, and undefined variable related to if a state serves at-risk) in states' eligibility definitions for Part C (Mackey Andrews and Taylor 2007). States with broad definitions use criteria that would allow more children to be served.

Exhibit 2.7 displays the states ordered by percentages of infants and toddlers identified for EI services under IDEA in 2006 and also shows classification of each state's eligibility criteria as broad, moderate, or narrow. The exhibit shows the overall national percentage for children ages birth through 2 years. In 2006, 14 of the 22 states with broad eligibility criteria had higher percentages than the national percentage, and 12 of the 16 states with narrow criteria had lower percentages than the national percentage.

Exhibit 2.7. Percentage of children ages birth through 2 identified for services under IDEA in 50 states and the District of Columbia, by the state's Office of Special Education Programs (OSEP) categorization of eligibility (2006)

Exhibit reads: In 2006, more than 7.0 percent of children ages birth through 2 were identified for services under IDEA in Hawaii, a state that was categorized as having broad eligibility for EI services.

NOTE: OSEP categorization is based on definition of developmental delay and whether the state serves at-risk children. The vertical line represents the national percentage. The numbers of children identified are calculated from counts of children identified for services under IDEA at a single time point between October 1, 2006, and December 1, 2006. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. National data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The percentages were calculated by dividing the number of children identified for services under IDEA (birth through 2) in a state by the number of children in the same state as indicated by the NVSS-constructed population proxy. NVSS birth data for 2006 are preliminary.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part C Child Count, 1997–2006, retrieved December 7, 2007, from http://www.ideadata.org/tables30th%5car_7-1.xls; U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System, 1990–2005, retrieved January 11, 2008, from <http://209.217.72.34/VitalStats/ReportFolders/ReportFolders.aspx>; birth data for 2006 are from table 6, p. 12, of Hamilton, Martin, and Ventura (2007).

Declassification of Infants and Toddlers Who Had Been Identified for Early Intervention Services Under IDEA

Two sources of data are used to report on declassification and early intervention. The first source of data is from the National Early Intervention Longitudinal Study (NEILS), which followed a nationally representative sample of more than 3,000 children from the time they began early intervention services until kindergarten. The second source is state-reported data on the number of children who exit Part C early intervention services and the four reasons children no longer receive EI services at 36 months of age: (1) children are eligible for Part B preschool services, (2) eligibility for Part B has not been determined, (3) exited to other programs, and (4) exited with no referrals to other programs. Both of these data sources are informative, but data from them cannot be compared because one follows a cohort of entrants over time and the other describes exiters in a given time period.

A longitudinal study of infants and toddlers who were identified for early intervention services found that 18 percent exited before reaching the age limit of 36 months for early intervention services (see exhibit 2.8). These children exited early intervention for various reasons, such as meeting all their developmental goals and losing eligibility because of developmental progress or parents' choosing to withdraw from services. At 36 months of age, an additional 20 percent of children exited EI and were not enrolled in Part B preschool services, while 62 percent of children exited EI at 36 months of age and did continue on to Part B preschool special education services.

Exhibit 2.8. National percentage of children exiting early intervention before 36 months of age and at 36 months of age who did and did not receive Part B services

Exhibit reads: Nationwide, 20 percent of a cohort of children identified for services under IDEA exited from early intervention at 36 months of age and did not go on to receive Part B preschool services.

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007.

Of all infants and toddlers served nationally under IDEA who exited early intervention at 36 months from 2005 to 2006, 66 percent were reported by states to have been eligible for Part B preschool services (see exhibit 2.9). Twelve percent were reported to have exited to other programs, and 6 percent were reported to have exited the early intervention system without referrals to other services, and 17 percent had not yet had their eligibility for Part B determined at their exit from early intervention. Across states, the percentage of children exiting EI services who were determined eligible for Part B services ranged from 100 percent in Minnesota to 10 percent in the District of Columbia (see exhibit 2.10), where Part B eligibility was undetermined for 87 percent of children at the time of reporting.

Exhibit 2.9. National percentage of children no longer receiving early intervention services under IDEA at 36 months of age, by exit category (2005–2006)

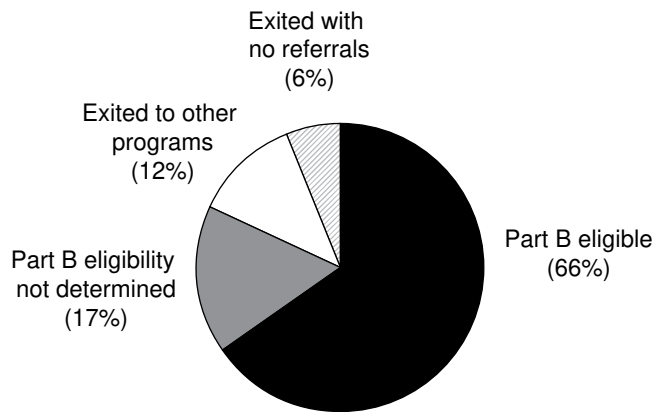

Exhibit reads: Nationwide, of all children served under IDEA who left EI at 36 months from 2005 to 2006, 66 percent were eligible for Part B services.

NOTE: The DANS data represented in this exhibit reflect data on all children who exited EI programs at 36 months of age in fall 2005.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), retrieved December 7, 2007, from https://www.ideadata.org/tables30th%5Car_7-8.xls.

Exhibit 2.10. Percentage of children no longer receiving early intervention services under IDEA at 36 months of age, by exit category and state (fall 2005)

Exhibit reads: Of all children who left EI at 36 months of age in Minnesota in fall 2005, 100 percent were eligible for Part B services.

NOTE: The DANS data represented in this exhibit reflect data on all children who exited EI programs at 36 months of age in fall 2005.

Outcomes for Infants and Toddlers Identified for Early Intervention Services Under IDEA

A critical policy question at all age levels is how children who receive services under IDEA are progressing. Addressing this question requires examining different outcomes for different age groups. For children younger than school age, consideration of outcomes often focuses on developmental domains or areas. IDEA lists five developmental areas in which children might experience developmental delay: communication development, cognitive development, social or emotional development, adaptive development, and physical development. Furthermore, the National Education Goals Panel identified five developmental areas considered important for young children—(1) physical well-being and motor development; (2) social and emotional development; (3) approaches toward learning; (4) language development; and (5) cognition and general knowledge (National Education Goals Panel 1995)—and many states have adopted similar areas in developing their early learning guidelines (Scott-Little, Kagan, and Frelow 2005).

The NEILS data can be used to describe outcomes for children who received EI services nationally. Outcome data collection included parent-reported information at 36 months of age and parent- and teacher-reported information in kindergarten. Most of the items in the parent interview and teacher surveys were developed for NEILS by the research team based on the study's conceptual framework. Some items were taken from protocols developed for other studies such as the National Household Education Survey (NHES); Early Childhood Longitudinal Study, Kindergarten Cohort (ECLS-K); and National Health Interview Survey (NHIS).

Telephone interviews were conducted with families to obtain information about child and family characteristics, child functioning, and families' perceptions of services. Families were interviewed when their children entered early intervention, annually on the anniversary of their entry, when their children were 3 years old, and again when they entered kindergarten. Findings presented here are based on parent reporting of the child's skill level for a set of developmental milestones for different ages and on other items where parents were asked to characterize the child's skill or behavior according to a fixed set of responses. An index of developmental skills was derived from the milestone data for each of four domains (motor, communication, independence, and cognition) for each child. The research team identified an expected age of attainment for each milestone based on a review of the literature and other developmental instruments. On the basis of the parent's responses to the milestones within a domain, each child was determined to have mastered nearly all or all of the age-expected developmental skills in the domain or not (Scarborough, Hebbeler, Simeonsson, and Spiker 2007).

In the spring of children's kindergarten year, the teachers were sent a two-part questionnaire that asked about the child's performance in kindergarten. The study child's parent provided the name of the child's kindergarten teacher. The teachers were sent a letter with the survey indicating that the child was participating in a study of early intervention, but the letter did not say the child had received early intervention. The teacher may or may not have known this. The kindergarten teacher survey included items on social skills (e.g., whether the child makes friends easily, follows directions, receives criticisms well, appears lonely, completes homework on time, etc.); language and literacy (whether the child produces rhyming words, composes simple stories, etc.); mathematical thinking (whether the child orders a group of objects, uses a variety of strategies to solve math problems, etc.); and other items involving comparisons of child's

skills and performance to that of other children the child's age or in the classroom. The language and literacy and mathematical thinking items were taken from the ECLS-K teacher instrument.

Information was collected from both parents and teachers as to whether or not children had been identified for services under Part B IDEA in kindergarten. Overall, 55 percent of former EI participants were identified for special education services in kindergarten (i.e., had Individualized Education Programs).

This section highlights children's outcomes at 36 months of age (based on parent report) and in kindergarten (based on teacher and parent reports) for each of the five developmental domains. Data are summarized to provide the following information:

- Overall findings regarding the outcomes for children who were identified for EI services under IDEA. Presented outcomes for these findings as well as for the additional findings described below are based on parent and teacher responses to several types of items that assessed perception of developmental and academic skills:
 - Items that asked the parent to compare their child's skill level to other children the same age (e.g., Compared to other children the same age, how well does [name of child] make [his/her] needs known to you and other? Would you say [he/she] communicates just as well as other children, has a little trouble communicating, has a lot of trouble communicating, or doesn't communicate at all?)
 - Developmental milestone items for which the parent reported on the child's level of accomplishment (e.g., How well does your child tell a simple story if asked? Would you say [she/he], doesn't do it at all, does it but not well, or does it well?). Using this information, the item level responses for the milestones were aggregated across milestones and children were classified as to whether they could or could not perform well all of the milestones expected for a child that age.
 - Items that asked the parent to report on the child's performance on simple cognitive tasks (e.g., How high can [child's name] count?), on aspects of the child's behavior (e.g., Would you say your child rarely has temper tantrums, sometimes has temper tantrums, or often has temper tantrums?), and on the child's health (i.e., Compared to other children the same age, would you say [child's name]'s general health is excellent, very good, good, fair, or poor?).
 - Items that asked the teacher to rate the child's abilities and disabilities across a number of areas -- such as communicating with others, thinking and reasoning, and behavior on a 6-point scale that ranged from "normal for age" to "extreme difficulty," the child's literacy and mathematics skills on a 5-point scale ranging from "not yet" to "proficient."
 - Items that asked the teacher to report how frequently the child displayed certain behaviors on a 3-point scale ranging from "never" to "very often" (e.g., Argue with others) and how many friends the child had in the classroom with answer choices ranging from "far fewer than most children" to "far more than most children."
 - An item that asked the teacher about how the child compares to other children in terms of activity level with answer choices ranging from "a lot less active than most" to "a lot more active than most."

- Outcome findings by IDEA Part C eligibility category (developmental delay, diagnosed condition, at risk for delay).⁵
- Comparison of outcomes for former EI participants continuing to receive services under IDEA in Kindergarten (i.e., children with IEPs) with outcomes for children no longer eligible for IDEA services (i.e., children with no IEPs).

Where applicable, outcome data were compared with general population data on 3- and 5-year-olds from NHES, ECLS-K; and NHIS. General population data included both children identified and not identified for EI and special education services.

Communication

Overall Findings

Children who participated in early intervention were reported as demonstrating communication skills below age-expected levels at 36 months. At 36 months of age, 42 percent of EI participants were reported by parents to communicate their needs as well as other children their age (see exhibit 2.11), 19 percent were reported to be very easy to understand, and 29 percent were reported by their parents to have mastered all age-expected communication milestones (see appendix exhibit A2.27; e.g., saying “mama” or “dada,” or saying two or three words in a sentence).

At kindergarten, 60 percent of EI participants were reported by parents to communicate their needs as well as other children, 40 percent were reported to be very easy to understand, 63 percent were reported by parents to understand verbal and nonverbal communication as well as other children, and 37 percent of EI participants were reported by their parents to have mastered all communication milestones expected of a 5-year-old (see appendix exhibit A2.27; e.g., saying sentences of four to six words or telling a simple story if asked). Kindergarten teachers reported that 60 percent of former EI participants’ understanding of others was at an age-expected level, and for 50 percent of children, communication with others was at an age-expected level.

⁵ IDEA Part C eligibility categories include developmental delay, diagnosed condition, at risk for delay. Developmental delay refers to individuals from birth through age 2 who need early intervention services because they are experiencing developmental delays, as measured by appropriate diagnostic instruments and procedures in one or more of the following areas: (1) cognitive development, (2) physical development, including vision and hearing, (3) communication development, (4) social or emotional development, (5) adaptive development. Diagnosed condition refers to individuals from birth through age 2 who need early intervention services because they have a diagnosed physical or mental condition that has a high probability of resulting in developmental delay. At-risk children refers to a term where, at a state’s discretion, children from birth through age 2 are considered at risk of having substantial developmental delays if early intervention services are not provided. [34 Code of Federal Regulations §303.16(a)]

Exhibit 2.11. National percentage of former EI participants for whom parents and teachers reported communication outcomes at 36 months of age and kindergarten

Outcome	Percent	SE	N
Parent report: 36 months of age			
Communicates needs as well as other children	41.7	1.39	2,670
When child talks to other people she/he doesn't know well, she/he is very easy to understand	18.8	1.29	2,644
All age-expected communication milestones mastered	29.0	0.99	2,651
Parent report: kindergarten			
Communicates needs as well as other children	59.9	1.49	2,280
When child talks to other people she/he doesn't know well, she/he is very easy to understand	39.7	1.10	2,165
All age-expected communication milestones mastered	36.9	2.02	2,095
Understands verbal and nonverbal communication as well as other children	63.0	1.37	2,275
Teacher report: kindergarten			
Understands others as expected for age	59.7	0.86	1,539
Communicates with others as expected for age	50.0	1.28	1,549

Exhibit reads: When former early intervention participants were 36 months of age, parents of 41.7 percent reported that the children communicated their needs as well as other children their age.

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007.

Findings by Eligibility Category

Communication outcomes for infants and toddlers identified for EI services varied by eligibility category. For two of the three communication skills at 36 months and for five out of the six kindergarten skills, communication outcomes for children eligible for EI because of a risk condition were reported to be significantly higher than for children with developmental delays, and children with developmental delays significantly higher than children with diagnosed conditions (see exhibit 2.12 for comparison of the communication outcome domain by reason for eligibility for early intervention; $p < .05$ for all significant comparisons cited). At 36 months of age, 67 percent of those with a risk condition at entry into EI were reported by parents to communicate needs as well as other children their age (SE = 3.26), compared with 39 percent (SE = 1.43) of EI participants with a developmental delay and 31 percent (SE = 2.28) of children with a diagnosed condition ($p < .001$ for developmental delay versus at-risk comparison; $p < .001$ for diagnosed condition versus at-risk comparison). At kindergarten, 74 percent (SE = 3.33) of former EI participants with a risk condition were reported by parents to communicate needs as well as other children, compared with 43 percent (SE = 2.96) of those who began EI with a diagnosed condition ($p < .001$). Kindergarten teachers were asked how well former EI participants were able to understand others, and their reports show a similar pattern. Teachers reported that for 72 percent (SE = 3.91) of those who began EI with a risk condition, their understanding of others was normal for their age, compared with 42 percent (SE = 2.53) of those who received EI because of a diagnosed condition ($p < .001$). Similarly, kindergarten teachers were asked how well former EI participants were able to communicate with others and

Exhibit 2.12. National communication outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category

Outcome	Eligibility category			Comparisons		
	Develop- mental delay (DD) % (SE)	Diag- nosed condition (DC) % (SE)	At risk (AR) % (SE)	DD vs. DC <i>p</i> value	DD vs. AR <i>p</i> value	DC vs. AR <i>p</i> value

Understands others as expected for age	62.2 (1.19)	42.3 (2.53)	72.2 (3.91)	<i>p</i> < .001	0.015	<i>p</i> < .001
Communicates with others as expected for age	50.9 (1.19)	33.6 (2.68)	68.9 (2.27)	<i>p</i> < .001	<i>p</i> < .001	<i>p</i> < .001

Exhibit reads: Thirty-nine percent of former early intervention participants who were eligible for EI due to a developmental delay were reported by parents to communicate needs as well as other children of the same age at 36 months.

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007.

reported that of those who began EI with a risk condition, 69 percent (SE = 2.27) communicated with others as expected for their age, compared with 51 percent (SE = 1.19) of children with a developmental delay (*p* < .001) and 34 percent (SE = 2.68) of children who began EI with a diagnosed condition (*p* < .001).

Comparison of Kindergarten Outcomes for Children With IEPs and Without IEPs

A significantly higher percentage of children without IEPs were reported by parents and teachers to demonstrate skills expected for their age on all communication measures at kindergarten than were children with IEPs (see exhibit 2.13). At kindergarten, a higher percentage of former EI participants with IEPs (21 percent, SE = 1.29) of former EI participants with IEPs were reported by parents to be very easy to understand, compared to former EI participants without IEPs (62 percent, SE = 2.00) (*p* < .001). Similarly, 45 percent (SE = 1.72) of

Exhibit 2.13. National percentage of former EI participants for whom kindergarten teachers and parents reported communication outcomes, by child's IEP status in kindergarten

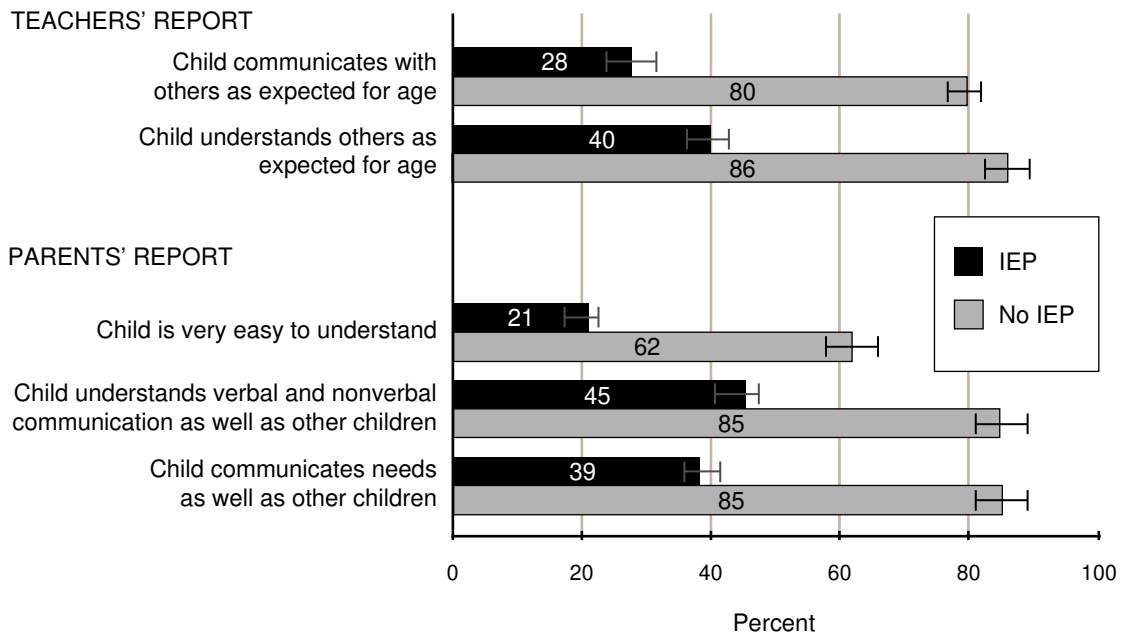

Exhibit reads: Nationwide, 28 percent of former EI participants who had an IEP in kindergarten were reported by their parents to communicate with others as expected for their age.

NOTE: Bars with the same value labels may be different sizes due to rounding of numbers. Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007.

former EI participants with IEPs were reported by parents to understand verbal and nonverbal communication as well as other children, compared with 85 percent (SE = 1.96) of those without an IEP ($p < .001$); and 39 percent (SE = 1.24) and 85 percent (SE = 2.06) of former EI participants with and without IEPs, respectively, were reported to communicate needs as well as other children ($p < .001$). Parents' reports of milestone attainment showed the same pattern; 22 percent (SE = 2.12) of former EI participants with IEPs were reported to have mastered all communication milestones expected for their age, compared with 55 percent (SE = 2.48) of former EI participants with no IEPs ($p < .001$). (See appendix exhibit A2.28.)

Kindergarten teachers reported that 80 percent (SE = 1.30) of former EI participants without IEPs communicated with others as expected for their age, compared with 28 percent (SE = 1.96) of former EI participants with IEPs ($p < .001$), and that 86 percent (SE = 1.73) of former EI participants without IEPs understood others as expected for their age, compared with 40 percent (SE = 1.67) of those with IEPs ($p < .001$).

Cognitive Development

Overall Findings

Exhibit 2.14 displays data regarding parents' reports of cognitive outcomes at 36 months of age and in kindergarten for former EI participants and for the general population of 3-year-olds.

For the two parent-reported measures of early literacy and mathematics skills, the percentage of former EI participants reported to demonstrate skills expected for their age was significantly lower than for the general population of 3-year-olds. When children were 36 months old, parents reported that 17 percent (SE = 1.13) of former EI participants could recognize most or all letters of the alphabet (see exhibit 2.14), whereas parents of 37 percent (SE = 1.41) of children in the general population⁶ reported that their children could do so ($p < .001$). Parents reported that at 36 months of age, 13 percent (SE = 1.38) of former EI participants could count to 20 or higher. In comparison, 41 percent (SE = 1.43) of children in the general population were reported to be able to count that high ($p < .001$). At kindergarten, parents reported that 72 percent of former EI participants (SE = 1.59) could count to 20 or higher, which was significantly lower than the 82 percent (SE = 2.20) of children in the general population of the same age who were reported to perform this skill ($p < .001$). When children were 36 months old, parents reported that 32 percent of former EI participants had mastered all of the cognitive milestones expected for their age (see appendix exhibit A2.27; e.g., knowing two body parts, giving his/her first name). By kindergarten, parents reported that 14 percent of former EI participants had mastered all cognitive milestones expected of 5-year-olds (see appendix exhibit A2.27, e.g., knowing both their first name and last name, answering correctly if they are a boy or a girl).

⁶ General population statistics are based on data from the National Household Education Survey (NHES).

Exhibit 2.14. National percentage of former EI participants and of the general population for whom parents reported cognitive outcomes at 36 months and in kindergarten

Exhibit reads: Nationwide, 17 percent of 3-year-olds who were former EI participants were reported by their parents to be able to recognize most or all letters of the alphabet.

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews (public use dataset), 2007; general population data from the National Household Education Survey (NHES) public use dataset, 1999 parent interview, available at <http://nces.ed.gov/nhes/dataproducts.asp>.

Across nine early literacy and seven numeracy skills, significantly fewer former EI participants than children in the general population were reported to have skills rated as intermediate or proficient. Kindergarten teachers reported on the level of each child’s skill across nine early literacy skills and seven early numeracy skills (see appendix exhibit A2.15 for data on all literacy and numeracy skills). For example, as shown in exhibit 2.15, for early literacy skills, 20 percent (SE = 1.04) of former EI participants were reported by teachers to be able to compose simple stories, which was significantly fewer than the 32 percent (SE = 0.81) of children in the general population ($p < .001$); 34 percent (SE = 1.79) of former EI participants were reported to be able to read simple books independently, compared with 43 percent (SE = 0.87) of those in the general population ($p < .001$), and 45 percent (SE = 1.61) of former EI participants were reported by teachers to be able to produce rhyming words, compared with 63 percent (SE = 0.92) of children in the general population ($p < .001$). For numeracy skills, 31 percent (SE = 1.14) of former EI participants were reported to use a variety of strategies to solve mathematics problems, compared with 46 percent (SE = 0.89) of children in the general population⁷ ($p < .001$). Teachers also reported that 35 percent (SE = 1.98) of former EI participants could solve number problems using concrete objects, compared with 53 percent

⁷ General population statistics are based on ECLS-K.

(SE = 0.88) of children in the general population ($p < .001$); and 43 percent (SE = 1.47) of former EI participants could understand relationships between quantities, whereas 59 percent (SE = 0.97) of children in the general population were reported to perform this skill ($p < .001$).

Exhibit 2.15. National percentage of former EI participants and of the general population for whom kindergarten teachers reported mathematics and early literacy outcomes

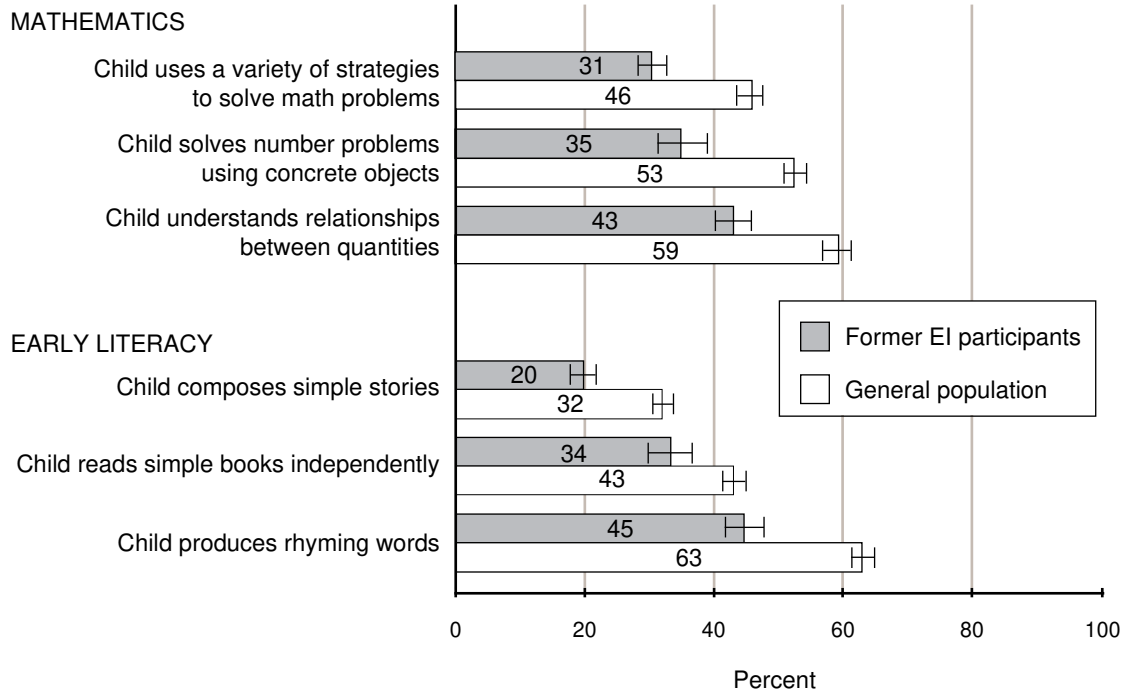

Exhibit reads: Nationwide, 31 percent of kindergarteners who were former EI participants were reported by their teachers to be able to use a variety of strategies to solve math problems.

NOTE: Bars with the same value labels may be different sizes due to rounding of numbers. Data are weighted to be nationally representative. Findings by Eligibility Category

Cognitive outcomes for infants and toddlers identified for EI services under IDEA varied by eligibility category. For one of the three cognitive skills at 36 months, cognitive outcomes for children eligible for EI because of an at risk condition was reported to be significantly higher than for children with developmental delays and those with diagnosed conditions (see exhibit 2.16 for comparison of the cognitive outcome domain by reason for eligibility for early intervention; $p < .05$ for all significant comparisons cited). Furthermore, an examination of these cognitive skills at 36 months indicated that for two measures, children with developmental delays had significantly better cognitive skills than children with a diagnosed

condition. Parents reported 19 percent (SE = 1.45) of children with developmental delays to recognize most or all alphabet letters compared with 12 percent (SE = 1.16) of children with a

Exhibit reads: Nineteen percent of former early intervention participants who were eligible for EI because of a developmental delay were reported by parents to be able to recognize most or all letters of the alphabet at 36 months.

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007.

diagnosed condition ($p < .001$). Parents also reported a higher percentage of children with developmental delays to have mastered all age-expected cognitive milestones (33 percent, $SE = 1.32$) as compared with children with a diagnosed condition (22 percent, $SE = 1.42$, $p < .001$). For this item specifically, parents reported that at 36 months, 45 percent ($SE = 5.00$) of EI participants who had been eligible because of a risk condition had mastered all age-expected cognitive milestones, compared with 22 percent ($SE = 1.42$) of children classified at entry with a diagnosed condition ($p < .001$).

At kindergarten, for 16 of the 21 measures of cognitive skills examined, children eligible for EI because of a risk condition had significantly better cognitive outcomes, specifically literacy and math skills, than children with diagnosed conditions, and on 19 of the 21 measures, children with developmental delays had better outcomes than children with a diagnosed condition (see exhibit 2.16 for comparison of the outcome domains by reason for eligibility for early intervention; $p < .05$ for all significant comparisons cited). At kindergarten, parents reported that 76 percent ($SE = 3.32$) of children eligible for EI because of a risk condition could recognize most or all letters of the alphabet, compared with 62 percent ($SE = 3.49$) of children eligible for EI because of a diagnosed condition ($p = .003$). At kindergarten, teachers reported that 66 percent ($SE = 3.79$) of children with an at-risk condition had thinking and reasoning that was at age-expected levels, compared with 54 percent ($SE = 1.66$) of children with developmental delays ($p = .003$) and 38 percent ($SE = 3.25$) of children with a diagnosed condition ($p < .001$).

Comparison of Kindergarten Outcomes for Children With IEPs and Without IEPs

Exhibits 2.17 and 2.18 display parents' and teachers' reports of cognitive outcomes for former EI participants and the general population of 5-year-olds, by IEP status.

At kindergarten, parents' and teachers' reports indicate that children without IEPs performed significantly better than those with IEPs on all measures of cognitive development. On all nine literacy indicators, higher percentages of children without IEPs than those with IEPs performed at age-expected levels. On eight of the nine literacy indicators, there were no statistically significant differences between former early intervention participants who did not have an IEP in kindergarten and the performance of young children in the general population. On all seven mathematics indicators, higher percentages of children without IEPs than those with IEPs, performed at age-expected levels, and on all indicators, there were no statistically significant differences between former EI participants who did not have an IEP in kindergarten and the performance of young children in the general population (see appendix exhibit A2.18 for comparison of the early literacy and mathematics indicators by IEP status).

For example, kindergarten teachers reported that 37 percent ($SE = 1.59$) and 78 percent ($SE = 2.46$) of former EI participants with and without IEPs, respectively, performed academic skills as expected for their age ($p < .001$), and 32 percent ($SE = 2.43$) of former EI participants with IEPs were reported by their teachers to think and reason as expected for their age, compared with 81 percent ($SE = 2.49$) of former EI participants without IEPs ($p < .001$). Parents reported that 60 percent ($SE = 1.79$) of former EI participants with IEPs at kindergarten could recognize most or all letters of the alphabet, compared with 83 percent ($SE = 1.61$) of former EI participants without IEPs ($p < .001$) and 75 percent ($SE = 2.47$) of children in the general population ($p < .001$). Parents also reported that 58 percent ($SE = 2.84$) of former EI participants with IEPs at kindergarten could count to 20 or higher, compared with 88 percent of children without IEPs ($SE = 1.68$) ($p < .001$) and 82 percent ($SE = 2.20$) of children in the general

Exhibit 2.17. National percentage of former EI participants and of the general population for whom kindergarten teachers and parents reported cognitive outcomes, by IEP status for former EI participants

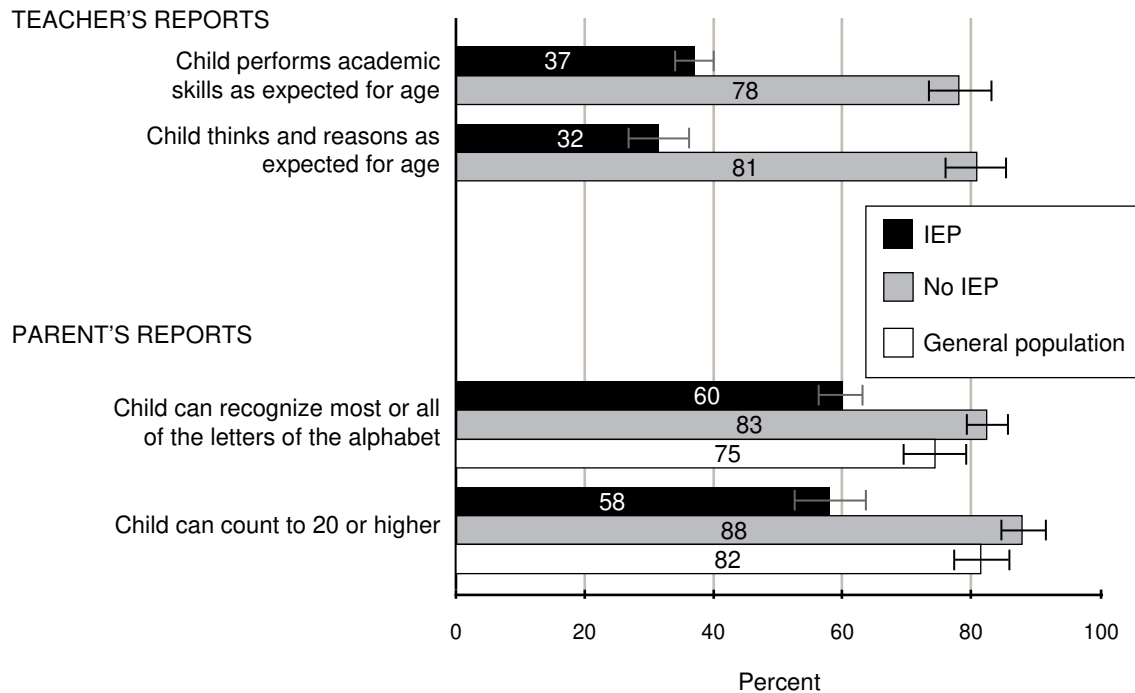

Exhibit reads: Nationwide, 37 percent of former EI participants who had an IEP in kindergarten were reported by their kindergarten teachers to be able to perform academic skills in age-expected ways.

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007; general population data from the National Household Education Survey (NHES) public use dataset, 1999 parent interview, available at <http://nces.ed.gov/nhes/dataproducts.asp>.

population ($p < .001$). In terms of cognitive milestones at kindergarten, 7 percent ($SE = 1.28$) of EI participants with IEPs were reported by parents to have mastered all age-expected cognitive milestones, whereas 22 percent ($SE = 1.45$) of EI participants without IEPs were reported to have done so ($p < .001$) (see appendix exhibit A2.28).

Teachers' reports of seven mathematics and nine early literacy skills at kindergarten indicated that larger percentages of former EI participants without IEPs than of those with IEPs performed at age-expected levels and at levels comparable to the general population (see exhibit 2.18). In mathematics, 16 percent ($SE = 1.47$) of former EI participants with IEPs were reported to use a variety of strategies to solve mathematics problems, compared with 49 percent ($SE = 2.25$) of children without IEPs ($p < .001$) and 46 percent ($SE = 0.89$) of children in the general population ($p < .001$). Twenty percent ($SE = 1.47$) of former EI participants with IEPs were reported to solve number problems using concrete objects, compared with 53 percent ($SE = 3.3$) of children without IEPs ($p < .001$) and 53 percent ($SE = 0.88$) of children in the general population ($p < .001$); and 26 percent ($SE = 2.01$) of children with IEPs were reported to understand relationships between quantities, compared with 64 percent

(SE = 2.45) of children without IEPs ($p < .001$) and 59 percent (SE = 0.97) of children in the general population ($p < .001$).

In early literacy, 11 percent (SE = 1.28) of former EI participants with IEPs were reported to be able to compose simple stories, according to their kindergarten teachers, compared with 31 percent (SE = 1.58) of children without IEPs ($p < .001$) and 32 percent (SE = 0.81) of children in the general population ($p < .001$). Additionally, 22 percent (SE = 2.84) of children with IEPs were said to be able to read simple books independently, compared with 47 percent (SE = 2.22) of children with no IEPs ($p < .001$) and 43 percent (SE = 0.87) of children in the general population ($p < .001$). Twenty-nine percent (SE = 2.53) of former EI participants with IEPs could produce rhyming words, compared with 65 percent (SE = 1.81) of children without IEPs ($p < .001$) and 63 percent (SE = 0.92) of the general population ($p < .001$).

Exhibit 2.18. National percentage of former EI participants and of the general population for whom kindergarten teachers reported mathematics and early literacy outcomes, by IEP status for former EI participants

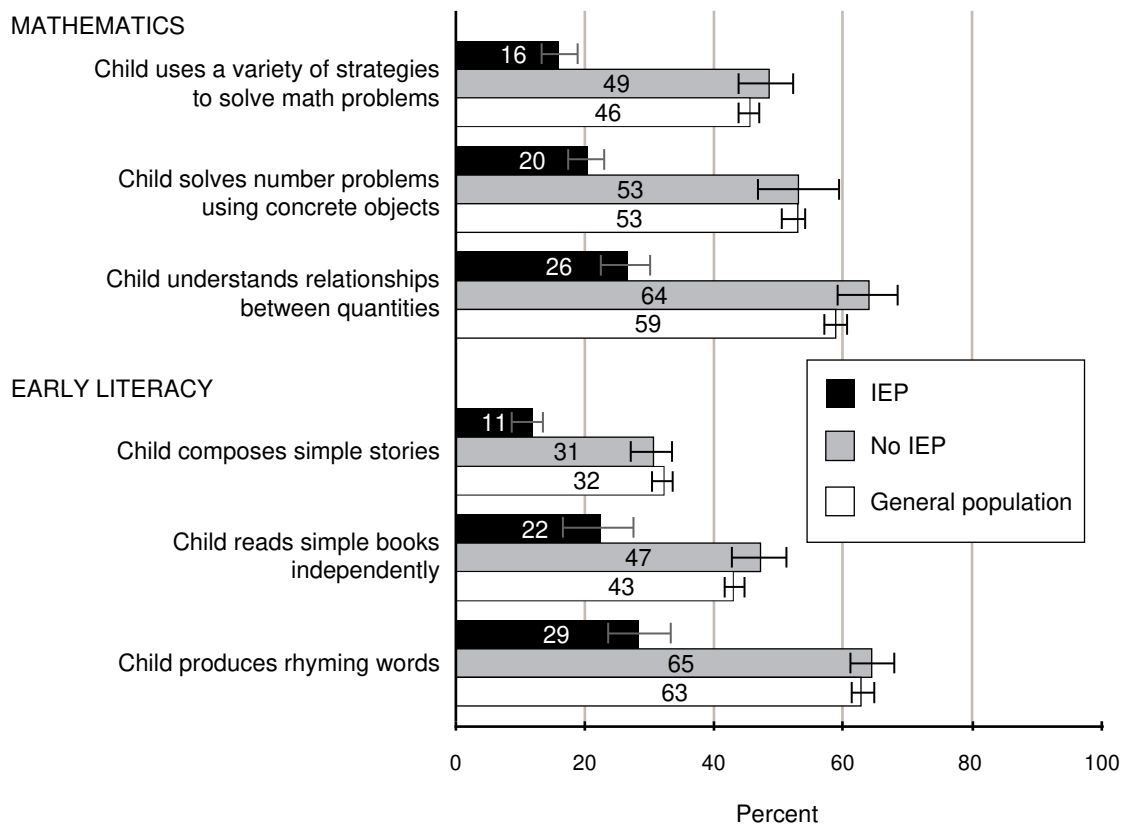

Exhibit reads: Nationwide, 16 percent of former EI participants who had an IEP in kindergarten were reported by their kindergarten teachers to be able to use a variety of strategies to solve math problems.

Social-Emotional Development

Overall Findings

At 36 months of age, 28 percent of former EI participants were reported by their parents to have mastered all age-expected social-emotional milestones (see appendix exhibit A2.27), whereas that accomplishment was reported for 39 percent of former EI participants at kindergarten (see appendix exhibit A2.27). Examples of kindergarten milestones in social-emotional development include playing pretend games with others using props, and following rules in a board game.

Kindergarten teachers were asked to report on the frequency with which children displayed certain negative behaviors (see exhibit 2.19). Teachers reported that 23 percent of former EI participants very often acted impulsively, 13 percent never responded appropriately to teasing, 10 percent never responded appropriately to pushing or hitting, 7 percent very often argued with others, 7 percent were never able to control their temper, 5 percent very often appeared lonely, 5 percent very often fought with others, and 4 percent never followed directions.

Exhibit 2.19. National percentage of former EI participants for whom kindergarten teachers reported negative behaviors

Exhibit reads: Nationwide, 4 percent of former EI participants were reported by their kindergarten teachers never to follow directions.

NOTE: Bars with the same value labels may be different sizes due to rounding of numbers. Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

Findings by Eligibility Category

Social-emotional outcomes for infants and toddlers identified for EI services under IDEA varied by eligibility category. At both 36 months and kindergarten, social-emotional outcomes were better for children classified as eligible for EI services because of a risk condition and those with a developmental delay, compared with those with a diagnosed condition. For 1 of the 3 measures of social-emotional skills examined at 36 months, children eligible for EI because of a risk condition had statistically better outcomes than children with a diagnosed condition. For 2 of the 3 measures children with developmental delays had statistically better outcomes than children with diagnosed conditions. Children with developmental delays at entry were reported at 36 months by parents to have mastered all age-expected social-emotional milestones, compared with 20 percent (SE = 2.04) of children with a diagnosed condition at EI entry ($p < .001$).

This same pattern held in kindergarten. Forty-one percent (SE = 1.44) of those children with a developmental delay were reported to have mastered all age-expected social-emotional milestones at kindergarten, compared with 27 percent (SE = 1.94) of children with a diagnosed condition ($p < .001$). On 3 of the 5 positive social-emotional (prosocial) kindergarten measures, children eligible for EI because of a risk condition had statistically better outcomes than children with developmental delays, who had better outcomes than children with diagnosed conditions. On 4 out of 11 measures examining negative social behaviors, children eligible for EI because of a risk condition had statistically lower negative behavioral outcomes than children with a diagnosed condition (see exhibit 2.20 for comparison of the social emotional outcome domain by reason for eligibility for early intervention; $p < .05$ for all significant comparisons cited). For example, parents reported 71 percent (SE = 4.51) of children with a risk condition as demonstrating social skills typical and appropriate for their age as compared with 59 percent (SE = 2.83) of children with developmental delays ($p = .033$) and 44 percent (SE = 3.76) of children with a diagnosed condition ($p < .001$). Parents also reported 5 percent (SE = 1.81) of children with a risk condition as having trouble playing with other children compared with 14 percent (SE = 1.89) of children with diagnosed condition ($p < .001$).

Exhibit 2.20. National social-emotional development outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category

Exhibit reads: Twenty-eight percent of former early intervention participants eligible for EI because of a developmental delay were reported by parents to often have temper tantrums at 36 months.

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007.

Comparison of Kindergarten Outcomes for Children With IEPs and Without IEPs

Parents and teachers reported on 14 measures of social-emotional development at kindergarten (see exhibits 2.21 and 2.22).

Parents and teachers reported that across many measures of social-emotional development, significantly higher percentages of former EI participants without IEPs than former EI participants with IEPs performed at age-expected levels in the social-emotional domain. For example, 23 percent (SE = 2.48) of EI participants with IEPs were reported by their parents to have mastered all age-expected social-emotional milestones, compared with 57 percent (SE = 1.25) of EI participants without IEPs ($p < .001$) (see appendix exhibit A2.28). Similarly, 36 percent (SE = 1.85) and 78 percent (SE = 0.99) of former EI participants with and without IEPs, respectively, were reported by kindergarten teachers to have social skills that were age appropriate ($p < .001$). Furthermore, 30 percent (SE = 1.38) of former EI participants with IEPs were reported by teachers to very often act impulsively, compared with 14 percent (SE = 1.36) of EI participants without IEPs ($p < .001$).

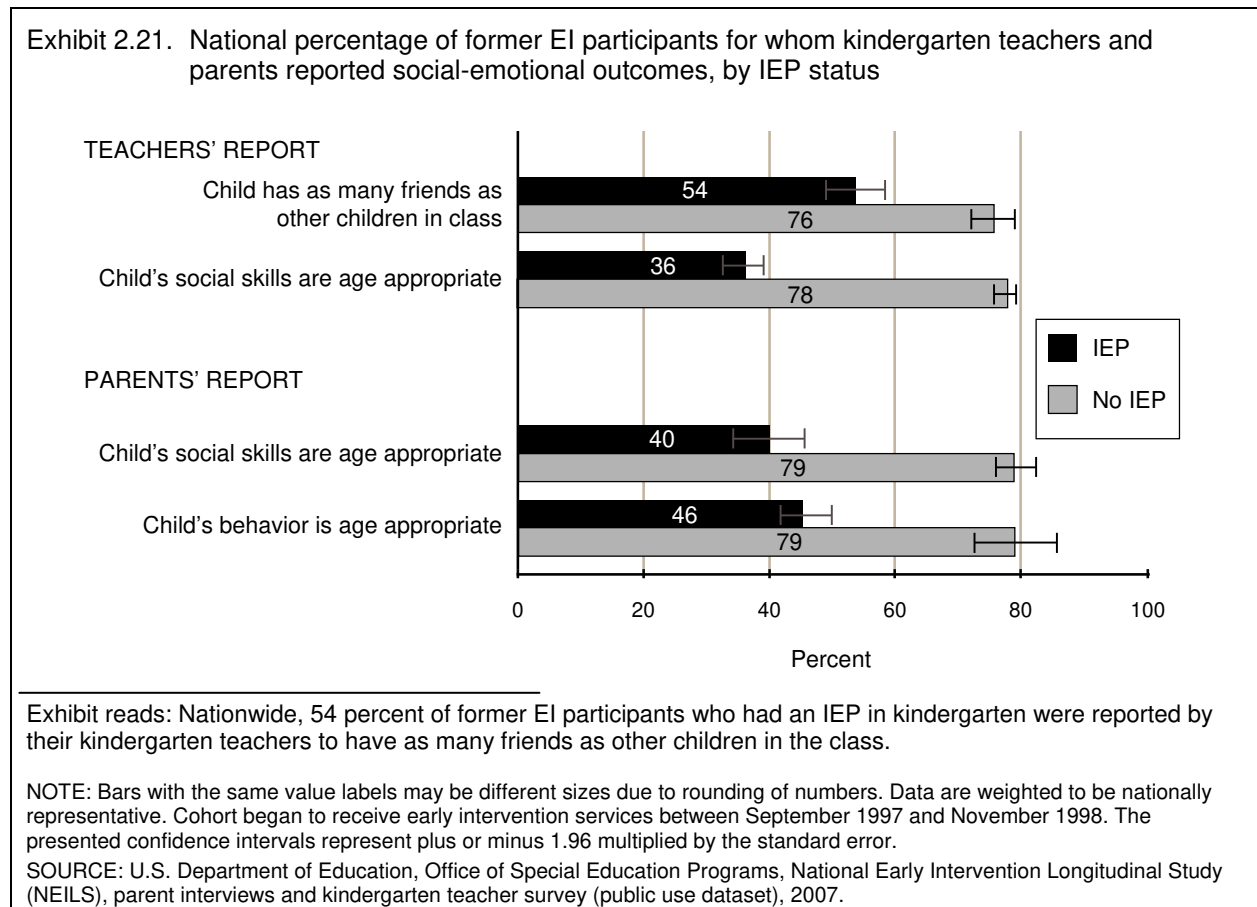

Exhibit 2.22. National percentage of former EI participants for whom kindergarten teachers reported negative behaviors, by IEP status

Exhibit reads: Nationwide, 5 percent of former EI participants who had an IEP in kindergarten were reported by their kindergarten teachers never to follow directions.

NOTE: Bars with the same value labels may be different sizes due to rounding of numbers. Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007.

Physical Development and Health

Overall Findings

Measures in this developmental area include attainment of age-expected physical milestones, such as catching a ball thrown or walking downstairs alternating feet, as well as overall health status and activity level. At 36 months, 28 percent of former EI participants were reported by their parents to have mastered all age-expected physical milestones; at kindergarten, 21 percent were reported to have done so (see appendix exhibit A2.27).

Significantly lower percentages of former EI participants performed at age-expected levels in the physical domain, compared with the general population, across two measures of physical development reported by parents and one measure of physical development reported by teachers. Higher percentages of former EI participants were reported to be in only fair or poor health by their parents, compared with the general population both at 36 months and at kindergarten. At 36 months and kindergarten, respectively, 13 percent (SE = 0.67) and

11 percent (SE = 0.92) of children formerly in EI were reported by their parents to have fair or poor health, whereas data from the NHIS indicated that for the general population of same-age children, parents reported 2 percent (SE = 0.28) at 36 months and 2 percent (SE = 0.31) to be in fair or poor health.

At kindergarten, 11 percent (SE = 0.98) of former EI participants and 3 percent (SE = 0.18) of children in the general population (ECLS-K) were rated by their parents as being less active than other children their age ($p < .001$). Similarly, kindergarten teachers reported that 22 percent (SE = 0.88) of former EI participants were less active than other children, compared with the general population of 5-year-olds, where 3 percent (SE = 0.18) of children were reported by parents or teachers to be less active than other children ($p < .001$) (see appendix exhibit A2.29).

Findings by Eligibility Classification

Physical outcomes for infants and toddlers identified for EI services under IDEA varied by eligibility category. At 36 months of age, significantly higher percentages of children who were eligible for EI because of either a risk condition or a developmental delay had mastered age-appropriate physical developmental milestones, compared with children with a diagnosed condition (see exhibit 2.23 for comparison of the outcome domains by reason for eligibility for early intervention; $p < .05$ for all significant comparisons cited). Thirty-four percent (SE = 3.78) of children with a risk condition at entry into EI and 31 percent (SE = 7.01) of those with a developmental delay were reported by parents to have mastered all age-expected physical milestones at 36 months, compared with 15 percent (SE = 1.57) of those with a diagnosed condition ($p < .001$ for both comparisons).

At kindergarten, 28 percent (SE = 4.55) of children with an at-risk classification at entry into EI and 24 percent (SE = 2.89) of those with developmental delays were reported to have mastered all their kindergarten milestones, compared with 10 percent (SE = 1.95) of children with a diagnosed condition ($p < .001$ for both comparisons).

Exhibit 2.23. National physical development outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category

Outcome	Eligibility category			Comparisons

Exhibit reads: Two percent of former early intervention participants eligible for EI because of a developmental delay were reported by parents to have poor health at 36 months.

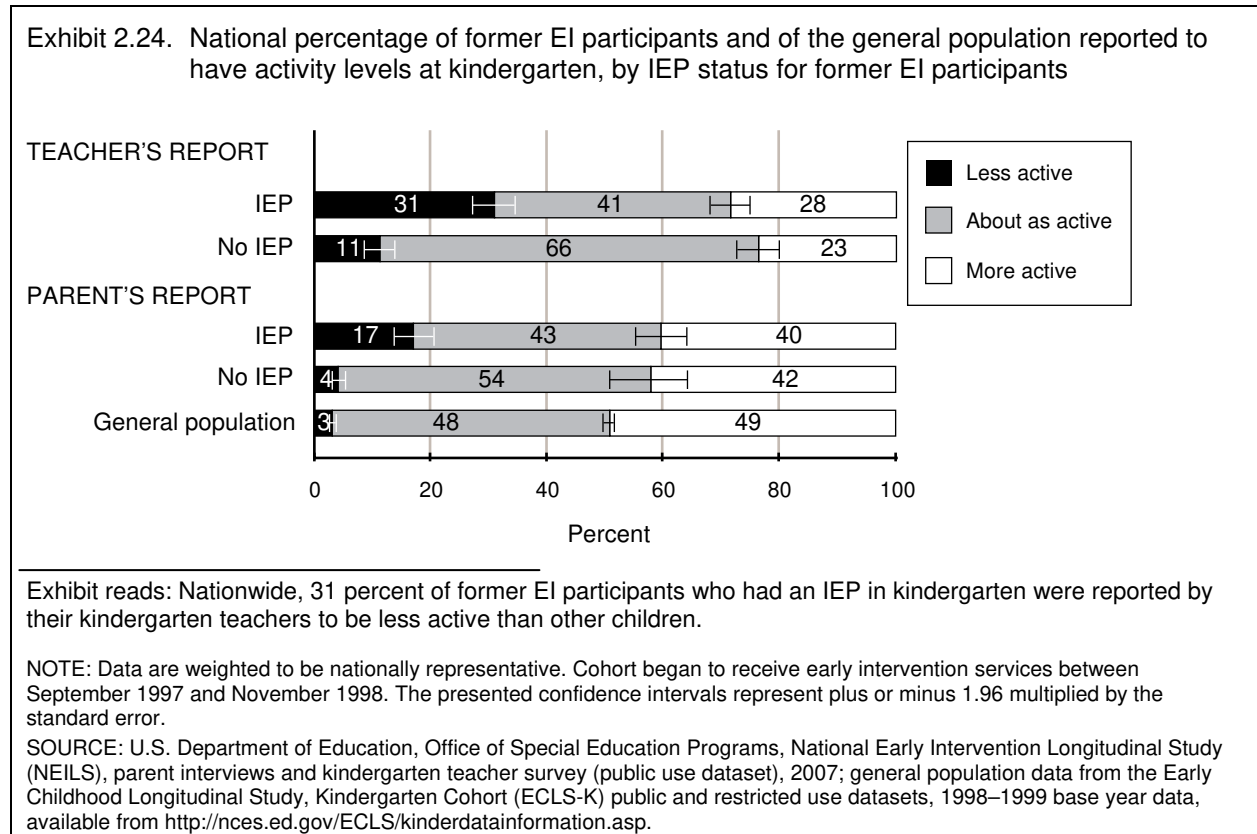

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007.

Comparison of Kindergarten Outcomes for Children With IEPs and Without IEPs

Significantly lower percentages of former EI participants with IEPs in kindergarten performed at age-expected levels in the physical domain, compared with children without IEPs and in the general population, across two measures of physical development reported by parents and two measures of physical development reported by teachers. At kindergarten, 10 percent (SE = 1.86) of EI participants with IEPs were reported by their parents to have mastered all age-expected physical milestones, compared with 35 percent (SE = 2.79) of EI participants without IEPs (*p* < .001) (see appendix exhibit A2.28). Thirty-one percent of former EI participants with IEPs (SE = 1.91), compared with 11 percent (SE = 1.38) of those without IEPs, were reported by their teachers as being less active than other children their age (*p* < .001) (see exhibit 2.24). Similar differences were noted when children with IEPs were compared with the general population of 5-year-olds (ECLS-K) at kindergarten; 31 percent of

former EI participants with IEPs (SE = 1.86) were reported by their teachers as being less active than other children their age, compared with 3 percent (SE = 0.18) of children in the general population of 5-year-olds ($p < .001$). Parents reported that 17 percent (SE = 1.76) of former EI participants with IEPs were less active than other children, whereas 4 percent of children without IEPs (SE = 0.56) and 3 percent (SE = 0.18) of the general population of 5-year-olds were reported by parents to be less active ($p < .001$ for both comparisons).

Parents reported on the health status of former EI participants in kindergarten (see exhibit 2.25). Sixteen percent (SE = 1.26) of children with IEPs were reported to be in fair or poor health, compared with 6 percent (SE = 0.75) of former EI participants without IEPs ($p < .001$) and 2 percent (SE = 0.03) of the general population of 5-year-olds (NHIS) ($p < .001$).

Exhibit 2.25. National percentage of former EI participants and of the general population reported by parents to have “fair” or “poor” health at kindergarten, by IEP status for former EI participants

Exhibit reads: Nationwide, 4 percent of former EI participants who had an IEP were reported by parents to be in poor health at kindergarten.

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007; general population data from the National Health Interview Survey public use dataset, 1999 Person Section, available from http://www.cdc.gov/nchs/about/major/nhis/quest_data_related_1997_forward.htm.

Adaptive Development

Overall Findings

Adaptive development refers to a child’s ability to take care of his or her own needs, including skills such as dressing and toileting. Measures of adaptive development included in NEILS come from a set of adaptive milestones. At 36 months of age, 9 percent of former EI participants were reported by their parents to have mastered all of those age-expected adaptive milestones, whereas 15 percent were reported to have done so at kindergarten (see appendix exhibit A2.27).

Findings by Eligibility Classification

Adaptive outcomes for infants and toddlers identified for EI services under IDEA varied by eligibility category. More children with a risk condition and developmental delays had mastered adaptive milestones, compared with children with a diagnosed condition at 36 months (see exhibit 2.26 for comparison of the adaptive outcome domain by reason for eligibility for early intervention; $p < .05$ for all significant comparisons cited). For example, 13 percent (SE = 2.72) of children with a risk condition had mastered all age-expected adaptive milestones at 36 months, compared with 4 percent (SE = 0.85) of children with a diagnosed condition ($p = .002$). At kindergarten, 16 percent (SE = 1.03) of children with a developmental delay were reported to have mastered all age- expected milestones, compared with 8 percent (SE = 2.16) of children with a diagnosed condition ($p = .001$).

Exhibit 2.26. National adaptive development outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category

Outcome	Eligibility category			Comparisons		
	Develop- mental delay (DD)	Diag- nosed condition (DC)	At risk (AR)	DD vs. DC	DD vs. AR	DC vs. AR
	% (SE)	% (SE)	% (SE)	<i>p</i> value	<i>p</i> value	<i>p</i> value
Parent-reported adaptive outcome (milestone achievement): 36 months						
All age-expected adaptive milestones mastered	9.0 (0.95)	4.4 (0.85)	13.1 (2.72)	<i>p</i> < .001	0.147	0.002
Parent-reported adaptive outcome (milestone achievement): kindergarten						
All age-expected adaptive milestones mastered	16.2 (1.03)	8.5 (2.16)	17.6 (3.80)	0.001	0.718	0.036

Exhibit reads: Nine percent of former early intervention participants who were eligible for EI because of a developmental delay were reported by parents to have mastered all age-expected adaptive milestones at 36 months.

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007.

Comparison of Kindergarten Outcomes for Children With IEPs and Without IEPs

At kindergarten, 7 percent (SE = 1.33) and 23 percent (SE = 1.93) of EI participants with and without IEPs, respectively, were reported by parents to have mastered all age-expected adaptive milestones (*p* < .001) (see appendix exhibit A2.28).

Key Findings Related to Preschool-Age Children Identified for Services Under IDEA

Who are the preschool-age children identified for special education services under IDEA and how has this changed over time?

In 2006, a total of 706,242 children ages 3 through 5 were identified for special education services under IDEA by states. Of the total population of preschool-age children, the percentage of 3- through 5-year-olds identified for special education services increased every year from 1997 when 4.70 percent were identified to 5.82 percent in 2006. Of preschool age children identified for services under IDEA, more boys than girls were identified (69.29 percent and 30.71 percent, respectively).

A larger proportion of preschool-age American Indian children were identified for services in 2006 (8.14 percent) than children in the other racial/ethnic categories; the smallest proportion were identified among Asian/Pacific Islander children (3.59 percent). The percentages for White, Black, and Hispanic preschool-age children were 6.45 percent, 5.93 percent, and 4.52 percent. The relative position for each of racial/ethnic category remained the same from 1998 to 2006.

In 2006, the largest percentage of preschool-age children identified was for children classified under the speech and language impairment and developmental delay categories of IDEA (2.73 percent and 2.06 percent, respectively). Between 2004 and 2006, the three largest relative percentage changes of preschool-age children identified for services under IDEA by their disability category were for children classified with autism (34.87 percent), other health impairments (24.64 percent), and deaf-blindness (-19.05 percent).

State identification of 3- through 5-year-olds for preschool services under IDEA showed variation. Percentages ranged from 3.32 percent to 13.66 percent of children in this age group across states, compared to the national average of 5.82 percent in 2006. Forty-nine states had higher identification percentages in 2006 than in 1997.

What are the literacy, math, and social outcomes of preschool age children identified for services under IDEA compared to their peers?

From the Pre-Elementary Education Longitudinal Study (PEELS), preschool age children identified for services under IDEA did not differ from the general population of same-age children on a measure of letter and word identification skills. However, they had a significantly lower mean score on a measure of vocabulary (a mean standard score of 90.1, SE = 0.59, compared with the mean of 100.0 for the general population); the significant difference was apparent for all three age cohorts (3-, 4-, and 5-year-olds, $p < .001$). This pattern also was observed on a measure of applied mathematics on which preschool age children identified for services under IDEA had a mean standard score of 90.3 (SE = 0.78), significantly lower than the mean for the general population (100.0), a difference apparent for all age cohorts ($p < .001$).

A teacher rating of social skills also showed lower functioning for preschool-age children identified for IDEA services than for the general population of 3- through 5-year-olds (92.8, SE = 0.88 vs. 100.0). Three-year-olds identified for IDEA services had a mean standard score of 85.2 (SE = 1.08), significantly lower than the score for both the general population and 5-year-old identified children ($p < .001$) whose mean score was 96.5 (SE = 1.37) which was not significantly different from the general population).

3. Preschool-Age Children Identified for Services Under IDEA

This chapter presents a summary of information on children ages 3 through 5 identified for special education services under IDEA. The chapter consists of four sections: (1) the legislative background for examining the status of preschool-age children identified for services under IDEA, (2) the identification of preschool-age children for services under IDEA, (3) their rates of losing eligibility of services under IDEA through “declassification,” and (4) their academic and social outcomes. This study is not designed to assess how outcomes presented in this report are affected by identification or declassification practices, nor is it designed to measure impacts of IDEA services on child outcomes.

Legislative Background

Amendments in 1986 (P.L. 99-457) made the provision of a free appropriate public education to children ages 3 through 5 a requirement for receiving federal funding to support special education services. Under IDEA, states are provided Part B Section 619 grant-funding to support the delivery of special education services to children ages 3 through 5 who are eligible for services. These funds are distributed to local education agencies, which are responsible for providing services to preschool-age children. The Part B provisions, such as an Individualized Education Program (IEP), due process, confidentiality, and a right to services in the least restrictive environment, apply to preschool-age children in the same way they apply to school-age children. The same eligibility categories used to identify school-age children as eligible for services are used to identify children ages 3 through 5. In 1991, the law was amended (P.L. 102-119) to allow states the option to use an additional disability category, “developmental delay,” as one of the recognized disability categories for children ages 3 through 9.

The most recent reauthorization of IDEA in 2004 (P.L. 108-446) brought an extension of Part C services to preschool-age children. Under Sections 632(5)(b) and 635(c), IDEA allows flexibility for the statewide system to include a state policy under which parents of preschool-age children with disabilities who are eligible for services under Section 619, and previously received services under Part C, may choose the continuation of early intervention services for children identified for services under Part C until the child enters or is eligible under state law to enter kindergarten.

Although IDEA 2004 continues to ensure that all children with disabilities receive a free appropriate public education, amendments affected state and local policies by stipulating that children with disabilities *make progress* in the general education curriculum and *improve* their academic and developmental outcomes. For children receiving early intervention and preschool services under IDEA, greater emphasis is on targeting developmental and academic outcomes, including preliteracy and language skills, as specified in the Individualized Family Service Plan (IFSP) or the Individualized Education Program (IEP).

Identification of Preschool-Age Children for Services Under IDEA

The identification section of this chapter presents the following types of information:

- The number and percentage of preschool-age children identified for services under IDEA nationally, by age and by disability category.
- The composition of preschool-age children by gender.

- The percentage of preschool-age children identified for services nationally and by age, race/ethnicity, and state. The percentages are also examined across time.

Currently, states report to OSEP the number of children with disabilities receiving Part B special education and related services as a part of their annual Section 618 report. State-reported data were obtained from OSEP's Data Analysis System (DANS) for 1997 to 2006. As of December 1 of each year, each state reports to OSEP the number of children, ages birth to 21, in the state who were identified for early intervention or special education services under IDEA. The number identified includes both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. To report on the identification of preschool-age children for services under IDEA, both the number and the percentages of the children are reported below. A proxy for the total population count for each age was created using birth data from the National Vital Statistics System (NVSS). Identification percentages¹ were computed for each year using the number of children ages 3 through 5 served under Part B (DANS) as a percentage of the total population of 3- through 5-year-olds (NVSS). These data are the basis for findings reported in this section of the chapter.

Number and Percentage of Children Identified for Services Under IDEA, by Age (1997 to 2006)

In 2005, 698,928 children ages 3 through 5 were identified for services out of the total of 7,013,238 children ages birth through 21 years reported by states to be identified for services under IDEA (see exhibit 3.1). More 5-year-olds (300,082 children) than 4-year-olds (245,526 children) were identified, and more 4-year-olds than 3-year-olds (153,320 children) were identified.

¹ See chapter 1 and appendix B for a definition of "percentage" and details regarding its calculation.

Exhibit 3.1. National number of preschool-age children identified for services under IDEA, by age (2005)

Exhibit reads: Nationwide, 153,320 3-year-olds were identified for services under Part B of IDEA in 2005.

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1, 2005, and December 1, 2005. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The ages of children eligible to receive preschool services under IDEA are 3 through 5 years. The shaded area represents the data for these children.

Exhibit 3.2. National number and percentage of preschool-age children identified for services under IDEA, by age (1997–2006)

Year	Preschool-age children identified for services							
	Number				Percentage of all preschool-age children			
	Ages 3 through 5	Age 3	Age 4	Age 5	Ages 3 through 5	Age 3	Age 4	Age 5
1997	564,546	113,998	195,595	254,953	4.70	2.88	4.89	6.27
1998	567,636	116,696	197,565	253,375	4.79	2.99	5.00	6.33
1999	582,383	120,894	202,740	258,749	4.96	3.11	5.20	6.55
2000	592,415	130,374	212,812	249,229	5.08	3.36	5.47	6.39
2001	611,919	134,621	230,277	247,021	5.22	3.42	5.93	6.35
2002	639,264	139,299	243,593	256,372	5.43	3.52	6.18	6.61
2003	671,630	148,592	233,701	289,337	5.62	3.66	5.90	7.34
2004	692,978	155,860	243,283	293,835	5.75	3.87	5.99	7.42
2005	698,928	153,320	245,526	300,082	5.77	3.81	6.10	7.39
2006	706,242	163,926	244,041	298,275	5.82	4.01	6.07	7.41

Exhibit reads: Nationwide, 564,546 children ages 3 through 5 were identified for services under IDEA in 1997. These represented 4.70 percent of all 3- through 5-year-olds.

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The total number of children is a population proxy constructed with National Vital Statistics System birth data, including births on Indian reservations. The percentage of children who were identified was calculated by dividing the number of children identified for services under IDEA (DANS) in a given age group by the total number of children in the same age group as indicated by the NVSS-constructed population proxy.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part B, Child Count, 1997–2006, retrieved December 7, 2007, from <http://www.ideadata.org/PartBChildCount.asp>; U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System, 1990–2005, retrieved January 11, 2008, from <http://209.217.72.34/VitalStats/ReportFolders/ReportFolders.aspx>.

In 2006, the percentage of preschool-age children identified for services under IDEA differed for children of each single year of age (see exhibit 3.2). Five-year-olds had the highest percentage (7.41 percent), followed by 4-year-olds (6.07 percent) and 3-year-olds (4.01 percent).

The percentage identified for services increased every year from 1997 to 2006 for all preschool-age children. Overall, the percentage of 3- through 5-year-olds identified for services under IDEA increased every year from 1997, when 4.70 percent were identified, to 2006, when 5.82 percent were identified (see exhibits 3.2 and 3.3). Between 1997 and 2006, this was an increase of 1.12 percentage points. For 5-year-old children, the percentage increased from 6.27 percent to 7.41 percent (1.14 percentage increase); for 4-year-olds, the increase was from 4.89 percent to 6.07 percent (1.18 percentage increase); and for 3-year-olds, the increase was from 2.88 percent to 4.01 percent (1.13 percentage increase). From 1997 to 2006, 5-year-olds had the highest identification percentage and 3-year-olds had the lowest.

Exhibit 3.3. Trends in national percentage of preschool-age children identified for services under IDEA, by age (1997–2006)

Exhibit reads: Nationwide, the percentage of 3-year-olds identified for services under IDEA increased from 2.88 percent in 1997 to 4.01 percent in 2006.

NOTE: The percentage of children who were identified was calculated by dividing the number of children identified for services under IDEA (DANS) in a given age group by the total number of children in the same age group as indicated by the NVSS-constructed population proxy. The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on Indian reservations.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part B, Child Count, 1997–2006, retrieved December 7, 2007, from <http://www.ideadata.org/PartBChildCount.asp>; U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System, 1990–2005, retrieved January 11, 2008, from <http://209.217.72.34/VitalStats/ReportFolders/ReportFolders.aspx>.

Number of Children Ages 3 Through 5 Identified, by Gender (2006)

Data on the gender of preschool-age children identified for services under IDEA were collected for the first time in 2006. These data indicate that 479,777 of the children were male (69.29 percent) and 212,675 were female (30.71 percent).

Percentage of Children Ages 3 Through 5 Identified, by Race/Ethnicity (1997 to 2006)

Exhibit 3.4 displays the number and percentage of preschool-age children ages 3 through 5 in each racial/ethnic category identified for services under IDEA from 1998 through 2006, and exhibit 3.5 graphs these percentages.

In 2006, the percentage of 3- through 5-year-olds identified for services under IDEA differed by racial/ethnic category (see exhibit 3.5). Percentages ranged from 3.59 percent (Asian preschool-age children) to 8.14 percent (American Indian preschool-age children).

Exhibit 3.4. National number and percentage of 3- through 5-year-olds identified for services under IDEA, by race/ethnicity (1998–2006)

Year	Preschool-age children identified for services									
	Number					Percentage of all preschool-age children				
	White	Black	Hispanic	Asian	American Indian	White	Black	Hispanic	Asian	American Indian
1998	359,145	82,530	62,846	10,453	6,810	4.86	4.43	3.10	2.28	6.31
1999	373,545	87,496	69,655	11,307	6,730	5.12	4.86	3.35	2.39	6.31
2000	400,652	93,276	78,071	13,202	7,201	5.57	5.30	3.67	2.72	6.72
2001	410,347	95,053	84,906	13,898	7,714	5.73	5.39	3.90	2.79	7.02
2002	426,342	97,888	91,620	15,018	8,327	5.97	5.52	4.09	2.93	7.44
2003	445,312	100,899	99,552	17,003	8,864	6.22	5.62	4.25	3.14	7.75
2004	454,638	103,332	107,080	19,014	9,181	6.39	5.77	4.36	3.34	7.95
2005	453,536	102,310	112,883	20,791	9,418	6.44	5.75	4.40	3.47	8.05
2006	450,869	103,948	120,080	22,166	9,572	6.45	5.93	4.52	3.59	8.14

Exhibit reads: Nationwide, 359,145 White 3- through 5-year-olds were identified for services under IDEA in 1998. These represented 4.86 percent of all White 3- through 5-year-olds.

NOTE: Black includes African American, Hispanic includes Latino, Asian includes Native Hawaiian or Other Pacific Islander, and American Indian includes Alaska Native. The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on Indian reservations. The percentages of children identified were calculated by dividing the number of 3- through 5-year-olds in a given racial/ethnic category who were identified for services under IDEA by the total number of 3- through 5-year-olds in the same racial/ethnic category as indicated by the NVSS -constructed population proxy.

Exhibit 3.5. Trends in national percentage of 3- through 5-year-olds identified for services under IDEA, by race/ethnicity (1998–2006)

Exhibit reads: Nationwide, the percentage of American Indian 3- through 5-year-olds identified for services under IDEA increased from 6.31 percent in 1998 to 8.14 percent in 2006.

NOTE: Black includes African American, Hispanic includes Latino, Asian includes Native Hawaiian or Other Pacific Islander, and American Indian includes Alaska Native. The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on Indian reservations. The percentages of children identified were calculated by dividing the number of 3- through 5-year-olds in a given racial/ethnic category who were identified for services under IDEA by the total number of 3- through 5-year-olds in the same racial/ethnic category as indicated by the NVSS-constructed population proxy.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part B, 1997-2005, retrieved on December 7, 2007, <http://www.ideadata.org>. U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System (NVSS), 1997 to 2006, retrieved January 9, 2008, from <http://209.217.72.34/VitalStats/ReportFolders/ReportFolders.aspx>. U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System (NVSS), (2007, December), *Births: Preliminary Data for 2006* (2007, December), 46(7), p. 12.

The percentage of preschool-age children identified for services under IDEA increased for each racial/ethnic category from 1998 to 2006 (see exhibits 3.4 and 3.5). The increases ranged from 1.31 percentage points for Asian preschool-age children to 1.83 percentage points for American Indian preschool-age children. The percentage of Asian, Hispanic, and White 3- through 5-year-olds identified for special education services nationally increased every year from

1998 to 2006 (1.31, 1.42, and 1.59 percentage increases, respectively). For American Indian children, the percentage identified increased every year after 1999. The percentage of Black children identified increased until 2004, declined between 2004 and 2005, and then increased thereafter, reaching 5.93 percent in 2006.

Between 1998 and 2006, the relative position of preschool-age children by racial/ethnic category remained the same for those identified for services under IDEA. For each year from 1998 to 2006, American Indian preschool-age children had the highest identification percentages (ranging from 6.31 in 1998 to 8.14 in 2006) followed by White (4.86 to 6.45), Black (4.43 to 5.93), Hispanic (3.10 to 4.52), and Asian preschool-age children (2.28 to 3.59).

Percentage and Percentage Change of Children Ages 3 Through 5 Identified, by Disability Category (2004 and 2006)

Exhibit 3.6 presents the percentage of preschool-age children identified for services with each IDEA disability category in 2004 and 2006. Exhibit 3.6 also presents the percentage changes from 2004 to 2006 for each disability category relative to the identification percentage in 2004. The relative percentage change was calculated for each disability category by subtracting the 2004 identification percentage from the 2006 percentage and dividing the difference by the 2004 percentage (multiplying the result by 100). (See appendix exhibit A3.6 for the number and percentage of preschool-age children by disability category.)

In 2006, the percentage of 3- through 5-year-olds identified for services under IDEA varied by disability category.² The largest percentages were for preschool-age children identified under the speech or language impairments and developmental delay categories of IDEA (2.73 percent and 2.06 percent, respectively).

Between 2004 and 2006, the relative percentage of 3- through 5-year-olds increased for all but four of the disability categories. Changes from 2004 to 2006 in the identification percentages for each disability category were examined relative to the identification percentage in 2004. The largest percentage increase, relative to the percentage of children identified under each disability category in 2004, was 34.87 percent for children classified under the autism category, followed by 24.64 percent for children classified with other health impairments. The relative increases for the remaining categories were as follows: multiple disabilities (12.59 percent), emotional disturbance (9.75 percent), specific learning disabilities (8.98 percent), visual impairments (6.64 percent), hearing impairments (4.69 percent), mental retardation (2.90 percent), and speech and language impairments (0.83 percent).

The relative decreases were -19.05 percent for children classified with deaf-blindness, followed by children classified with orthopedic impairments (-5.24 percent), developmental delay (-3.98 percent), and traumatic brain injury (-2.30 percent). (See appendix exhibit A3.6 for the number and percentage of preschool children by disability category.)

² The 13 disability categories under which 3- through 21-year-old children may be identified for services under IDEA, Part B, are specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), and deaf-blindness (DB), and developmental delay (DD). States or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category.

Exhibit 3.6. National percentage of preschool-age children identified for services under IDEA, by disability category (2004 and 2006)

Exhibit reads: Nationwide, in 2004, 0.11 percent of all 3- through 5-year-olds were identified for services under the specific learning disability category.

Rounds to zero.

NOTE: Disability categories are: specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB), developmental delay (DD). States or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category. In 2004, 46 states reported counts under this category, and in 2006, 48 states reported counts under this category. The numbers of children identified in this exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on Indian reservations. The percentage of children who were identified under a given IDEA disability category was calculated by dividing the number of 3-through 5-year-olds identified for services under that category (DANS) in a given year by the total number of 3-through 5-year-olds in that same year as indicated by the NVSS-constructed population proxy. Relative percentage change from 2004 to 2006 for each disability category was calculated by subtracting the 2004 identification percentage from the 2006 percentage and dividing the difference by the 2004 percentage (multiplying the result by 100).

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), retrieved December 7, 2007, from https://www.ideadata.org/tables28th%5Car_1-2.xls and https://www.ideadata.org/tables30th%5Car_1-2.xls; U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System (NVSS), 1997–2005, retrieved January 11, 2008, from <http://209.217.72.34/VitalStats/ReportFolders/ReportFolders.aspx>.

Percentage of Children Ages 3 Through 5 Identified for Services Under IDEA, by State (1997 to 2006)

The state-level percentages of preschool-age children identified for services under IDEA are reported for three time frames: 1997, the average between 1998 and 2005, and 2006. Exhibit 3.7 displays the national and state percentages for preschool-age children ages 3 through 5 for these time frames, ordered by their values in 2006.

In 2006, states varied in the percentage of 3 through 5 year olds identified for services under IDEA. The national percentage of preschool-age children identified in 2006 was 5.82 percent. This is more than the average percentage of preschool-age children identified between 1998 and 2005 (5.33 percent) and in 1997 (4.70 percent). Across states in 2006, the percentage identified ranged from 3.32 percent in the District of Columbia to 13.66 percent in Wyoming. Of the 50 states and the District of Columbia, 49 states had higher identification percentages in 2006 than in 1997 (the exceptions are Idaho and Texas). (See appendix exhibit A3.7a for state percentages for each time frame and appendix exhibit A3.7b for the state percentages for each year, 1997 through 2006.)

Exhibit 3.7. Percentage of 3- through 5-year-olds identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2005 average, and 2006)

Exhibit reads: In 2006, the percentage of 3- through 5-year-olds served under IDEA ranged from 3.32 percent (District of Columbia) to 13.66 percent (Wyoming).

NOTE: States are ordered by the percentage of children identified for services in 2006. Vertical lines represent the average percentages for the 50 states and the District of Columbia. The numbers of children identified are the state counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on Indian reservations. The percentage of all children identified was calculated by dividing the number of 3- through 5-year-olds identified for services under IDEA in a given state (or nationally) in a given year (or range of years) by the total number of 3- through 5-year-olds in the same state (or nationally) in the same year (or range of years) as indicated by the NVSS-constructed population proxy. NVSS birth data for 2006 are preliminary.

Outcomes for Children Identified for Preschool Services Under IDEA

Since April 2006, the Office of Special Education Programs (OSEP) in the U.S. Department of Education has required states to report outcome data for children served through Part C and Part B of IDEA as part of their Annual Performance Report. It is during this age range that children transition from Part C to Part B of the Individuals With Disabilities Education Act (IDEA) and from preschool to kindergarten, including the children whose families have chosen for them to continue to receive their services under Part C. Early learning standards have been developed by states to define guidelines for early childhood education, including preschool education and services. Standards for practice now include targeted outcomes for preschool services reflecting continued maturation in key developmental domains, as well as emerging academic capabilities for skills, including pre-literacy, language, and numeracy skills, that will gain increasing importance as children age and enter the K–12 education system.

This section presents emerging academic, social, and functional outcomes and draws from PEELS findings originally published in *Preschoolers with Disabilities: Characteristics, Services, and Results: Wave 1 Overview Report From the Pre-Elementary Education Longitudinal Study* (Markowitz et al. 2006). The PEELS data can be used to describe outcomes for children ages 3 through 5 who received special education preschool services nationally, including 5-year-old children who transitioned into kindergarten. Outcome data collection as a part of the longitudinal study included individual child assessments and behavior rating scales (teacher report). Outcomes are summarized to provide the following information:

- Emerging academic skill outcomes related to early language and communication skills, as well as early literacy and numeracy skills. These outcomes also address the precursor skills necessary for children to succeed in elementary school when they are taught academic subject areas (e.g., reading, mathematics).
- Social and functional development including positive social-emotional skills referring to how children get along with others and interact in a group setting, how they relate to adults and to other children, and how they follow rules related to groups and the use of appropriate self-care and self-direction behavior addressing how children take care of basic needs and take care of themselves (e.g., dressing, feeding, hair brushing, toileting).
- Variation in these outcomes by disability category where each child's eligibility was categorized into three groups—developmental delay, speech or language impairments, and all other categories.

Child outcomes are reported in the form of standard scores for children ages 3 through 5 and for each age; the general population (based on norm samples including both children with and without disabilities) has a mean standard score of 100.0 and a standard deviation of 15.0.

Emerging Academic Skills

Children in preschool increasingly acquire skills that are important building blocks for success in the K-12 system. These skills can be divided into four areas: literacy, vocabulary, numeracy, and preacademic skills. To assess the emergence of literacy, letter and word identification skills were measured using the Woodcock-Johnson III (WJ III) Letter-Word Identification subtest (Woodcock, McGrew, and Mather 2001). Vocabulary skills (i.e., receptive language development) were measured using the Peabody Picture Vocabulary Test-Third Edition (PPVT-III) (Dunn and Dunn 1997). Numeracy skills were measured using the WJ III Applied

Problems subtest (Woodcock, McGrew, and Mather 2001). Preacademic skills (i.e., basic skills that form the foundations for reading, writing, mathematics, and other skills needed for daily, independent functioning) were measured using the Adaptive Behavior Assessment System-Second Edition (ABAS-II), Functional Preacademics subtest (Harrison and Oakland 2003). ABAS-II relies on teacher ratings of child performance rather than on face-to-face individual assessments that were used to measure literacy, vocabulary, and numeracy skills. Exhibit 3.8 presents academic outcomes in each area for children ages 3 through 5 identified for preschool services under IDEA as a group and for each age.

In letter-word identification, the mean score for 5-year-olds identified for services (96.8, SE = 0.98) differed from that of the general population, but the scores of the 3- and 4-year-olds did not (100.8 and 98.5, SE = 1.37 and 0.98, respectively). As a group, all children ages 3 through 5 identified for preschool services under IDEA had a mean standard score on the Letter-Word Identification subtest of 98.2 (SE = 0.78), which was not significantly different from the general population mean of 100.0 (SD = 15.00). Age-year cohort comparisons were not significantly different from each other. (See appendix exhibits A3.8a, A3.8e, and A3.8f for means, standard errors, and *p* values.)

Vocabulary scores for preschool-age children identified for IDEA services, both overall and for each age, were significantly lower than that of the general population. Children identified for preschool services under IDEA had significantly lower mean scores on the vocabulary test than preschool-age children in the general population for the group as a whole (90.1 vs. 100.0, SE = 0.59, *p* < .001), as well as for children in each age (88.6, 89.7, and 91.1; SE = 0.78, 0.78, and 0.88 for 3-, 4-, and 5-year-olds, respectively; *p* < .001 for all comparisons). Differences by age in vocabulary scores for children identified for preschool services under IDEA were not significant. (See appendix exhibits A3.8b, A3.8e, and A3.8f for means, standard errors, and *p* values.)

Numeracy outcomes for preschool-age children identified for IDEA services, both overall and for each age, were significantly lower than those of the general population. Preschool-age children with disabilities had a mean standard score on the WJ III Applied Problems subtest of 90.3 (SE = 0.98), which was significantly lower than the mean score of 100.0 (SD = 15.00) for the general population (*p* < .001). The significant difference from the general population was apparent for all three age cohorts, with mean scores of 88.2 (SE = 1.27), 91.2 (SE = 1.57), and 90.6 (SE = 0.98) for 3-, 4-, and 5-year-olds, respectively (*p* < .001 for all comparisons). Cross-age differences among them were not statistically significant. (See appendix exhibits A3.8c, A3.8e, and A3.8f for means, standard errors, and *p* values.)

Preacademic skills for preschool-age children identified for IDEA services as a group and for all age groups individually were significantly lower than those of the general population. For children ages 3 through 5 who were identified for preschool services under IDEA and not yet in kindergarten, the overall mean teacher/daycare provider rating on the Functional Preacademics subtest was 89.5 (SE = 0.98), which was significantly lower than the general population mean of 100.0 (SD = 15.00, *p* < .001). The difference from the general population was also statistically significant for all three age cohorts, with mean scores of 88.5 (SE = 0.98), 90.0 (SE = 0.98), and 93.5 (SE = 1.47) for 3-, 4-, and 5-year-olds, respectively (*p* < .001 for all comparisons). Because of the different forms used for preschool and kindergarten, age-group comparisons were not possible. (See appendix exhibits A3.8d, A3.8e, and A3.8f for means, standard errors, and *p* values.)

Exhibit 3.8. Mean literacy, numeracy, and preacademic skills scores of 3- through 5-year-olds identified for services under IDEA (2005)

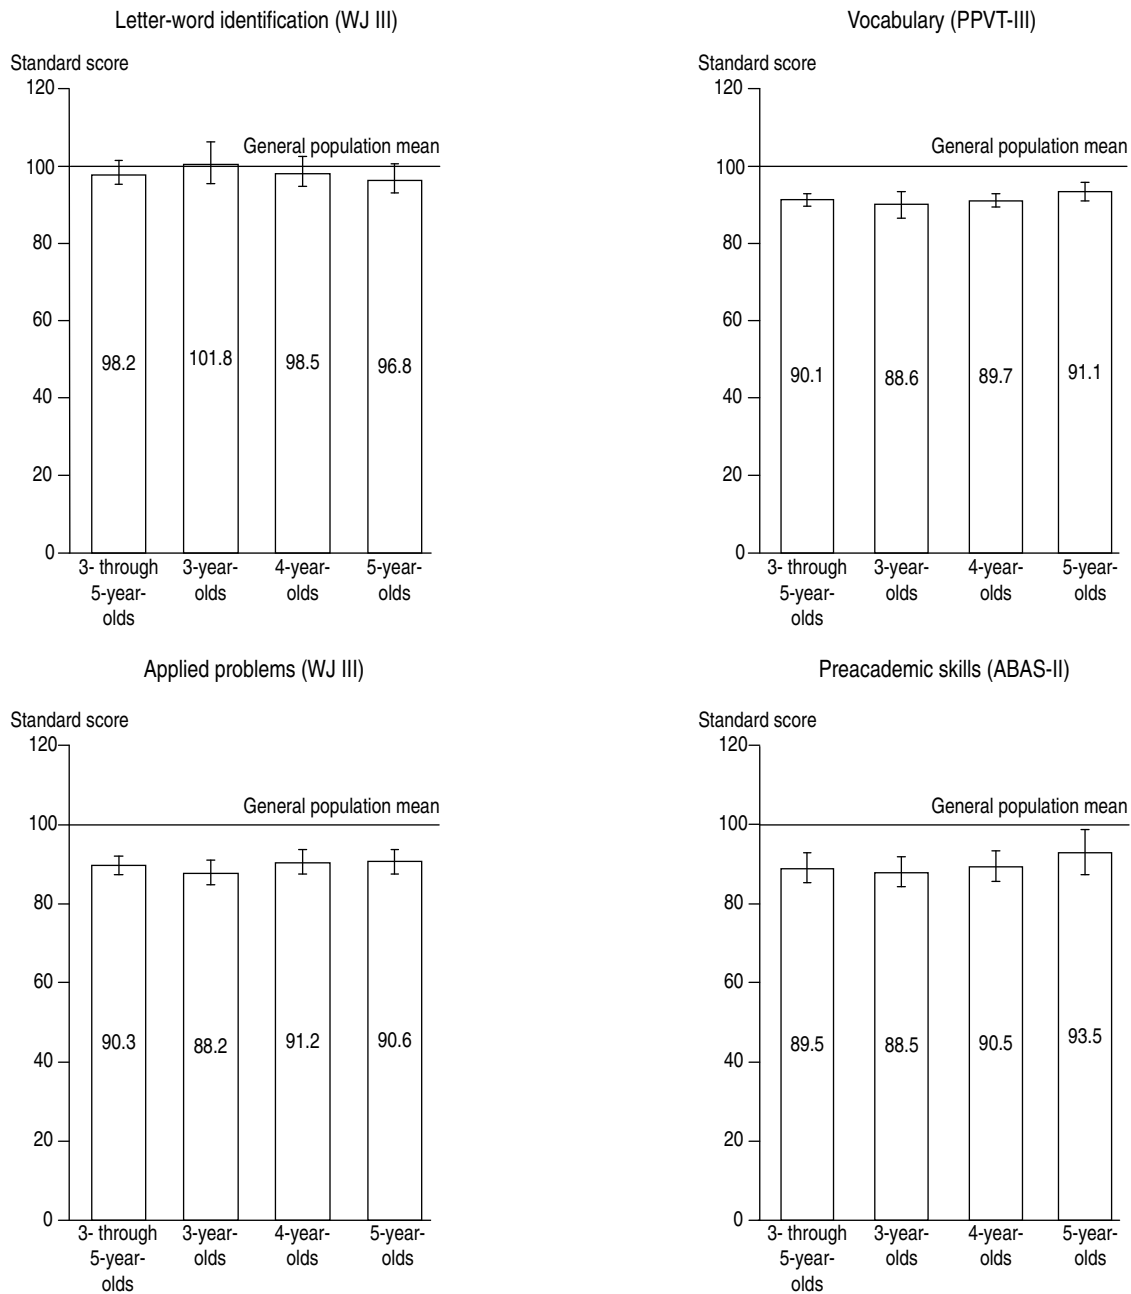

Exhibit reads: Preschool-age children identified for services under IDEA had a mean standard score of 98 on the letter-word identification subtest.

NOTE: Data were preliminary at the time of publication (2005). Findings reported in the exhibit are based on a direct assessment of individual students using Woodcock-Johnson III (WJ III) (Woodcock, McGrew, and Mather 2001), Peabody Picture Vocabulary Test-Third Edition (PPVT-III) (Dunn and Dunn 1997), and Adaptive Behavior Assessment System-Second Edition (ABAS-II) (Harrison and Oakland 2003). All measures are based on a general population mean of 100 and a standard deviation of 15. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Special Education Research, Pre-Elementary Education Longitudinal Study (PEELS), direct assessment, 2005.

Social and Functional Development

Social and functional development of children continues to be important during the preschool years and is addressed directly in many preschool service contexts. Four domains of social and functional development are presented here: social skills, problem behaviors, self-care skills, and self-direction skills. Social skills and problem behaviors were measured with the Preschool and Kindergarten Behavior Scales-Second Edition (PKBS-2) (Merrell 2002), a teacher rating that assesses age-appropriate personal and interpersonal behaviors of preschool and early-elementary-age children and the prevalence of problem behaviors. Self-care skills (basic personal care skills such as eating, dressing, and bathing) were measured using the ABAS-II. Self-direction skills (such as independence, self-control, and personal responsibility) were also measured using the ABAS-II. Exhibit 3.9 presents the social and functional outcomes for children ages 3 through 5 identified for preschool services under IDEA as a group and for each age cohort.

Social skills ratings for 3- and 4-year-old children identified for services under IDEA were significantly lower than ratings for the general population. The mean score for 3-year-old children identified for preschool services was 85.2 (SE = 1.08), for 4-year-olds was 93.0 (SE = 1.08), and for 5-year-olds was 96.5 (SE = 1.37). Scores for 3- and 4-year-olds differed significantly from the general population ($p < .001$). Children ages 3 through 5 identified for preschool services under IDEA had a mean Social Skills standard score of 92.8 (SE = 0.88), which was significantly lower than the general population mean score of 100.0 (SD = 15.00, $p < .001$). Cross-age comparisons showed that the mean performances of 5-year-old and 4-year-old identified children were significantly higher than that of 3-year-old identified children ($p < .001$). (See appendix exhibits A3.9a, A3.9e, and A3.9f for means, standard errors, and p values.)

Mean problem behavior ratings of 5-year-old children identified for services under IDEA (98.2, SE = 0.69) were significantly lower than for the general population ($p = .003$). Problem behavior outcomes for 3-year-olds (99.2, SE = 0.78) and 4-year-olds (99.0, SE = 1.08) were not significantly different compared with the general population of same-age children. The mean standard score of 98.2 (SE = 0.69) on the Problem Behavior subscale for children ages 3 through 5 identified for services under IDEA was significantly lower than that of preschool-age children in the general population (100.0, $p < .001$). Cross-age comparisons did not detect significantly different problem behavior ratings between 3-, 4-, and 5-year-olds served under IDEA. (See appendix exhibits A3.9b, A3.9e, and A3.9f for means, standard errors, and p values.)

Self-care outcomes for children ages 3 through 5 identified for IDEA services were significantly lower than those of the general population. For children identified for preschool services under IDEA, the overall mean teacher/daycare provider rating on the Self-care subscale was 93.0 (SE = 0.98), which was significantly lower than the general population mean of 100.0 (SD = 15.00, $p < .001$). Scores of 3-, 4-, and 5-year old children (91.0, 94.0, 90.5; SE = 0.98, 0.98, 1.47, respectively) were significantly lower than those of the general population of same-age children ($p < .001$ for all comparisons). Cross-age differences were not statistically significant. (See appendix exhibits A3.9c, A3.9e, and A3.9f for means, standard errors, and p values.)

Exhibit 3.9. Mean social skills, problem behaviors, self-care, and self-direction scores of 3- through 5-year-olds identified for services under IDEA (2005)

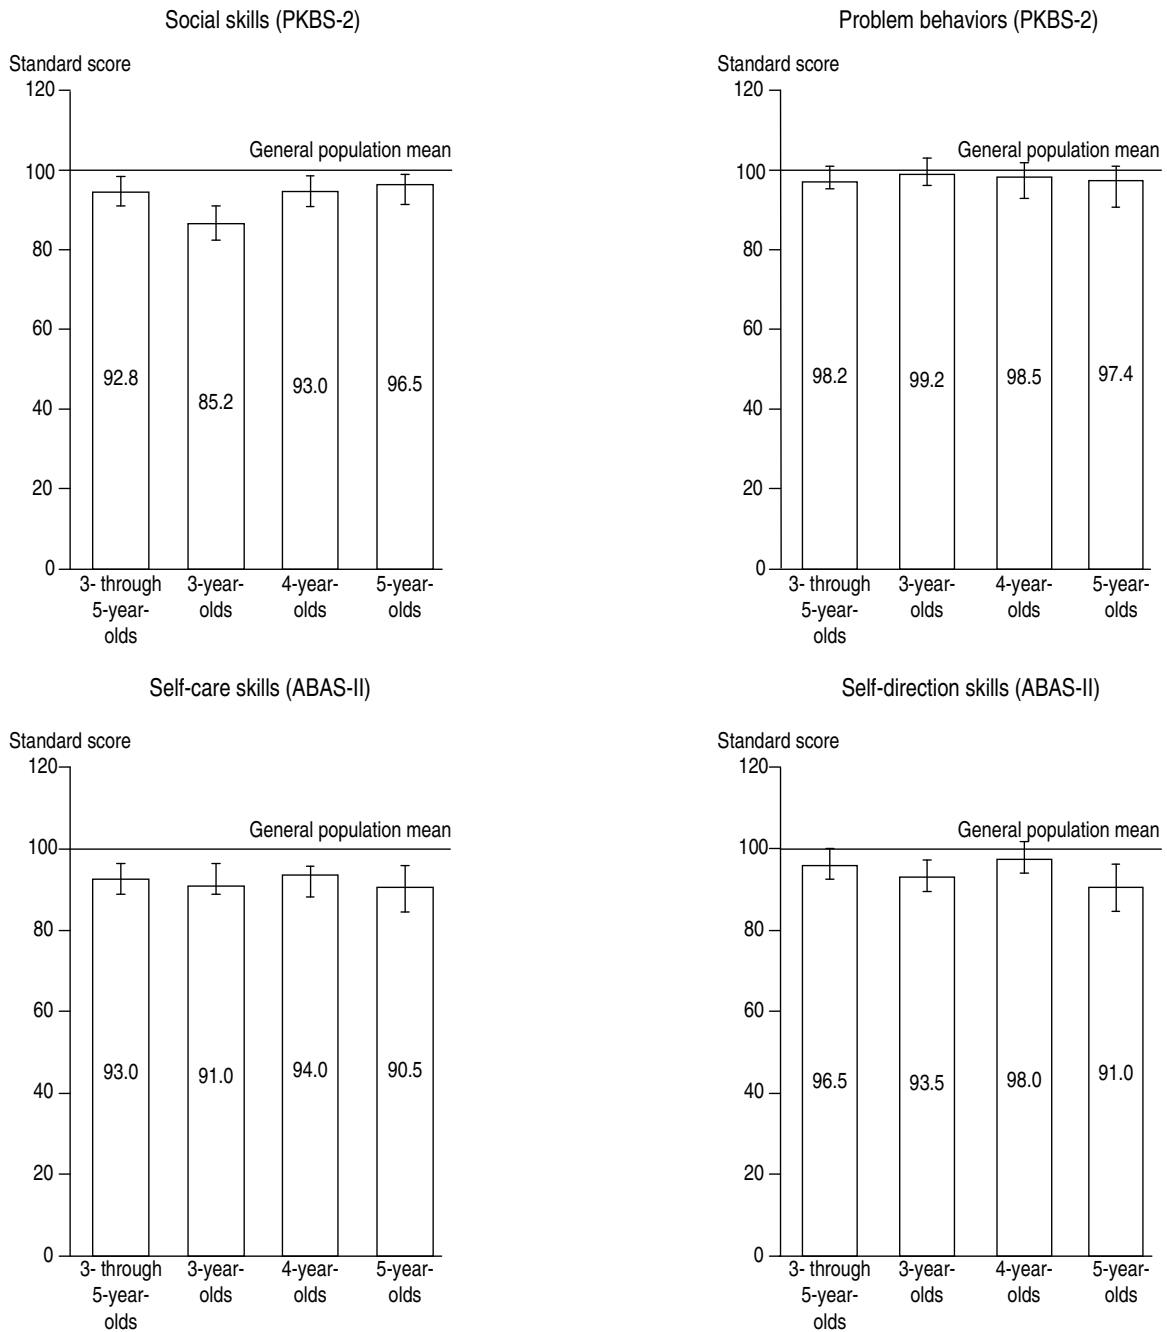

Exhibit reads: Preschool-age children identified for services under IDEA had a mean standard score of 93 on the social skills scale.

NOTE: Data were preliminary at the time of publication (2005). Social skills and problem behaviors were measured by the Preschool and Kindergarten Behavior Scales-Second Edition (PKBS-2) (Merrell 2002). Self-care skills and self-direction skills were measured by the Adaptive Behavior Assessment System-Second Edition (ABAS-II) (Harrison and Oakland 2003). All measures are based on a general population mean of 100 and a standard deviation of 15. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Special Education Research, Pre-Elementary Education Longitudinal Study (PEELS), direct assessment, 2005.

Self-direction outcomes for 3- and 5-year-olds identified for IDEA services were significantly lower than those of the general population. The ratings of 3-year-olds (93.5, SE = 1.96) and 5-year-olds (91.0, SE = 2.94) were significantly lower than that of the general population of same-age children ($p < .001$). Children ages 3 through 5 who were identified for services under IDEA had a mean teacher/daycare provider rating on the Self-direction subscale of 96.5 (SE = 1.96), which was significantly different from the general population mean of 100.0 (SD = 15.00). Four-year-old children (98.0, SE = 1.96) had significantly higher self-direction ratings than both 3-year-old ($p < .001$) and 5-year-old children ($p < .001$). (See appendix exhibits A3.9d, A3.9e, and A3.9f for means, standard errors, and p values.)

Variations in Outcomes by Disability Category

Children with a range of disabilities are eligible for services under IDEA. In the PEELS sample, the categories of speech or language impairments (46 percent) and developmental delay (28 percent) are the largest categories. Exhibit 3.10 compares the standard scores of children with speech or language impairments and developmental delay in emerging academic skills, social skills, and problem behaviors with those of children in all other disability categories.

In academic skills, children in each of the disability categories differed significantly from the general population in the areas of numeracy, vocabulary, and preacademics (for all p values, see appendix exhibit A3.10). In the letter-word identification subtest, children with developmental delay had a mean score (93.0, SE = 1.3, $p < .001$) that was significantly lower than that of the general population, whereas children with speech or language impairments or other disabilities did not differ from the general population. Further, children with speech or language impairments had significantly higher scores than those with developmental delay in each of the literacy and numeracy outcomes. (See appendix exhibits A3.11a through A3.11f for means, standard errors, and p values.)

In social and functional development, children with developmental delay and those with other disabilities had significantly lower ratings than the general population in social skills, self-care, and self-direction ($p < .05$ for all comparisons; see appendix exhibits A3.10b and A3.10d for all p values). In these domains, children with speech or language impairments did not differ from the general population. By contrast, children with speech or language impairments had significantly lower ratings for problem behaviors than the other two groups of children. For comparisons by disability groups, children with speech or language impairments had significantly higher ratings in social, self-care, and self-direction skills and significantly lower rating for problem behaviors compared with children with developmental delay and those with other disabilities ($p < .05$ for all comparisons; see appendix exhibit A3.10f for all p values).

Exhibit 3.10. Mean emerging academic skills, social skills, and problem behavior scores of 3- through 5-year-olds identified for services under IDEA, by disability category (2005)

Exhibit reads: On a letter-word identification test, the mean scores of 3- through 5-year-olds with developmental delay, speech or language impairments, and all other disability categories were 93, 100, and 100, respectively.

NOTE: Data were preliminary at the time of publication (2005). Measures are: WJLW: Research version of the Woodcock-Johnson III (WJ III) letter-word identification subtest (Woodcock, McGrew, and Mather 2001); WJAP: Research version of the WJ III applied problems subtest (Woodcock, McGrew, and Mather 2001); PPVT-III: Peabody Picture Vocabulary Test-Third Edition (Dunn and Dunn 1997); ABAS-II: Adaptive Behavior Assessment System-Second Edition (Harrison and Oakland 2003); PKBS-2: Preschool and Kindergarten Behavior Scales-Second Edition (Merrell 2002). All measures are based on a general population mean of 100 and a standard deviation of 15. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

Key Findings Related to School-Age Children Identified for Services Under IDEA

Who are the school age children identified for services under IDEA and how has this changed over time?

In 2005, 5,707,712 children and youth ages 6 through 17 had been identified for services under IDEA by states. These children represented 12.92 percent of all children and youth enrolled in grades 1 through 12, an increase from 12.31 percent in 1997.

The percentage of school-age children identified under IDEA varied by age in 2005, with 10- to 13-year-olds as the largest age group (13.75 percent) followed by 14- through 17-year-olds (13.13 percent) and 6- through 9-year-olds (11.85 percent). For each year between 1997 and 2005, the 10- to 13- year-olds had the highest percentage compared to the other two age groups.

Among children identified for IDEA services by age groups in 1997 and 2005, children classified with a learning disability category was the largest for children ages 10 through 13 and 14 through 17, whereas for children ages 6 through 9, the largest category was children classified with speech and language impairments. The largest relative percentage change between 1997 and 2005 of children ages 10 through 13 and 14 through 17 was for children identified with autism under IDEA (411.43 percent and 345.27 percent, respectively), whereas for children ages 6 through 9, the largest relative percent change was for children classified with a developmental delay (1,955.83 percent) followed by children classified with autism (264.65 percent).

Who leaves IDEA services?

National data sources suggest that the percentage of children and youth being declassified from IDEA services varied by age group: 49 percent among children who were in kindergarten in 1998, 17 percent among those who were 6 through 12 years old in 1999, and 5 percent among those who were ages 13 through 16 in 2000.

What are the outcomes for school age children identified for services under IDEA compared to their peers?

Academics. Children identified for IDEA services had significantly lower scores than their peers not identified for IDEA services in both reading and mathematics in the 2003, 2005, and 2007 administrations of the NAEP. In addition, the average test scores in fourth-grade reading and fourth- and eighth-grade mathematics for fourth-graders identified and not identified for services under IDEA increased from 2003 to 2007. In each administration of the NAEP, there was considerable variation in performance from state to state. For example, average scale scores ranged from 162 (SE = 4.7) to 213 (SE = 2.9) on the NAEP fourth-grade reading test and from 203 (SE = 2.4) to 248 (SE = 2.8) on the eighth-grade test, differences across states of 51 points and 45 points, respectively for children identified for services under IDEA.

School Completion. Forty-six percent of children identified for IDEA services and estimated to be enrolled as of 4 years prior completed secondary school with a regular diploma in 2005, 29 percentage points below the rate for children in the total population (75 percent).

4. School-Age Children Identified for Services Under IDEA

This chapter presents a summary of information on children and youth ages 6 through 21 identified for special education services under IDEA. The chapter consists of four sections: (1) the legislative background for examining the status of school-age children identified for services under IDEA, (2) descriptive findings on the identification of school-age children for services under IDEA, (3) descriptive findings on their rates of losing eligibility for services under IDEA through “declassification,” and (4) descriptive findings on their academic and school completion outcomes. This study is not designed to assess how outcomes presented in this report are affected by identification or declassification practices, nor is it designed to measure impacts of IDEA services on child outcomes.

Legislative Background

Since 1975, every child in the United States ages 3 through 21 who has been identified with a disability and needs special education services has been entitled to a free appropriate public education under the Individuals with Disabilities Education Act (IDEA). Under IDEA Part B, provisions such as an Individualized Education Program (IEP), due process, confidentiality, and a right to services in the least restrictive environment, apply in the same way to preschool-age and school-age children. The same eligibility categories used to identify preschool-age children as eligible for services are used to identify school-age children ages 6 through 21. In 1990, P.L. 101-476 renamed the EHA as the Individuals With Disabilities Education Act (IDEA) and extended the law to include support for youth with disabilities in the transition to young adulthood and added new disability categories. The new classifications included children with autism and traumatic brain injury. The law was amended in 1991 (P.L. 102-119) to allow states the option for an additional disability category, “developmental delay,” to be used for children ages 3 through 9. In 1991, the U.S. Department of Education issued a joint policy memo¹ stating that children identified with an attention deficit hyperactivity disorder (ADHD) could be identified as eligible for special education services under the disability classification of other health impaired (Joint Policy Memo 1991). Sections 611-618 of Part B of IDEA 2004 (P.L. 108-446) set forth the requirements for states and school districts to provide special education and related services to eligible children with disabilities, ages 3 through 5 as well as ages 6 through 21.

The most recent reauthorization of IDEA in 2004 (P.L. 108-446) aligned more clearly with the guiding federal legislation, the No Child Left Behind Act of 2001 (NCLB). Under IDEA and NCLB, states are expected to align their performance goals and indicators for children with disabilities with their definition of adequate yearly progress (AYP) and report on graduation rates and drop-out rates. Children with disabilities are expected to participate in state assessment systems and demonstrate continued improvement and progress in their academic outcomes, including those students who take an alternate assessment. School-age children identified for services under IDEA are now assessed for accountability purposes under the No Child Left Behind Act of 2001 (NCLB). States publicly report on their participation and progress toward

¹ The Assistant Secretaries for the following offices in the U.S. Department of Education jointly signed this policy memo: Office of Special Education and Rehabilitative Services, Office of Elementary and Secondary Education, and Office of Civil Rights.

meeting State goals on the assessments with the same frequency and detail as for children without disabilities.

Identification of School-Age Children for Services Under IDEA

The identification section of this chapter presents the following types of information:

- The number and percentage of school-age children identified for services, by age group and by disability category. Changes from 1997 to 2005 in the identification percentages for each disability category are examined relative to the identification percentage in 1997.
- The composition of school-age children identified for IDEA services by gender.
- The percentage of school-age children identified for services nationally by race/ethnicity, and state. The percentage point differences are also examined across time.

For 27 years, the U.S. Department of Education, Office of Special Education Programs (OSEP), has reported to Congress on the implementation of IDEA on the basis of state counts on the number of children identified under IDEA. Currently, states report to OSEP the number of children with disabilities receiving Part B special education and related services as a part of their annual Section 618 report. State-reported data were obtained from OSEP's Data Analysis System (DANS) for 1997 to 2005. As of December 1 of each year, each state reports to OSEP counts of number of children, birth through age 21, in the state who were identified for services under IDEA. The number identified includes both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. To report on the identification of children for services under IDEA, both the counts and the percentages of the children are reported. Data were obtained from the Common Core of Data (CCD) on the total population enrolled in elementary and secondary school. Identification percentages² were computed for each year using the number of children ages 6 through 17 identified for services under Part B (DANS) as a percentage of the total population enrolled in grades 1 through 12 (CCD). For identification percentages by race/ethnicity, percentages were calculated using the number of children ages 6 through 21 divided by the total population enrolled in grades 1 through 12 (CCD). These data are the basis for the findings on the identification number and percentages reported in this section of the chapter.

The K–12 school system divides school into three levels: elementary school, middle school, and high school. While the grades that align with these three levels of school can differ from school district to school district, most districts follow this practice. To align age groups and school levels, six age groups were constructed: ages 6 through 21, ages 6 through 17, ages 6 through 9, ages 10 through 13, ages 14 through 17, and ages 18 through 21. Children ages 18 through 21 who have been identified for IDEA services are only included in the section on the number (counts) of children identified overall, and in the sections for findings by gender and by race/ethnicity using the available data in the aggregate on children ages 6 through 21. As these aggregate counts were the only data available, identification percentages by race/ethnicity were computed using the number of children ages 6 through 21 as a percentage of the total population

² See appendix B for additional details regarding its calculation.

enrolled in grades 1 through 12 (CCD).³ CCD enrollment counts in grades 1 through 12 were used as a proxy for the number of children ages 6 through 21 in elementary and secondary schools. Using this approach to calculate the identification percentages by race/ethnicity for each year may result in an overestimation of the percentages as the ideal denominator for these computations would be the total population of children ages 6 through 21 enrolled in elementary and secondary schools.

In this chapter, the national findings are presented for all 6- through 17-year-olds as a group. Then selected findings are presented by age group (6 through 9, 10 through 13, and 14 through 17 years) and by disability category. As noted earlier, national findings are presented for all 6 through 21 year olds are presented by gender and by race/ethnicity, as DANS only collects for this age range. In addition to the national description of school-age children identified for services under IDEA, a description of the state data is presented. In particular, the identification percentages of children ages 6 through 17 served under IDEA during three time frames are reported: 1997, the average from 1998 through 2004, and 2005. The national means also are reported for the same time period.

Number and Percentage of Children Identified for Services Under IDEA, by Age

Of the total population of 7,013,238 children identified in 2005, states reported 6,019,596 children ages 6 through 21 who had been identified for services under IDEA (see shaded ages in exhibit 4.1). In 2005, there were 361,567 6-year-olds identified. The number identified by a single year of age was largest for 14-year-olds (521,723) and smallest for 21-year-olds (13,353).

In 2005, children ages 10 through 13 years comprised the largest of the three age groups of school-age children identified for services under IDEA (N = 2,047,905), whereas children ages 6 through 9 years were the smallest group (N = 1,715,661) (see exhibit 4.1; see appendix exhibit A4.1 for the values by age).

In 2005, 12.92 percent of all 6- through 17-year-olds were identified for services under IDEA. From 1997 to 2004, the percentage for this age group increased each year (from 12.31 percent in 1997 to 13.01 percent in 2004, respectively). From 2004 to 2005, the percentage of 6- through 17-year-olds decreased from 13.01 percent to 12.92 percent (see exhibit 4.2).

³ This analytic approach was established by the National Research Council (2002) in the National Academy of Sciences report, *Minority Students in Special and Gifted Education*.

Exhibit 4.1. National number of school-age children identified for services under IDEA, by age (2005)

Exhibit reads: Nationwide, 361,567 6-year-olds were identified for services under Part B of IDEA in 2005.

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1, 2005, and December 1, 2005. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. School-age children eligible to receive services under IDEA are ages 6 through 21 years. The shaded area represents the data for these children.

Exhibit 4.2. National number and percentage of school-age children identified for services under IDEA, by age group (1997–2005)

Year	Children identified for services							
	Number				Percentage of all children			
	Ages 6–17	Ages 6–9	Ages 10–13	Ages 14–17	Ages 6–17	Ages 6–9	Ages 10–13	Ages 14–17
1997	5,081,196	1,691,239	1,914,456	1,475,501	12.31	11.63	13.79	11.49
1998	5,208,947	1,703,932	1,979,050	1,525,965	12.48	11.58	14.09	11.74
1999	5,340,850	1,709,872	2,040,417	1,590,561	12.68	11.60	14.35	12.07
2000	5,435,248	1,689,352	2,098,728	1,647,168	12.77	11.51	14.42	12.34
2001	5,517,641	1,669,628	2,129,140	1,718,873	12.83	11.46	14.34	12.65
2002	5,601,337	1,668,350	2,133,318	1,799,669	12.90	11.53	14.18	12.93
2003	5,668,404	1,687,535	2,116,871	1,863,998	12.96	11.72	14.00	13.13
2004	5,722,059	1,710,233	2,089,215	1,922,611	13.01	11.85	13.90	13.25
2005	5,707,712	1,715,661	2,047,905	1,944,146	12.92	11.85	13.75	13.13

Exhibit reads: Nationwide, 5,081,196 children ages 6 through 17 were identified for services under IDEA in 1997. These represented 12.31 percent of all 6- through 17-year-olds.

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. To compute the percentages, the ages of children with disabilities, including children in BIE schools, were aligned with the grades of the children for their age as follows: 6- to 9-year-olds, grades 1–4; 10- to 13-year-olds, grades 5–8; 14- to 17-year-olds, grades 9–12; and 6- to 17-year-olds, grades 1–12. The number of children in a given age group identified for services under IDEA (DANS) was then divided by the total number of children enrolled in the corresponding grade level (CCD). BIE schools were not included in 1997 CCD enrollment data for grades 1-12 as BIE were included starting in 1998.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part B, Child Count, 1997–2005, retrieved December 7, 2007, from <http://www.ideadata.org/PartBChildCount.asp>; U.S. Department of Education, National Center for Education Statistics, Common Core of Data, 1997–98 to 2005–06, retrieved December 10, 2007, from <http://www.nces.ed.gov/ccd/bat/>.

Between 1997 and 2005, the patterns in the identification of school-age children identified under IDEA varied by age group (see exhibits 4.2 and 4.3). From 1997 to 2005, 6- through 9-year-olds increased by 0.22 percentage points and 10- through 13-year-olds decreased by 0.04 percentage points; 14- through 17-year-olds had the largest *change* (an increase of 1.64 points).

The 10- through 13-year-olds had the highest percentage of students identified for each year from 1997 through 2005. The percentage increased each year from 1997 (13.79 percent) to 2000 (14.42 percent) and then decreased each year to 2005, reaching 13.75 percent in 2005. From 1997 to 2005, the 14- through 17-year-olds had the largest percentage point increase of children receiving services under IDEA (1.64 points). The 14- through 17-year-olds had the lowest percentage of students identified among all age groups in 1997 (11.49 percent). The percentage increased each year until 2004, surpassing the percentage of 6- through 9-year-olds identified in 1998. In 2005, the 14- through 17-year-olds had the second highest percentage (13.13 percent). The percentage of 6- through 9-year-olds identified underwent both increases and decreases from 1997 through 2002 and then increased through 2005.

(See appendix exhibit A4.2/3 for the number of children served under IDEA by age group, the number of children enrolled in school by grade, and the percentage by age group for each year.)

Exhibit 4.3. Trends in national percentage of school-age children identified for services under IDEA, by age group (1997–2005)

Exhibit reads: Nationwide, the percentage of 6- through 9-year-olds identified for services under IDEA increased from 11.63 percent in 1997 to 11.85 percent in 2005.

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The school enrollment numbers are aggregated counts of student enrollment in all public schools in the 50 states and the District of Columbia, including BIE schools. To compute the percentages, the number of students with disabilities, including children in BIE schools, for each age year was divided by the enrollment count for the corresponding grade level. The following age groups and grade levels are as followed: 6- through 9-year-olds (grades 1–4); 10- through 13-year-olds (grades 5–8); 14- through 17-year-olds (grades 9–12); and 6- through 17-year-olds (grades 1–12). BIE schools were not included in 1997 CCD enrollment data for grades 1-12 as BIE were included starting in 1998.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part B, Child Count, 1997–2005, retrieved December 7, 2007, from <http://www.ideadata.org/PartBChildCount.asp>; U.S. Department of Education, National Center for Education Statistics, Common Core of Data, 1997–98 to 2005–06, retrieved December 10, 2007, from <http://www.nces.ed.gov/ccd/bat/>.

Number of School-Age Children Identified, by Gender

Data on the gender of school-age children ages 6 through 21 identified for services under IDEA were collected by DANS for the first time in 2006. These data indicate that 3,939,918 (66.91 percent) male children were identified for services under IDEA, whereas 1,948,309 (33.09 percent) female children were identified.⁴

Number and Percentage of School-Age Children Identified, by Race/Ethnicity

Exhibit 4.4 displays the number and percentage of children ages 6 through 21 in each racial/ethnic category who were identified for services under IDEA in 1998 through 2005, and exhibit 4.5 graphs the national percentages.⁵

In 2005, the percentages of 6- through 21-year-olds identified for services under IDEA differed by their racial/ethnicity category. In the most recent year for which data are available (2005), percentages of students identified ranged from 16.67 percent (Black school-age children) to 6.34 percent (Asian school-age children). The percentages for American Indian, White, and Hispanic school-age children were 15.76 percent, 14.05 percent, 11.83 percent, respectively.

Exhibit 4.4. National number and percentage of 6- through 21-year-olds identified for services under IDEA, by race/ethnicity (1998–2005)

Year	Children identified for services									
	Number					Percentage of all children				
	White	Black	Hispanic	Asian	American Indian	White	Black	Hispanic	Asian	American Indian
1998	3,500,672	1,111,200	725,634	95,322	68,911	13.88	16.57	12.80	6.01	14.69

Exhibit reads: Nationwide, 3,500,672 White 6- through 21-year-olds were identified for services under IDEA in 1998. These represented 13.88 percent of all White 6- through 21-year-olds.

NOTE: Black includes African American, Hispanic includes Latino, Asian includes Native Hawaiian or Other Pacific Islander, and American Indian includes Alaska Native. The numbers of children identified in the exhibit are aggregated counts of children ages 6- through 21 identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The percentages were calculated by dividing the number of 6- through 21-year-olds in a given racial/ethnic category identified for services under IDEA (DANS) by the total number of students enrolled in grades 1 through 12 in the same racial/ethnic category (CCD).

⁵ States report race/ethnicity data on school-age children served under IDEA for one age grouping, ages 6 through 21, and have reported these data since 1998 to be included in DANS.

percentage of school-age children identified for services under IDEA was a 0.97 percentage-point decrease for Hispanic 6- through 21-year-olds (from 12.80 percent to 11.83 percent) and a 1.07 percentage-point increase for American Indian children (from 14.69 percent to 15.76 percent). The overall change in percentages for the other three racial/ethnic categories from 1998 to 2005 ranged from an increase of 0.10 to 0.33 percentage points: for Black children, 16.57 percent in 1998 to 16.67 percent in 2005 (0.10 percentage-point increase); for White children, 13.88 percent in 1998 to 14.05 percent in 2005 (0.17 percentage-point increase); and for Asian children, 6.01 percent in 1998 to 6.34 percent in 2005 (0.33 percentage-point increase).

Exhibit 4.5. Trends in national percentage of 6- through 21-year-olds identified for IDEA services, by race/ethnicity (1998–2005)

Exhibit reads: Nationwide, the percentage of White 6- through 21-year-olds identified for services under IDEA increased from 13.88 percent in 1998 to 14.05 percent in 2005.

NOTE: Black includes African American, Hispanic includes Latino, Asian includes Native Hawaiian and Other Pacific Islander, and American Indian includes Alaska Native. The percentages of children identified in the exhibits were calculated using aggregated counts of children ages 6 through 21 identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The percentages were calculated by dividing the number of 6- through 21-year-olds in a given racial/ethnic category identified for services under IDEA (DANS) by the total number of students enrolled in grades 1 through 12 in the same racial/ethnic category (CCD).

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997–2005, retrieved February 22, 2008, from <http://www.ideadata.org/docs%5CPartBTrendData%5CB3B.xls>; U.S. Department of Education, National Center for Education Statistics, Common Core of Data, 1997–98 to 2005–06, retrieved December 10, 2007, from <http://www.nces.ed.gov/ccd/bat/>.

The relative position of each of the racial/ethnic categories remained the same for each of the years between 1998 and 2005. For each of year from 1998 to 2005, Black school-age children had the highest identification percentages (ranging from 16.57 percent in 1998 to 16.67 percent in 2005), followed by American Indian (14.69 percent to 15.76 percent),

White (13.88 percent to 14.05 percent), Hispanic (12.80 percent to 11.83 percent), and Asian school-age children (6.01 percent to 6.34 percent). (See appendix exhibits A4.4/5 for values.)

Percentage and Percentage Change of School-Age Children Identified, by Disability Category

Exhibit 4.6 presents, for 1997 and 2005, the percentage of school-age children identified for services under each IDEA category. Exhibit 4.6 also presents the relative percentage changes from 1997 to 2005 for each disability category. The relative percentage change for each disability category was calculated by subtracting the 1997 identification percentage from the 2005 percentage and dividing the difference by the 1997 percentage (multiplying the result by 100). (See appendix exhibit A4.6a through A4.6d for the number and percentage of school-age children by disability category.)

In 2005, the disability category with the largest percentage of students identified varied by age group. For children ages 6 through 9, the largest percentage was for the speech and language impairment category (5.46 percent). For children ages 10 through 13 and 14 through 17, the largest percentage was for the specific learning disability category (7.07 percent and 7.58 percent, respectively).

From 1997 to 2005, the percentage of 6- through 9-year-olds identified for services under IDEA increased for 6 of the 13 disability categories.⁶ The largest percentage increase, relative to the percentage of children ages 6 through 9 identified under each disability category in 1997, was 198.85 percent for children identified with developmental delays, followed by 272.36 percent for children classified with autism. The relative increases for the remaining categories were as follows: children identified with other health impairment (114.21 percent), traumatic brain injury (61.62 percent), deaf-blindness (13.04 percent) and speech and language impairments (4.39 percent).

The relative decreases were -32.92 percent for children identified with mental retardation followed by children classified with specific learning disability (-23.39 percent), emotional disturbance (-19.74 percent), orthopedic impairments (-17.50 percent), multiple disabilities (-10.51 percent), hearing impairments (-4.05 percent), and visual impairments (-3.41 percent). (See appendix exhibit A4.6a for the number and percentage of children ages 6 through 9 by disability category.)

From 1997 to 2005, the percentage of 10- through 13-year-olds identified for services under IDEA increased for 6 of the 12 disability categories. The largest percentage increase, relative to the percentage of children ages 10 through 13 identified under each disability category in 1997, was 410.67 percent for children identified with autism, followed by 176.92 percent for children classified with other health impairments. The relative increases for the remaining categories were as follows: children identified with traumatic brain injury (93.38 percent), multiple disabilities (22.11 percent), deaf-blindness (16.00 percent) and speech and language impairments (7.39 percent).

⁶ The 13 disability categories under which 3- through 21-year-old children may be identified for services under IDEA, Part B, are specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB), and developmental delay (DD). States or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category.

The relative decreases were for -20.86 percent for children identified with mental retardation followed by children identified with a specific learning disability (-13.52 percent), orthopedic impairment (-13.33 percent), emotional disturbance (-7.55 percent), visual impairments (-6.62 percent), and hearing impairments (-2.52 percent). (See appendix exhibit A4.6b for the number and percentage of 10- through 13-year-olds children by disability category.)

From 1997 to 2005, the percentage of 14- through 17-year-olds identified for services under IDEA increased for 8 of the 12 disability categories. The largest percentage increases, relative to the percentage of 14- through 17-year-old children identified under each disability category in 1997 was 409.72 percent for children identified with autism, followed by 225.62 percent for children classified with other health impairments. The relative increases for the remaining categories were as follows: children identified with traumatic brain injury (92.43 percent), multiple disabilities (38.65 percent), speech and language impairments (20.46 percent), deaf-blindness (6.45 percent), specific learning disability (5.98 percent), and emotional disturbance (1.58 percent).

The relative decreases were -11.75 percent for children identified with visual impairments followed by children identified with mental retardation (-6.73 percent), orthopedic impairments (-7.41 percent), and hearing impairment (-2.28 percent). (See appendix exhibit A4.6c for the number and percentage of youth of 14- through 17-year-olds by disability category.)

(See appendix exhibit A4.6d for the number and percentage of children of 6- through 17-year-olds by disability category.)

2005	7.578	0.4552	1.3726	1.4613	0.1542	0.0533	0.1212	1.3207	0.2778	0.0610	0.2884	0.0033	†
Change	5.98	20.46	-6.73	1.58	-2.28	-11.75	-7.41	225.62	409.72	92.43	38.65	6.45	†

Exhibit reads: In 1997 and 2005, among 14- through 17-year-olds, 7.151 percent and 7.578 of the school age population was identified for services under the specific learning disability category, respectively, a percentage change of 5.98.

† Not applicable.

NOTE: Disability categories are: specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB), developmental delay (DD). State or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category. In 1997, 6 states reported counts under this category, and in 2005, 48 states reported counts under this category. The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. To compute the percentages, the ages of children with disabilities, including children in BIE schools, were aligned with the grades of the children for their age, as follows: 6- through 9-year-olds, grades 1–4; 10- through 13-year-olds, grades 5–8; 14- through 17-year-olds, grades 9–12; and 6- through 17-year-olds, grades 1–12. The number of children in a given age group identified for services under a given IDEA disability category (DANS) was then divided by the total number of children enrolled in the corresponding grade level (CCD). In each age group, the relative percentage change from 1997 to 2005 for each disability category was calculated by subtracting the 1997 identification percentages from the 2005 percentage and dividing the difference by the 1997 percentage (multiplying the result by 100).

Percentage of School-Age Children and Youth Identified for Services Under IDEA, by State (1997 to 2005)

The state-level percentages of school-age children identified for services under IDEA focuses on the same four age groups featured in the national portrait: 6 through 17, 6 through 9, 10 through 13, and 14 through 17. The state percentages are reported for three time frames: 1997, the average between 1998 and 2004, and 2005. The states are ordered by their percentages. Exhibit 4.7 displays the national and state percentages for school-age children ages 6 through 17 for these time frames.

In 2005, states varied in the percentage of children identified for services under IDEA. The national percentage of children identified in 2005 was 12.92 percent. This is more than the average percentage of children identified between 1998 and 2005 (12.80 percent) and in 1997 (12.29 percent). Across states in 2005, the percentage identified ranged from 9.87 percent in Colorado to 18.59 percent in Rhode Island. Of the 50 states and the District of Columbia, the percentage of children identified was higher than in 1997 for 41 states (the exceptions are Colorado, California, Texas, Connecticut, Alabama, Tennessee, Maryland, Alaska, New Mexico, and Massachusetts).

Exhibits with the national and state percentages of children served under IDEA for specific age groups (i.e., ages 6 through 9, 10 through 13, and 14 through 17) are available in appendix A (see appendix exhibits A4.7a through A4.7d).

Exhibit 4.7. Percentage of 6- through 17-year-olds identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2004 average, and 2005)

Exhibit reads: In 2005, the percentage of 6- through 17-year-olds served under IDEA ranged from 9.87 percent (Colorado) to 18.59 percent (Rhode Island).

NOTE: States are ordered by the percentage of children identified for services in 2005. Vertical lines represent the average percentages for the 50 states and the District of Columbia. The numbers of children identified are the state counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. To compute the percentages, the number of 6- through 17-year-old children identified for services in a given state in a given year (or range of years) (DANS) was then divided by the total number of children enrolled in the corresponding grade levels, grades 1 through 12, in the same state in the same year (or range of years) (CCD).

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part B, 1997–2005, retrieved December 7, 2007, from <http://www.ideadata.org>; U.S. Department of Education, National Center for Education Statistics, Common Core of Data, 1997–98 to 2005–06, retrieved December 10, 2007, from <http://www.nces.ed.gov/ccd/bat/>.

Declassification of School-Age Children With Disabilities

As the educational needs of students who qualify for special education and related services varies over time, the nature, quantity, degree, and duration of those services can also be expected to vary. For some students, the services they receive in school or the therapeutic supports they may receive from other sources may ameliorate a condition (e.g., a speech articulation problem) or accommodate an impairment (e.g., through the use of mobility or other assistive technology) to the point where they no longer need or are eligible for special education services. As a result, IDEA calls for students to be reevaluated for eligibility at least every 3 years and more often if requested. For some students, the services they receive in school or the therapeutic supports they may receive from other sources may ameliorate a condition (e.g., a speech articulation problem) or accommodate an impairment (e.g., through the use of mobility or other assistive technology) to the point where they no longer need or are eligible for special education services. Students who are found to be ineligible by such a reevaluation are “declassified”—that is, they return to full-time general education programs and no longer receive special education or related services. In addition, some parents may elect to remove their children from service provision under IDEA.

Two sources of declassification information are presented in this section. Information from prior reports based on national datasets is summarized to describe rates of declassification across age groups and by disability categories. Data from the Special Education Elementary Longitudinal Study (SEELS), which followed a nationally representative sample of students ages 6 through 12 receiving special education, provides information on the academic outcomes of students who were declassified as compared to outcomes of students who continued to receive special education services. SEELS was selected because it provides nationally generalizable information about declassification rates and outcomes by disability category.

Frequency of Declassification

Rates of declassification of school-age students who were identified for services under IDEA are presented below based on reports from extant national datasets. However, these reports should be examined separately and not be compared with each other, because the reports describe children at different grade levels where the distribution of children and youth across IDEA disability categories differ from one another, particularly in the category of speech or language impairment.

Across grade levels, declassification rates among children and youth identified for IDEA services varied from 49 percent among kindergarteners to 5 percent among secondary-school-level students (Holt, McGrath, and Herring 2007). The National Center for Education Statistics (2007) reported on declassification rates for students in primary grades using Early Childhood Longitudinal Study, Kindergarten Cohort (ECLS-K) data. Of the students who were identified for services under IDEA in kindergarten, 33 percent did not receive services in first grade or third grade, and 16 percent of students who received services in first grade no longer received services in third grade. Therefore, a total of 49 percent were no longer receiving services by third grade. Further, of students who were identified for services under IDEA for the first time in first grade, ECLS-K data indicate that 44 percent were not receiving services by third grade—an average declassification rate of 22 percent over the 2-year period.

In later elementary grades, Walker and colleagues (Walker et al. 1988) reported that of school-age students who were identified for services under IDEA, *17 percent received services for a period of only 2 years.* Special Education Elementary Longitudinal Study (SEELS) data

also show that of students ages 6 through 12 who were identified for services, 17 percent (SE = 1.1) no longer received services over a 2.5-year period (SEELS 2005). The same report also shows that an additional 4 percent of students were declassified but resumed eligibility for IDEA services within 2 years.

At the secondary school end of the age spectrum, National Longitudinal Transition Study-2 (NLTS2) data for 13- through 16-year-olds who were identified for services under IDEA in December 2000 indicate that 5 percent were reported by their schools to no longer be eligible for services in spring 2002, approximately 16 months later (Wagner 2003).

Differences in Declassification Rates, by Disability Category

The proportions of 6- through 12-year-olds who had been declassified from special education services within approximately 2 years ranged from 2 percent to 34 percent across disability categories (see exhibit 4.8).⁷ Students ages 6 through 12 who were identified under the speech or language impairments category had the highest percentage of declassification among all disability groups (34 percent, SE = 2.7). This rate is higher than those reported by students identified under the other health impairments (12 percent, $p < .001$, SE = 1.8), emotional disturbance (10 percent, $p < .001$, SE = 1.8), orthopedic impairments (9 percent, $p < .001$, SE = 1.8), specific learning disabilities (9 percent, $p < .001$, SE = 1.5), hearing impairments (6 percent, $p < .001$, SE = 1.3), visual impairments (5 percent, $p < .001$, SE = 1.5), multiple disabilities (4 percent, $p < .001$, SE = 1.2), autism (3 percent, $p < .001$, SE = 0.9), mental retardation (2 percent, $p < .001$, SE = 0.7), and traumatic brain injury categories (2 percent, $p < .001$, SE = 1.7). Further, students who had been classified as having speech or language impairments made up more than two-thirds of the students who were declassified in the 2-year period, despite making up only approximately one-third of 6- through 12-year-old children identified for services under IDEA in 1999–2000 (SEELS 2005). (See appendix exhibit A4.8 for percentages and standard errors.)

At the secondary school level, of 13- through 16-year-olds who were identified for services under IDEA, NLTS2 reported that no students with multiple disabilities were declassified in a 16-month period, and no more than 1 percent of students with disability categories of mental retardation (0.5 percent, SE = 0.5), autism (0.8 percent, SE = 0.6), or deaf-blindness (1 percent, SE = 1.3) were reported to have been declassified. Declassification rates were between 2 percent and 6 percent for students with emotional disturbance (6 percent, SE = 1.8); learning disabilities (5 percent, SE = 1.3); traumatic brain injury (1.5 percent, SE = 1.4); or hearing (3 percent, SE = 1.8), visual (6 percent, SE = 1.4), orthopedic (3 percent, SE = 1.2), or other health impairments (5 percent, SE = 1.4). In contrast, 21 percent (SE = 2.6) of students who had been classified as having speech or language impairments were declassified (NLTS2 2003).

⁷ The 13 disability categories under which 3- through 21-year-old children may be identified for services under IDEA, Part B, are specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB) and developmental delay (DD). States or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category.

Exhibit 4.8. Percentage of 6- through 12-year-olds identified for IDEA services in December 1999 who were declassified by spring 2002, by disability category

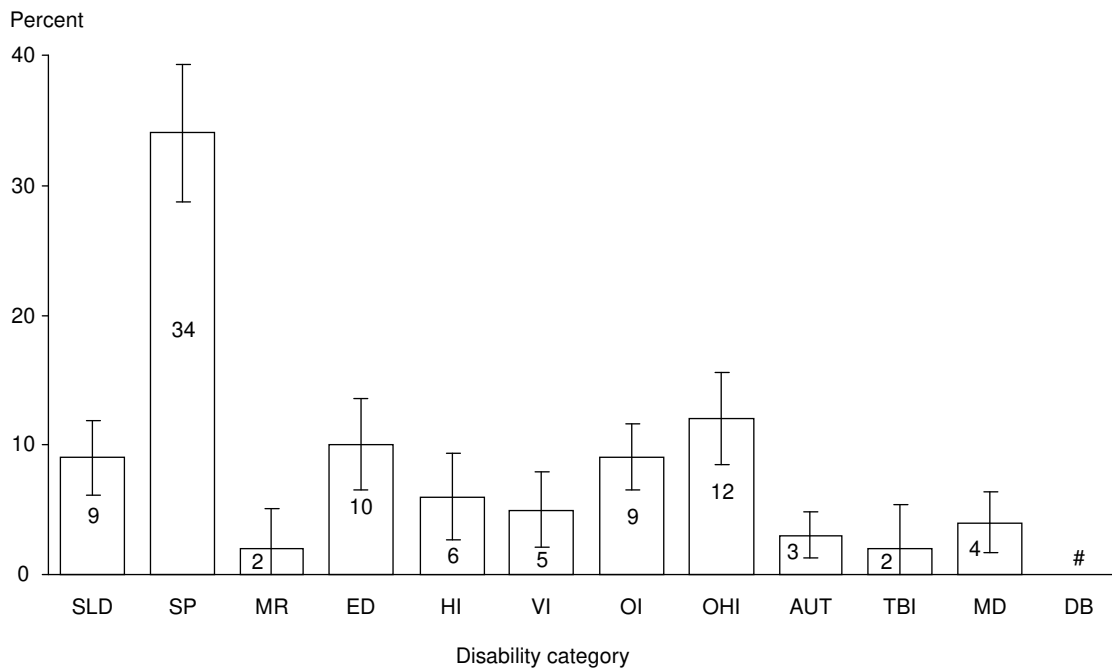

Exhibit reads: Nine percent of 6- through 12-year-olds who had been identified for IDEA services under the category of specific learning disabilities in December 1999 were reported by schools or parents not to be receiving special education services as of spring 2002.

Rounds to zero.

NOTE: Disability categories are: specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB). The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Special Education Elementary Longitudinal Study (SEELS), parent interviews and students' school program survey, 2002. Reported in SEELS (2005).

Academic Outcomes of Students Who Were and Were Not Declassified From IDEA Services

Students declassified from IDEA services had significantly higher scores on literacy and mathematics outcomes than students who continued to receive services. To compare performance between students who were declassified and those who continued to receive services, direct assessment data in reading and mathematics from SEELS are presented below. SEELS used research versions of Woodcock-Johnson III (WJ III) subtests related to letter-word identification, reading passage comprehension, mathematical calculations, and applied problem solving (Woodcock, McGrew, and Mather 2001). Analyses of data from those tests revealed that, as a group, children who were declassified as of spring 2002 performed significantly better than children who continued to receive special education services (see exhibit 4.9). The mean standard score on the letter-word identification subtest was 96 for declassified students (SE = 1.57), whereas it was 82 (SE = 0.77) for children who continued to receive services ($p < .001$). Similarly, passage comprehension mean standard scores for the two groups were 92

and 83, respectively (SE = 1.46 and 0.75, $p < .001$); for math calculation, they were 104 and 91 (SE = 1.40 and 0.71, $p < .001$); and for applied problems, they were 101 and 88 (SE = 1.56 and 0.74, $p < .001$). (See appendix exhibit A4.9 for means, standard errors, and p values.)

Exhibit 4.9. Mean WJ III reading and mathematics scores of 6- to 17-year-old children identified for IDEA services, by classification status (2002)

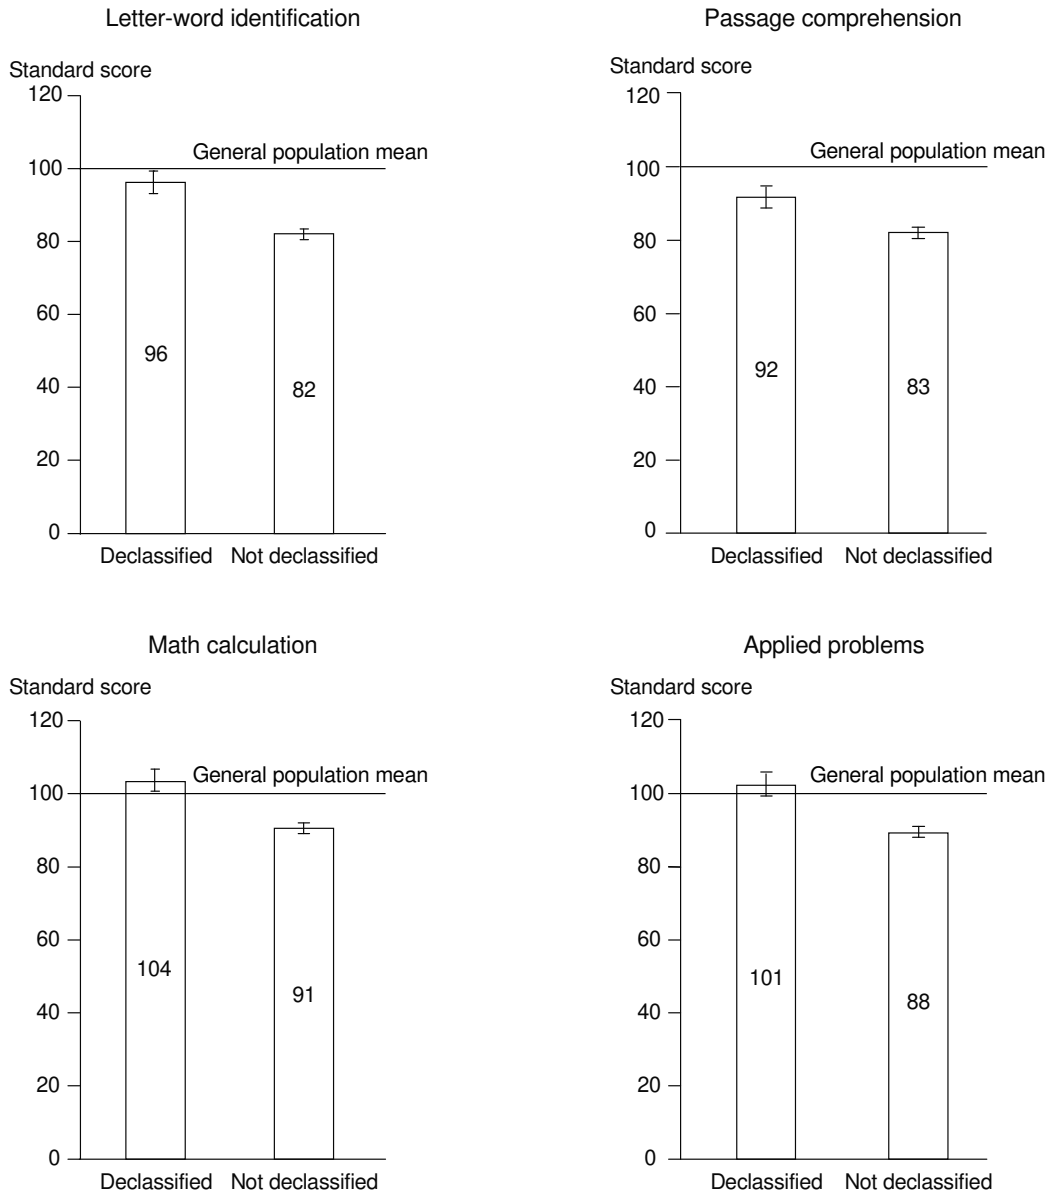

Exhibit reads: The mean standard score of declassified 6- to 17-year-olds on the letter-word identification subtest was 96, whereas the average score of students who were not declassified was 82.

NOTE: Scores reflect students' performance on a research version of the Woodcock-Johnson III (WJ III) (Woodcock, McGrew, and Mather 2001). All measures are based on a general population mean of 100 and a standard deviation of 15. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

Outcomes for School-Age Children Identified for Services Under IDEA

Children identified for services under IDEA participate in a K–12 educational system that is governed by state standards in core academic subjects and are assessed for accountability purposes under NCLB. These accountability requirements focus the attention of state, district, and school policymakers, administrators and teachers on the academic improvements, graduation rates, and dropout rates of school-age children with disabilities. For example, NCLB places an emphasis on ensuring that all children will read by the end of third grade and holds schools accountable for the school completion rates of all students. IDEA 2004 requires states to establish guidelines regarding children that require accommodations and alternate assessments, including where necessary the use of them in their respective individualized education programs. As a result of these federal mandates, as well as state and local policies and reform, improved academic performance and school completion are becoming widely used measures of school performance for all school-age children with disabilities.

In this section, outcomes for children identified for services under IDEA are presented in the areas of academic performance and school completion. Findings drawn from the National Assessment of Educational Progress (NAEP) in reading and mathematics are presented first, for the nation as a whole, over time, and by state, followed by a comparison of NAEP findings with those from state accountability assessments. Differences in academic performance by IDEA eligibility category are then described, using data from SEELS and NLTS2 for 7- through 14-year-olds and 16- through 18-year-olds, respectively. Finally, this section looks at the issue of high school exit and presents data on rates of school completion, school dropout, and school ageout (those students who reach the maximum eligible age to receive services), using data from the OSEP Data Analysis System (DANS).

Academic Skills in Reading and Mathematics (NAEP)

Improved reading and mathematics performance is a goal of both NCLB and IDEA. National outcome data in reading and mathematics from the NAEP are representative of the nation and permit comparisons between children who are and are not identified for services under IDEA. However, NAEP is not aligned with individual state content and achievement standards, so it does not necessarily measure what children are expected to learn in their states. The NAEP reading test measures four aspects of reading (general understanding, interpretation, making connections, and examining content) within three contexts (literary experiences, information, and task performance). The NAEP mathematics test measures student performance in five content areas: number properties and operations, measurement, geometry, data analysis and probability, and algebra. NAEP reports reading and mathematics test results as average scale scores, which range from 0 to 500, with an average of 250 and a standard deviation of 50 at grade 8. The analyses presented here are taken from the 2003, 2005, and 2007 administrations of NAEP, because its participation and accommodation policies relative to children with disabilities have been stable over that time period and those years span the implementation of both NCLB and IDEA.

Children with disabilities have been included in NAEP, some with testing accommodations, since 1997. The NAEP program has established procedures to help school staff make participation decisions about including children with disabilities and about which, if any, testing accommodations they should receive. The NAEP inclusion policy states that a child with a

disability or equivalent classification should participate in NAEP without an accommodation unless (1) the Individualized Education Program (IEP) team or equivalent group has determined that the student cannot participate in assessments such as NAEP; (2) the student's cognitive functioning is so severely impaired that she or he cannot participate; or (3) the student's IEP requires that the student be tested with an accommodation or adaptation and the student cannot demonstrate his/her knowledge of the assessment subject area without that accommodation or adaptation. It is important to note that some schools may include NAEP students who receive services for a disability under Section 504 of the Rehabilitation Act 1973, as amended (29 U.S.C. § 794), as well as those who are identified for services under IDEA. Therefore, *the children with disabilities who participate in NAEP each year do not reflect the total population of children identified for IDEA services or all children with disabilities, but only children with disabilities who meet the criteria for inclusion noted above.*

In each summary report, NAEP publishes overall sample sizes, identification rates, and participation rates for that particular administration. The identification rate is the percentage of students in NAEP schools who were identified as students with disabilities according to the criteria described above and would be eligible to participate in NAEP. The participation rate is the percentage of all children in the grade who were identified with disabilities and who participated in the assessment with or without allowable accommodations. Both of these rates can vary across administrations of NAEP. For grade 4 reading administrations, the IDEA identification rate was constant at 13 percent in 2003, 2005, and 2007. However, the percentage of students who participated varied across administrations. The NAEP participation rate for the grade 4 reading test was 8 percent of students in 2003 and 2005 and 9 percent in 2007. For the grade 4 math test, the NAEP participation rate was 10 percent in all three years. For eighth-graders, the IDEA identification rate was 13 percent in 2003 and 12 percent in 2005 and 2007, whereas the NAEP participation rate for the eighth-grade reading test was 9 percent in 2003 and 8 percent in 2005 and 2007; for eighth-grade math, the participation rate was 10 percent in 2003 and 2005 and 8 percent in 2007 (Braswell, Dion, Daane, and Jin 2005; Donahue, Daane, and Jin 2005; Lee, Grigg, and Donahue 2007; Perie, Grigg, and Dion 2005; Perie, Grigg, and Donahue 2005).

National Trends in NAEP Results (2003, 2005, and 2007)

Academic achievement trends from 2003 through 2007 measured by the NAEP showed significant increases in average reading scale scores for both children identified and children not identified for IDEA services in grade 4 but not grade 8 reading (see exhibit 4.10). For children identified for services under IDEA, average grade 4 reading scale score of 184 (SE = 0.6) in 2003 was significantly lower than the average scale score of 190 (SE = 0.6) in 2007 ($p < .001$). During the same period, average scale score of 220 (SE = 0.3) in 2003 for children not identified for IDEA services was significantly lower than the average score of 223 (SE = 0.3) in 2007 ($p < .001$). In the grade 8 reading test, average scale scores for children identified for services under IDEA were 224 (SE = 0.6) in 2003 and 226 (SE = 0.5) in 2005 and 2007 (comparisons between 2003 and 2007 scores not significant). Average scale scores for children not identified for IDEA services were 266 (SE = 0.3) in 2003, 264 (SE = 0.2) in 2005, and 265 (SE = 0.2) in 2007 (comparisons between 2003 and 2007 not significant). See appendix exhibits A4.10, A4.11a, A4.11b, A4.11d, A4.12a, A4.12b, and A4.12d for p values.

Exhibit 4.10. Mean reading and mathematics scale scores of fourth- and eighth-grade students identified and not identified for services under IDEA (2003, 2005, and 2007)

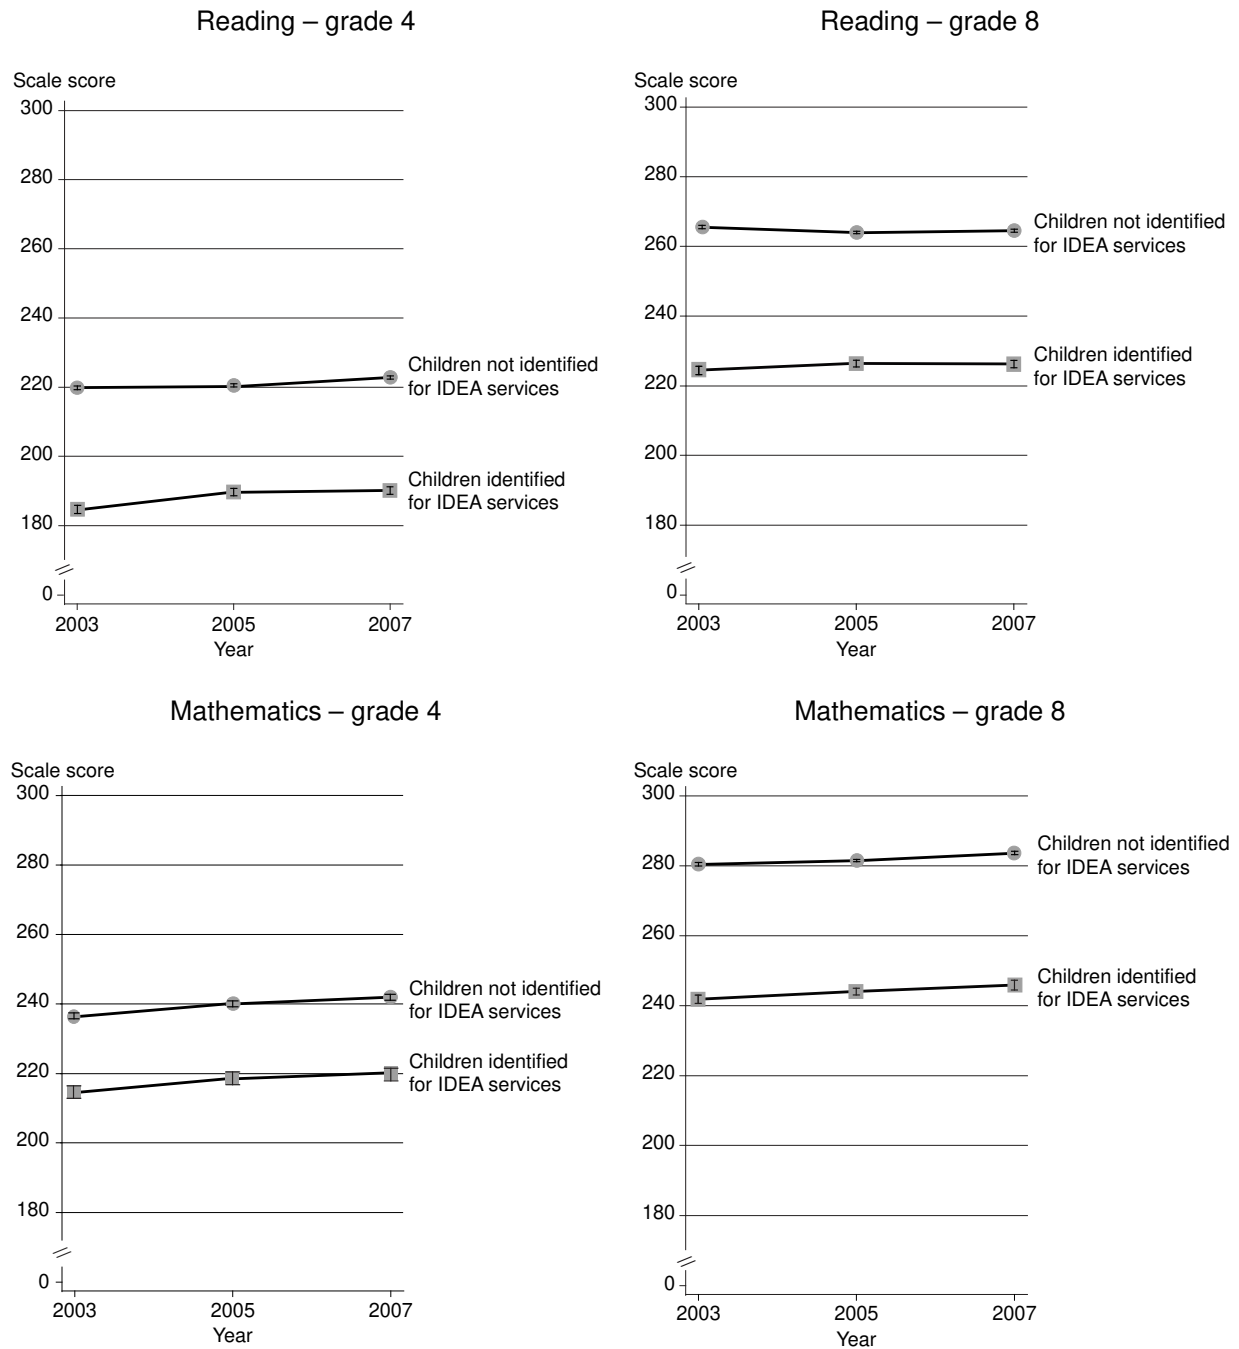

Exhibit reads: In 2007, the mean reading scale score of fourth-grade students not identified for IDEA was 223 compared with 190 for students identified.

NOTE: The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003, 2005, and 2007, retrieved January 18, 2008, from NAEP Data Explorer, <http://nces.ed.gov/nationsreportcard/naepdata/>.

At each time point, children identified for IDEA services had significantly lower scores in reading than children not identified. In grade 4 reading, the differences between children identified and not identified for services under IDEA were 35 (SE = 0.7), 31 (SE = 0.6), and 33 (SE = 0.6) scale score points in 2003, 2005, and 2007, respectively ($p < .001$ for all differences). In grade 8 reading, the differences between children identified and not identified for services under IDEA were 41 (SE = 0.7), 38 (SE = 0.5), and 38 (SE = 0.6) scale score points in 2003, 2005, and 2007 ($p < .001$ for all differences). At both grade levels, the size of the difference declined 3 (SE = 0.9 and SE = 0.9) scale score points from 2003 to 2007 ($p < .001$). See appendix exhibits A4.11e, A4.11f, A4.12e, and A4.12f, for p values.

NAEP trends showed significant increases in average scale scores in mathematics from 2003 to 2007 for both children identified and children not identified for IDEA services. In grade 4 mathematics, average scale scores for children identified for services under IDEA were 214 (SE = 0.4) in 2003, 219 (SE = 0.4) in 2005, and 220 (SE = 0.4) in 2007, a difference between 2003 and 2007 of 6 (SE = 0.6) scale score points ($p < .001$). During the same period, average scale scores for children not identified for IDEA services were 237 (SE = 0.2) in 2003, 240 (SE = 0.2) in 2005, and 241 (SE = 0.2) in 2007, a difference between 2003 and 2007 of 5 scale score points ($p < .001$). In grade 8 mathematics, average scale scores for children identified for services under IDEA were 242 (SE = 0.6), 244 (SE = 0.5), and 246 (SE = 0.7) in 2003, 2005, and 2007, respectively, a difference of 4 scale score points from 2003 to 2007 ($p < .001$). Average scale scores for children not identified for IDEA services were 280 (SE = 0.3) in 2003, 282 (SE = 0.2) in 2005, and 284 (SE = 0.2) in 2007, a difference of 3 (SE = 0.4) scale score points ($p < .001$). See appendix exhibits A4.10, A4.13a, A4.13b, A4.13d, A4.14a, A4.14b, and A4.14d for p values.

Children identified for IDEA services had significantly lower scores in mathematics than children not identified at each time point. In grade 4 mathematics, the differences between children identified and not identified for services under IDEA were 22 (SE = 0.5), 21 (SE = 0.4), and 21 (SE = 0.4) scale score points in 2003, 2005, and 2007, respectively ($p < .001$ for all differences). The 1 scale score point decrease from 2003 to 2007 was not significantly different. In grade 8 mathematics, the differences by IDEA service status were 39 (SE = 0.82), 38 (SE = 0.5), and 38 (SE = 0.7) scale score points in 2003, 2005, and 2007, respectively ($p < .001$ for all differences). The size of the difference was the same in 2003 and 2007. See appendix exhibits A4.13e, A4.13f, A4.14e, and A4.14f for p values.

NAEP Results by State

Reading. Exhibit 4.11 displays the average scale scores on the 2007 NAEP reading test for fourth-graders identified and not identified for services under IDEA for 50 U.S. states, the District of Columbia, and the Department of Defense Education Agency. Exhibit 4.12 displays the average scale score on the NAEP reading test for eighth-graders identified and not identified for services under IDEA in 2007. In both exhibits, the states are ordered from high to low on the basis of the average scale score of children identified for IDEA services. Appendix exhibits A4.11j and A4.12j present these data ordered from high to low on the basis of the average scale scores for children not identified for IDEA services.

Across states, fourth-grade NAEP reading scores varied for both children identified and children not identified for IDEA services. Twenty-seven states differed significantly from the national average for children identified for IDEA services, and 40 states differed

Exhibit 4.11. Mean reading scale scores of fourth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

Exhibit reads: The mean reading scale score of fourth-grade students identified for services under IDEA in Massachusetts was 213 in 2007.

NOTE: States are ordered by the mean scores of students identified for IDEA services. Vertical lines represent national means. DoDEA refers to the Department of Defense Education Agency. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003, 2005, and 2007, retrieved January 18, 2008, from NAEP Data Explorer, <http://nces.ed.gov/nationsreportcard/naepdata/>.

from the national average for children not identified for IDEA services. Average scale scores varied across states for both groups of children. Among children identified for IDEA services, the difference across states was 51 scale score points, with a high score of 213 (SE = 2.9) in Massachusetts and a low score of 162 (SE = 4.7) in the District of Columbia. Fourteen states, with average scale scores ranging from 195 (SE = 3.8) to 213 (SE = 2.9), were significantly higher than the national average of 190 (SE = 0.6) for children identified for IDEA services. Thirteen states, with average scale scores ranging from 162 (SE = 4.7) to 182 (SE = 3.0), were significantly lower than the national average (for *p* values, See appendix exhibit A4.11g). For children not identified for IDEA services, the range was a high score of 239 (SE = 1.1) in Massachusetts and a low score of 199 (SE = 0.8) in the District of Columbia, a difference of 40 scale score points. Twenty-seven states, with average scale scores ranging from 226 (SE = 0.9) to 239 (SE = 1.1), were significantly above the national average of 222 (SE = 0.6) for children not identified for IDEA services. Thirteen states, with average scale scores ranging from 199 (SE = 0.8) to 220 (SE = 1.0), were significantly lower than the national average (for *p* values, see appendix exhibits A4.11g and A4.11h).

Differences in fourth-grade reading scores for children identified and not identified for IDEA services varied by state. Seventeen states had differences between children identified and not identified for IDEA services that were significantly different from the national difference (see exhibit 4.11). Differences ranged across states from 14 scale score points (SE = 1.2) in Tennessee to 50 scale score points (SE = 1.2) in Iowa. Eight states had differences between children identified and not identified for IDEA services ranging from 18 (SE = 3.2) to 25 (SE = 3.7) scale score points that were significantly less than the national difference of 33 scale score points. Nine states had differences between children identified and not identified for IDEA services ranging from 40 (SE = 2.4) to 50 (SE = 3.4) scale score points that were significantly greater than the national difference (for *p* values, see appendix exhibit A4.11i).

Across states, eighth-grade NAEP reading scores varied for both children identified and children not identified for IDEA services. Twenty-one states differed significantly from the national average for children identified for IDEA services, and 40 states differed from the national average for children not identified for IDEA services (see exhibit 4.12). Among those children, the difference was 45 scale score points, ranging from a high scale score of 248 (SE = 2.4) in Vermont to a low scale score of 203 (SE = 2.8) in Alabama. Fourteen states, with average scale scores ranging from 233 (SE = 3.2) to 248 (SE = 2.4), were significantly higher than the national average of 226 (SE = 0.5) for children identified for IDEA services. Seven states, with average scale scores ranging from 202 (SE = 2.8) to 216 (SE = 3.6), were significantly lower than the national average. Among children not identified for IDEA services, the difference was 35 scale score points, ranging on a high scale score of 278 (SE = 0.8) in Vermont to a low scale score of 243 (SE = 0.8) in the District of Columbia. Twenty-six states, with average scale scores ranging from 268 (SE = 0.9) to 278 (SE = 0.8), were significantly higher than the national average of 265 (SE = 0.2) for children not identified for IDEA services. Fourteen states, with average scale scores ranging from 243 (SE = 0.8) to 262 (SE = 1.0), were significantly lower than the national average (for *p* values, see appendix exhibits A4.12g and A4.12h).

Differences in eighth-grade reading scores for children identified and not identified for IDEA services varied by state. Eleven states had differences between children identified

Exhibit 4.12. Mean reading scale scores of eighth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

Exhibit reads: The mean reading scale score of eighth-grade students identified for services under IDEA in Vermont was 248 in 2007.

NOTE: States are ordered by the mean scores of students identified for IDEA services. Vertical lines represent national means. DoDEA refers to the Department of Defense Education Agency. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003, 2005, and 2007, retrieved January 18, 2008, from NAEP Data Explorer, <http://nces.ed.gov/nationsreportcard/naepdata/>.

and not identified for IDEA services that were significantly different from the national average. The differences between children identified and not identified for IDEA services ranged across states from 29 scale score points (SE = 0.6) in Delaware to 55 scale score points (SE = 0.9) in Alabama. Six states had differences between the two groups (29 [SE = 3.0] to 32 [SE = 2.6] scale score points) that were significantly less than the national difference of 38 (SE = 0.6). Five states had differences (48 (SE = 3.3) to 55 (SE = 3.0) scale score points) between children identified and not identified for IDEA services that were significantly greater than the national difference (for *p* values, see appendix exhibit A4.12i).

Mathematics. Exhibit 4.13 displays the average scale scores on the NAEP mathematics test for fourth-graders identified and not identified for services under IDEA in 2007. Exhibit 4.14 displays the average scale score on the NAEP mathematics test for eight-graders identified and not identified for IDEA services in 2007. In both exhibits, the states are ordered from high to low on the basis of the average scale score of children identified for IDEA services. See appendix exhibits A4.13j and A4.14j present these data ordered from high to low on the basis of the average scale scores for children not identified for IDEA services.

Across states, fourth-grade NAEP mathematics scores varied for both children identified and children not identified for IDEA services. Twenty-six states differed significantly from the national average for children identified for IDEA services, and 41 states differed from the national average for children not identified for IDEA services. Among children identified for IDEA services, the difference was 50 scale score points, with a high of 238 (SE = 1.4) in Massachusetts and a low of 188 (SE = 2.4) in the District of Columbia. Fifteen states, with average scale scores ranging from 226 (SE = 1.3) to 238 (SE = 1.4), were significantly higher than the national average of 220 (SE = 0.4) for children identified for IDEA services. Eleven states, with average scale scores ranging from 216 (SE = 2.3) to 188 (SE = 2.4), were significantly lower than the national average. For children not identified for services under IDEA, the difference was 39 scale score points, with a high of 255 (SE = 0.9) in Massachusetts and a low of 216 (SE = 0.8) in the District of Columbia. Twenty-seven states, with average scale scores ranging from 243 (SE = 3.0) to 255 (SE = 0.9), were significantly higher than the national average of 242 (SE = 0.2) for children not identified for IDEA services. Fourteen states, with average scale scores ranging from 216 (SE = 0.8) to 239 (SE = 0.7), were significantly lower than the national average (for *p* values, see appendix exhibits A4.13g and A4.13h).

Differences in fourth-grade mathematics scores for children identified and not identified for IDEA services varied by state. Nineteen states had differences between children identified and not identified for IDEA services that were significantly different from the national average. Differences between the two groups of children ranged across states from 11 scale score points (SE = 2.7) in Mississippi to 42 scale score points (SE = 2.5) in Hawaii. Eight states had differences of 12 (SE = 1.0) to 17 (SE = 1.4) scale score points) between children identified and not identified for IDEA services that were significantly less than the national difference. Eleven states had differences of 26 (SE = 2.2) to 42 (SE = 2.5) scale score points between children identified and not identified for IDEA services that were significantly greater than the national difference (for *p* values, see appendix exhibit A4.13i).

Across states, eighth grade NAEP mathematics scores varied for both children identified and children not identified for IDEA services. Twenty-four states differed

Exhibit 4.13. Mean mathematics scale scores of fourth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

Exhibit reads: The mean mathematics scale score of fourth-grade students identified for services under IDEA in Massachusetts was 238 in 2007.

NOTE: States are ordered by the mean scores of students identified for IDEA services. Vertical lines represent national means. DoDEA refers to the Department of Defense Education Agency. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003, 2005, and 2007, retrieved January 18, 2008, from NAEP Data Explorer, <http://nces.ed.gov/nationsreportcard/naepdata/>.

Exhibit 4.14. Mean mathematics scale scores of eighth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

Exhibit reads: The mean mathematics scale score of eighth-grade students identified for services under IDEA in Massachusetts was 271 in 2007.

NOTE: States are ordered by the mean scores of children identified for services under IDEA. Vertical lines represent national means. DoDEA refers to the Department of Defense Education Agency. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003, 2005, and 2007, retrieved January 18, 2008, from NAEP Data Explorer, <http://nces.ed.gov/nationsreportcard/naepdata/>.

significantly from the national average for children identified for IDEA services, and 41 states differed from the national average for children not identified for IDEA services.

Among children identified for IDEA services, the difference was 69 scale score points, with a high of 271 (SE = 2.7) in Massachusetts and a low of 212 (SE = 3.1) in the District of Columbia. Thirteen states, with average scale scores ranging from 254 (SE = 2.6) to 271 (SE = 2.7), were significantly above the national average of 246 (SE = 0.7) for children receiving IDEA services. Eleven states, with average scale scores ranging from 211 (SE = 3.1) to 238 (SE = 2.9), were significantly lower than the national average (for *p* values, see appendix exhibit A4.14g). For children not identified for services under IDEA, the difference was 49 scale score points, with a high of 301 (SE = 1.3) in Massachusetts and a low 252 (SE = 0.9) in the District of Columbia. Twenty-five states, with average scale scores ranging from 287 (SE = 0.8) to 301 (SE = 1.3), were significantly higher than the national average of 284 (SE = 0.2) for children not receiving IDEA services. Sixteen states, with average scale scores ranging from 252 (SE = 0.9) to 281 (SE = 1.4), were significantly lower than the national average (for *p* values, see appendix exhibits A4.14g and A4.14h).

Differences in eighth-grade NAEP mathematics scores for children identified and not identified for IDEA services varied by state. Twelve states had differences between children identified and not identified for IDEA services that were significantly different from the national average. Differences between children who were and were not identified for IDEA services ranged across states from 25 scale score points (SE = 1.2) in Maryland to 51 scale score points (SE = 1.4) in Hawaii. Eight states had differences of 25 (SE = 1.2) to 32 (SE = 1.3) scale score points) between children identified and not identified for IDEA services that were significantly less than the national difference of 38 (SE = 0.2). Four states had differences of 46 (SE = 2.6) to 51 (SE = 1.4) scale score points) between the groups that were significantly greater than the national difference (for *p* values, see appendix exhibit A.4.14i).

Comparisons of NAEP and State Accountability Tests

Recent reports have compared the results for the NAEP to state accountability tests for the general population (Bandeira de Mello, Blackenship and McLaughlin 2009; Stoneberg 2007). However, such comparisons have yet to be made for children identified for IDEA services. This section compares the performance of children identified for IDEA services on the NAEP with the reported performance from state accountability tests in 2003, the only year in which both sets of data are available. State performance data on regular and alternate assessments are reported in Annual Performance Reports (APRs) provided to OSEP and compiled by the National Center on Educational Outcomes (NCEO). These analyses depict student performance data in terms of achievement levels, rather than scale scores because it is the only common metric for state accountability test data. Achievement levels are defined as thresholds of performance to characterize the performance of students who have scores at or above them. Under NCLB, states determine the level of performance considered to be “proficient” in regular and alternate assessments for the purposes of calculating school and school district performance under the adequate yearly progress (AYP) metric of NCLB. NAEP reports student performance in three performance levels: basic, proficient, and advanced. In this section, state data for students identified for IDEA services on state regular assessments with or without accommodations at the achievement level of “proficient” are presented in conjunction with NAEP achievement levels “proficient or above” and “basic or above.” State alternate assessment data are not presented because of variability in alternate assessment systems across states and the lack of an alternate

assessment in NAEP. Achievement levels are reported here for fourth-grade reading and mathematics and for eighth-grade reading; comparable data are not available for eighth-grade mathematics. State tests differ from each other and from the NAEP in content, test design, and cut-score determination. State tests also differ from the NAEP in terms of criteria for including children with disabilities. Observed differences between achievement levels for children with disabilities on the NAEP and achievement levels reported on state tests may be due to differences in the tests, differences in the children being tested, or to both, so these patterns should be interpreted cautiously.

Reading. Exhibit 4.15 displays, by state, the percentage of children identified for IDEA services at the "basic or above" and "proficient or above" achievement levels on the 2003 NAEP grade 4 reading test and the percentage of children identified for IDEA services at "proficient or above" on state accountability tests in 2003 for 35 states that reported data. Exhibit 4.16 displays similar data on the NAEP and state accountability grade 8 reading tests. The states are ordered from low to high on the basis of the percentage of children identified for services at the NAEP "basic or above" achievement level.

The percentage of students meeting achievement levels in reading in fourth grade on NAEP and state regular assessments varied across states. The range of percentages of children identified for IDEA services at the NAEP "proficient or above" achievement level was 17 percentage points, from 2 percent (SE = 1.4) in the District of Columbia to 19 percent (SE = 2.8) in Virginia. The range of children at the NAEP "basic or above" achievement level was 39 percentage points, from 9 percent (SE = 2.2) in the District of Columbia to 48 percent (SE = 4.5) in Delaware. The percentage of children identified for IDEA services reported as "proficient or above" on regular state accountability tests ranged from 9 percent in South Carolina to 83 percent in Mississippi. Thirteen of 35 states with state data reported proficiency rates on regular assessments that were above the confidence interval for the percentage of children at the basic achievement level in NAEP. Nine states reported proficiency rates on regular assessments that fell below the lower confidence interval for the percentage of children at the basic achievement level in NAEP. Thirty-two of 35 states with state data reported proficiency rates that fell above the upper confidence interval for the percentage of children at the proficient achievement level in NAEP (see appendix exhibit A4.15 for values).

The percentage of students meeting achievement levels in reading in eighth grade on NAEP and state regular assessments varied across states. The range of children identified for IDEA services at the NAEP "proficient or above" achievement level was 13 percentage points, from 1 percent (SE = 0.7) in Mississippi to 14 percent (SE = 2.3) in Tennessee. The range of children at the NAEP "basic or above" achievement level was 44 percentage points, from 11 percent (SE = 2.4) in the District of Columbia to 55 percent (SE = 4.3) in Vermont. The percentage of children identified for IDEA services reported as proficient on standard state accountability tests ranged from 2 percent in South Carolina to 56 percent in North Carolina. Five of 40 states with state data reported proficiency rates on regular assessments that fell above the upper confidence interval for the percentage of children at the basic achievement level in NAEP. Twenty-five of 40 states with state data reported proficiency rates on regular assessments that fell below the lower confidence interval for the percentage of children at the basic achievement level in NAEP. Thirty-three of 35 states with state data reported proficiency rates on regular assessments that fell above the upper confidence interval for the percentage of children at the proficient achievement level in NAEP (see appendix exhibit A4.16 for values).

Exhibit 4.15. Percentage of fourth-grade students identified for IDEA services performing at “basic or above” and “proficient or above” in reading, by state (2003)

Exhibit reads: Two percent of fourth-grade students identified for services under IDEA in the District of Columbia had scores on the NAEP reading test that put them at the “proficient or above” achievement level.

NOTE: States are ordered by the percentage of students identified for IDEA services scoring at the “basic or above” level. DoDEA refers to the Department of Defense Education Agency. For NAEP results only, the presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003, retrieved January 18, 2008, from NAEP Data Explorer, <http://nces.ed.gov/nationsreportcard/naepdata/>; U.S. Department of Education, Office of Special Education Programs, Annual Performance Reports, 2003, from the NCEO Data Viewer, <http://data.nceo.info/>.

Exhibit 4.16. Percentage of eighth-grade students identified for services under IDEA performing at “basic or above” and “proficient or above” in reading, by state (2003)

Exhibit reads: One percent of eighth-grade students identified for services under IDEA in the District of Columbia had scores on the NAEP reading test that put them at the “proficient or above” achievement level.

NOTE: States are ordered by the proportion of students identified for IDEA services scoring at the “basic or above” level. DoDEA refers to the Department of Defense Education Agency. For NAEP results only, the presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003, retrieved January 18, 2008, from NAEP Data Explorer, <http://nces.ed.gov/nationsreportcard/naepdata/>; U.S. Department of Education, Office of Special Education Programs, Annual Performance Reports, 2003, from the NCEO Data Viewer, <http://data.nceo.info/>.

Mathematics. Exhibit 4.17 displays the percentage of children identified for IDEA services at the “basic or above” and “proficient or above” achievement levels on the NAEP mathematics test for fourth grade in 2003 and the percentage of children identified for IDEA services at the “proficient or above” level on state regular assessments for 34 states that reported data. The states are ordered from low to high on the basis of the percentage of children identified for IDEA services at the NAEP “basic or above” achievement level.

The percentage of students meeting achievement levels in mathematics in fourth grade on NAEP and state regular assessments varied across states. The range of children identified for IDEA services at the NAEP “proficient or above” achievement level was 24 percentage points, from 2 percent (SE = 0.9) in the District of Columbia to 26 percent (SE = 2.8) in North Carolina. The range of children at the NAEP “basic or above” achievement level was 61 percentage points, from 9 percent (SE = 2.1) in the District of Columbia to 70 percent (SE = 2.7) in North Carolina. Three of 34 states with state data reported proficiency rates on regular assessments that fell above the upper confidence interval for the percentage of children at the basic achievement level in NAEP. Twenty-four states with state data reported proficiency rates on regular assessments that fell below the lower confidence interval for the percentage of children at the basic achievement level in NAEP. Thirty of 34 states with state data reported proficiency rates on regular assessments that fell above the upper confidence interval for the percentage of children at the proficient achievement level in NAEP. (See appendix exhibit A4.17 for values.)

Exhibit 4.17. Percentage of fourth-grade students identified for services under IDEA performing at “basic or above” and “proficient or above” in mathematics, by state (2003)

Exhibit reads: Two percent of fourth-grade students identified for services under IDEA in the District of Columbia had scores on the NAEP mathematics test that put them at the “proficient or above” achievement level.

NOTE: States are ordered by the percentage of students identified for IDEA services scoring at the “basic or above” level. DoDEA refers to the Department of Defense Education Agency. For NAEP results only, the presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

IDEA Eligibility Category Differences in the Reading and Mathematics Achievement of School-Age Students Identified for Services Under IDEA

The performance data presented thus far—NAEP and state accountability tests—do not permit examination of the variation in academic outcomes for students of different eligibility categories under IDEA. Therefore, the most recent data available to address this question come from two studies from the National Assessment of IDEA '97: the Special Education Elementary Longitudinal Study (SEELS) and the National Longitudinal Transition Study-2 (NLTS2). Each study included a direct assessment of the academic achievement in reading and mathematics of children and youth identified for IDEA services who were able to participate.⁸ Data reported here are from the 2001 SEELS direct assessment, when participants were ages 7 through 14; NLTS2 data combine the results of assessments conducted in 2002 and 2004, when two successive cohorts of youth were ages 16 through 18. Both studies assessed children's reading and mathematics abilities using research editions of subtests of the WJ III. Findings on these subtests are reported in the following sections in the form of standard scores, which for the general population (including both students with and without disabilities) have a mean of 100 and a standard deviation of 15.

To measure reading achievement, SEELS used research versions of WJ III subtests related to letter-word identification and reading passage comprehension. NLTS2 also used the WJ III Passage Comprehension subtest, in addition to the subtest on antonyms and synonyms. Exhibit 4.18 presents reading scores from SEELS and NLTS2 for their respective age groups. Both SEELS and NLTS2 included research versions of WJ III subtests focused on mathematical calculations and applied problem solving. Exhibit 4.19 presents mathematics scores for elementary/middle and high school students from SEELS and NLTS2, respectively.

Reading scores for 7- through 14-year-old children identified for IDEA services varied by IDEA eligibility category and were significantly lower than those for the general population. The mean standard score for children in this age group who were identified for services under IDEA was 83.2 on letter-word identification and 82.9 on passage comprehension (SE = 0.76 and 0.78, respectively), each 17-points lower than the general population mean of 100.0 ($p < .001$ for both comparisons). Across disability categories, mean letter-word identification scores ranged from 61.7 for children with mental retardation to 93.7 for children with speech or language impairments (SE = 1.56 and 1.07, $p < .001$), similar to the range of 62.4 to 92.0 (SE = 1.66 and 1.10) on the Passage Comprehension subtest. All differences in mean standard scores on both reading measures between children identified for services under IDEA and children in the general population were statistically significant (for p values, see appendix exhibits A4.18a and A4.18b).

Reading scores for 16- through 18-year-old children identified for IDEA services varied by IDEA eligibility category and were statistically significantly lower than those for the general population. The mean standard scores for this high-school-age group were 87.4 and 79.2 (SE = 0.68 and 0.82) for the Antonyms/Synonyms and Passage Comprehension subtests, respectively, 13 and 21 scale score points lower than the mean scores for the general population ($p < .001$ for both comparisons). The mean score of 79.2 (SE = 0.82) for this age group on the Passage Comprehension subtest was significantly lower than their mean score on the

⁸ Ninety-seven percent of SEELS participants and 83 percent of NLTS2 participants took part in the direct assessment and have data reported here.

Exhibit 4.18. Mean WJ III reading scores of school-age children identified for services under IDEA: ages 7 through 14 (2001) and 16 through 18 (2002 and 2004), by disability category

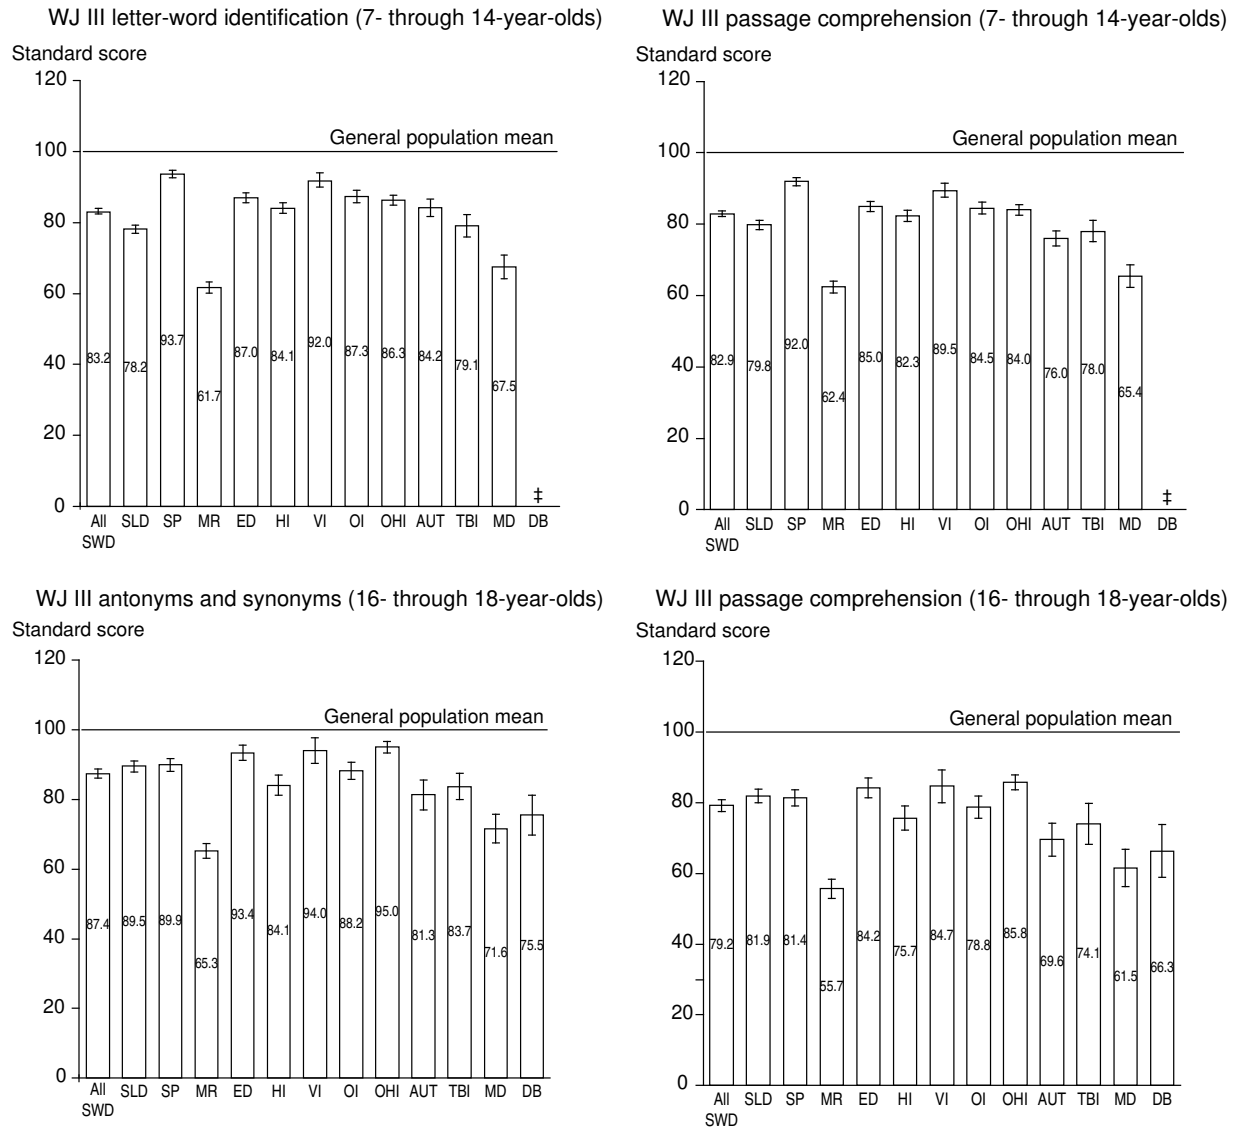

Exhibit reads: Seven- through 14-year-olds identified for services under IDEA had a mean score of 83 on the letter-word identification subtest.

‡ Did not meet reporting standards.

NOTE: Disability categories are: all students with disabilities (All SWD), specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB). SEELS administered a research edition of the Woodcock-Johnson III (WJ III) to 7- through 14-year-olds in 2001. NLTS2 administered a research edition of the WJ III in Waves 2 and 4 of the study (2002 and 2004, respectively). Each wave of testing included students who were 16- through 18-years-old at the time of administration. All measures are based on a general population mean of 100 and a standard deviation of 15. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Special Education Elementary Longitudinal Study (SEELS), direct assessment, 2001; U.S. Department of Education, Institute of Education Sciences, National Center for Special Education Research, National Longitudinal Transition Study-2 (NLTS2), direct assessment, 2002 and 2004.

Antonyms/Synonyms subtest (87.4, SE = 0.68, $p < .001$) and significantly lower than the mean score on Passage Comprehension for the 7- through 14-year old group represented in SEELS (82.9, SE = 0.78, $p < .001$). The mean scores ranged from 55.7 to 85.8 (SE = 1.41 and 1.10) on the Passage Comprehension subtest and from 65.3 to 95.0 (SE = 1.06 and 0.86) on the Antonyms/Synonyms subtest across disability categories. On both measures, youth with mental retardation had the lowest scores, and youth with other health impairments had the highest scores. As with the younger age group, all disability category differences between youth represented by NLTS2 and those in the general population were statistically significant (for p values, see appendix exhibits A4.18c and A4.18d).

Mathematics scores for 7- through 14-year-old children identified for IDEA services varied by IDEA eligibility category and were significantly lower than those for the general population for all but two IDEA eligibility categories. Exhibit 4.19 presents mean standard scores on the Calculation and Applied Problems subtests for children identified for services under IDEA that were 91.9 and 90.1, respectively (SE = 0.71 and 0.76), significantly lower than scores for the general population ($p < .001$ for both comparisons) but significantly higher than their own reading scores ($p < .001$ comparing scores for the Applied Problems subtest and the two reading subtests). Calculation subtest scores ranged from 71.3 to 99.8 (SE = 1.63 and 1.14) across disability categories, and scores ranged from 66.1 to 99.3 for applied problems (SE = 3.15 and 1.26, $p < .001$). On both measures, youth with mental retardation had the lowest scores, and youth with speech or language impairments had the highest scores. Unlike for reading, in which children in all disability categories averaged scores that were significantly below those of the general population, children with speech or language impairments did not differ from the general population on either mathematics measure, with means of 99.8 and 99.3 (SE = 1.14 and 1.26) on calculation and applied problems subtests, respectively. Children with visual impairments also had a mean score on the Calculation subtest that did not differ significantly from that of general population peers (97.8, SE = 1.83). Significant differences between the general population and children identified for services under IDEA were apparent for all other categories, however, on both mathematics subtests (for p values, see appendix exhibits A4.19a and A4.19b).

Mathematics scores for 16- through 18-year-old children identified for IDEA services varied by IDEA eligibility category and were significantly lower than the general population. Mean standard scores on the Calculation and Applied Problems subtests for this age group of youth identified for special education services under IDEA were 83.8 and 85.2, respectively (SE = 0.83 and 0.69), significantly lower than scores for the general population ($p < .001$). Across disability categories, Calculation subtest scores ranged from 61.4 for youth with mental retardation to 92.2 for youth with visual impairments (SE = 1.43 and 1.14); Applied Problems mean scores ranged from 63.4 for youth with mental retardation to 88.4 for youth with other health impairments (SE = 1.31 and 0.98). All differences on both measures between the general population and youth in all disability categories were statistically significant (for p values, see appendix exhibits A4.19a, A4.19b). Both mathematics scores for youth identified for services under IDEA were significantly higher than their mean score for reading passage comprehension (79.2, SE = 0.82, $p < .001$), whereas the Calculation subtest score was significantly lower than the mean score on the Antonyms/Synonyms subtest (87.4, SE = 0.68, $p < .001$; for p values, see appendix exhibits A4.19c and A4.19d).

Exhibit 4.19. Mean WJ III mathematics scores of school-age children identified for services under IDEA: ages 7 through 14 (2001) and 16 through 18 (2002 and 2004), by disability category

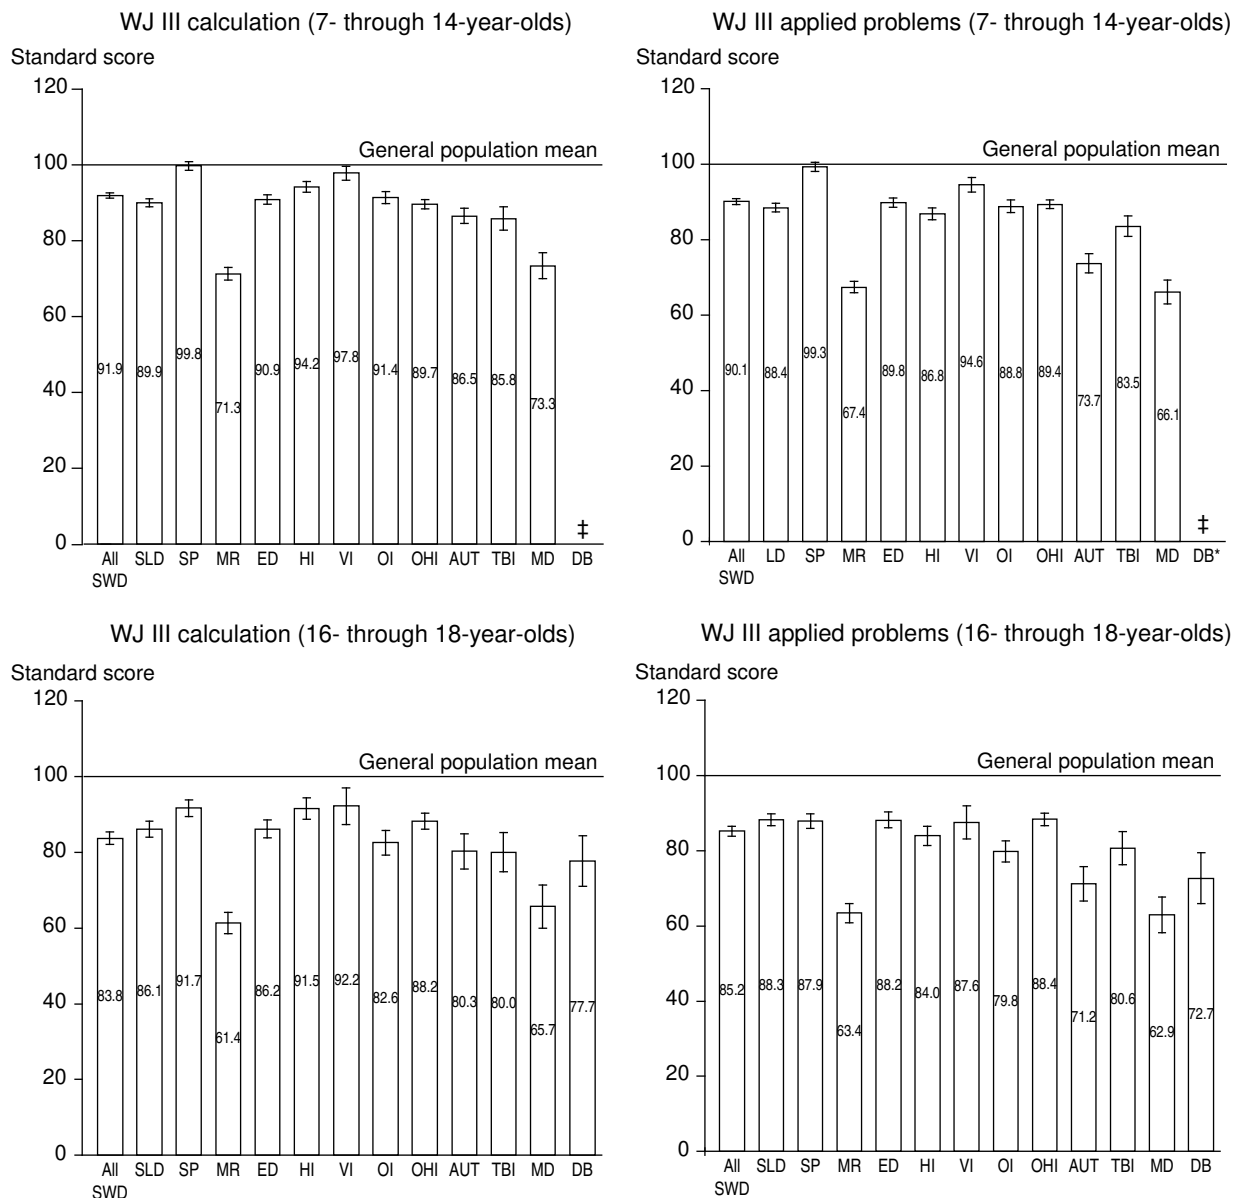

Exhibit reads: 7- through 14-year-olds identified for services under IDEA had a mean score of 92 on the calculation subtest.

NOTE: Disability categories are: All students with disabilities (All SWD), specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB). SEELS administered a research edition of the Woodcock-Johnson III (WJ III) to 7- through 14-year-olds in 2001. NLTS2 administered a research edition of the WJ III in Waves 2 and 4 of the study (2002 and 2004, respectively). Each wave of testing included students who were 16- through 18-years-old at the time of administration. All measures are based on a general population mean of 100 and a standard deviation of 15. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

School Completion

As a result of federal mandates, as well as state and local policies and reforms, school completion is becoming a widely used measure of school performance and an important outcome for youth with disabilities (Education Commission of the States 2007; Lehr, Hansen, Sinclair and Christenson, 2003). The consequences of not completing high school have been well documented. For example, studies of the general population have revealed higher unemployment rates and lower wages among dropouts than among high school graduates (U.S. Department of Labor 2003). Furthermore, youth who leave school without a diploma are less likely to enroll in postsecondary education (National Center for Education Statistics 2004) and more likely to experience negative health and social outcomes, including substance abuse (Swaim and Beavis 1997) and crime and arrests (APA Commission on Youth Violence 1993; Office of Juvenile Justice and Delinquency Programs 1995), than their peers who obtain a diploma. Similar differences in the outcomes for dropouts and high school completers have been found among youth with disabilities (e.g., Hasazi, Gordon, and Roe 1985; Wagner et al. 2005; Blackorby and Wagner 1996).

This section presents data on school completion for youth identified for IDEA services from 1998 to 2005, as well as comparison data for the total population. Four categories of information are presented:

- school completion rates across time (1998-2005);
- school completion rates by disability category (2005);
- school completion rates by disability cluster (2003, 2004, 2005); and
- comparison of state graduation rates for students identified for services and total population.

Data on school completion are presented in two ways. Exhibits 4.20 through 4.25 display data on the proportion of youth identified for IDEA services exiting school in a particular year who graduated with a diploma, received a certificate of completion, reached the maximum age, or dropped out. Thus, for a given year, rates for graduates, dropouts, those who reached the maximum age for services (i.e., “aged out” at age 21), and those who received a certificate of completion are calculated by the respective exit category as the numerator and the sum of all four exit categories as the denominator. These rates should be interpreted cautiously since definitions of school exit categories vary across states; observed differences in rates across states may reflect definitional differences as well as differences in exit patterns. Comparisons of state Averaged Freshman Graduation Rates (AFGR) are presented in exhibit 4.26. The AFGR provides an estimate of the percentage of high school youth who graduate within 4 school years by dividing the number of graduates with regular diplomas by the estimated size of the incoming freshman class 4 years earlier. Data on the school exit status for youth identified for IDEA services come from OSEP’s Section 618 data (DANS), and those for the total population come from the Common Core of Data (CCD) State Nonfiscal Survey of Public Elementary/Secondary Education.

Change in Rates of Graduation, Dropout, Certificate Receipt, and Reaching the Maximum Age for Services (1998 Through 2005)

For youth identified for services under IDEA, the rate of graduating with a regular diploma decreased by 1 percentage point from 1998 to 2005, and the rate of receiving a

certificate of completion increased by 4 percentage points (see exhibit 4.20). During this period, the graduation rate went from 58 percent to 57 percent, with a high of 62 percent in 2001 and a low of 55 percent in 2003 and 2004, and the rate of exiting secondary school with a certificate of completion went from 11 percent in 1998 to 15 percent in 2004 and 2005. Dropout rates among youth identified for IDEA services were 29 percent in 1998 and reached a low of 26 percent in 2005 and a high of 31 percent in 2003. The percentage of youth who aged out of secondary school went from 2 percent in the 1998 through 2000 time frame to 1 percent in subsequent years. (See appendix exhibit A4.20 for values.)

Exhibit 4.20. National percentage of youth identified for services under IDEA no longer in high school, by exit type (1998–2005)

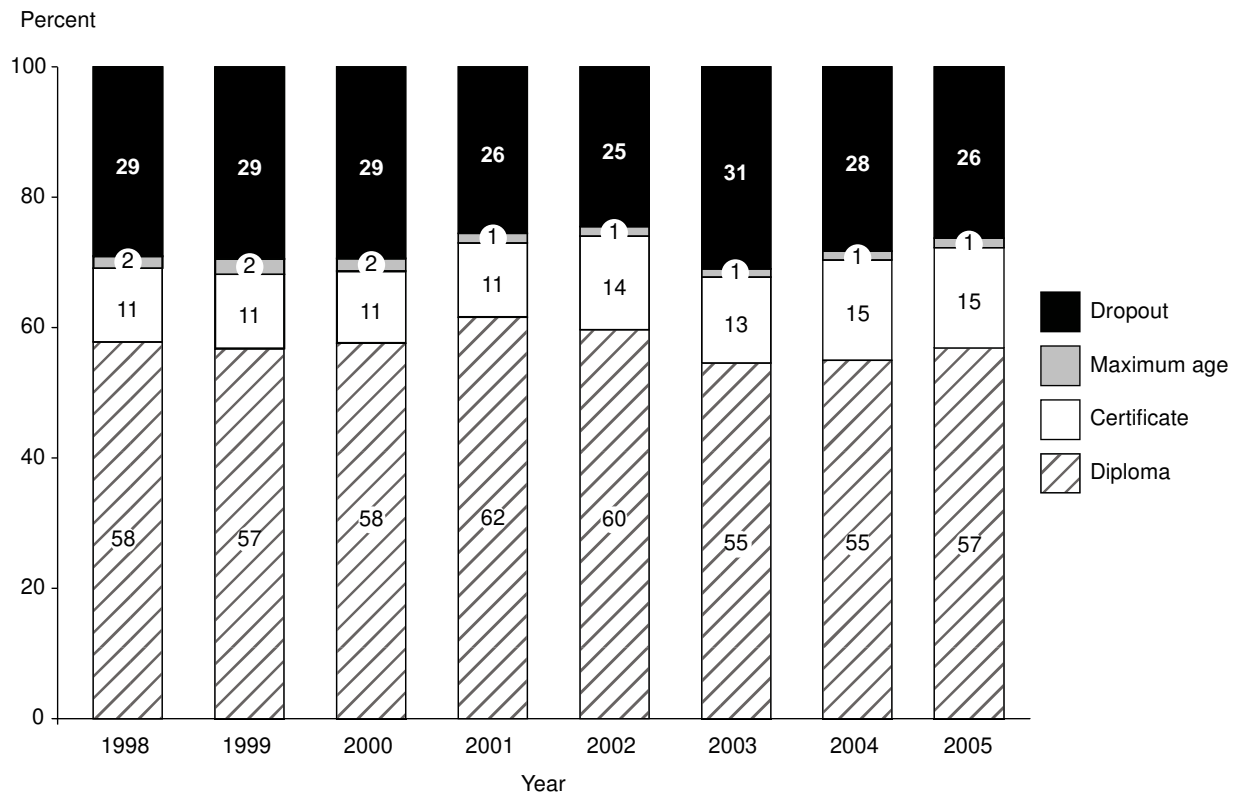

Exhibit reads: Nationwide, in 1998, 29 percent of youth who had been identified for services under IDEA and had exited high school had done so by dropping out.

SOURCE: U.S. Department of Education, Office of special Education Programs, Data Analysis System (DANS) as of June 10, 2008.

Rates of School Exit, by Disability Category in 2005

In 2005, how youth identified for IDEA services exited school varied by disability category (see exhibit 4.21); youth with visual impairments had the highest rates of graduating with a regular diploma (73 percent). Youth with mental retardation had the lowest graduation rate among exiting youth identified for IDEA services (37 percent).

The dropout rate was highest for youth with emotional disturbance (45 percent) in 2005. Representing the category with the lowest dropout rate were youth with autism (9 percent).

In 2005, youth with mental retardation had the highest rate of exiting secondary school with a certificate of completion (36 percent). The percentage of youth exiting with a certificate was lowest for youth with speech or language impairments (9 percent).

Youth with multiple disabilities were the most likely to leave secondary school because they reached the maximum age of 21 for service; 9 percent aged out in 2005. The percentages leaving secondary school because of reaching the maximum age of 21 were lowest for youth in the speech or language impairments and specific learning disabilities categories. (See appendix exhibit A4.21 for values.)

Exhibit 4.21. National percentage of school-age youth who had been identified for services under IDEA and were no longer in high school, by exit type and disability category (2005)

Exhibit reads: Nationwide, 26 percent of children who had been identified for services under all IDEA disability categories and had exited high school did so by dropping out.

NOTE: Disability categories are: all students with disabilities (All SWD), specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB).

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS) as of June 10, 2008.

Rates of School Exit, by Disability Cluster (2003 Through 2005)

Exhibits 4.22 through 4.25 illustrate school exiting patterns, by major groups of disability categories and by individual categories for youth exiting in 2003, the year before the most recent IDEA reauthorization, through 2005. For these analyses, disability categories have been combined into three clusters as recommended by the President's Commission on Excellence in Special Education (PCESE 2002): According to the Commission's recommendations, the sensory disability cluster includes youth with visual impairments (VI), hearing impairments (HI), or deaf-blindness (DB); the physical disability cluster includes youth with autism (AUT), multiple disabilities (MD), other health impairments (OHI), orthopedic impairments (OI), or traumatic brain injury (TBI); the developmental disability cluster includes youth with specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), or emotional disturbance (ED).

Graduation rates increased by 1 to 2 percentage points for youth in all three disability clusters from 2003 to 2005 (see exhibit 4.22). For example, rates of graduation for youth with developmental disabilities went from 54 percent in 2003 to 56 percent in 2005. Youth with sensory disabilities had higher rates of exiting secondary school with a diploma than did those with physical or developmental disabilities in the 2003 through 2005 time frame. Within the sensory disabilities cluster, graduation rates changed by less than 2 percentage points for youth with visual or hearing impairments; whereas graduation rates among exiting youth with deaf-blindness increased by 16 percent (from 52 percent in 2003 to 68 percent in 2005). In the physical disabilities cluster, youth with multiple disabilities had the lowest graduation rates across all three years, and this was the only group for which graduation rates declined from 2003 to 2005 (48 percent to 45 percent). Among youth in the developmental disability cluster, youth with mental retardation exited school with the lowest graduation rate, and this was the only category in this cluster that experienced a decline in graduation rates from 2003 to 2005 (39 percent to 37 percent). (See appendix exhibit A4.22 for values.)

Exhibit 4.22. National percentage of school-age youth identified for services under IDEA exiting high school with a diploma, by disability cluster and category (2003 through 2005)

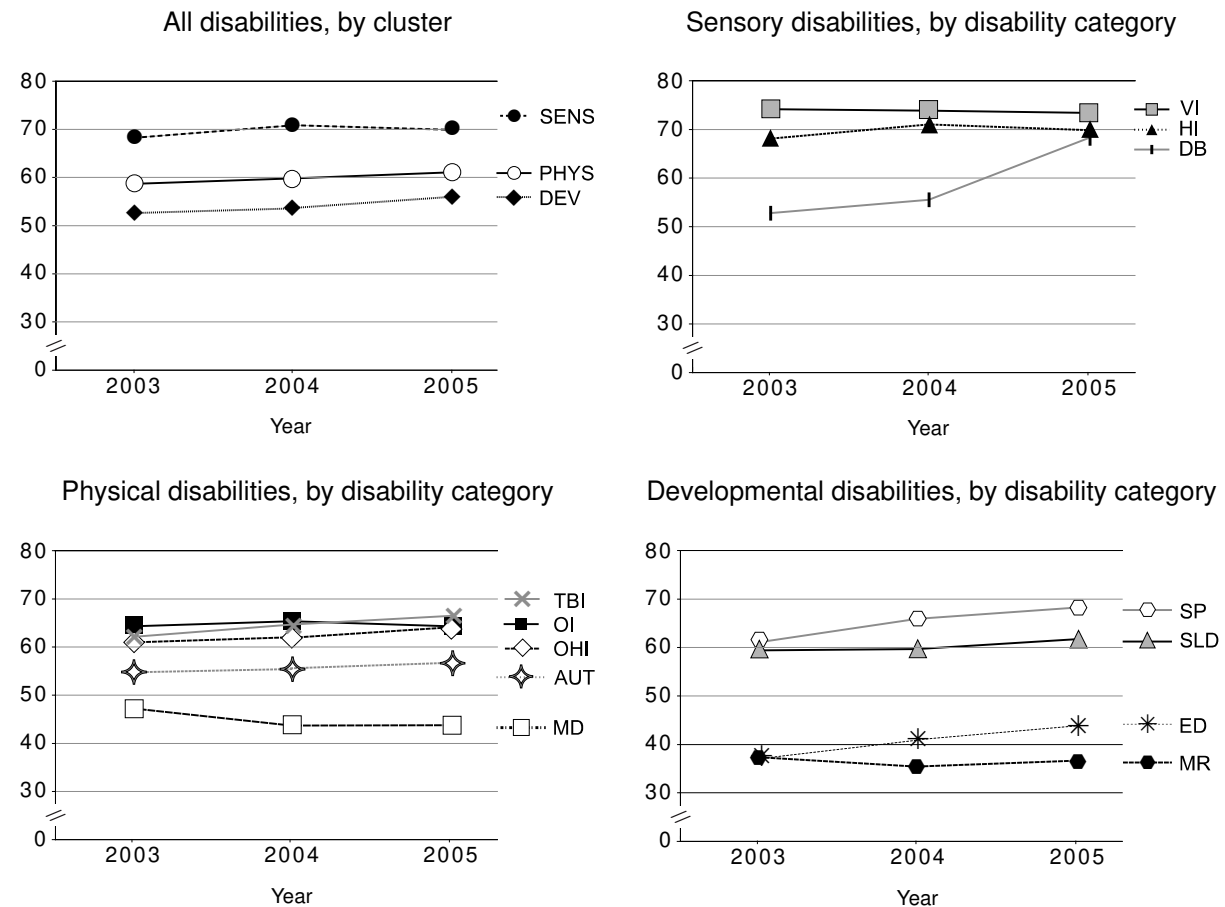

Exhibit reads: The percentage of youth with sensory disabilities who exited school with a regular diploma went from 69 percent in 2003 to 70 percent in 2005.

NOTE: The sensory disability cluster includes youth with visual impairments (VI), hearing impairments (HI), or deaf-blindness (DB); the physical disability cluster includes youth with autism (AUT), multiple disabilities (MD), other health impairments (OHI), orthopedic impairments (OI), or traumatic brain injury (TBI); the developmental disability cluster includes youth with specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), or emotional disturbance (ED).
SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), 2003, 2004, and 2005 as of June 10, 2008.

Youth in the developmental disabilities cluster had the highest dropout rates across all three years, and those in the sensory disabilities cluster had the lowest rates during this period (see exhibit 4.23). For all three disability clusters, dropout rates declined by an average of 3 percentage points from 2003 to 2004 and by another 2 percentage points from 2004 to 2005. Within the sensory disabilities cluster, the dropout rate for youth with visual impairments deviated from the general pattern of a steady decline, with an increase from 2003 to 2004 (18 to 22 percent) and a decrease of 12 percentage points from 2004 to 2005 (22 to 10 percent). Among youth in the physical disabilities cluster, youth with other health impairments had the highest

dropout rates across all three years, and youth with autism had the lowest rates of exiting school by dropping out. In the developmental disability cluster, dropout rates for youth with emotional disturbance were much higher than for youth with other developmental disabilities across all three years and decreased at a greater rate from 2003 to 2005 (52 percent to 45 percent). (See appendix exhibit A4.23 for values.)

Rates of exiting secondary school with a certificate of completion increased by 2 percentage points from 2003 to 2005 across all three disability clusters (see exhibit 4.24). Only certification rates of receiving a certificate of completion increased for youth in the sensory disabilities cluster (ranging from 11 percent to 16 percent in 2003 to 14 percent to 16 percent in 2005), except for youth with deaf-blindness whose certification rates decreased by 1 percentage point). In the physical disabilities cluster, youth with other health impairments had the lowest rates of exiting school with a certificate of completion (11 percent in 2003 to 12 percent in 2005). Youth with autism and those with multiple disabilities had the highest rates of exiting school with a certificate of completion (21 and 23 percent in 2003 to 27 percent for each category in 2005). Among youth in the developmental disabilities group, rates of exiting school with a certificate were higher for youth with mental retardation than those in the other disability categories, and youth with mental retardation experienced the greatest increase in certification rates (from 30 percent in 2003 to 36 percent in 2005). (See appendix exhibit A4.24 for values.)

Rates of exiting secondary school by reaching the maximum age were less than 3 percent across all three disability clusters and years (see exhibit 4.25) and changed by less than 0.5 percent from 2003 to 2005. In the sensory disabilities cluster, the rate of exiting school by reaching the maximum age was higher for youth with deaf-blindness than for youth with a vision or a hearing impairment, and the rate of aging out for youth with deaf-blindness changed the most, decreasing by 6 percentage points (from 14 percent in 2003 to 8 percent in 2005). In the physical disabilities cluster, youth with multiple disabilities had the highest rates of aging out of secondary school across all three years (almost 9 percent in 2003 and 2005); whereas youth in the other health impairments category had the lowest ageout rates across the same time period (close to 0.5 percent each year). Among disability categories in the developmental disability cluster, youth with mental retardation were the most likely to age out of secondary school (more than 4 percent all three years), compared with rates of less than 1.5 percent for youth in the other disability categories within this cluster. (See appendix exhibit A4.25 for values.)

Exhibit 4.23. National percentage of school-age youth identified for services under IDEA exiting high school by dropping out, by disability cluster (2003 through 2005)

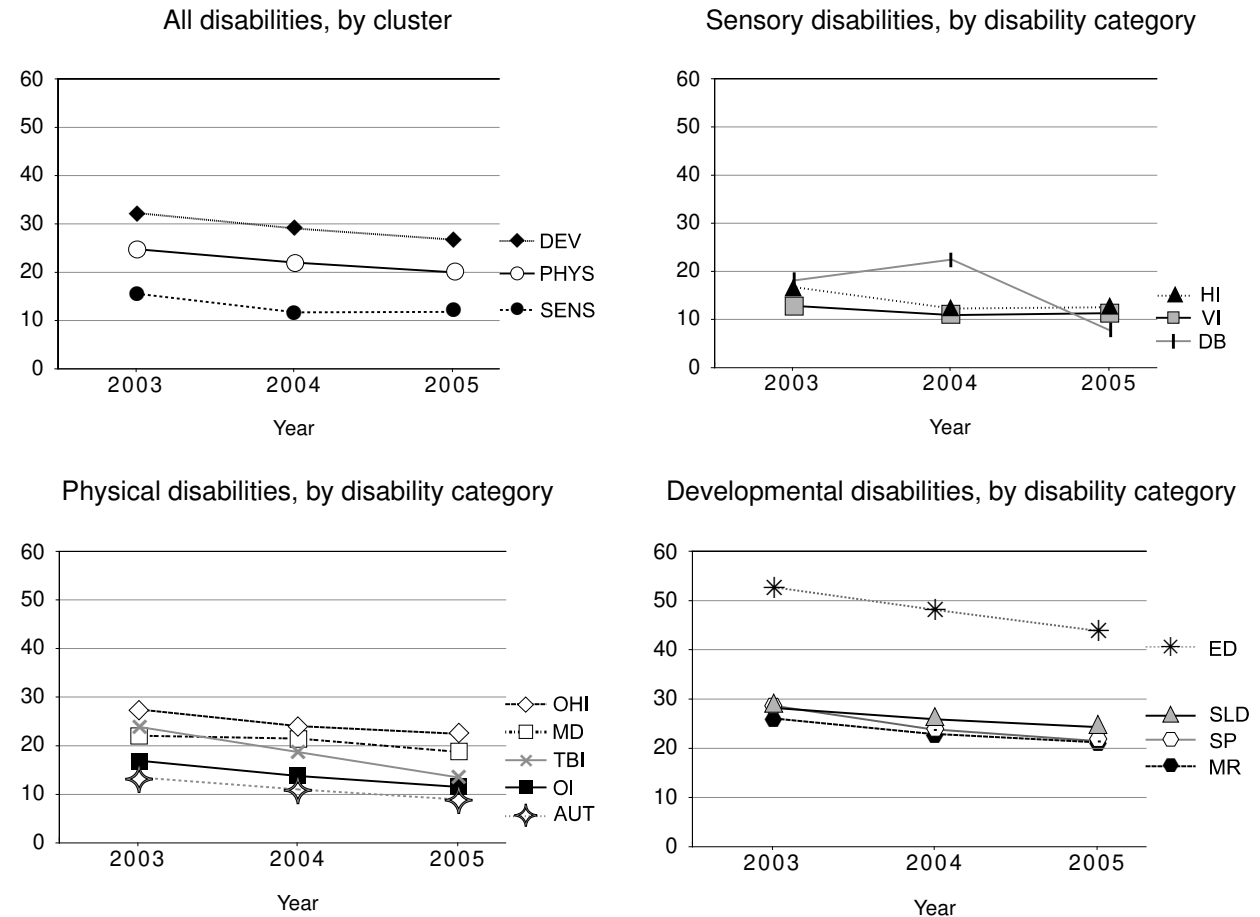

Exhibit reads: The percentage of youth with developmental disabilities who exited school by dropping out went from 32 percent in 2003 to 27 percent in 2005.

NOTE: The sensory disability cluster includes youth with visual impairments (VI), hearing impairments (HI), or deaf-blindness (DB); the physical disability cluster includes youth with autism (AUT), multiple disabilities (MD), other health impairments (OHI), orthopedic impairments (OI), or traumatic brain injury (TBI); the developmental disability cluster includes youth with specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), or emotional disturbance (ED).

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), 2003, 2004, and 2005 as of June 10, 2008.

Exhibit 4.24. National percentage of school-age youth identified for services under IDEA exiting high school by receiving a certificate of completion, by disability cluster (2003 through 2005)

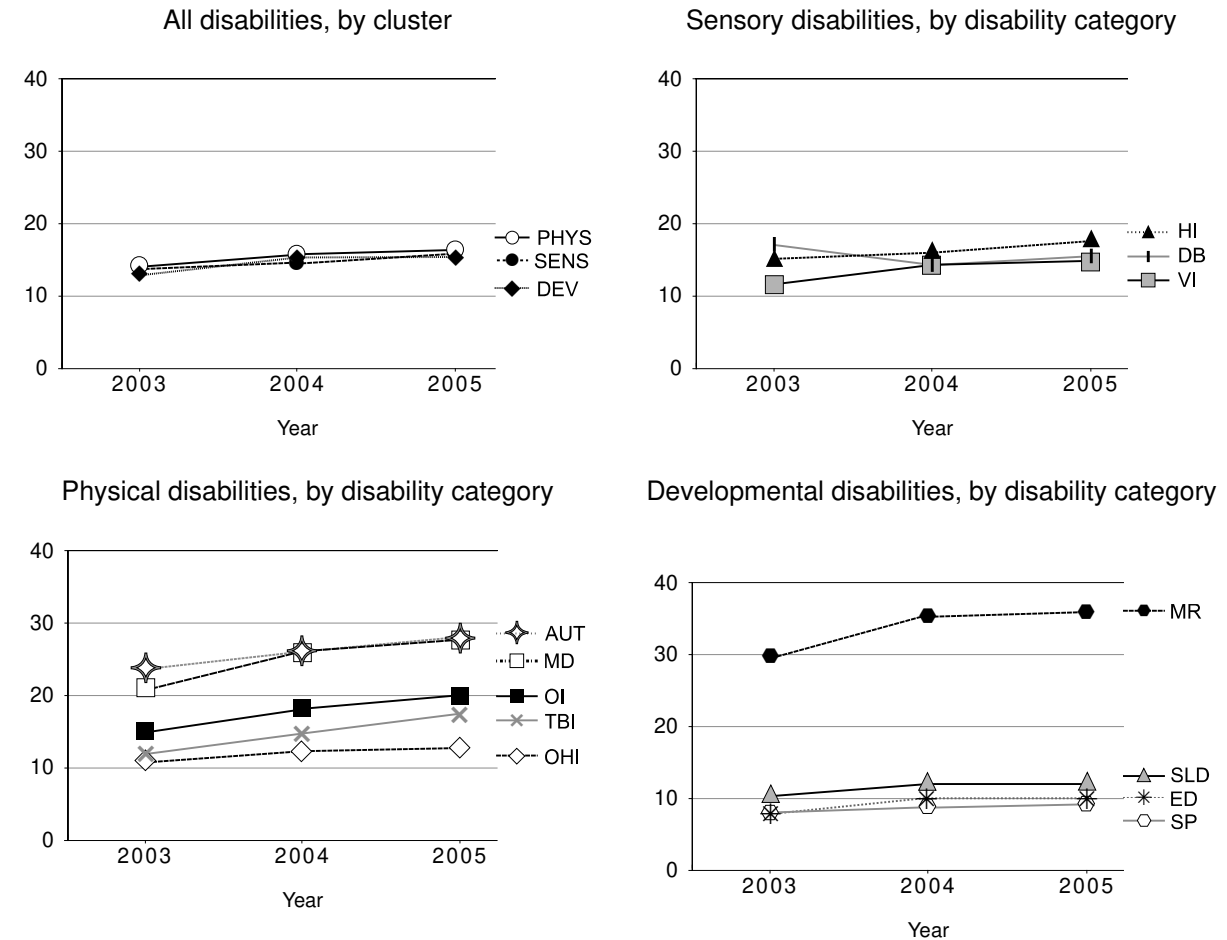

Exhibit reads: The percentage of youth with physical disabilities who exited school by receiving a certificate of completion went from 14 percent in 2003 to 16 percent in 2005.

NOTE: The sensory disability cluster includes youth with visual impairments (VI), hearing impairments (HI), or deaf-blindness (DB); the physical disability cluster includes youth with autism (AUT), multiple disabilities (MD), other health impairments (OHI), orthopedic impairments (OI), or traumatic brain injury (TBI); the developmental disability cluster includes youth with specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), or emotional disturbance (ED).

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), 2003, 2004, and 2005 as of June 10, 2008.

Exhibit 4.25. National percentage of school-age youth identified for services under IDEA exiting high school by reaching the maximum age for service, by disability cluster (2003 through 2005)

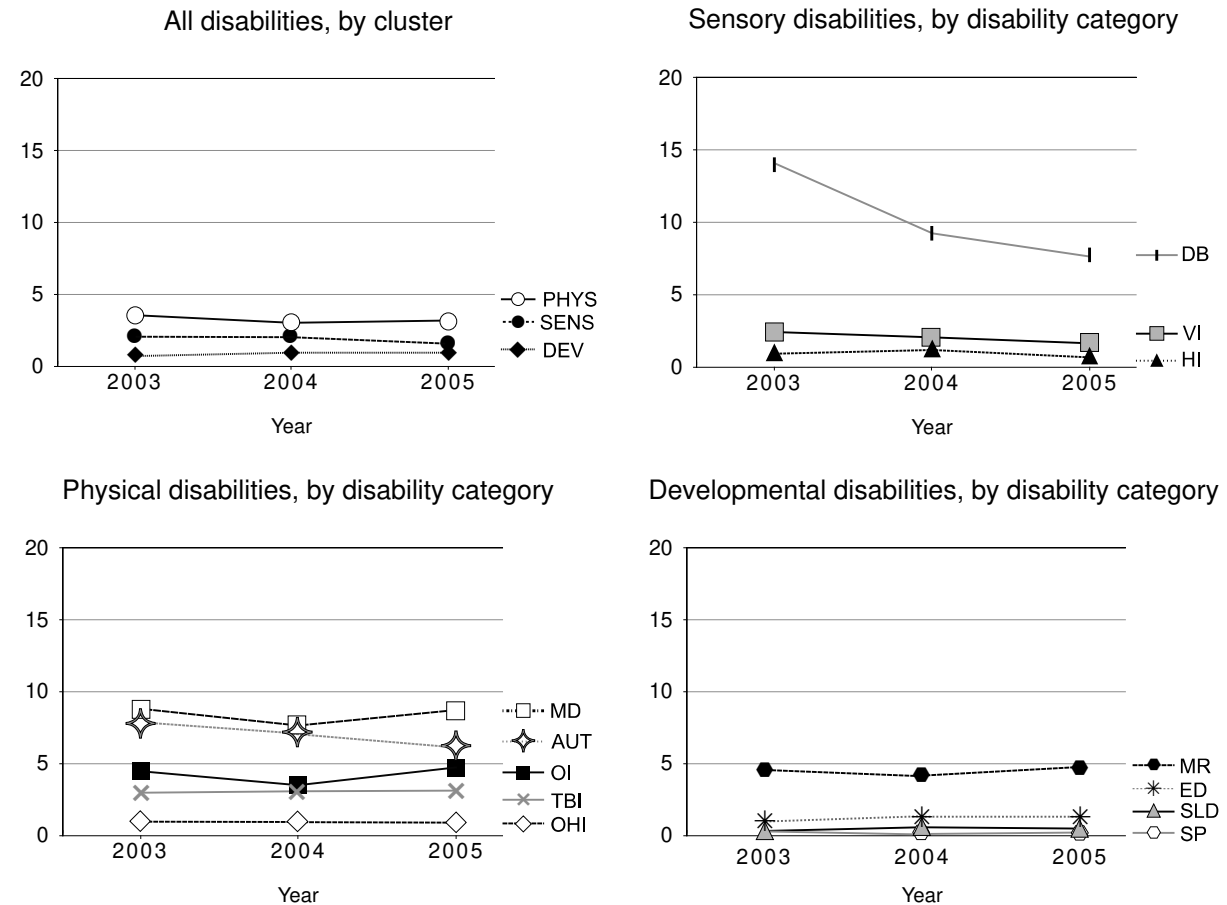

Exhibit reads: The percentage of youth with physical disabilities who exited school by reaching the maximum age for service went from 3 percent in 2003 to under 3 percent in 2005.

NOTE: The sensory disability cluster includes youth with visual impairments (VI), hearing impairments (HI), or deaf-blindness (DB); the physical disability cluster includes youth with autism (AUT), multiple disabilities (MD), other health impairments (OHI), orthopedic impairments (OI), or traumatic brain injury (TBI); the developmental disability cluster includes youth with specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), or emotional disturbance (ED).

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), 2003, 2004, and 2005 as of June 10, 2008.

Change in Averaged Freshman Graduation Rates (1998 Through 2005)

Exhibit 4.26 shows the Averaged Freshman Graduation Rate (AFGR) for youth identified for IDEA services and for the total population in 2005, as well as the average AFGR for the years 1998 to 2004. The AFGR provides an estimate of the percentage of high school students who graduate in 4 years, using aggregate student enrollment data to estimate the size of an incoming freshman class and aggregate counts of the number of graduates 4 years later. This estimate is not a true cohort graduation rate that uses longitudinal data on individual students who enter ninth grade for the first time in a given year and graduate 4 years later. Though the AFGR has a number of limitations, it is an estimate of graduation rates that can be calculated with available data. To estimate the size of the incoming freshman class, counts for youth identified for IDEA services are based on age, whereas, counts for youth in the total population are based on their grade level.⁹

Nationwide, 46 percent of youth identified for IDEA services and estimated to be enrolled as of 4 years prior completed secondary school with a regular diploma in 2005, 29 percentage points below the rate for youth in the total population nationwide who received a regular diploma that year (75 percent).¹⁰ The AFGR in 2005 for youth identified for IDEA services ranged across states from 17 percent in Louisiana to 78 percent in Pennsylvania. For the total population of youth, the AFGR ranged from 56 percent in Nevada to 91 percent in New Jersey. The 7-year average AFGR for 1998 to 2004 ranged from 16 percent in Mississippi and Alabama to 73 percent in New Jersey for youth identified for IDEA services, and for the total population this average ranged from 59 percent and 60 percent in South Carolina and Georgia to 90 percent in New Jersey.

The greatest gap between the 2005 AFGR for youth identified for IDEA services and the total population occurred in Arizona with a difference of 56 percentage points. The state with the smallest difference between youth identified for IDEA services and the total population in the percentage of the estimated freshman class receiving a regular diploma in 2005 was Pennsylvania (5 percentage points). For the 1998 to 2004 period Hawaii had the smallest gap (9 percentage points), and with a difference of 48 percentage points, 4 states, Nebraska Louisiana, Nevada, and Alabama, had the greatest gap between the AFGR rates of youth identified for IDEA services and the total population. (See appendix exhibit A4.26 for values.)

⁹ More detailed information on the AFGR as a measure of graduation rates is presented in the notes to exhibit A4.26 in the appendix.

¹⁰ Comparisons between children identified for services under IDEA and the total population, as well as comparisons between states, should be treated with caution because of limitations of the data sources. See the notes to exhibit A4.26 for further information.

Exhibit 4.26. Averaged freshman graduation rate of school-age youth identified for services under IDEA and total population, by state (2005 and 1998–2004 average)

Exhibit reads: In Louisiana, 17 percent of the estimated enrollment of students identified for IDEA services 4 years prior to 2005 graduated with a regular diploma in 2005.

NOTE: States are ordered by the graduation rate of youth identified for services under IDEA in 2005. Vertical lines represent national rates. The Averaged Freshman Graduation Rate (AFGR) uses aggregate student enrollment data to estimate the size of an incoming freshman class and aggregate counts of the number of graduates 4 years later. For a given year, the freshman class size four years prior is estimated by summing the enrollment in 8th grade 4 years prior, 9th grade for the next year, and 10th grade for the year after and then dividing by 3. The averaging is intended to account for higher grade retentions in the 9th grade. To calculate the AFGR, the number of diplomas awarded in a year serves as the numerator, and the averaged freshmen class enrollment serves as the denominator (for more information about the use of the AFGR for the general population, go to: <http://nces.ed.gov/pubsearch/pubsinfo.asp?pubid=2008053>). Using data from the Common Core of Data (CCD), the formula for calculating the AFGR for youth in the total population is shown below.

AFGR formula for youth in the total population for 2005-06 school year:
 Regular High School Diplomas Awarded at End of 2005-06 School Year

Enrollment in (Grade 8 in fall 2001 + Grade 9 in fall 2002 + Grade 10 in fall 2003)/3

Common Core of Data (CCD)¹

Overview

The Common Core of Data (CCD) is a data collection program of the U.S. Department of Education's National Center for Education Statistics that annually collects fiscal and non-fiscal data about all public schools, public school districts, and state education agencies (SEAs) in the United States.

The CCD is the Department of Education's primary database on public elementary and secondary education in the United States. The CCD is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts that contains data designed to be comparable across all states. The CCD data are population counts for states, school districts, and schools, including Department of Defense and Bureau of Indian Education (BIE) schools.² No student-level data are collected as part of the CCD.

Scope/Topic

CCD contains three categories of information: general descriptive information on schools and school districts, data on students and staff, and fiscal data. The general descriptive information includes name, address, phone number, and type of locale; the data on students and staff include selected demographic characteristics; and the fiscal data cover revenues and current expenditures. Designation of whether a child has an Individualized Education Program (IEP) is included in the data collection.

CCD student enrollment counts (membership counts) by grade level are submitted annually to NCES by all 50 states, the District of Columbia, Puerto Rico, the four outlying areas (American Samoa, Guam, the Commonwealth of the Northern Marianas Islands, and the U.S. Virgin Islands), the Department of Defense (DOD) dependents school system (overseas and domestic), and the BIE. BIE schools were added in 1998–99.

Sampling Strategy

No sampling is used.

Data Collection Methods

The CCD comprises five surveys sent to state education departments, the District of Columbia, Puerto Rico, the four outlying areas (American Samoa, Guam, the Commonwealth of the Northern Marianas Islands, and the U.S. Virgin Islands), the DOD dependents school system (overseas and domestic), and the BIE. Most of the data are obtained from administrative records maintained by the SEAs and above mentioned entities. They compile CCD-requested data into prescribed formats and transmit the information to NCES.

¹ <http://nces.ed.gov/ccd>

² The Bureau of Indian Education (BIE), Bureau of Indian Affairs (BIA), U.S. Department of the Interior compiles a directory of BIA-funded schools that includes the name of each school, location, and number of teachers and students. NCES primarily uses this directory to obtain the counts of schools, teachers and students for inclusion the CCD dataset.

Respondents and Response Rate

Statistical information is collected annually from public elementary and secondary schools (approximately 94,000); public school districts (approximately 17,000); the 50 states, the District of Columbia; the DOD Schools; and BIE.

For 1998–1999 when the BIE schools did not report data for the school year, student membership (student enrollment) data were imported from a public website. Imputations and adjustments are made to create each CCD data file. However, no other imputations or adjustments were made for the outlying areas, including BIE schools, for other years. Detailed data file information of the *State Nonfiscal Public Elementary/Secondary Education Survey Data* is available at <http://nces.ed.gov/ccd/stnfis.asp>.

Timing

These data are collected annually. Data are available in electronic format dating back to 1993–1994; earlier data are also available.

Availability

CCD has publicly available online data files (<http://nces.ed.gov/ccd/ccddata.asp>) and application tools to create customized tables of CCD public school data from multiple years and for states, districts, and schools (<http://nces.ed.gov/ccd/search.asp>). *Build-A-Table* provides access to enrollment data and enables users to format basic tables. Access to the restricted-use data files is available by license only because potentially identifiable information is protected by law.

The Early Childhood Longitudinal Study, Kindergarten Class (ECLS-K)³

Overview

The Early Childhood Longitudinal Study, Kindergarten Class of 1998-99 (ECLS-K) is funded by the U.S. Department of Education's National Center for Educational Statistics (NCES). ECLS-K includes a nationally representative sample of kindergarteners, their teachers, parents, and schools and focuses on children's early school experiences from kindergarten to middle school (eighth-grade). In the base year, the ECLS-K data set included information on 21,000 children attending more than 1,200 public and private schools. Children in the sample come from diverse socioeconomic and racial/ethnic backgrounds, represent both public and private schools, and attended both full-day and part-day kindergarten programs. ECLS-K is designed to provide descriptive information on children's cognitive, social, emotional, and physical development as they enter school, transition to kindergarten, and progress through school. Some key areas examined include school readiness, the relationship between the kindergarten experience and later school performance, and growth in cognitive and non-cognitive domains. Also included in the data set is information on the child's home environment, home educational activities, school and classroom environment, and teacher qualifications.

Scope/Topic

The ECLS-K is a multi-faceted, longitudinal study that includes data on (1) the achievement of children beginning with their entry into formal schooling until eighth- grade; (2) the developmental status of children in the United States upon entry to formal schooling until eighth-grade; (3) the relationships among children, families, and schools as children progress through their formal school experiences; and (4) the nature and quality of kindergarten programs in the United States during the 1998-1999 school year. Major areas examined in the survey in the ECLS-K include children's growth and development (both cognitive and non-cognitive), children's health, children's transitions to non-parental care and education programs, kindergarten and beyond, and school readiness.

Sampling Strategy

ECLS-K used a clustered, primary sampling unit (PSU) multi-stage design for sample selection; schools were selected first and then students within each of the selected schools were randomly selected. Private schools, private school children, and Asian and Pacific Islander children were all oversampled. Children with disabilities were not oversampled in the ECLS-K. Many of the children in the sample are identified as needing special education services and begin receiving services over the life of the study. Thus, the sample of children receiving special education services increases in size between kindergarten and fifth-grade.

Data Collection Methods

Data collection methods varied according to the type of respondent. Data were collected from children through direct, one-on-one assessments as well as student surveys in third-, fifth-, and eighth-grade. Information about the child's reading and mathematics skills and knowledge, general knowledge in kindergarten and first-grade, and science knowledge in third-, fifth-, and eighth-grade were collected through the direct assessments. Direct assessments also included measurements of height and weight, and psychomotor skills were assessed in the fall of kindergarten. The student surveys collected data on perceptions of competence and skills, school experiences and activities, and diet. Teachers and school

³ <http://nces.ed.gov/ecls/Kindergarten.asp>

administrators completed surveys about the classroom and school environment, classroom instruction, and teacher background. Additional school information was collected through a school records abstract and school facilities checklist. Parent data were collected through a phone interview by a trained interviewer that is recorded using computer assisted interviewing methods. If a child's family did not have a telephone, the parent interview was conducted in person.

ECLS-K gathered information on children with a disability through the parent interview, special education teacher survey, and school records abstracts, including whether a child (1) has an IEP and (2) is receiving special education services (both from school records). Data are available on what services children receive.

ECLS-K Indicators and Technical Information

The ECLS-K assessed children through direct and indirect Assessment Measures. Direct assessments include cognitive assessments, a self-description questionnaire, and physical and motor specifications. Indirect assessments include information from teachers on the Academic Rating Scale and from parents and teachers on the Social Rating Scale. Direct assessment data were collected by a trained assessor through an un-timed, one-on-one item routing test. Data on the child's reading and mathematics skills and knowledge, their general knowledge (K-first-grade), and science knowledge (third- to eighth-grade) were collected through the direct assessment. Scores from the cognitive direct assessments include IRT-based scales (scale scores), standardized scores (T-scores), and number right "raw" scores (routing scale scores). The direct assessment also includes information about the child's height and weight. In kindergarten, the direct assessment also included data on the child's fine and gross motor skills such as hopping, skipping, jumping, manipulating blocks, and drawing figures. In the third-, fifth-, and eighth-grades, children also complete a Self-Description Questionnaire that includes topics such as perception of competence and skills, approaches to learning, school experiences and activities, and self-concept. Indirect assessment data were collected from parents and teachers and include information on the child's cognitive knowledge and skills in relation to the other children in the classroom; program placements; and social skills such as approaches to learning, self-control, social interaction, impulsivity/overactivity, and sadness/loneliness.

Data from the Academic Rating Scale were used in this report to provide indicators for the total population of kindergarteners. Findings using adapted items from the Social Rating Scale were provided from NEILS but no Social Rating Scale data were presented from ECLS-K. The methodology report (Pollack, Atkins-Burnett, Rock and Weiss 2005) that documents the design, development, and psychometric characteristics of the assessment instruments used in the ECLS-K can be found at: <http://nces.ed.gov/pubsearch/pubsinfo.asp?pubid=200205>.

Academic Rating Scale. The academic rating scale (ARS) indirect measures were developed for the ECLS-K to measure teachers' evaluations of students' academic achievement in the three domains that were also directly assessed in the cognitive battery: language and literacy (reading), general knowledge (science and social studies), and mathematical thinking. The ARS was designed both to overlap and to augment the information gathered through the direct cognitive assessment battery. Teachers were to rate each child's skills, knowledge, and behaviors on a scale from "Not Yet" to "Proficient." If a skill, knowledge, or behavior had not yet been introduced into the classroom, the teacher coded that item as N/A (not applicable). The reliability for the scales for spring of kindergarten was: Language and literacy, .91; Mathematical thinking, .94. The summary fit statistics for items and persons were acceptable for all the scales (NCES, 2002).

Social Rating Scale (SRS). This scale is an adaptation of the Social Skills Rating System (Gresham & Elliott 1990). Both the teacher and parent used a frequency scale to report on how often the student demonstrates the social skill or behavior described. Factor analyses (both exploratory analyses and

confirmatory factor analyses using LISREL) were used to confirm the scales. The split-half reliability for the teacher scale ranged from .79 to .90 across the four scales (NCES, 2002).

Respondents and Response Rate

In each round of data collection, data were collected from children through direct assessments and student surveys (beginning in third-grade), from parents through computer assisted phone interviews or face-to-face interviews when needed, as well as from teachers and school administrators through surveys.

The ECLS-K data set includes a nationally representative sample of kindergartens, children attending kindergarten in 1998, and kindergarten teachers. In 1999, the sample was freshened to create a nationally representative sample of first-graders, first-grade classrooms, and first-grade teachers. As a result, the data collected on the children in kindergarten (1998) and first-grade (1999) can be generalized to the entire U.S. population of children attending kindergarten in 1998 and children attending first-grade in 1999. The data were not freshened prior to the 2002 or 2004 data collections. Thus, the data are not nationally representative of all children in third-grade or fifth-grade. The fifth and final round of ECLS-K data was collected in spring of 2007.

Response Rates to Date: Child-Level Completion Rates

Data Collection Instruments	Fall 1998 (%)	Spring 1999 (%)	Fall 1999 (%)	Spring 2000*	Spring 2000**	Spring 2002***	Spring 2004 (%)
Child assessment	89.9	88.0	90.3	88.0	87.2	80.1	83.9
Parent interview	85.3	83.9	88.6	84.5	83.5	76.9	88.3
Teacher survey A	90.8	87.0	N/A	78.1	77.6	61.7	
Teacher survey B	96.6	90.4	N/A	77.5	77.0	61.6	
Teacher survey C	91.4	85.9	N/A	78.0	77.4	62.0	
School administrator survey		85.9	N/A	76.3	75.9	65.5	76.4

* Response rates for children who were sampled in the base year

** Response rates for children who were sampled in the first grade year

*** Response rates for children who were sampled in the base year and first grade year

The teacher surveys A, B, and C were replaced by a teacher-level survey and surveys for reading, mathematics, and science teachers in the spring/fifth-grade round of data collection. Response rates for the spring/fifth-grade teacher surveys were as follows: teacher-level survey (79.3 percent); reading teacher (78.7 percent); mathematics teacher (77.5 percent); science teacher (78.8 percent).

Availability

ECLS-K has a public use database for the base year and restricted use databases for the first-grade, third-grade, and fifth-grade years. The CD-ROMs that are available include different combinations of these years. For example, the most complete CD-ROM contains kindergarten, first-, third-, and fifth-grade public-use data from the Early Childhood Longitudinal Study, Kindergarten Class of 1998-99 (ECLS-K). The CD-ROM contains an electronic code book (ECB), data files, and survey and ECB documentation for six waves of the ECLS-K. This data file and ECB can be used to examine changes in children's experiences and achievement across school years. Researchers conducting cross-sectional or within-grade analyses should use the separate base year (kindergarten), first-grade, third-grade, and fifth-grade data files and ECBs.

National Assessment of Educational Progress (NAEP)⁴

Overview

The National Assessment of Educational Progress (NAEP), also known as “the Nation’s Report Card,” is the only nationally representative and continuing assessment of what America’s students know and can do in various subject areas. Since 1969, assessments have been conducted periodically in reading, mathematics, science, writing, U.S. history, civics, geography, and the arts. NAEP is designated in *No Child Left Behind* legislation as a comparison point for state assessments. All states now participate.

NAEP can be divided into four programs:(1) National NAEP assessments are based on frameworks that change over time to reflect changes in national educational policy and practice. (2) Long-term-trend NAEP uses a more stable framework to allow more facile comparison from 1969 to the present-day. (3) State NAEP has provided more detail about some states over the years. (4) Trial Urban District Assessments (TUDA) has done the same for 10 urban school districts. In recent years, a merging of national NAEP and state NAEP has increased the sample sizes for National NAEP.

NAEP does not provide scores for individual students or schools; instead, it offers results regarding subject-matter achievement, instructional experiences, and school environment for populations of students (e.g., fourth-graders) and groups within those populations (e.g., female students, Hispanic students). NAEP results are based on a sample of student populations of interest. National NAEP reports information for the nation and specific geographic regions of the country. Data can be analyzed by state. NAEP includes students drawn from both public and nonpublic schools and reports results for student achievement at grades 4, 8, and 12.

National NAEP uses nationally representative samples of U.S. students in grades 4, 8, and 12. The students, their teachers, and administrators at their schools are surveyed. The students are also assessed.

Scope/Topic

The primary purpose of the NAEP data collection is to provide a series of snapshots of what the nation’s students know and can do in a variety of subject areas, including reading and mathematics. The collection includes background information on students, teachers, and school administrators. The background variables collected vary over time, grade level, and assessment area. For example, the latest grade 8 mathematics assessment included 287 background variables in seven categories: major reporting groups, student factors, instructional content and practice, teacher factors, school factors, community factors, and factors beyond school.

Sampling Strategy

National probability samples of schools and students are selected to represent the United States. The numbers of schools and students vary from cycle to cycle depending on the number of subjects and items assessed. This national sample has sufficient schools and students to yield data for public and nonpublic schools and four regions of the country (northeast, southeast, central, and west), as well as sex, race, degree of urbanization of school location, parent education, and participation in the National School Lunch Program (NSLP).

School Sample. The sample of schools is selected from geographic sampling units. Twenty-two geographic sampling units are always selected. These are large metropolitan areas such as New York City, Los Angeles, and Chicago, and between them they include about 40 percent of the students in the

⁴ <http://nces.ed.gov/nationsreportcard/>

country. Without this group, the sample would not be representative of the United States. An additional 72 geographic sampling units are selected randomly to represent the rest of the United States. This second group includes smaller cities and rural areas, and the choice of areas varies with each assessment cycle. This design allows the centrally administered assessments to be scheduled efficiently.

Student Sample. Students are selected randomly within schools. From 30 to 150 students are selected in each school depending on the size of the school and the number of subjects to be assessed. Some of the students who are randomly selected are classified as students with disabilities (SD) or as limited-English proficient (LEP) students. NAEP's goal is to assess all students in the sample, and NAEP will assess these students if at all possible.

The number of schools ranges from 900 to 2,500 and the number of students from 40,000 to 150,000. Again, the variation depends on the number of subjects to be assessed and the number of assessment booklets developed for each subject. Generally, the requirement is for each assessment booklet to be answered by 2,000 students.

Data Collection Methods

A limited number of subject areas are assessed in any given spring. Sampled students are gathered in a room to take the assessment and answer a series of survey questions. A Balanced Incomplete Block (BIB) design is used so that multiple forms are used throughout the room, and no student takes the full assessment. For this reason, NAEP cannot provide true scores for any given student. Instead, researchers are provided a set of five plausible values for student scores.

The teachers of the selected students also receive a written survey. Their responses are linked with those of their students in a student-level data set. An administrator at each chosen school also completes a written survey. These results are available in a separate school-level data set.

NAEP Indicators and Technical Information

Main NAEP Reading Assessment requires students to read longer passages or pairs of passages; measures a range of reading skills, from identifying explicitly stated information, to making complex inferences about themes, to comparing multiple texts on a variety of dimensions. Students respond to questions of three possible types: multiple choice, short answer (scored on a two- or three-point scale), and extended answer (scored on a four-point scale). The weighted alpha reliability is the average of correlations for polytomous and dichotomous items within a block (or a group of assessment items created by dividing the item pool for an age or grade into subsets). Alpha reliability for the 2003 reading assessment items (combined national and state main assessment) ranged from 0.69 to .79 for grade 4 and from 0.65 to 0.79 for grade 8. Average item correlations for the 2005 and 2007 grade 4 and grade 8 assessments are not publicly available.

Main NAEP Mathematics Assessment focuses on numbers, measurement, geometry, probability and statistics, and algebra. Assesses basic skills and recall of definitions as well as problem solving and reasoning in all topic areas. Students respond to questions of several possible types: multiple choice, short answer, and extended answer. There are three answer categories for constructed-response questions (right or wrong; right, partially right, or wrong; or extended constructed-response with several levels of partial credit, scored on a four-point scale). Students may be asked to explain their work. Alpha reliability for the 2003 mathematics assessment items (combined national and state main assessment) ranged from 0.74 to 0.81 for grade 4 and from 0.75 to 0.85 for grade 8. Average item correlations for the 2005 and 2007 grade 4 and grade 8 assessments are not publicly available. A study was recently conducted by the NAEP Validity Studies Panel (2007) to examine the validity of NAEP Mathematics Assessment. The NVS Panel

report concluded that the NAEP framework covered content areas for grades 4 and 8 similar to selected comparison standards and that the NAEP item pool was in broad alignment with the framework. Based on the mean rating of mathematicians who reviewed the NAEP mathematics items, 67% of the NAEP grade 4 items and 73% of the NAEP grade 8 items were classified as adequate.

Numerous technical studies have been conducted as a part of NAEP's research agenda. Publications are available on-line providing information on the item analysis, scaling for each assessment year, linking of scales across multiple years, inter-scorer agreement, and weighting procedures. As these are conducted for each assessment year, specific information is available on-line (<http://nces.ed.gov/nationsreportcard/tdw/sitemap.asp>). Publicly available technical information is currently limited to the 2000-2001 and 2003 assessments.

Respondents and Response Rate

The size of the NAEP Assessment samples has increased in recent years. The 2003 Mathematics Grade 8 student-teacher data set, for example, contains 162,727 records. The corresponding school data set contains 6,334 records. The school participation rate (with student-centered weighting) for this sample was 97 percent before substitution. The student participation rate was 92 percent.

For children with disabilities: NAEP intends to assess all students selected to participate. However, some students may have difficulty with the assessment as it is normally administered because of a disability or limited English proficiency.

Beginning with the 1996 national assessment, NAEP implemented a two-part modification of procedures to increase inclusion in NAEP assessments. First, revised criteria were developed to define how decisions about inclusion should be made. Second, NAEP provided certain accommodations that were either specified in a student's IEP or frequently used to test the student. The accommodations vary depending on the subjects being assessed.

When a school identifies a student as having a disability or limited English proficiency, the teacher or staff member who is most familiar with the student is asked to complete a questionnaire to provide information about the services received by the student and to determine whether the student should take part in the assessment. Students may be included in the student with a disability category if they are eligible for special education under *IDEA* or if they receive services under Section 504 of the *Rehabilitation Act Amendments of 1973*. The questionnaire provides useful information about differential exclusion rates across disability conditions and across the states. Students who cannot take part, even with an accommodation allowed by NAEP, are excluded from the assessment. As an example, in 2005, 2 percent of students selected to be assessed were excluded from the grade four mathematics test because of their disability. Three percent of students were identified as disabled and assessed without accommodations; 7 percent were assessed with accommodations. Similarly, for eighth-grade mathematics in 2005, 3 percent of students selected to be assessed were excluded from the grade eight mathematics assessment because of their disability. Three percent of students were identified as disabled and assessed without accommodations; 7 percent were assessed with accommodations. There is no alternate assessment in NAEP.

Timing

Since 1996, NAEP Assessments have been conducted annually. The 2005 national assessment included reading, math, science, and a high school transcript study.

Other

Throughout its history, NAEP has encouraged the inclusion of all students who could meaningfully participate in the assessment, including those with disabilities. An estimated 10 percent of the school population is classified as having a disability or limited English proficiency (SD/LEP). Nearly half of these students have been included in previous assessments, although the percentages vary by grade and subject being assessed. Previously, because of concerns about standardized administration, accommodations were not permitted, excluding some students who could have participated if accommodations had been made. The NCES formally tested new policies with the 1996 NAEP assessment. Under these guidelines, school administrators were encouraged even more than in the past to include SD/LEP students if any doubt about excluding the student existed. Although NAEP establishes the criteria for inclusion, differences remain among states in how SD/LEP students are treated. Because of the 1997 amendments to *IDEA*, some states are changing their procedures for students with disabilities. Additionally, because there have been issues about different exclusion rates from state to state, some of the difference in achievement levels between the states may be due to this.

Availability

NAEP has a publicly available online database called the NAEP Data Explorer (<http://nces.ed.gov/nationsreportcard/nde/>). *Quick Start* provides access to data about student performance in terms of NAEP's scale scores and achievement levels for major reporting group variables and enables users to format basic tables and graphics. The *Advanced* level provides full access to student groups' scale scores and achievement-level performance for any NAEP variable and allows additional flexibility in generating and formatting data tables and graphics. Because potentially identifiable information is protected by law, access to the complete restricted-use data files is available by license only.

National Early Intervention Longitudinal Study (NEILS)⁵

Overview

The National Early Intervention Longitudinal Study (NEILS) began in 1996 and was part of a program of longitudinal studies funded by OSEP in the U.S. Department of Education. NEILS followed a sample of 3,338 infants and toddlers with disabilities, or at risk for disabilities, and their families through their experiences in early intervention and into early elementary school. The study provides information about the characteristics of children and families, the services they received, and the outcomes they experienced. Because data were collected in a nationally representative sample, NEILS results can be generalized to the population of children in early intervention in the United States.

Scope/Topic

NEILS provides information on children and families receiving early intervention services, early intervention services received by participating children and families and how those services are delivered, the costs of these services, the outcomes of participating children and families, and the relationship of outcomes to variations in child and family characteristics and services provided.

Sampling Strategy

A three-stage stratified sampling procedure was used to identify the original sample for the study. Twenty states were selected on the basis of the number of children served in early intervention and the region of the country. These states represented variation with regard to lead agency (e.g., education, health) and whether they served children at risk. The second stage involved the selection of counties on the basis of the estimated number of children served in Part C programs. Within each state, 3 to 7 counties were selected, for a total of 93 counties. The third stage of the sampling involved selection of the children and families. Between September 1997 and November 1998, all families ($N = 5,668$) who enrolled in the early intervention programs in the sampled counties and who met the study eligibility criteria were invited to participate in the study.

Data Collection Methods

Data were collected through telephone interviews with families, plus surveys of early intervention professionals, directors of programs serving the children and families in the study, and with kindergarten teachers. NEILS outcome data are based on parent and teacher report of student function and not on direct assessments of children. NEILS data were collected prior to the 2004 reauthorization of IDEA.

NEILS Indicators and Technical Information

NEILS outcome data were based on parent and teacher report of the child's skill level. Parents reported through a telephone interview on the child's development in several areas using one of several item formats: items that asked the parent to compare their child to other children the same age, developmental milestones that asked the parent to report on how well the child could do the item, and ratings of the child's status or behavior in an area. Content and type of items used in this report include:

Communication: Ratings of how well child makes needs known to others and how easy child is to understand.

⁵ <http://www.sri.com/neils/index.html>

Social skills: Ratings of child’s social skills compared with other children of the same age, and appropriateness of child’s behavior.

Cognition: Ratings of learning, thinking, and problem solving, paying attention and overall activity level.

Child health: Ratings taken from the National Health Interview Survey (NHIS).

Developmental skills: Ratings in the areas of mobility, independence, communication, cognition. Caregivers were provided with a verbal description of a developmental skill and asked to rate their child’s mastery of each skill on a three-point scale: (a) “Doesn’t do it at all,” (b) “Does it, but not well,” to (c) “Does it well.” The responses of “Don’t know” or “Refused” also were recorded. Questions were asked in developmental skills areas, ordered by developmental age, continuing until two consecutive items in the area were indicated “Doesn’t do it at all.”

Literacy and numeracy: Ratings of alphabet recognition, counting, reading books, and color identification.

The Kindergarten Teacher Survey contained items addressing multiple developmental areas including the following:

Social skills: Ratings of child’s social skills from the Social Skills Rating Scale (items addressing getting along with others and problem behaviors, etc.). This is an adapted version of the Social Rating Scale used in the ECLS-K.

Literacy and numeracy: Items from the Language and Literacy and Mathematics sections of the Academic Rating Scale: (whether the child produces rhyming words, solves number problems using concrete objects, etc.). This is an adaptation of the Academic Rating Scale used in the ECLS-K. Items that asked the teacher to compare the child’s performance to other kindergarten children (academic skills, activity level, etc.).

With the exception of the items used in other studies as indicated above, the parent interview and teacher survey items were developed specifically for NEILS based on the study’s conceptual framework. The milestone items in the parent interview were developed based on extensive reviews of similar items in infant assessments and developmental checklists. Item development included extensive field testing of the protocols.

Respondents and Response Rate

NEILS collects data from parents/families, service providers, program directors, and kindergarten teachers. NEILS has a total sample of 3,338 infants and toddlers. According to the NEILS website, the enrollment parent interviews were completed with 2,959 families. Interim interviews were completed with 2,357 parents, transition interviews (when the child was 3) with 2,616 families, and 2,223 kindergarten family interviews were completed. A total of 6,809 service records were completed. The NEILS website reports that 2,827 service provider surveys, 641 program director surveys, and 581 surveys were returned; however, these numbers do not include the most recent data collected.

Timing

Children and families entered the NEILS sample over a 14.5-month period, and the timing of the following parts of data collection was tied to when they entered the study. The frequency of data collection is described below and followed by a chart of the NEILS data collection timeline.

Family Interview. Families were interviewed when their children entered early intervention, annually on the anniversary of their entry, when their children were 3 years old, and again when they enter kindergarten.

Service Record. Every 6 months for as long as the child continued to receive early intervention, an early intervention professional completed a questionnaire on the early intervention services provided to the NEILS family.

Service Provider Survey. Early intervention professionals working with the children and families during the first 6 months of early intervention completed a mail survey about their background, training, and the ways they deliver services.

Program Director Survey. Directors of programs serving the children and families during their first 6 months in service completed a mail survey on the characteristics of their programs.

Kindergarten Teacher Survey. In the spring of children's kindergarten year, teachers completed a questionnaire.

NEILS Data Collection Timeline

National Household Education Surveys Program (NHES)

Overview

The National Household Education Surveys Program (NHES) is a data collection program of the National Center for Educational Statistics in the U.S. Department of Education's Institute of Education Sciences. The NHES uses telephone interviews to collect data from respondents in U.S. households and was specifically designed to collect data on issues that are best addressed by contacting households directly instead of schools and other educational institutions.

The NHES surveys collect data on the educational activities of the U.S. population and include data from learners of all ages: early childhood, school age, and adulthood. This data provides information on the condition of education in the U.S. to researchers, educators, and policymakers.

Scope/Topic

The topics included in each administration of the NHES vary. Some survey topics, such as Adult Education, Early Childhood Program Participation, and Parent and Family Involvement in Education, are repeated in multiple years in order to monitor trends over time. Other topics, such as Household Library Use, are included only once. The table below shows the NHES topics and the years they were administered.

Survey	Data Collection Year(s)
Adult Education	1991, 1995, 1999, 2001, 2003, 2005
Before- and After-School Programs and Activities	1999, 2001, 2005
Early Childhood Program Participation	1991, 1995, 1999, 2001, 2005
Parent and Family Involvement in Education	1996, 1999, 2003, 2007
Civic Involvement	1996, 1999
Household Library Use	1996
School Readiness	1993, 1999, 2007
School Safety and Discipline	1993

Most NHES surveys collect general descriptive information on all household members including first name, age, and gender. Other descriptive data collected varies slightly from survey to survey but generally includes household income, marital status, and receipt of assistance from state welfare programs and other similar agencies. Surveys for youth do not include questions on descriptive information.

Sampling Strategy

Participants are selected through a random sample of telephone numbers. The exact method used to sample the telephone numbers has varied from year to year.

Data Collection Methods

NHES data are collected through telephone surveys using computer assisted telephone interviewing (CATI) procedures.

Respondents and Response Rate

Between 45,000 and 64,000 households are screened for participation in each administration of the NHES surveys. Only individuals from households that meet specific criteria are asked to participate in extended interviews.

Timing

The NHES data collection was conducted for the first time in 1991 and has been conducted every one to three years since that time. NHES data collections took place in the springs of 1991, 1993, 1995, 1996, 1999, 2001, 2003, 2005, and 2007.

Availability

NHES data are publicly available online at <http://nces.ed.gov/nhes/dataproducts.asp>. Data from the 1999 and later administrations can be downloaded directly from this website. Available data products include complete data files, manuals, electronic codebooks, and setup files for SPSS, SAS, and STATA. These data products and the data products from the 1991-1996 NHES administrations are available on CD-ROM; CD-ROMs can be ordered free of charge through the same website. All direct participant identifiers are omitted or modified in the publicly available data to protect participant identity.

The National Health Interview Survey (NHIS)⁶

Overview

The National Health Interview Survey (NHIS) is one of the major data collection programs of the Centers for Disease Control and Prevention's (CDC's) National Center for Health Statistics (NCHS). Initiated in 1957, the NHIS is "the principal source of information on the health of the civilian noninstitutionalized population of the United States."⁷ The NHIS data allow the CDC and others to monitor the health of the US population by tracking data on a broad range of health topics. The survey has been administered yearly or annually since 1957. In order to include data on the most relevant topics, the NHIS is revised every 10-15 years. The last major revision occurred in the mid 1990s; this revised version was implemented in 1997 and is still in use today.

The current version of the NHIS consists of three major parts: the Basic Module, the Periodic Module, and the Topical Module. The Basic Module is mostly unchanged from year to year thereby allowing examination of trends in data over time. The Basic Module consists of three parts: the Family Core, the Sample Adult Core, and the Sample Child Core. The Family Core collects data on every member of participant families; only one adult and one child (if children are present) are randomly selected to provide data for the Sample Adult Core and Sample Child Core, respectively. The Periodic Module is used to collect more detailed information on topics in the Basic Module and is not used every year. The Topical Module is used to "respond to public health data needs as necessary"⁸ and is also not used every year.

Scope/Topic

The NHIS is a primary source for health data on the U.S. civilian noninstitutionalized population. The survey collects data on a broad range of health topics such as health care access and utilization, health indicators, and health behaviors. The NHIS includes a Basic Module which undergoes major revision every 10-15 years but is basically unchanged between these revisions. Two other modules, the Periodic Module and the Topical Module, are used to enrich or add to data collected as needed during the years between revisions.

Sampling Strategy

The NHIS is based on a stratified multistage sample design.⁹ The details of the sampling strategy, however, are revised every ten years, traditionally following the decennial censuses of the US population. The 1995-2004 NHIS was "designed to produce estimates for the Nation, for each of the four census regions, and within census regions by areas determined by metropolitan and nonmetropolitan status. Although the 1995-2004 survey samples from all of the States and the District of Columbia, it is not designed to produce reliable State-level estimates for every State." The primary sampling units (PSUs) for the survey were counties or contiguous groups of counties. The 1995-2004 sample included 358 PSUs. The black and Hispanic populations were oversampled.

⁶ <http://www.cdc.gov/nchs/nhis.htm>

⁷ Retrieved on 10/30/08 from <http://www.cdc.gov/nchs/about/major/nhis/hisdesc.htm>

⁸ Botman SL, Moore TF, Moriarity CL, and Parsons VL. Design and estimation for the National Health Interview Survey, 1995–2004. National Center for Health Statistics. Vital Health Stat 2(130). 2000.

⁹ Division of Health Interview Statistics, National Center for Health Statistics, Centers for Disease Control and Prevention, U.S. Department of Health and Human Services. 1999 National Health Interview Survey (NHIS) Public Use Data Release. February, 2002.

Data Collection Methods

NHIS data are collected through in-person interviews conducted by Census interviewers from the U.S. Census Bureau. Data are collected with laptop computers using computer-assisted personal interviewing (CAPI).

Respondents and Response Rate

In each year of data collection, NHIS data are collected via in person interviews conducted with adults in the selected households. Data are collected on all family members in the selected households. All adults 17 years of age and older who are home at the time of the interview are invited to respond for themselves. Information on all children and any adults not home at the time of the interview is provided by an adult family member who is 18 years of age or older.

In 1999, the year from which nationwide data were pulled for comparison with NEILS data, the interviewed sample included 37,573 households which included 97,059 persons in 38,171 families. The household response rate was approximately 87.6%.¹⁰

Timing

Sampling and interviewing for the NHIS are continuous throughout the year.

Availability

NHIS public use data files are available online. Partial data files from select NHIS data collection years are also available on ASCII CD (1969 through 2002) and SETS (Statistical Export and Tabulation System) CDs (1987 through 1996); these can be ordered by sending a request to NCHSQUERY@CDC.GOV or by calling the NCHS Data Dissemination Branch at 301-458-4636 or toll-free at 866-441-6247. In addition, NHIS LINKING files are available: MEPS/NHIS (Medical Expenditure Panel Survey/National Health Interview Survey) linkage files for select data collection years are available (see NHIS website).

National Longitudinal Transition Study-2 (NLTS2)¹¹

Overview

NLTS2 is a 10-year study of the experiences of young people who were 13 to 16 years old and receiving special education in the 2000-2001 school year. The sample of approximately 12,000 youth is nationally representative of youth with disabilities in that age group as a whole and those in each Federal special education disability category. Data are being collected through telephone interviews with parents and youth, surveys of school staff while youth are in secondary school, direct assessments of academic skills and knowledge, and collection of transcripts. The first NLTS, funded by OSEP from 1984 to 1993, provided valuable information that helped inform federal special education policy throughout the 1990s. NLTS2 will both revisit many of the NLTS topics and take a deeper look at such issues as access to the general education curriculum in high school, the social adjustment of youth, and increasing postsecondary education participation. NLTS2 is longitudinal. It includes a sample over 11 thousand participants and is nationally representative of students receiving special education who were ages 13 through 16 and in at least seventh-grade on December 1, 2000. Statistical summaries generated from NLTS2 will generalize to students receiving special education nationally in this age group, to each of the 12 Federal special education disability categories, and to each single-year age cohort.

Scope/Topic

NLTS2 includes information on the characteristics of secondary school students in special education and their households, the secondary school experiences of students in special education, including their schools, school programs, related services, and extracurricular activities, the experiences of students once they leave secondary school, including adult programs and services, social activities, the secondary school and post-school outcomes of students in the education, employment, social, and residential domains, and the secondary school and postschool outcomes of students in the education, employment, social, and residential domains.

Sampling Strategy

The NLTS2 sample is designed so that information from the study will represent youth with disabilities nationally as a group, youth in each of the 12 Federal special education disability categories, and youth in each of the five single-year age groups in the study.¹² The sample was selected in two stages to include 11,276 students, representing all special education disability categories, selected from more than 500 school districts and state-supported special schools throughout the United States. State-supported special schools for the deaf and blind were also invited to participate. In all, 476 school districts and 38 special schools were willing to take part. In the second stage, students who were 13 to 16 years old, in at least seventh-grade, and receiving special education as of Dec. 1, 2000, were selected from rosters of all students receiving special education services in participating districts and schools. Students were selected randomly from each disability category so that approximately 1,000 students are in the sample in most categories (fewer are in the low-incidence categories of traumatic brain injury and deaf/blindness). Accounting for attrition, the initial sample of approximately 1,000 students in each disability category will result in samples in the out years of the study of sufficient size to allow analyses with required level

¹¹ <http://www.nlts2.org/>

¹² The 12 disability categories under which 13- through 21-year-old children may be identified for services under IDEA, Part B, are specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), and deaf-blindness (DB).

of precision. The sample will be statistically weighted to represent the relative sizes of the disability categories nationally.

Data Collection Methods

NLTS2 is a longitudinal study, and is currently in progress. Information about youth has been collected repeatedly as they transition from secondary school to early adulthood. Data collection methods included telephone interviews with parents/guardians that focus on student and family characteristics, nonschool activities, satisfaction with school programs, and activities after high school. The teacher who provided instruction to a student during the first academic general education class on a typical Monday was surveyed about the classroom practices and the student's performance in that classroom. A teacher who knows the student's program well was surveyed about his/her overall program and performance more broadly (e.g., instructional settings that make up the student's whole experience, vocational education and transition planning experiences, and accommodations received). Information was also collected once at the onset of the study on the characteristics of schools and data on aggregate measures of school performance to use as supporting data. A direct assessment was conducted, including measures of students' reading and math skills, vocabulary, science and social studies content knowledge, as well as interviews about self-concept and self-determination. An Alternate Assessment (checklist completed by knowledgeable adult) was used when a student was unable to complete a direct assessment due to cognitive or behavioral limitations. NLTS2 assessment data were collected prior to the 2004 reauthorization of IDEA. Finally, transcripts were collected to learn about course-taking patterns, grades, and attendance.

NLTS2 Indicators and Technical Information

The Woodcock-Johnson III Tests of Achievement (Woodcock, McGrew, & Mather 2001) are a test battery designed to assess academic achievement across the general domains of reading, mathematics, written language, oral language, and academic knowledge. Authors report correlations of the complete achievement battery with the Wechsler Individual Achievement Test (Wechsler 1992; $r=.65$), and the Kaufman Test of Educational Achievement (Kaufman & Kaufman 1985; $r=.79$).

Woodcock-Johnson III: Synonyms and Antonyms (Woodcock, McGrew, and Mather 2001). The WJ III synonym and antonym subtest is an individually administered achievement test that measures word knowledge and comprehension. Students are presented with printed words and must verbally provide a suitable response having the same or the opposite meaning respectively. The items are arranged in order of difficulty, with the easiest items presented first and the most difficult items last. McGrew and Woodcock (2001) reported a .72 one year test retest correlation for the reading vocabulary cluster, of which synonyms and antonyms are a part, for children ages 14 to 17 (McGrew & Woodcock 2001).

Woodcock-Johnson III: Passage Comprehension (Woodcock, McGrew, and Mather 2001). This test requires children to identify letters that appear in large type on their side of the assessment easel. Later items require children to read words aloud. McGrew and Woodcock (2001) reported a .86 one year test retest correlation for children ages 8 to 10 and .76 one year test retest correlation for children ages 11 to 15 (McGrew & Woodcock 2001).

Woodcock-Johnson III: Calculation (Woodcock, McGrew, and Mather 2001). This test requires the child to perform math computations. The child is presented with a range of math problems arranged in order of difficulty to carry out the required math operation and produce the correct answer. Test developers reported a one year test retest correlation of .83 for children ages 8 to 10 and .81 for children ages 11 to 15 (McGrew & Woodcock 2001).

Woodcock-Johnson III: Applied Problems (Woodcock, McGrew, and Mather 2001). This test requires the child to analyze and solve math problems. To solve the problems, the child listens to the problem, recognizes the procedure to be followed, and then performs relatively simple calculations. Test developers reported a one year test retest correlation of .85 for children ages 8 to 10 and .88 one year test retest correlation for children ages 11 to 15 (McGrew & Woodcock 2001).

Respondents and Response Rate

Data were collected from parents/guardian and the teacher who provided instruction to a student during the first academic general education class on a typical Monday. Data was also collected from a teacher who knows the student’s program well, from the school administrator, and from the student through direct assessments. In the table below, both the number and response rate are presented, since the sample size (particularly for the assessment) did not include the whole sample.

Response Rates

	Wave 1 number	Wave 1 (%)	Wave 2 number	Wave 2 (%)
Direct student assessment	2,583	50.9	2,639	60.7
Functional rating	577	11.4	474	10.9
Parent interview-complete	8,672	76.9	--	--
Parent interview-partial	300	2.7	--	--
Mail questionnaire-complete	258	2.3	--	--
Parent interview – Part I	--	--	6,859	83.5
Parent interview – Part II	--	--	2,962	36.1
Youth interview or questionnaire	--	--	3,360	41.9
School program survey	5,588	53.1%	4,078	52.2%

A total of 2,592 general academic teacher surveys were completed.

Note: Waves do not correspond exactly to school years.

Timing

The table below depicts the timing of each planned study activity. Note that the school characteristics survey was completed only once, even if several sampled students attended the same school.

National Vital Statistics System (NVSS)¹³

Overview

The National Vital Statistics System (NVSS) is a collaborative effort between the National Center for Health Statistics (NCHS) and the states to collect and disseminate statistical information about vital events including births, deaths, marriages, divorces, and fetal deaths. Federal law mandates that vital statistics data be collected and published, and state laws mandate the completion of documents such as birth, death, marriage, and divorce certificates. Shared standards and procedures allow data to be collected at a national level.

Scope/Topic

NVSS contains five types of information: births, deaths, marriages, divorces, and fetal deaths. This report uses data on births, including counts of infants born on an Indian reservation.¹⁴

Sampling Strategy

No sampling is used.

Data Collection Methods

The states have the legal responsibility for registering vital events and for developing documents and procedures for collecting, recording, and sharing of data; however, through intergovernmental cooperation and agreement, standard forms and model procedures are developed and recommended to states for the uniform collection of vital statistics data. Birth certificates provide the primary source for data on births.

Respondents and Response Rate

Statistical information on vital events is collected from the 50 states, 2 cities (Washington, DC, and New York City), and 5 territories (Puerto Rico, the Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Mariana Islands). States are required to collect information on every vital statistics event.

Timing

States and other jurisdictions are required to issue a birth certificate within 5 days of a live birth.

Availability

NCHS provides user-friendly reports and tables on vital statistics data:
<http://www.cdc.gov/nchs/datawh/statab/unpubd/natality/natab2003.htm>

Further information about the collection of live birth data can be found at:
<http://www.cdc.gov/nchs/data/TechApp04.pdf>

¹³ <http://www.cdc.gov/nchs/nvss.htm>

¹⁴ <http://www.cdc.gov/nchs/data/dvs/FinalBirthSpecs3-24-2005.pdf>

Pre-Elementary Education Longitudinal Study (PEELS)¹⁵

Overview

The Pre-Elementary Education Longitudinal Study (PEELS), is funded by the U.S. Department of Education's National Center for Special Education Research (NCSEER). It follows a nationally representative sample of 3,100 children with disabilities ages 3–5 for a period of 6 years, starting in 2003-2004 and ending in 2008-2009. PEELS examines the achievement of students with disabilities in preschool, kindergarten, and elementary school and determines the factors associated with this achievement. Data were gathered through parent/guardian interviews, child assessments, and teacher and service provider questionnaires. In addition, information was collected through mail questionnaires from each child's preschool program director or school principal, local educational agency (LEA), and state education agency (SEA).

PEELS data are a nationally representative sample weighted to generate national estimates; therefore, the results can be generalized to the entire U.S. population of children with disabilities ages 3–5 (see sampling procedures below). PEELS is a longitudinal study.

Scope/Topic

PEELS includes information on the characteristics of children receiving preschool special education, the preschool programs and services they receive, transition between early intervention and preschool, and between preschool and elementary school, the function of performance of these children in preschool, kindergarten, and early elementary school, and the association of child, service, and program characteristics with performance over time on assessments of academic and adaptive skills.

Sampling Strategy

PEELS used a two-phase sample design. In the first phase, a national sample of LEAs was selected and asked to participate. In the second phase, researchers selected individuals at random from lists of eligible children provided by the participating LEAs. These lists included age-eligible children who had an IEP prior to March 1, 2003, as well as eligible children who were newly identified by their LEAs between March 1, 2003, and February 29, 2004. The child sample was divided into three age cohorts, which are defined as Cohort A (born 3/1/00 through 2/28/01), Cohort B (born 3/1/99 through 2/29/00) and Cohort C (born 3/1/98 through 2/28/99). in the table below.

Once LEAs were recruited, LEA staff determined whether the sampled children were eligible for the study based on three criteria:

1. There was an English- or Spanish-speaking adult or an adult who used signed communication in the household who could respond to the telephone interview or alternatively respond using a telephone relay service or interpreter for the hearing impaired.
2. This was the first child in the family sampled for PEELS.
3. The sampled child's family resided in the participating LEA at the time of enrollment in PEELS.

¹⁵ <https://www.peels.org/default.asp>

Data Collection Methods

Data collection methods varied according to the type of respondent. Teacher, principal, program director, LEA and SEA respondents received mail questionnaires. For parent data, a parent/guardian of each child was asked to complete a 1-hour computer-assisted telephone interview (CATI) about the participating child's health and disability, behavior, school programs and services, special education and related services, child care, and out-of-school activities. Respondents also were asked a series of questions about their household, its resources, and family background. Child performance data were obtained through direct assessment by over 400 assessors. For children who could not participate in the direct assessment, data were obtained from their teachers. See addendum for a list of assessments used.

PEELS Indicators and Technical Information

Adaptive Behavior System – Second Edition (ABAS-II; Harrison and Oakland 2003). The ABAS-II is a checklist of the child's functional knowledge and skills, and is completed by a teacher or other service provider. It assesses children's functional performance in several areas: communication, community use, functional (pre) academics, school living, health and safety, leisure, self care, self direction, social, and work. It also can be used to produce composite scores in conceptual, social, and practical domains. The ABAS-II has two versions. The first version, the Teacher/Daycare Provider Form, is for children not yet in kindergarten. The second version, the Teacher Form, is for children in kindergarten or higher grades. Harrison and Oakland (2003) reported coefficient alpha reliabilities for the ABAS-II subtests on the Teacher/Daycare Provider Form ranging from .72 to .94, depending on the age group and subtest, with higher reliabilities for composite domain scores ($r = .92$ to $.97$). On the Teacher Form, they reported coefficient alphas ranging from .84 to .97, with composite domain coefficients in the .96 to .98 range. Test retest reliabilities for periods of two days to six weeks ranged from .66 to .98, depending on age level and subtest. The correlation between the overall composite scores on the ABAS-II, Teacher/Daycare Provider Form, and Vineland Adaptive Behavior Scales, Classroom Edition was $r = .75$. The correlation between the ABAS-II Teacher Form overall composite and Vineland overall composite was $r = .84$ (Harrison & Oakland 2003).

Peabody Picture Vocabulary Test-Third Edition (PPVT-III; Dunn and Dunn 1997). In this test of receptive language, assessors show children a page with four pictures and ask them to point to the picture of the item that the assessor names. The version used for PEELS had been shortened using item response theory. Item response theory (IRT) uses the pattern of correct, incorrect, and omitted responses to the items actually administered in a test and the difficulty of each item to estimate the score each child would have obtained if all of the test items had been administered. In the adapted Peabody Picture Vocabulary Test (PPVT) used in PEELS, all children completed a core set of items. Based on their performance on the core, they either took an easier, basal set of items; stopped after the core set; or took a harder (ceiling) set of items. The standard version of the PPVT-III had high alternate form reliability for the standardized scores (.88 to .96). Split half reliability coefficients were also high (.86 to .97). Test retest reliability coefficients were in the .90s (Dunn & Dunn 1997). PPVT-III scores were significantly correlated with age; the steepest part of the growth curve occurred from age 2 V2 to 12. Dunn and Dunn (1997) reported that the PPVT-III correlated with the Wechsler Intelligence Scale for Children Third Edition (Wechsler 1991; $r = .82$ to $.92$), Kaufman Adolescent and Adult Intelligence Test (Kaufman & Kaufman 1993; $r = .76$ to $.91$), Kaufman Brief Intelligence Test (Kaufman & Kaufman 1990; $r = .62$ to $.82$), and the Oral and Written Language Scales (Carrow Woolfolk 1995; $r = .63$ to $.83$).

Preschool and Kindergarten Behavior Scales, Second Edition (PKBS-2; Merrell 2002). The PKBS-2 was included in the Early Childhood Teacher and Kindergarten Teacher Questionnaires. It is a norm referenced, standardized instrument that includes two scales, a social skills scale (34 items) and a problem behavior scale (42 items) (Merrell 2002). Test developers reported Cronbach alpha coefficients of .96 to

.97 for ages 3 to 6 on the Social Skills scale and .93 to .95 on the Problem Behavior scale. Three week test retest reliability for subscales of the Social Skills scale ranged from .58 to .66. For subscales of the Problem Behavior scale, test retest reliability was in the .70 to .78 range. Merrell (1995) reported significant correlations between the PKBS-2 and the Social Skills Rating System (SSRS, Gresham & Elliott 1990), Matson Evaluation of Social Skills with Youngsters (Matson, Esvelt Dawson, & Kazdin 1983), Connors Teacher Rating Scales (Connors, 1990), and School Social Behavior Scales (Merrell 1993).

Woodcock-Johnson III: Letter-Word Identification (Woodcock, McGrew, and Mather 2001). This test requires children to identify letters that appear in large type on their side of the assessment easel. Later items require children to read words aloud. McGrew and Woodcock (2001) reported a .92 one year test retest correlation for children ages 4 to 7. Test scores were correlated with age (McGrew & Woodcock 2001). They also reported that the complete Woodcock Johnson III achievement battery was correlated with the Wechsler Individual Achievement Test (Wechsler 1992; $r = .79$) and the Kaufman Test of Educational Achievement (Kaufman & Kaufman 1985; $r = .79$).

Woodcock-Johnson III: Applied Problems (Woodcock, McGrew, and Mather 2001). This test requires the child to analyze and solve math problems. To solve the problems, the child listened to the problem, recognized the procedure to be followed, and then performed relatively simple calculations. Test developers reported a one year test retest correlation of .92 for children ages 4 to 7 (McGrew & Woodcock 2001).

Respondents and Response Rate

Data were collected from children through direct assessment, from parents through CATI phone interviews, and from early childhood, kindergarten and elementary teachers through questionnaires. In addition, data were collected from school program directors/principals, LEA directors, and SEA directors.

Response Rates to Date:

Data Collection Instruments	2003-04	2004-05	2005-06
Parent interview	96	93	88
Child assessment	96	94	93
Teacher questionnaire	76	86	84
Principal/program director questionnaire	76	--	--
LEA questionnaire*	86	67	--

*In Wave 2, this questionnaire was sent only to the 15 LEAs in the supplemental sample.

Timing

	Wave 1 03-04	Wave 2 04-05	Wave 3 05-06	Wave 4 06-07	Wave 5 08-09
Parent interviews	X	X	X	X	X
Child assessments	X	X	X	X	X
Teacher/service provider questionnaires	X	X	X	X	X
School/program administrator questionnaires	X	X**	X**		X
District administrator questionnaires	X	X*			
State administrator questionnaires	X				

*Only in the 15 LEAs added in Wave 2.

**Only for Wave 1 & 2 non-respondents and administrators with children who moved into their schools/programs.

Availability

PEELS Wave 1 and Wave 2 data have been released. The PEELS Restricted Use CD-ROM includes a User's Guide for the data files; Electronic Codebooks for each file, as well as pdf versions of the codebooks; an installation program for the Electronic Codebooks; and a User's Guide for the Electronic Codebooks. The data user can create SAS, SPSS for Windows, and Stata programs that will generate an extract data file from any of the PEELS data files on the CD-ROM. In addition, PEELS data will be available on the web through a dynamic table production system called the PEELS Data Analysis System.

Section 618 Data (DANS)¹⁶

Overview

Under Section 611, 633 and 618 of *IDEA*, states and the Department of the Interior, Bureau of Indian Affairs, Bureau of Indian Education (BIE) are required to report annual data to OSEP, U.S. Department of Education.

Scope/Topic

The data set includes the number of children 1) receiving services under IDEA Part C and Part B, 2) served in various educational settings, 3) exiting schools or programs through various routes, and 4) removed for disciplinary reasons, as well as counts of personnel employed to serve these children. In 2004-05, a new data collection was added—counts of students participating in state assessments and their performance on those assessments.

Child count is a point-in-time count by each state of children birth through 21 receiving early intervention, special education and related services under *IDEA* on a state-designated date between October 1 and December 1 of each year. Considerations about the child count data include: (1) It is not a cumulative count of all students served throughout the most recent 12 month period for Part C and school year for Part B; (2) States have different eligibility criteria for each disability category. (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part 618 Data Collection Information retrieved on September 28, 2009 from <https://www.ideadata.org/618DataCollection.asp>.)

Sampling Strategy

No sampling is conducted.

Data Collection Methods

Paper data collection forms and CD ROMs are sent to states annually.

Respondents and Response Rate

Data are collected from SEAs, with all states reporting. The Department of the Interior submits reports for students receiving IDEA services provided by the BIE. Beginning in 2004, DANS began a practice of suppressing counts of less than 5 and reports the count as zero.

Timing

These data are collected annually. Some of the data (e.g., personnel) have been collected since 1975, although data elements have changed over time. See *OSEP Part B Data Collection History* for a complete description of how these data have been collected over the years. (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part 618 Data Collection Information retrieved on September 28, 2009 from <https://www.ideadata.org/618DataCollection.asp>.)

¹⁶ <https://www.ideadata.org/index.html>

Availability

The IDEAdata.org website provides public access to the most recent data about children with disabilities served under IDEA at <https://www.ideadata.org/default.asp>. They are provided in the form of tables produced for OSEP's Annual Reports to Congress. The tables, and most pages of this web site, are organized according to the part of the law that governs services for children in an age group. Part B serves children ages 3 through 21. Part C serves infants and toddlers, ages birth through 2.

Special Education Elementary Longitudinal Study (SEELS)¹⁷

Overview

The Special Education Elementary Longitudinal Study (SEELS) was a 6-year study of students receiving special education who were ages 6 through 12 in spring 2000. The sample included students who were 12 through 18 at the end of the study. Students were selected randomly from rosters of students receiving special education. Statistical summaries generated from SEELS generalize to special education students nationally as a group, to each of the Federal special education disability categories, and to each single-year age cohort. SEELS collected descriptive information about characteristics of students with disabilities as they transitioned from elementary to middle and middle to high school. It documented the educational services they received and their academic, social, and vocational development. Data were collected through telephone interviews with parents, surveys of school staff, direct assessments of academic skills and knowledge, and collection of transcripts for middle and high school students.

Scope/Topic

SEELS measured the amount of change over time in the lives of elementary and middle school students with disabilities at both group and individual levels. The eight topical areas addressed included: 1) household characteristics, 2) student functioning, 3) activities in students' non-school hours, 4) parental expectations and supports, 5) school and special education enrollment, 6) school programs, 7) parents' perceptions of schools and school programs, and 8) students' school engagement and academic performance

Sampling Strategy

The SEELS sample was constructed in two stages. In the first stage, a sample of 1,124 LEAs was selected randomly from the universe of approximately 14,000 LEAs that served students receiving special education in at least one grade from first- to seventh-grade. These districts and 77 state-supported special schools that served primarily students with hearing and vision impairments and multiple disabilities were invited to participate in the study. A total of 245 LEAs and 32 special schools agreed to participate. In the second stage, the LEAs provided rosters of students receiving special education in the designated age range, from which the student sample was selected. The roster of all students receiving special education from each LEA and special school was stratified by disability category. Students then were randomly selected from each disability category. Sampling fractions were calculated that would produce enough students in each category so that, in the final study year, the data could be generalized to most categories individually with an acceptable level of precision, accounting for attrition and for response rates to both the parent interview and the direct assessment. A total of 11,512 students were selected and eligible to participate in the SEELS parent interview/survey sample.

Data Collection Methods

Data collection methods varied according to type of respondent. Teachers and school principals received mail questionnaires. For parent data, a parent/guardian of each child was asked to complete a computer-assisted telephone interview (CATI) about the participating child's extracurricular activities, historical information, household characteristics and the family's level and type of involvement in school-related areas. Parents with an accurate address who could not be reached by telephone were mailed a self-administered questionnaire. Child performance data were obtained through direct assessment. For children who could not participate in the direct assessment, data were obtained by a teacher completed alternate assessment. SEELS assessment data were collected prior to the reauthorization of IDEA in 2004.

¹⁷ <http://www.seels.net/>

SEELS Indicators and Technical Information

The Woodcock-Johnson III Tests of Achievement (Woodcock, McGrew, & Mather 2001) is a test battery designed to assess academic achievement across the general domains of reading, mathematics, written language, oral language, and academic knowledge. Authors report correlations of the complete achievement battery with the Wechsler Individual Achievement Test (Wechsler 1992; $r=.65$), and the Kaufman Test of Educational Achievement (Kaufman & Kaufman 1985; $r=.79$).

Woodcock-Johnson III: Letter-Word Identification (Woodcock, McGrew, and Mather 2001). This test requires children to identify letters that appear in large type on their side of the assessment easel. Later items require children to read words aloud. WJ-III Letter Word Identification measures the student's reading skills in identifying isolated letters and words; it is not necessary that the subject know the meaning of any words correctly identified. McGrew and Woodcock (2001) reported a .85 one year test retest correlation for children ages 8 to 10 and .84 one year test retest correlation for children ages 11 to 15 (McGrew & Woodcock 2001).

Woodcock-Johnson III: Passage Comprehension (Woodcock, McGrew, and Mather 2001). This test requires children to identify letters that appear in large type on their side of the assessment easel. Later items require children to read words aloud. McGrew and Woodcock (2001) reported a .86 one year test retest correlation for children ages 8 to 10 and .76 one year test retest correlation for children ages 11 to 15 (McGrew & Woodcock 2001).

Woodcock-Johnson III: Calculation (Woodcock, McGrew, and Mather 2001). This test requires the child to perform math computations. The child is presented with a range of math problems, arranged in order of difficulty, to carry out the required math operation and produce the correct answer. Test developers reported a one year test retest correlation of .83 for children ages 8 to 10 and .81 for children ages 11 to 15 (McGrew & Woodcock 2001).

Woodcock-Johnson III: Applied Problems (Woodcock, McGrew, and Mather 2001). This test requires the child to analyze and solve math problems. To solve the problems, the child listens to the problem, recognizes the procedure to be followed, and then performs relatively simple calculations. Test developers reported a one year test retest correlation of .85 for children ages 8 to 10 and .88 one year test retest correlation for children ages 11 to 15 (McGrew & Woodcock 2001).

Respondents and Response Rate

In each round of data collection, data were collected from children through direct assessment, from parents through CATI phone interviews, and from principals and language arts teachers through mailed surveys.

Response Rates to Date

State Annual Performance Reports (APRs) - State Accountability Test Data

Overview

Under No Child Left Behind (NCLB), states administer academic tests in core subject areas for the purposes of monitoring school district and school progress towards performance goals defined under adequate yearly progress (AYP). States design and administer both standard assessments with accommodations and alternate assessments based on alternate achievement standards. The results of each type of assessment are characterized by achievement levels such as proficient, advanced, and below proficient. These assessments are conducted and the results reported to the public annually. States define academic standards and standard and alternate assessments for accountability purposes differently. Across states, the assessments also differ in content, test design, cut score identification, and scoring approaches. Therefore, any direct comparisons between states must be made cautiously. Under IDEA, states must report the results of their state accountability tests for students with disabilities to OSEP on the state's annual progress report. These data, in turn, have been compiled by the National Center on Educational Outcomes (NCEO) at the University of Minnesota.

Scope/Topic

State accountability data provide performance data on reading, mathematics, and sciences tests in counts and percentages of students meeting various achievement levels.

Sampling Strategy

No sampling is used.

Data Collection Methods

States report performance data to OSEP annually on the state APR. NCEO compiles these data for OSEP.

Respondents and Response Rate

These data are collected in all 50 states in compliance with accountability provisions of NCLB. According to law, states must include and be accountable for all students in these assessments, including students with disabilities. Students with disabilities in states participate via standard assessments with no accommodations, standard assessments with accommodations or alternate assessments based on alternate achievement standards. At state level, the results of these efforts annually are reported to OSEP in the form of counts and percentages. There is considerable state variation in determining eligibility for assessments, nature of accommodations, how such decisions are made, as well as how they are used in accountability systems.

Timing

These data are collected annually. At the time of writing this report, there were no grade 8 mathematics data available.

Availability

The National Center on Educational Outcomes (NCEO) makes these data available to the public on the world wide web through the NCEO data viewer application (<http://data.nceo.info/>).

United States Census 2000¹⁸

Overview

The U.S. decennial census is mandated by the U. S. Constitution. Census data are used to count the nation's population for the purpose of allocating electoral votes, congressional seats, and funding for some federal programs, as well as to evaluate federal policies and programs. The census is conducted by the U.S. Bureau of the Census of the U. S. Department of Commerce. U.S. Census figures are based on actual counts of persons, including citizens, non-citizen legal residents, non-citizen long-term visitors, and illegal immigrants, dwelling in U.S. residential structures. Recent censuses also include estimates of uncounted housed, homeless, and migratory persons.

Scope/Topic

The U. S. Census collects the following information on the short form from every respondent: whether a housing unit is owned or rented, name, sex, age, relationship to householder, Hispanic origin, and Race. The long form includes additional questions on the following subjects: social characteristics (marital status, place of birth/citizenship/year of entry, education-school enrollment/educational attainment, ancestry, residence 5 years ago, language spoken at home, veteran status, disability, grandparents as caregivers), economic characteristics (labor force status, place of work and journey to work, work status last year, industry/occupation/class of worker, income), dwelling characteristics (units in structure, number of rooms, number of bedrooms, plumbing and kitchen facilities, year structure built, year moved into unit, house heating fuel, telephone, vehicles available, farm residence, value of home, monthly rent, and selected shelter costs).

Sampling Strategy

No sampling is used.

Data Collection Methods

Census data are collected through questionnaires distributed and returned by mail, questionnaires that are hand-delivered to households, and direct counts by census workers for households that do not complete a questionnaire. Two forms of the questionnaire are used, the short form and the long form. All respondents receive the short form, and a sample of respondents (about one in six) receives additional questions on a long form. For the 2000 census, data collection began at the end of March and concluded in August.

Respondents and Response Rate

The response rate for the 2000 census was 67%.

Timing

The census is conducted every ten years.

Availability

Further information about the 2000 census, as well as Census 2000 data, may be found at <http://www.census.gov/main/www/cen2000.html>

**Appendix A2. Infants and Toddlers Identified for
Early Intervention Services Under IDEA**

Appendix A2. Infants and Toddlers Identified for Early Intervention Services Under IDEA

In chapter 2, we present data related to questions of identification and outcomes of infants and toddlers identified for services under IDEA. This appendix provides supporting information for each exhibit in chapter 2. Exhibits A2.1 through A2.7 provide relevant counts and percentages related to identification. Exhibits A2.8 through A2.10 provide relevant counts, percentages, and significance tests related to declassification. Exhibits A2.11 through A2.28 provide means, standard errors, confidence intervals, p values, and Benjamini-Hochberg-adjusted statistical significance levels related to outcomes.

Exhibit A2.1. National number of infants and toddlers identified for services under IDEA, by age (2005)

Children served under IDEA by age												
Year	Birth to less than 1	1 to less than 2	2 to less than 3	3 to less than 4	4 to less than 5	5 to less than 6	6 to less than 7	7 to less than 8	8 to less than 9	9 to less than 10	10 to less than 11	11 to less than 12
2005	41,865	94,445	158,404	153,320	245,526	300,082	361,567	411,694	454,033	488,367	504,071	509,464

Children served under IDEA by age											
Year	12 to less than 13	13 to less than 14	14 to less than 15	15 to less than 16	16 to less than 17	17 to less than 18	18 to less than 19	19 to less than 20	20 to less than 21	21 to less than 22	
2005	514,497	519,873	521,723	519,973	484,682	417,768	209,608	60,306	28,617	13,353	

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA, based on enrollment numbers at a single time point between October 1, 2005, and December 1, 2005. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The ages of children eligible to receive early intervention services under Part C of IDEA are birth through 2. The shaded portion represents the data for these children.

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The total number of children is a population proxy constructed with National Vital Statistics System birth data, including births on Indian reservations. Birth data for 2006 are preliminary. The percentage of children who were identified was calculated by dividing the number of children identified for services under IDEA (DANS) in a given age group by the total number of children in the same age group as indicated by the population proxy constructed with National Vital Statistics System birth data.

2005	2.55	177,153	6,949,628	2.32	40,579	1,748,576	2.09	59,815	2,865,130	1.95	12,781	656,516	2.45	2,947	120,501
2006	—	177,379	—	—	40,894	—	—	64,699	—	—	13,625	—	—	3,098	—

— Percentages for 2006 could not be calculated because birth data for 2006 by race/ethnicity were not available.

NOTE: Black includes African American, Hispanic includes Latino, Asian includes Native Hawaiian or Other Pacific Islander, and American Indian includes Alaska Native. The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children and births. The percentages of children identified were calculated by dividing the number of children identified for services under IDEA (birth through 2) in a given racial/ethnic category by the total number of children (birth through 2) in the same racial/ethnic category as indicated by the NVSS-constructed population proxy.

¹ Throughout this exhibit, "98–05" presents the average percentage for the years 1998 through 2005.

NOTE: National data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The numbers used to calculate the percentages of children identified are (1) counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year and (2) population proxy constructed with data from the National Vital Statistics System (NVSS) birth data, including births on Indian reservations. The annual state counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. The percentages were calculated by dividing the number of children identified for services under IDEA (birth through 2) in a state (or nationally) by the number of children in the same state (or nationally) as indicated by the NVSS-constructed population proxy. NVSS birth data for 2006 are preliminary.

NOTE: OSEP categorization is based on definition of developmental delay and whether the state serves at-risk children. The numbers of children identified are calculated from counts of children identified for services under IDEA at a single time point between October 1, 2006, and December 1, 2006. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. National data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. The percentages were calculated by dividing the number of children identified for services under IDEA (birth through 2) in a state by the number of children in the same state as indicated by the NVSS-constructed population proxy. NVSS birth data for 2006 are preliminary.

Exhibit A2.8. National percentage of children exiting early intervention before 36 months of age and at 36 months of age who did and did not receive Part B services

Outcome	Percent	Standard error	N	Confidence interval
Exited before 36 months	17.8	1.93	365	3.84
Exited at 36 months to Part B	61.9	1.73	1,452	3.19
Exited at 36 months, no Part B	20.4	1.55	458	3.14

NOTE: Data are weighted to be nationally representative. Cohort began to receive early intervention services between September 1997 and November 1998.

SOURCE: U.S. Department of Education, Office of Special Education Programs, National Early Intervention Longitudinal Study (NEILS), parent interviews and kindergarten teacher survey (public use dataset), 2007.

Exhibit A2.9. National percentage of children no longer receiving early intervention services under IDEA at 36 months of age, by exit category (2005–2006)

Outcome	Number of children	Percentage of children no longer receiving EI services
Total	170,113	
Part B eligible	112,164	65.93
Exited to other programs	19,811	11.64
Part B eligibility not determined	28,167	16.56
Exited with no referrals	9,971	5.86

NOTE: The DANS data represented in this exhibit reflect data on all children who exited EI programs at 36 months of age in fall 2005.

Appendix A3. Preschool-Age Children Identified for Services Under IDEA

Appendix A3. Preschool-Age Children Identified for Services Under IDEA

In chapter 3, we present data related to questions of identification and outcomes of preschool-age children identified for IDEA services. This appendix provides supporting information for each exhibit in chapter 3. Exhibits A3.1 through A3.7 provide relevant counts, proportions, and ratios related to identification. Exhibits A3.8 through A3.10 provide means, standard errors, confidence intervals, p values and Benjamini-Hochberg-adjusted statistical significance levels related to outcomes.

Exhibit A3.1. National number of preschool-age children identified for services under IDEA, by age (2005)

Year	Children served under IDEA by age											
	Birth to less than 1	1 to less than 2	2 to less than 3	3 to less than 4	4 to less than 5	5 to less than 6	6 to less than 7	7 to less than 8	8 to less than 9	9 to less than 10	10 to less than 11	11 to less than 12
2005	41,865	94,445	158,404	153,320	245,526	300,082	361,567	411,694	454,033	488,367	504,071	509,464

Year	Children served under IDEA by age										
	12 to less than 13	13 to less than 14	14 to less than 15	15 to less than 16	16 to less than 17	17 to less than 18	18 to less than 19	19 to less than 20	20 to less than 21	21 to less than 22	
2005	514,497	519,873	521,723	519,973	484,682	417,768	209,608	60,306	28,617	13,353	

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1, 2005, and December 1, 2005. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The ages of children eligible to receive preschool services under IDEA are 3 through 5 years. The shaded area represents the data for these children.

SOURCE: U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Part B, Child Count, 1997–2006, retrieved December 7, 2007, from <http://www.ideadata.org/PartBChildCount.asp>.

2002	639,264	11,781,864	5.43	139,299	3,959,417	3.52	243,593	3,941,553	6.18	256,372	3,880,894	6.61
2003	671,630	11,959,784	5.62	148,592	4,058,814	3.66	233,701	3,959,417	5.90	289,337	3,941,553	7.34
2004	692,978	12,044,164	5.75	155,860	4,025,933	3.87	243,283	4,058,814	5.99	293,835	3,959,417	7.42
2005	698,928	12,106,473	5.77	153,320	4,021,726	3.81	245,526	4,025,933	6.10	300,082	4,058,814	7.39
2006	706,242	12,137,609	5.82	163,926	4,089,950	4.01	244,041	4,021,726	6.07	298,275	4,025,933	7.41

NOTE: The percentage of children who were identified was calculated by dividing the number of children identified for services under IDEA (DANS) in a given age group by the total number of children in the same age group as indicated by the NVSS-constructed population proxy. The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on Indian reservations.

See notes at end of exhibit.

Exhibit A3.6. National number and percentage of preschool-age children identified for services under IDEA, by disability category (2004–2006)—Continued

Child category	2004	2005	2006
Percentage of children identified for services who are served in each disability category			
Specific learning disabilities	1.92	1.71	2.06
Speech or language impairments	47.11	46.63	46.96
Mental retardation	3.24	3.24	3.30
Emotional disturbance	0.84	0.83	0.91
Hearing impairments	1.11	1.11	1.15
Visual impairments	0.47	0.49	0.50
Orthopedic impairments	1.23	1.17	1.15
Other health impairments	1.81	1.86	2.23
Autism	3.70	4.32	4.94
Traumatic brain injury	0.15	0.15	0.15
Multiple disabilities	1.19	1.20	1.32
Deaf-blindness	0.04	0.03	0.03
Developmental delay	37.20	37.27	35.31

NOTE: States or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category. In 2004, 46 states reported counts under this category, and in 2006, 48 states reported counts under this category. The numbers of children identified in this exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on Indian reservations. The percentage of children who were identified under a given IDEA disability category was calculated by dividing the number of 3- through 5-year-olds identified for services under that category (DANS) in a given year by the total number of 3- through 5-year-olds in that same year as indicated by the NVSS-constructed population proxy. Relative percentage change from 2004 to 2006 for each disability category was calculated by subtracting the 2004 identification percentage from the 2006 percentage and dividing the difference by the 2004 percentage (multiplying the result by 100).

2005	Wyoming	13.05	2,469	18,918

¹ Throughout this exhibit, "98–05" presents the average of the 1998 through 2005 DANS and NVSS data counts (nationally and by state) and the average percentage for the years 1998 through 2005.

NOTE: National data represent the counts and average percentages for the 50 states and the District of Columbia. The numbers of children identified are the state counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. The total number of children is a population proxy constructed with National Vital Statistics System (NVSS) birth data, including births on Indian reservations. The percentage of all children identified was calculated by dividing the number of 3- through 5-year-olds identified for services under IDEA in a given state (or nationally) in a given year (or range of years) by the total number of 3- through 5-year-olds in the same state (or nationally) in the same year (or range of years) as indicated by the NVSS-constructed population proxy.

¹ BH statistical significance: Y = statistically significant at 0.05 (2-tailed test) after adjustment using the Benjamini-Hochberg procedure for multiple comparisons and false discovery rate.

NOTE: Data were preliminary at the time of publication (2005). Social skills and problem behaviors were measured by the Preschool and Kindergarten Behavior Scales-Second Edition (PKBS-2) (Merrell 2002). Self-care skills and self-direction skills were measured by the Adaptive Behavior Assessment System-Second Edition (ABAS-II) (Harrison and Oakland 2003). All measures are based on a general population mean of 100 and a standard deviation of 15. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

Appendix A4. School-Age Children Identified for Services Under IDEA

Appendix A4. School-Age Children Identified for Services Under IDEA

In chapter 4, we present data related to questions of identification, declassification, and outcomes of school-age children identified for services under IDEA. This appendix provides supporting information for each exhibit in chapter 4. Exhibits A4.1 through A4.7 provide relevant counts, proportions, and percentages related to identification. Exhibits A4.8 through A4.9 provide percentages, means, and percentages related to declassification from IDEA services. Exhibits A4.10 through A4.14 provide means, standard errors, confidence intervals, p values and Benjamini-Hochberg-adjusted BH statistical significance levels related to outcomes from NAEP. Exhibits A4.15 through A4.17 provide percentages and standard errors for NAEP achievement levels and percentages for state accountability test achievement levels. Exhibits A4.18 through A4.19 provide means, standard errors, confidence intervals, p values and Benjamini-Hochberg-adjusted BH statistical significance levels related to outcomes from the SEELS and NLTS2. Exhibits A4.20 through A4.26 provide counts and percentages related to school completion.

Exhibit A4.1. National number of school-age children identified for services under IDEA, by age (2005)

Children served under IDEA by age												
Year	Birth to less than 1	1 to less than 2	2 to less than 3	3 to less than 4	4 to less than 5	5 to less than 6	6 to less than 7	7 to less than 8	8 to less than 9	9 to less than 10	10 to less than 11	11 to less than 12
2005	41,865	94,445	158,404	153,320	245,526	300,082	361,567	411,694	454,033	488,367	504,071	509,464

Children served under IDEA by age											
Year	12 to less than 13	13 to less than 14	14 to less than 15	15 to less than 16	16 to less than 17	17 to less than 18	18 to less than 19	19 to less than 20	20 to less than 21	21 to less than 22	
2005	514,497	519,873	521,723	519,973	484,682	417,768	209,608	60,306	28,617	13,353	

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1, 2005, and December 1, 2005. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. School-age children eligible to receive services under IDEA are ages 6 through 21 years. The shaded area represents the data for these children.

2005	5,707,712	44,177,425	12.92	1,715,661	14,476,698	11.85	2,047,905	14,897,970	13.75	1,944,146	14,802,757	13.13

NOTE: The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. To compute the percentages, the ages of children with disabilities, including children in BIE schools, were aligned with the grades of the children for their age as follows: 6- through 9-year-olds, grades 1–4; 10- through 13-year-olds, grades 5–8; 14- through 17-year-olds, grades 9–12; and 6- through 17-year-olds, grades 1–12. The number of children in a given age group identified for services under IDEA (DANS) was then divided by the total number of children enrolled in the corresponding grade level (CCD).

NOTE: Black includes African American, Hispanic includes Latino, Asian includes Native Hawaiian or Other Pacific Islander, and American Indian includes Alaska Native. The numbers of children identified in the exhibit are aggregated counts of children ages 6 through 21 identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. The percentages were calculated by dividing the number of 6- through 21-year-olds in a given racial/ethnic category identified for services under IDEA (DANS) by the total number of students enrolled in grades 1 through 12 in the same racial/ethnic category (CCD).

NOTE: State or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category. In 1997, 6 states reported counts under this category, and in 2005, 48 states reported counts under this category. The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. To compute the percentages, the ages of children with disabilities, including children in BIE schools, were aligned with the grades of the children for their age, as follows: 6- through 9-year-olds, grades 1–4; 10- through 13-year-olds, grades 5–8; 14- through 17-year-olds, grades 9–12; and 6- through 17-year-olds, grades 1–12. The number of children in a given age group identified for services under a given IDEA disability category (DANS) was then divided by the total number of children enrolled in the corresponding grade level (CCD). In a given age group, the relative percentage change from 1997 to 2005 for each disability category was calculated by subtracting the 1997 identification percentages from the 2005 percentage and dividing the difference by the 1997 percentage (multiplying the result by 100).

† Not applicable to this age group.

NOTE: State or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category. In 1997, 6 states reported counts under this category, and in 2005, 48 states reported counts under this category. The numbers of children identified in the exhibit are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. To compute the percentages, the ages of children with disabilities, including children in BIE schools, were aligned with the grades of the children for their age, as follows: 6- through 9-year-olds, grades 1–4; 10- through 13-year-olds, grades 5–8; 14- through 17-year-olds, grades 9–12; and 6- through 17-year-olds, grades 1–12. The number of children in a given age group identified for services under a given IDEA disability category (DANS) was then divided by the total number of children enrolled in the corresponding grade level (CCD). In a given age group, the relative percentage change from 1997 to 2005 for each disability category was calculated by subtracting the 1997 identification percentages from the 2005 percentage and dividing the difference by the 1997 percentage (multiplying the result by 100).

2003	Wyoming	13.45	10,636	79,054
2004	Wyoming	13.71	10,710	78,095

¹ Throughout this exhibit, "98–04" presents the average of the 1998 through 2004 DANS and CCD data counts (nationally and by state) and the average percentage for the years 1998 through 2004. NOTE: National data represent the counts and average percentages for the 50 states and the District of Columbia. The numbers of children identified are the state counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. To compute the percentages, the ages of children with disabilities were aligned with the grades of the children for their age, as follows: 6- through 17-year-olds, grades 1–12. The number of children identified for services in a given age group in a given state in a given year (or range of years) (DANS) was then divided by the total number of children enrolled in the corresponding grade level in the same state in the same year (or range of years) (CCD).

Exhibit A4.7b. Percentage of 6- through 9-year-olds identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2004, and 2005)

NOTE: States are ordered by the percentage of 6- through 9-year-olds in grades 1–4 identified for services in 2005. Vertical lines represent the average percentages for the 50 states and the District of Columbia. The numbers of children identified are the state counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. To compute the percentages, the ages of children with disabilities were aligned with the grades of the children for their age, as follows: 6- through 9-year-olds, grades 1–4; 10- through 13-year-olds, grades 5–8; 14- through 17-year-olds, grades 9–12; and 6- through 17-year-olds, grades 1–12. The number of children identified for services in a given age group in a given state in a given year (or range of years) (DANS) was then divided by the total number of children enrolled in the corresponding grade level in the same state in the same year (or range of years) (CCD).

¹ Throughout this exhibit, "98–04" presents the average of the 1998 through 2004 DANS and CCD data counts (nationally and by state) and the average percentage for the years 1998 through 2005.

NOTE: National data represent the counts and average percentages for the 50 states and the District of Columbia. The numbers of children identified are the state counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. To compute the percentages, the ages of children with disabilities were aligned with the grades of the children for their age, as follows: 6- through 9-year-olds, grades 1–4; 10- through 13-year-olds, grades 5-8; 14- through 17-year-olds, grades 9–12; and 6- through 17-year-olds, grades 1–12. The number of children identified for services in a given age group in a given state in a given year (or range of years) (DANS) was then divided by the total number of children enrolled in the corresponding grade level in the same state in the same year (or range of years) (CCD).

Exhibit A4.7c. Percentage of 10- through 13-year-olds identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2004, and 2005)

NOTE: States are ordered by the percentage of 10- through 13-year-olds in grades 5–8 identified for services in 2005. Vertical lines represent the average percentages for the 50 states and the District of Columbia. The numbers of children identified are the state counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. To compute the percentages, the ages of children with disabilities were aligned with the grades of the children for their age, as follows: 6- through 9-year-olds, grades 1–4; 10- through 13-year-olds, grades 5–8; 14- through 17-year-olds, grades 9–12; and 6- through 17-year-olds, grades 1–12. The number of children identified for services in a given age group in a given state in a given year (or range of years) (DANS) was then divided by the total number of children enrolled in the corresponding grade level in the same state in the same year (or range of years) (CCD).

¹ Throughout this exhibit, "98–04" presents the average of the 1998 through 2004 DANS and CCD data counts (nationally and by state) and the average percentage for the years 1998 through 2005.

NOTE: National data represent the counts and average percentages for the 50 states and the District of Columbia. The numbers of children identified are the state counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. To compute the percentages, the ages of children with disabilities were aligned with the grades of the children for their age, as follows: 6- through 9-year-olds, grades 1–4; 10- through 13-year-olds, grades 5–8; 14- through 17-year-olds, grades 9–12; and 6- through 17-year-olds, grades 1–12. The number of children identified for services in a given age group in a given state in a given year (or range of years) (DANS) was then divided by the total number of children enrolled in the corresponding grade level in the same state in the same year (or range of years) (CCD).

Exhibit A4.7d. Percentage of 14- through 17-year-olds identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2004, and 2005)

NOTE: States are ordered by the percentage of 14- through 17-year-olds identified for services in grades 9–12 identified for services in 2005. Vertical lines represent the average percentages for the 50 states and the District of Columbia. The numbers of children identified are the state counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. To compute the percentages, the ages of children with disabilities were aligned with the grades of the children for their age, as follows: 6- through 9-year-olds, grades 1–4; 10- through 13-year-olds, grades 5–8; 14- through 17-year-olds, grades 9–12; and 6- through 17-year-olds, grades 1–12. The number of children identified for services in a given age group in a given state in a given year (or range of years) (DANS) was then divided by the total number of children enrolled in the corresponding grade level in the same state in the same year (or range of years) (CCD).

See notes at end of exhibit.

Exhibit A4.7d. Percentage of 14- through 17-year-olds identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2004 average, and 2005)—Continued

Year	State	Percentage of children age 14 through 17	Number of children identified	Number of children
1997	Wyoming	9.85	3,091	31,388
98–04 ¹	Wyoming	11.46	23,366	203,887
2005	Wyoming	12.32	3,353	27,214
1998	Wyoming	10.91	3,413	31,292
1999	Wyoming	10.94	3,330	30,436
2000	Wyoming	10.97	3,266	29,783
2001	Wyoming	11.37	3,302	29,035
2002	Wyoming	11.77	3,317	28,190
2003	Wyoming	12.06	3,340	27,703
2004	Wyoming	12.38	3,398	27,448

¹ Throughout this exhibit, "98–04" presents the average of the 1998 through 2004 DANS and CCD data counts (nationally and by state) and the average percentage for the years 1998 through 2005.

NOTE: National data represent the counts and average percentages for the 50 states and the District of Columbia. The numbers of children identified are the state counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. To compute the percentages, the ages of children with disabilities were aligned with the grades of the children for their age, as follows: 6- through 9-year-olds, grades 1–4; 10- through 13-year-olds, grades 5-8; 14- through 17-year-olds, grades 9–12; and 6- through 17-year-olds, grades 1–12. The number of children identified for services in a given age group in a given state in a given year (or range of years) (DANS) was then divided by the total number of children enrolled in the corresponding grade level in the same state in the same year (or range of years) (CCD).

Exhibit A4.9. Mean WJ-III reading and mathematics scores of 6- to 17-year-old children identified for services under IDEA, by classification status (2002)

	Letter-word identification		Passage comprehension		Calculation		Applied problems	
	Declassified	Not declassified	Declassified	Not declassified	Declassified	Not declassified	Declassified	Not declassified
Standard score	96.26	82.12	92.25	82.59	103.68	90.91	100.96	88.27
Standard error	1.57	0.77	1.46	0.75	1.40	0.71	1.56	0.74
Confidence interval	3.08	1.50	2.87	1.47	2.74	1.38	3.05	1.45

NOTE: Scores reflect students' performance on a research version of the Woodcock-Johnson III (WJ III) (Woodcock, McGrew, and Mather 2001). All measures are based on a general population mean of 100 and a standard deviation of 15. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

Exhibit A4.11j. Mean reading scale scores of fourth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

Exhibit reads: The mean reading scale score of fourth-grade students identified for services under IDEA in Massachusetts was 213 in 2007.

NOTE: States are ordered by the mean scores of students identified for IDEA services. Vertical lines represent national means. DoDEA refers to the Department of Defense Education Agency.

Exhibit A4.12j. Mean reading scale scores of eighth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

Exhibit reads: The mean reading scale score of eighth-grade students identified for services under IDEA in Vermont was 248 in 2007.

NOTE: States are ordered by the mean scores of students identified for IDEA services. Vertical lines represent national means. DoDEA refers to the Department of Defense Education Agency. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

Exhibit A4.13j. Mean mathematics scale scores of fourth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

Exhibit reads: The mean mathematics scale score of fourth-grade students identified for services under IDEA in Massachusetts was 238 in 2007.

NOTE: States are ordered by the mean scores of students identified for IDEA services. Vertical lines represent national means. DoDEA refers to the Department of Defense Education Agency. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error. Exhibit A4.14j. Mean mathematics scale scores of eighth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

Exhibit reads: The mean mathematics scale score of eighth-grade students identified for services under IDEA in Massachusetts was 271 in 2007.

NOTE: States are ordered by the mean scores of children identified for services under IDEA. Vertical lines represent national means. DoDEA refers to the Department of Defense Education Agency. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

NOTE: Disability categories are: all students with disabilities (All SWD), specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB). NLTS2 administered a research edition of the WJ III in Waves 2 and 4 of the study (2002 and 2004, respectively). Each wave of testing included students who were 16- through 18-years-old at the time of administration. All measures are based on a general population mean of 100 and a standard deviation of 15. The presented confidence intervals represent plus or minus 1.96 multiplied by the standard error.

¹ The Averaged Freshman Graduation Rate (AFGR) uses aggregate student enrollment data to estimate the size of an incoming freshman class and aggregate counts of the number of graduates 4 years later. For a given year, the freshman class size four years prior is estimated by summing the enrollment in 8th grade 4 years prior, 9th grade for the next year, and 10th grade for the year after and then dividing by 3. The averaging is intended to account for higher grade retentions in the 9th grade. To calculate the AFGR, the number of diplomas awarded in a year serves as the numerator, and the averaged freshmen class enrollment serves as the denominator (for more information about the use of the AFGR for the general population, go to: <http://nces.ed.gov/pubsearch/pubsinfo.asp?pubid=2008053>). Using data from the Common Core of Data (CCD), the formula for calculating the AFGR for youth in the total population is shown below.

AFGR formula for youth in the total population for 2005-06 school year:

Regular High School Diplomas Awarded at End of 2005-06 School Year

Enrollment in (Grade 8 in fall 2001 + Grade 9 in fall 2002 + Grade 10 in fall 2003)/3

² Because counts of students enrolled by grade level were not available in Data Analysis System (DANS), the formula used to calculate the AFGR for youth identified for services under IDEA differed for that for youth in the total population. Instead of counts by grade level, we used enrollment counts by age in calculating the estimated size of the freshman class.

For students identified for services, for a given year we summed the enrollment of those who were age 13 4 years prior, age 14 the next year, and age 15 the year after and divided by 3 to estimate the size of the freshman class. Using DANS data, the AFGR formula for youth identified for IDEA services is shown in the example below.

AFGR formula for youth identified for IDEA services for 2005-06 school year:

$$\frac{\text{High School Diplomas Awarded at End of 2005-06 School Year}}{\text{Enrollment (age 13 in fall 2001 + age 14 in fall 2002 + age 15 in fall 2003)/3}}$$

³ The 1998-2004 average of the freshman class estimate for the total population was obtained by summing the fall enrollment in 8th grade for 1994-2000, the fall enrollment in 9th grade for 1995-2001, and the enrollment in 10th grade for 1996-2002 and then dividing by 3. Similarly, the 1998-2004 average of the freshman class estimate for youth identified for IDEA services was obtained by summing the enrollment of 13 year olds in 1994-2000, 14 year olds in 1995-2001, and 15 year olds in 1996-2002 and then dividing by 3. To calculate the average AFGR for 1998-2004 for youth in the total population and those identified for IDEA services, the total number of diplomas received in 1998-2004 was divided by the respective estimate for the size of the freshman class for this time period.

NOTE: Both data sources report counts provided by states of the number of students receiving a regular diploma. There is considerable variation by state in how regular diplomas are awarded and counted, with some states awarding regular diplomas to all students who meet completion requirements, regardless of the extent to which these requirements address defined academic standards and other states awarding an alternative credential to students who meet some, but not all, requirements. Thus, comparisons across states should be treated very cautiously.

The AFGR is not the same as a true cohort graduation rate that uses individual-level data to show the proportion of students entering the 9th grade for the first time who graduate in 4 years. The data used in these analyses come from repeated cross-sectional surveys--individual students are not followed from year to year. The denominator, the averaged freshman class, is only an approximation of the freshman class 4 years prior. The extent to which it departs from the actual number of students graduating on time depends on the number of students who were not first time 9th graders 4 years prior, the number who transferred in or out of a class, dropped out, or were retained. Similarly, the aggregate number of graduates in a given year likely includes students who did not enter high school 4 years prior. The AFGR is thus an imperfect approximation of the graduation rate, but one that can be calculated using existing data.

Appendix B. Technical Notes

Technical Notes

Specific variables from multiple data sources were used to conduct analyses related to identification of children identified for IDEA services, declassification of children who are no longer eligible for IDEA services, and outcomes of children receiving IDEA services (see Appendix A.1 for description of data sources). This Appendix provides information about the following: (1) brief description of the variables that were used in analyses and presentations of identification, declassification, and outcomes of children identified for IDEA services; (2) calculation of identification percentages across chapters using the National Vital Statistics System (NVSS) birth data and Common Core of Data (CCD) counts; (3) the Benjamini-Hochberg approach for multiple comparisons applied across chapters; and (4) description of specific analyses conducted, by chapter and exhibit, including the nature of the data presented in each exhibit and any transformations that were applied to the data.

A. Variables Used in Analyses

Brief descriptions of variables used in analyses related to identification, declassification, and outcomes of children identified for early intervention services (children ages birth through 2), for preschool special education services (children ages 3 through 5), or for special education services in elementary or secondary school (children ages 6 through 21) are provided below.

1. Identification of Children for Services under IDEA

- Number of children identified, based on state-reported counts in Data Analysis System (DANS) include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. For the birth through 2 and 3 through 5 age groups, the DANS count of children identified for services in each age group was available for each year from 1997 through 2006 under all IDEA early intervention eligibility categories and special education disability categories. For school-age children (ages 6 through 21), the DANS count of children identified for services under IDEA was available for each year from 1997 to 2005 for each disability category.^{1 2}
- Identification percentages of children in a given subgroup (i.e., age group, race/ethnicity category) who were identified for services were calculated by dividing the number of children of each age year (for a given subgroup) who are identified for services by the number of children in that age group in the total population and multiplying the result by 100 (see exhibit B.1 for calculations). Because Census data are not available for each calendar year of interest, proxies were created for total population counts: NVSS birth record data

¹ The 3 disability categories under which 0- through 3-year-old children may be identified for services under IDEA, Part C are developmental delay, at risk condition, diagnosed condition. The 13 disability categories under which 3- through 21-year-old children may be identified for services under IDEA, Part B, are specific learning disabilities (SLD), speech or language impairments (SP), mental retardation (MR), emotional disturbance (ED), hearing impairments (HI), visual impairments (VI), orthopedic impairments (OI), other health impairments (OHI), autism (AUT), traumatic brain injury (TBI), multiple disabilities (MD), deaf-blindness (DB), and developmental delay (DD). States or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category.

² Number of children ages 5–21 years identified for IDEA services on an Indian reservation is submitted from the Bureau of Indian Education (BIE), Bureau of Indian Affairs (BIA), Department of the Interior, to the Department of Education. This data is made available through DANS. For the birth through 2 and 3 through 5 age groups, states report these counts through DANS.

were used for children in the age groups birth through 2 and 3 through 5, and CCD student enrollment data were used for the 6 through 17 age group (and the 6 through 21 age group for analyses relating to race/ethnicity). A detailed description of the calculation of identification percentages, including a comparison of the use of the NVSS proxy and Census data are presented in the next section.

Exhibit B.1. Alignment of data sources with calculation of identification ratios for the year 2000

Age Group	Data Source	Data Description	Data Source Period
Birth through 2	DANS NVSS	<u>Child count @Dec 1 (0s, 1s, 2s)</u> Number of birth across calendar years (0s, 1s, 2s)	<u>12/1/00</u> 1998–2000 (0s =00, 1s=99, 2s=98)
3 through 5	DANS NVSS	<u>Child count @Dec 1 (3s, 4s, 5s)</u> Number of birth across calendar years (3s, 4s, 5s)	<u>12/1/00</u> 1995–1997 (3s =97, 4s=96, 5s=95)
6 through 9	DANS CCD	<u>Child count @Dec 1 (6s, 7s, 8s, 9s)</u> Enrollment of 1st –4th graders	<u>12/1/00</u> 2000–2001 school-year
10 through 13	DANS CCD	<u>Child count @Dec 1 (10s, 11s, 12s, 13s)</u> Enrollment of 5th–8th graders	<u>12/1/00</u> 2000–2001 school-year
14 through 17	DANS CCD	<u>Child count @Dec 1 (14s, 15s, 16s, 17s)</u> Enrollment of 9th –12th graders	<u>12/1/00</u> 2000–2001 school-year
NOTE: The proxy for the number of children birth through age 2 and ages 3 through 5 was calculated based on births during prior years. To support the use of this proxy, births for both age groups, the correlation between Census 2000 and CCD 2000 and Census 2000 and NVSS-constructed proxies for 2000 were calculated and presented in a later section of this appendix.			

- Composition of the population of children with disabilities by gender (preschool- and school-age children only) is calculated by dividing the count of male (or female) children of a given age group who were identified for services in the year represented by the total count of children in the same age group identified for services in the year represented.

2. Declassification of Children with Disabilities

- The percentage of children exiting early intervention before 36 months of age and at 36 months of age, who did and did not receive Part B services, was based on data from the National Early Intervention Longitudinal Study (NEILS).
- The percentage of children no longer receiving early intervention services under IDEA at 36 months of age, by exit category, was based on state-reported data on the number of children who exit Part C early intervention services and why children no longer receive EI services. Four of the nine reasons for exit from the program apply to children leaving at 36 months of age. The declassification analysis for children birth through age 2 in chapter 2 looked only at these four reasons: (1) children are eligible for Part B preschool services, (2) eligibility for Part B has not been determined, (3) exited to other programs, and (4) exited with no referrals to other programs. (U.S. Department of Education, Office of Special Education Programs, Data Analysis System, Section 618, Part C, 1998–2005).

- Data from the Special Education Elementary Longitudinal Study (SEELS) provide the percentages across disability categories of 6- through 12-year-olds identified for services under IDEA in 1999 who no longer were receiving special education services 28 to 32 months later. The National Longitudinal Transition Study-2 (NLTS2) data provide the percentage across disability categories of 13- through 16-year-olds identified for services under IDEA in December 2000 who no longer were receiving special education services about 16 months later, based on parents' reports (reported for all children and by disability category).

3. Outcomes for Children Identified for Services Under IDEA

- For children ages birth through 2 (chapter 2), variables in each outcome domain are reported, based on NEILS data, for children overall who were identified for EI services under IDEA, by Part C eligibility category, and by whether a child was identified for services under IDEA in kindergarten.
 - Communication skills of children at 36 months of age and at kindergarten were measured by parents' reporting of children's ability to communicate needs as well as other children their age, children's communication being very easy to understand, children reaching age-expected communication milestone (NEILS parent interview). Kindergarten measure of communication also included parents' report of children's ability to understand verbal and nonverbal communication as well as other children their age. At kindergarten, teachers reported of children's ability to understand others and communicate with others as expected for age (NEILS teacher survey).
 - Cognitive development at 36 months of age and at kindergarten was measured by parents' reports of children's ability to recognize most or all letters of the alphabet, to count to 20 or higher, and mastery of all age-appropriate cognitive milestones (NEILS parent interview). Kindergarten teachers reported on children's mastery of nine early literacy skills and seven early numeracy skills (NEILS teacher survey).
 - Social-emotional development was measured at 36 months and kindergarten by parents' reports of children's behavior on 14 social-emotional skills and whether they reached all age-appropriate social-emotional milestones (NEILS parent interview); kindergarten teachers' reports of children demonstrating eight negative behaviors, such as never following directions, number of friendships relative to other children in class, and age appropriateness of their overall social skills (NEILS teacher survey).
 - Adaptive development was based on parent reports of children reaching a set of age-expected adaptive milestones, such as feeding, dressing, and toileting independently (NEILS parent interview; reported only for children at 36 months of age).
 - Physical development and health was measured at 36 months and kindergarten by parents' reports of children's reaching a set of age-expected physical milestones, such as catching a thrown ball or walking downstairs alternating feet, parents' report of general health status, parents' and teacher's report of activity level compared with same-age peers (NEILS parent interview and teacher survey).
- For preschool-age children ages 3 through 5 (chapter 3), outcomes were reported based on Pre-Elementary Education Longitudinal Study (PEELS) for children overall and by disability category:
 - Emergent literacy skills were measured by direct assessments of children's letter and word identification skills (WJ-III) and vocabulary skills (PPVT-III).

- Emergent numeracy skills were measured by direct assessments of children’s ability to solve applied mathematics problems read to them by assessors (WJ-III).
- Preacademic skills were based on teachers’ reports of children’s abilities to perform basic skills that form the foundation for developing academic skills and independent functioning (ABAS-II).
- Social development was based on teachers’ reports of children’s social skills, prevalence of problem behaviors, self-care skills, and self-directedness (PKBS-2).
- For school-age students ages 6 through 21 (chapter 4), outcomes were reported for three domains:
 - Reading abilities are reported for children and youth identified and not identified with a disability using grade 4 and 8 National Assessment of Educational Progress (NAEP) scale scores and achievement levels in 2002, 2005, and 2007 on general understanding, interpretation, making connections, and examining content of written material for children and achievement levels on state accountability tests. Additionally, reading skills are reported for children identified for special education services and by disability category using standard scores on the WJ-III direct assessments of letter and word identification skills and reading comprehension for 7- through 14-year-olds (SEELS) and identification of antonyms and synonyms and passage comprehension for 16- through 18-year-olds (NLTS2).
 - Mathematics skills were reported for children and youth identified and not identified with a disability using grade 4 and 8 NAEP scale scores and achievement levels in 2002, 2005, and 2007 related to number properties and operations, measurement, geometry, data analysis, probability, and algebra and achievement levels on state accountability tests. In addition, mathematics skills are reported for children identified for special education services and by disability category using WJ-III standard scores on direct assessments of proficiency with mathematics calculations and solving applied problems for 7- through 14-year-olds (SEELS) and 16- through 18-year-olds (NLTS2).
 - School completion (high school students only) was based on several measures, including percentage of students identified for special education services leaving high school in a given year who left by graduating with a diploma, receiving a certificate of completion, reaching the maximum age for attendance (ageout), or dropping out. School completion by disability categories and change over time in rates of graduation, certification, ageout, and dropout were also reported. In addition, the Averaged Freshman Graduation Rate (AFGR) was computed as the percentage of high school students who graduated in 4 years. Changes in rates of graduation, certification, ageout, and dropout were calculated over time (1998 through 2005) and by disability category (2003 through 2005).

B. Calculation of Identification Percentages

To address research questions on the percentage of children identified for early intervention and special education services under IDEA, identification percentages were calculated by dividing the number of children in each age group or subgroup (e.g., race/ethnicity category) who are identified for services by the number of children in that age group (or subgroup) in the total population, multiplied by 100. For analyses involving children from birth through age 5, identification percentages were calculated using the number of children identified for services under IDEA in the birth through 2 and 3 through 5 age groups (obtained from DANS) in a particular year and geographic area (i.e., nation or state) divided by the NVSS-constructed

population proxy. NVSS birth record data were used to create a proxy for the birth through 2 and 3- through 5-year-old resident population count by compiling the number of births during prior years (see exhibit B.1 for calculations). These proxies were constructed for each geographic area and were not adjusted for deaths, migration between states, immigration, or emigration. For ages 6 through 17, the numerator is the number of children and youth identified for services under IDEA as a whole or who are classified as having a particular disability in the target geographic area (obtained from DANS). The denominator is the total number of children and youth enrolled in school in the grade that aligns with the age range in the target geographic area (obtained from the CCD): 6- through 9-year-olds align with grades 1 through 4, 10- through 13-year-olds align with grades 5 through 8, and 14- through 17-year-olds align with grades 9 through 12; 6- through 17-year-olds align with grades 1 through 12. CCD school enrollment data for grades 1 through 12 were used to create a proxy for the total number of children and youth ages 6 through 17 enrolled in school. As DANS (Section 618) data only reports the aggregated 6-21 counts for the race/ethnicity information, identification percentages by race/ethnicity category were calculated by dividing the number of children and youth ages 6 through 21 identified for services under IDEA by the number of children and youth identified for services under IDEA enrolled in grades 1 through 12.

1. Comparison of Birth Data and Enrollment Data with Census Counts

The most accurate indicator of the number of children birth through 5 and 6 through 17 in the population is census counts of the number of children in the age group of interest. However, the U.S. Census is only conducted every 10 years. This necessitated using a proxy to represent this population in the denominator. Consequently, it was important to determine if (1) the proxy for the birth through 2 and 3 through 5-year-old population represents population counts and (2) representing the number of children ages 6 through 17 in the population by the number students in the corresponding grade would provide population counts similar to that of the census.

To examine how well these sources align with US Census counts, we calculated the ratio of the number of children in various age categories in 2000 as derived from the 2000 Census, NVSS birth records, and CCD counts. For example, the number of children ages 0 through 2 in 2000 derived from NVSS birth records for 1998-2000 was 11,959,784, and the number of children ages 0 through 2 in 2000 from the 2000 Census was 11,458,830. The ratio of the child counts from the two sources is 1.04. Exhibit B.2 presents the national and state ratios of the number of children ages 0 through 2 and 3 through 5 as reported by the U.S. Census Survey (2000) and derived from NVSS birth records (1995-2000). Exhibit B.3 presents the national and state ratios of the number of school-age children as reported by U.S. Census Survey (2000) and the CCD (2000), by age group.

Exhibit B.2. National and state ratios of children ages 0 through 2 and 3 through 5 as reported by the U.S. Census Survey (2000) and derived from the National Vital Statistics System Birth Records (1995–2000)

2. Imputation Procedures Used for NVSS Data

For calculations of identification percentages by race/ethnicity categories using NVSS data, procedures were used to reclassify the cases reported by NVSS as “Other Races” and as Hispanic ethnicity. NVSS reports births by mother’s race (i.e., White, Black, American Indian, Asian or Pacific Islander, and prior to 1992, Other Races). In addition, births for each race are reported by Hispanic origin (i.e., Hispanic, non-Hispanic, and Not Stated or Not on Birth Certificate).

Race. “Other Races” births that were of non-Hispanic ethnicity were allocated to specific races on the basis of the proportion of the specific races in the non-Hispanic category. For example, in 1990, out of a total of 3,457,417 non-Hispanic births, 2,626,500 were White, and 1,423 were “Other Races.” The percentage of White non-Hispanic births among births classifiable by race is $2,626,500 / (3,437,417 - 1,423) = 76$ percent. Therefore, we classified 76 percent of the 1,423 “Other Race” non-Hispanic births as White non-Hispanic. Similarly,

“Other Races” births in the Hispanic category were allocated to specific races on the basis of the proportions of the specific races in the Hispanic category.

Hispanic Ethnicity. An analogous procedure was used to classify births whose Hispanic Origin classification was “Not Stated” or “Not on Birth Certificate.” Such births were allocated on the basis of the percentage of Hispanic births for their race. For example, in 2005, out of a total of 3,229,294 White births, 2,279,768 were non-Hispanic, and 23,443 were “Other Races.” The percentage of White non-Hispanic births among births classifiable by Hispanic ethnicity is $2,279,768 / (3,229,294 - 23,443) = 71$ percent. Therefore, we classified 71 percent of the 23,443 “Not Stated” White births as White non-Hispanic. Similarly, “Not Stated” or “Not on Birth Certificate” births in the Black, American Indian, and Asian or Pacific Islander categories were allocated on the basis of the proportions of the classifiable births of Hispanic ethnicity in the respective racial category.

C. Benjamini-Hochberg Approach to Multiple Comparisons

The Benjamini-Hochberg (1995) approach was used in this study to control for alpha level inflation in multiple comparisons. This approach controls the false discovery rate (FDR).

The FDR is the expected proportion of all rejected null hypotheses that are rejected erroneously (i.e., the expected fraction of statistically significant test statistics that are false discoveries)... The rationale behind the FDR is that a few erroneous rejections may not be as problematic for drawing conclusions about the family tested when many null hypotheses are rejected as they would be if only a few null hypotheses are rejected. The rejection of many null hypotheses is a signal that there are real differences across the contrasted groups. Thus, researchers might be willing to tolerate more false positives ... if the [number of rejected hypotheses] were large than if they were small. Under this approach conclusions regarding intervention effects are to be based on the preponderance of evidence; the set of discoveries to be used to reach an overall decision about the treatment. (Schochet 2008, page B-3).

The version of the Benjamini-Hochberg (BH) applicable to independent tests was used rather than the version applicable to dependent tests (Benjamini and Yekutieli, 2001), for the following reasons: (1) the BH procedure (Benjamini and Hochberg 1995) controls the false discovery rate for independent tests corresponding to the true null hypotheses—independence not being required for test statistics corresponding to the false null hypotheses; and (2) Benjamini and Yekutieli (2001) found that the original BH procedure also controls the false discovery rate for true null hypotheses with “positive regression dependence.” In addition, conducting tests under an assumption of dependence would require further empirical investigation (Schochet 2008, p. B-8).

For each domain to which the Benjamini-Hochberg test was applied, the p values for each individual test were sorted from largest to smallest values. Let m be the number of tests conducted in a domain, and $p_{(1)} \leq p_{(2)} \leq \dots \leq p_{(m)}$ be the ordered p -values. Let

$$k = \max \left[i : p_{(i)} \leq \frac{i}{m} q \right]$$

where $q = 0.05$ is the FDR. If any i satisfies the condition in the brackets, we rejected null hypotheses $H_{(1)}: p_{(1)} = 0$ through $H_{(k)}: p_{(k)} = 0$.

The Benjamini-Hochberg test (Benjamini and Hochberg 1995) was applied at the 5% FDR level separately to eight domains, as shown in exhibit B.4.

Exhibit B.4. Application of Benjamini-Hochberg Adjustment to Outcome Analyses

Outcome Analyses	Number of Tests	Number of p values < 5%	Number of p values satisfying the Benjamini-Hochberg criteria
All NEILS tests shown in appendices	369	241	228
All PEELS tests shown in appendices	80	48	39
NAEP grade 4 reading scores for 2003, 2005, and 2007	633	244	173
NAEP grade 4 math scores for 2003, 2005, and 2007	633	302	254
NAEP grade 4 reading scores for 2003, 2005, and 2007	633	173	118
NAEP grade 4 math scores for 2003, 2005, and 2007	633	200	150
All SEELS tests shown in appendices	44	41	41
All NLTS2 tests shown in appendices	36	33	33

D. Analyses Conducted (by chapter and by exhibit)

Chapter 2 – Early Intervention

Exhibit 2.1. National number of infants and toddlers identified for services under IDEA, by age (2005)

Exhibit 2.1 presents the unmodified numbers of children of each single year of age who were identified for services under IDEA in 2005. The numbers are aggregated counts of children identified for services under IDEA, based on numbers at a single time point between October 1, 2005 and December 1, 2005. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for all 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. Data were retrieved on December 7, 2007 from www.ideadata.org/PartCChildCount.asp for children ages birth through 2 and www.ideadata.org/PartBChildCount.asp for children ages 3 through 21 (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B and C, 2005). The ages of children eligible to receive early intervention services under Part C of IDEA are birth through 2, as indicated by the shaded area.

Exhibit 2.2. National number and percentage of infants and toddlers identified for early intervention services under IDEA, by age (1997–2006)

Exhibit 2.3. Trends in national percentage of infants and toddlers identified for early intervention services under IDEA, by age (1997–2006)

Exhibit 2.2 presents number and percentage of children identified for services under IDEA for ages birth through 2. Exhibit 2.3 presents the percentages for this age group in graphical form. The numbers are of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. Data represent all 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. This annual count includes both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA.

For each year, percentage of all children identified for early intervention services was calculated by dividing the unmodified count of 0- through 2-year-olds identified for services under IDEA for that year by the sum of the unmodified number of births in the given year and 1 and 2 years earlier (e.g., births from the years 1995 and 1996 were used for the denominator of the 1997 percentage, including births on Indian reservations), and multiplying the result by 100. For example, to calculate the percentage in 2006:

$$\left(\frac{\text{DANS count of all 0- through 2-year-olds identified for services under all IDEA classifications in 2006}}{\text{Total number of births in 2006 and 1 and 2 years earlier (from NVSS)}} \right) \times 100$$

Data for children identified for services under IDEA were retrieved on December 7, 2007 from www.ideadata.org/PartCChildCount.asp (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997-2006). Vital statistics birth data (NVSS) for 1997 to 2005 were retrieved on January 11, 2008 from <http://205.207.175.93/VitalStats/ReportFolders/ReportFolders.aspx> (Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System (NVSS)). The birth data for 2006 are from table 6, pg. 12, of Hamilton, Martin, and Ventura (2007).

Exhibit 2.4. National number and percentage of children ages birth through 2 identified for early intervention services under IDEA, by race/ethnicity (1998–2006)

Exhibit 2.5. Trends in national percentage of children ages birth through 2 identified for early intervention services under IDEA, by race/ethnicity (1998–2006)

Exhibit 2.4 presents number and percentages, from 1998 to 2006, of children birth through age 2 for five racial/ethnic categories. Exhibit 2.5 presents the percentages of the racial/ethnic categories for this age group in graphical form. The numbers are aggregated counts of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for the 50 states and the District of Columbia, including Bureau of

Indian Affairs (BIA) children. Identification data by race/ethnicity were first collected in 1998. Vital statistics birth data by race were not available after 2005.

For each racial/ethnic category, the percentage was calculated by dividing the number of children receiving early intervention services under IDEA (birth through age 2) in the given racial/ethnic category by the sum of the unmodified number of births in the same racial/ethnic category as reported in the NVSS data in the given year and 1 and 2 years earlier, and multiplying the result by 100. For example, to calculate percentages in 2005:

$$\left(\frac{\text{DANS count of all 0- through 2-year-olds in racial/ethnic group identified for services under all IDEA classifications in 2005}}{\text{Total number of births in 2005 and 1 and 2 years earlier (from NVSS)}} \right) \times 100$$

DANS data were obtained from the Data Analysis System (DANS), Section 618, Part C, 1998–2006, retrieved from <http://www.ideadata.org/docs/PartCTrendData/C3.xls>. Vital statistics birth data (NVSS) were obtained from the Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System (NVSS), 1990–2005, <http://205.207.175.93/VitalStats/ReportFolders/ReportFolders.aspx>. The birth data for 2006 are from table 6, pg 12, of Hamilton, Martin, and Ventura (2007).

Exhibit 2.6. Percentage of children ages birth through 2 identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2005 average, and 2006)

Exhibit 2.6 presents percentages for each of the 50 states and the District of Columbia, including Bureau of Indian Affairs (BIA) children. In this exhibit, states are ordered by their 2006 percentage. Vertical lines represent national percentages. See note to exhibit 2.2 for calculation of percentages. The percentages for the average of 1998 through 2005 were calculated by summing the percentages for 1998 through 2005 and dividing the total by 8.

DANS data were obtained from the Data Analysis System (DANS), Section 618, 1997–2006, Part C, at <http://www.ideadata.org/PartCChildCount.asp>. NVSS data were obtained from the U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System (NVSS), 1990–2005, at <http://205.207.175.93/VitalStats/ReportFolders/ReportFolders.aspx>. Birth data for 2006 are from table 6, pg 12, of Hamilton, Martin, and Ventura (2007).

Exhibit 2.7. Percentage of children ages birth through 2 identified for services under IDEA in 50 states and the District of Columbia, by the state’s Office of Special Education Programs (OSEP) categorization of eligibility (2006)

Exhibit 2.7 presents state percentages coded by the OSEP categorization of the breadth of the state’s eligibility criteria for children birth through 2 years of age. OSEP classifications of state definitions were retrieved from <http://spp-apr-calendar.rrfcnetwork.org/explorer/view/id/284> on November 1, 2007. OSEP categorization of states’ eligibility criteria for EI services is based on the definition of developmental delay and whether the state serves at-risk children (Mackey, Andrews, and Taylor

2007). The vertical line in this exhibit represents the national percentage for children birth through age 2 for 2006.

Data from the Data Analysis System (DANS), Section 618, 2006, Part C, were retrieved from http://www.ideadata.org/tables30th%5car_7-1.xls. The NVSS data were obtained from the U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System (NVSS), 1990–2005, retrieved from <http://205.207.175.93/VitalStats/ReportFolders/ReportFolders.aspx>. Birth data for 2006 are from table 6, pg 12, of Hamilton, Martin, and Ventura (2007).

Exhibit 2.8. National percentage of children exiting early intervention before 36 months of age and at 36 months of age who did and did not receive Part B services

Exhibit 2.8 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflects the percentages of children exiting EI both at 36 months of age and before 36 months of age who did and did not go on to receive Part B preschool services. The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The variable used in this analysis was constructed from items taken from the Transition Family Interview, the Kindergarten Family Interview, and the Kindergarten Teacher Survey. The items that were used from the NEILS family interviews to construct this variable included the following: (1) Was an IEP (Individualized Education Program) developed for [child] around the time he/she turned age 3? (2) Since leaving EI did child ever receive special education services or therapy services through a public school system? (3) Has child been receiving special education services or therapy services through the public schools more or less continuously since the end of EI? The item used from the Kindergarten Teacher Survey to construct this variable was the following: Did the child have an IEP during the year prior to the current school year? Information incorporated from these variables as well as two exit status grouping variables (one derived from NEILS service records, and the other from NEILS 36 month family interview items on transition) were used to determine group assignment (exited EI at 36 months of age no Part B, exited EI at 36 months of age to Part B, exited EI before 36 months).

Exhibit 2.9. National percentage of children no longer receiving early intervention services under IDEA at 36 months of age, by exit category (2005–2006)

Exhibit 2.9 uses DANS state-reported data to present the percentage for each exit category of children who exited EI programs at 36 months of age in 2005. The DANS data were obtained from the Data Analysis System (DANS), Section 618, Part C, retrieved from http://www.ideadata.org/tables30th%5car_7-8.xls.

Exhibit 2.10. Percentage of children no longer receiving early intervention services under IDEA at 36 months of age, by exit category and state (fall 2005)

Exhibit 2.10 uses DANS data to present for each state the percentage, by exit category, of children who had exited EI programs as of 36 months of age in 2005. The DANS data were obtained from the Data Analysis System (DANS), Section 618, Part C, 1998–2005, retrieved from http://www.ideadata.org/tables30th%5car_7-8.xls.

Exhibit 2.11. National percentage of former EI participants for whom parents and teachers reported communication outcomes at 36 months of age and kindergarten

Exhibit 2.11 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007. The data are parent reports of communication outcomes at 36 months of age and parent and teacher reports at kindergarten (percentages and confidence intervals). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The communication measures used in this analysis come from Transition Family Interview, the Kindergarten Family Interview, and the Kindergarten Teacher Survey. The percentage of children who achieved all age-expected milestones in an outcome area was computed by: (1) determining the age by which most (75 percent to 90 percent) children in the general population have achieved each milestone. This determination was made through reviews of the literature and common child development assessment tools; (2) from among all milestones presented, identifying the set of milestones that children would be expected to achieve by 36 months of age and 60 months of age, respectively; and (3) examining the parent's responses to the age-expected set of milestones within each outcome area. For example, if in the 36 month interview, the parent responded "does it well" to each of the communication milestones presented that should have been mastered by 36 months, the child was considered to have mastered all age-expected communication milestones. The percentage of milestone items that were done well was calculated for each child and then grouped as follows: 0-50 percent, 51-75 percent, 76-99 percent, 100 percent. Children with 100 percent were categorized as having achieved all of their age expected milestones.

Exhibit 2.12. National communication outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category

Exhibit 2.12 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007. The data are parent reports of outcomes for former EI participants at 36 months of age and parent and teacher reports at kindergarten (percentages and standard errors) by eligibility category (developmental delay, at risk condition, diagnosed condition). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The measures used in this analysis come from the Transition Family Interview, the Kindergarten Family Interview, and the Kindergarten Teacher Survey. Comparisons between eligibility groups were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.13. National percentage of former EI participants for whom kindergarten teachers and parents reported communication outcomes, by child's IEP status in kindergarten

Exhibit 2.13 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflects parent and teacher reports of communication outcomes both at 36 months of age and at kindergarten, by IEP status (percentages and confidence intervals). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The communication measures used in this analysis were taken from the NEILS Kindergarten Family Interviews and Kindergarten Teacher Survey. IEP status was a constructed variable using information from the Kindergarten Family Interview and the Teacher Survey. If either of these sources indicated the child was receiving special education services or had an IEP, the child was coded as having an IEP. Comparisons between IEP and no IEP groups were done using pairwise comparisons. The

Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.14. National percentage of former EI participants and of the general population for whom parents reported cognitive outcomes at 36 months and in kindergarten

Exhibit 2.14 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflects parent reports of cognitive outcomes at 36 months of age and at kindergarten (percentages and confidence intervals). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The cognitive measures used in this analysis come from the 36-month and Kindergarten Family Interviews. General population data, including children receiving and not receiving EI and special education services, were from the National Household Education Survey (NHES) public use dataset, 1999 parent interview, retrieved from <http://nces.ed.gov/nhes/dataproducts.asp>. Comparisons between NEILS data and general population data were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.15. National percentage of former EI participants and of the general population for whom kindergarten teachers reported mathematics and early literacy outcomes

Exhibit 2.15 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflects kindergarten teacher reports of mathematics and early literacy skills for former EI participants compared with the total population of 5-year-olds (percentages and confidence intervals). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The cognitive measures used in this analysis come from the Kindergarten Teacher Survey. Percentages reflect children who were reported by teachers as “intermediate” or “proficient” in their skill level. General population data, including children receiving and not receiving special education services, were from the Early Childhood Longitudinal Study, Kindergarten Cohort (ECLS-K) public and restricted use datasets, 1998–1999 base year data, retrieved from <http://nces.ed.gov/ECLS/kinderdatainformation.asp>. Comparisons between NEILS data and total population data were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.16 National cognitive development outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category

Exhibit 2.16 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflects parent reports of cognitive outcomes for former EI participants at 36 months of age and parent and teacher reports at kindergarten (percentages and standard errors) by eligibility category (developmental delay, at risk condition, diagnosed condition). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The cognitive measures used in this analysis come from the Kindergarten Family Interviews and the Kindergarten Teacher Survey. Comparisons between eligibility groups were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.17. National percentage of former EI participants and of the general population for whom kindergarten teachers and parents reported cognitive outcomes, by IEP status for former EI participants

Exhibit 2.17 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflects parent and teacher reports of cognitive outcomes at kindergarten by IEP status (percentages and confidence intervals). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The cognitive measures used in this analysis come from the Kindergarten Family Interviews and the Kindergarten Teacher Survey. IEP status was a constructed variable using information from the Kindergarten Family Interview and the Teacher Survey. If either of these sources indicated the child was receiving special education services or had an IEP, the child was coded as having an IEP. General population data, including children receiving and not receiving special education services, were from the National Household Education Survey (NHES) public use dataset, 1999 parent interview, retrieved from <http://nces.ed.gov/nhes/dataproducts.asp>. Comparisons between groups were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.18. National percentage of former EI participants and of the general population for whom kindergarten teachers reported mathematics and early literacy outcomes, by IEP status for former EI participants

Exhibit 2.18 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflects kindergarten teacher reports of mathematics and early literacy skills for former EI participants compared with the general population of 5-year-olds (percentages and confidence intervals). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The cognitive measures used in this analysis were from the Kindergarten Teacher Survey. Percentages reflect children who were reported by teachers as “intermediate” or “proficient” in their skill level. IEP status was a constructed variable using information from the Kindergarten Family Interview and the Teacher Survey. If either of these sources indicated the child was receiving special education services or had an IEP, the child was coded as having an IEP. General population data, including children receiving and not receiving special education services, were used from the Early Childhood Longitudinal Study, Kindergarten Cohort (ECLS-K) public and restricted use datasets, 1998–1999 base year data, retrieved from <http://nces.ed.gov/ECLS/kinderdatainformation.asp>. Comparisons between groups were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.19. National percentage of former EI participants for whom kindergarten teachers reported negative behaviors

Exhibit 2.19 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflects kindergarten teacher reports of negative behaviors for former EI participants (percentages and confidence intervals). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The cognitive measures used in this analysis come from the Kindergarten Teacher Survey.

Exhibit 2.20. National social-emotional development outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category

Exhibit 2.20 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflects parent reports of social-emotional outcomes for former EI participants at 36 months of age and parent and teachers reports at kindergarten (percentages and standard errors) by eligibility category (developmental delay, at risk condition, diagnosed condition). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The social-emotional measures used in this analysis come from the Kindergarten Family Interview and the Kindergarten Teacher Survey. Comparisons between eligibility groups were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.21. National percentage of former EI participants for whom kindergarten teachers and parents reported social-emotional outcomes, by IEP status

Exhibit 2.21 presents data from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflects parent and teacher reports of social-emotional outcomes at kindergarten by IEP status (percentages and confidence intervals). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The social-emotional measures used in this analysis come from the Kindergarten Family Interview and the Kindergarten Teacher Survey. IEP status was a constructed variable using information from the Kindergarten Family Interview and the Teacher Survey. If either of these sources indicated the child was receiving special education services or had an IEP, the child was coded as having an IEP. Comparisons between groups were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.22. National percentage of former EI participants for whom kindergarten teachers reported negative behaviors, by IEP status

The data presented in exhibit 2.22 are from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflect kindergarten teacher reports of negative behaviors for former EI participants (percentages and confidence intervals) by IEP status. The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The cognitive measures used in this analysis come from the Kindergarten Teacher Survey. IEP status was a constructed variable using information from the Kindergarten Family Interview and the Teacher Survey. If either of these sources indicated the child was receiving special education services or had an IEP, the child was coded as having an IEP. Comparisons between groups were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.23. National physical development outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category

The data presented in exhibit 2.23 are from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflect parent reports of physical development outcomes for former EI participants at 36 months of age and teacher and parent reports at kindergarten (percentages and standard errors) by eligibility category (developmental delay, at

risk condition, diagnosed condition). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The physical development outcomes used in this analysis come from the Kindergarten Teacher Survey and the Kindergarten Family Interview. Comparisons between eligibility groups were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.24. National percentage of former EI participants and of the general population reported to have activity levels at kindergarten, by IEP status for former EI participants

The data presented in exhibit 2.24 are from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflect kindergarten teacher and parent reports of activity levels for former EI participants (percentages and confidence intervals) by IEP status and compared with the total population of 5-year-olds. The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. IEP status was a constructed variable using information from the Kindergarten Family Interview and the Teacher Survey. If either of these sources indicated the child was receiving special education services or had an IEP, the child was coded as having an IEP. The activity level measures used in this analysis come from the Kindergarten Teacher Survey and the Kindergarten Family Interview. General population data, including children receiving and not receiving special education services, are from the Early Childhood Longitudinal Study, Kindergarten Cohort (ECLS-K) public and restricted use datasets, 1998–1999 base year data, retrieved from <http://nces.ed.gov/ECLS/kinderdatainformation.asp>. Comparisons between groups were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.25. National percentage of former EI participants and of the general population reported by parents to have “fair” or “poor” health at kindergarten, by IEP status for former EI participants

The data presented in exhibit 2.25 are from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflect parent reports of health status for former EI participants (percentages and confidence intervals) by IEP status and compared with the total population of 5 year olds. The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The health measure used in this analysis was taken from the Kindergarten Family Interview. IEP status was a constructed variable using information from the Kindergarten Family Interview and the Teacher Survey. If either of these sources indicated the child was receiving special education services or had an IEP, the child was coded as having an IEP. General population data, including children receiving and not receiving special education services, are from the National Health Interview Survey (NHIS) public use dataset, 1999 Person Section, retrieved from http://www.cdc.gov/nchs/about/major/nhis/quest_data_related_1997_forward.htm. Comparisons between groups were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 2.26. National adaptive development outcomes of former early intervention participants at 36 months and kindergarten, by eligibility category

The data presented in exhibit 2.26 are from the National Early Intervention Longitudinal Study (NEILS), public use dataset, 2007, and reflect parent reports of adaptive development

outcomes for former EI participants at 36 months of age and at kindergarten (percentages and standard errors) by eligibility category (developmental delay, at risk condition, diagnosed condition). The NEILS cohort began early intervention between September 1997 and November 1998. Data are weighted to be nationally representative. The physical development outcomes used in this analysis come from the Kindergarten Family Interview. Comparisons between eligibility groups were done using pairwise comparisons. The Benjamini-Hochberg method was applied to identify comparisons that were statistically significant at the 5 percent level.

Chapter 3 – Preschool

Exhibit 3.1. National number of preschool-age children identified for services under IDEA, by age (2005)

Exhibit 3.1 presents unmodified numbers of children of each single year of age who were identified for services under IDEA in 2005. The numbers are aggregated counts of children identified for services under IDEA, based on enrollment numbers at a single time point between October 1, 2005 and December 1, 2005. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent the counts for all 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. Data were retrieved on December 7, 2007 from www.ideadata.org/PartCChildCount.asp for children ages birth through 2 and www.ideadata.org/PartBChildCount.asp for children ages 3 through 21 (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B and C, 2005). The ages of preschool-age children eligible to receive services under IDEA are 3 through 5 years, as indicated by the shaded area.

Exhibit 3.2. National number and percentage of preschool-age children identified for services under IDEA, by age (1997–2006)

Exhibit 3.3. Trends in national percentage of preschool-age children identified for services under IDEA, by age (1997–2006)

Exhibit 3.2 presents the number and percentage for 3- through 5-year-olds for the years 1997 through 2006. Exhibit 3.3 presents the percentages of this age group in graphical form. The numbers are of children identified for services under IDEA at a single time point between October 1 and December 1 of each year. Data represent all 50 states, the District of Columbia, including Bureau of Indian Education (BIE) schools. The numbers include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. The percentage is calculated by dividing the unmodified count of 3- through 5-year-olds identified for services under IDEA for a given year by the sum of the unmodified number of births for 3, 4, and 5 years before the year for which the percentage is reported (e.g., births from the years 1993, 1994, and 1995 were used for the denominator of the 1997 percentage, including births on Indian reservations), and multiplying the result by 100. For example, to calculate percentages in 2005:

$$\left(\frac{\text{DANS count of all 3- through 5-year-olds identified for services under all IDEA classifications in 2005}}{\text{Total number of births in 2000, 2001, and 2002 (from NVSS)}} \right) \times 100$$

DANS data were retrieved on December 7, 2007 from www.ideadata.org/PartBChildCount.asp (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997-2006). The birth data were retrieved on January 11, 2008 from U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System (NVSS), 1997 to 2005, <http://205.207.175.93/VitalStats/ReportFolders/ReportFolders.aspx>. The birth data for 2006 are from table 6, pg. 12, of Hamilton, Martin, and Ventura (2007).

Exhibit 3.4. National number and percentage of 3- through 5-year-olds identified for services under IDEA, by race/ethnicity (1998–2006)

Exhibit 3.5. Trends in national percentage of 3- through 5-year-olds identified for services under IDEA, by race/ethnicity (1998–2006)

Exhibit 3.4 presents the number and percentage for 3- through 5-year-olds for the years 1998 through 2006 for five racial/ethnic categories. Exhibit 3.5 presents the percentages of these categories in graphical form. The numbers are unmodified counts of 3- through 5-year-olds identified for services under IDEA at a single point between October 1 and December 1 of each year. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent all 50 states, the District of Columbia, including Bureau of Indian Education (BIE) schools. For each racial/ethnic group, the percentage is calculated by dividing the unmodified count of 3- through 5-year-olds identified for services under IDEA in the year by the sum of the unmodified number of births of that racial/ethnic group for 3, 4, and 5 years before the year for which the percentage is reported (e.g., births from the years 1994, 1995, and 1996 were used for the denominator of the 1998 percentage, including births on Indian reservations), and multiplying the result by 100. For example, to calculate percentages in 2005:

$$\left(\frac{\text{DANS count of all 3- through 5-year-olds in racial/ethnic group identified for services under all IDEA classifications in 2005}}{\text{Total number of births for racial/ethnic group in 2000, 2001, and 2002 (from NVSS)}} \right) \times 100$$

DANS data were retrieved on December 7, 2007 from www.ideadata.org/docs%5CPartBTrendData%5CB3A.xls (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1998-2006). For vital statistics birth data, the race/ethnicity of the mother was used to classify the child, due to a relatively large amount of missing information for the father (17%) and to uncertainty concerning how to classify children whose parents were of different races/ethnicities. Information on the mother's race/ethnicity was retrieved from the National Vital Statistics

System (NVSS) on January 11, 2008 at <http://205.207.175.93/VitalStats/ReportFolders/ReportFolders.aspx> (U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System (NVSS), 1997 to 2005)

Exhibit 3.6. National percentage of preschool-age children identified for services under IDEA, by disability category (2004 and 2006)

Exhibit 3.6 presents the percentage of 3- through 5-year-olds who were identified for services under each IDEA disability category in 2004 and 2006. The percentages include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represent all 50 states and the District of Columbia, including Bureau of Indian Education (BIE) schools. As states or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category, there were 46 states that reported counts under this category in 2004 and 48 states in 2006. The percentage is calculated by dividing the number of children identified for services under IDEA for a given IDEA category in a given year by the sum of the unmodified number of births for 3, 4, and 5 years before the year for which the percentage is reported (e.g., births from the years 1993, 1994, and 1995 were used for the denominator of the 1997 percentage, including births on Indian reservations), and multiplying the result by 100, as follows:

$$\left(\frac{\text{DANS count of 3- through 5-year-olds identified for services under a given IDEA category and in a given year}}{\text{Total number of births 3, 4, and 5 years before the given year (from NVSS)}} \right) \times 100$$

Relative changes in the identification percentages from 2004 to 2006 were calculated as follows:

$$\left(\frac{\text{2006 identification percentage of all children in age group identified for services under given IDEA category} - \text{2004 identification percentage of all children in age group identified for services under given IDEA category}}{\text{2004 identification percentage of all children in age group identified for services under given IDEA category}} \right) \times 100$$

Data for children identified for services under IDEA were retrieved on December 7, 2007 from http://www.ideadata.org/tables28th%5Car_1-2.xls and http://www.ideadata.org/tables30th%5Car_1-2.xls (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 2004 and 2006). Birth data were retrieved on January 11, 2008 from <http://205.207.175.93/VitalStats/ReportFolders/ReportFolders.aspx> (U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System (NVSS), 1997 to 2005).

Exhibit 3.7. Percentage of 3- through 5-year-olds identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2005 average, and 2006)

Exhibit 3.7 presents the state percentages for 3- through 5-year-olds for the years 1997 and 2006 and the average of the percentages for 1998 through 2005. The percentage is calculated by dividing the unmodified state count of 3- through 5-year-olds identified for services under IDEA in each year (DANS) by the sum of the unmodified number of births in each state for 3, 4, and 5 years before the year for which the percentage is reported (e.g., births from the years 1993, 1994, and 1995 were used for the denominator of the 1997 percentage, including births on Indian reservations) (NVSS), and multiplying the result by 100, as follows:

$$\left(\frac{\text{DANS count for state of all 3- through 5-year-olds identified for services under all IDEA classifications in a given year}}{\text{Total number of births in state 3, 4, and 5 years before the given year (from NVSS)}} \right) \times 100$$

The percentages for the average of 1998 through 2005 were calculated by summing the percentages for 1998 through 2005 and dividing the total by 8. DANS data were retrieved on December 7, 2007 from www.ideadata.org/PartBChildCount.asp (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997-2006). DANS data represent each of the 50 states and the District of Columbia, excluding Bureau of Indian Education (BIE). Birth data were retrieved from the National Vital Statistics System (U.S. Department of Health and Human Services, Centers for Disease Control and Prevention, National Center for Health Statistics, National Vital Statistics System (NVSS), 1997 to 2005) at <http://205.207.175.93/VitalStats/ReportFolders/ReportFolders.aspx> on January 11, 2008.

Exhibit 3.8. Mean literacy, numeracy, and preacademic skills scores of 3- through 5-year-olds identified for services under IDEA (2005)

Exhibit 3.9. Mean social skills, problem behaviors, self-care, and self-direction scores of 3- through 5-year-olds identified for services under IDEA (2005)

Exhibit 3.10. Mean emerging academic skills, social skills, and problem behavior scores of 3- through 5-year-olds identified for services under IDEA, by disability category (2005)

Exhibit 3.8 presents standard scores on the Woodcock-Johnson III (WJ III) (Woodcock, McGrew, and Mather 2001) Letter-Word Identification subtest (WJLW), the Peabody Picture Vocabulary Test-Third Edition (PPVT-III) (Dunn and Dunn 1997), the WJ III Applied Problems subtest (WJAP) (Woodcock, McGrew, and Mather 2001) and the Adaptive Behavior Assessment System-Second Edition (ABAS-II), Functional Preacademics subtest (Harrison and Oakland 2004). Exhibit 3.9 presents standard scores on Preschool and Kindergarten Behavior Scales Second Edition (PKBS-2) Social Skills and Problem Behavior subscales (Merrell 2002) and the ABAS-II Self-Care and Self-Direction subscales. Results for each of these areas for all children identified for preschools services under IDEA as a group and for each age-year cohort are reported in exhibits 3.8, and 3.9. Differences between three disability groupings (speech and language impairments, developmental delay, and all other disability categories) are presented in

exhibit 3.10. All data are taken from the chapters and appendices in *Preschoolers' Characteristics, Services, and Results: Wave 1 Overview Report from the Pre-Elementary Education Longitudinal Study* (Markowitz et al. 2006). Data are as they were in the PEELS report with the exception of the ABAS scales, which were transformed to a standard score scale with a mean of 100 and standard deviation of 15 to be consistent with the other measures.

The Benjamini-Hochberg method was applied as a group to the following sets of comparisons to identify those that were statistically significant at the 5 percent level:

(1) Each age group (3, 4, or 5 years old) versus a nominal value of 100, across 8 measures (WJLW, WJAP, PPVT, ABAS, PKBS-Social, PKBS-Problem Behavior, ABAS-Self Care, and ABAS-Self Direction), resulting in 32 hypotheses.

(2) Each age group (3, 4, or 5 years old) versus each other age group, across 8 measures (WJLW, WJAP, PPVT, ABAS, PKBS-Social, PKBS-Problem Behavior, ABAS-Self Care, and ABAS-Self Direction), resulting in 32 hypotheses

(3) Each age group (3, 4, or 5 years old) versus all children not in that age group, across 8 measures (WJLW, WJAP, PPVT, ABAS, PKBS-Social, PKBS-Problem Behavior, ABAS-Self Care, and ABAS-Self Direction), resulting in 32 hypotheses.

(4) Each disability group (speech and language impairments, developmental delay, and all other disability categories) versus a nominal value of 100, across 8 measures (WJLW, WJAP, PPVT, ABAS, PKBS-Social, PKBS-Problem Behavior, ABAS-Self Care, and ABAS-Self Direction), resulting in 32 hypotheses.

(5) Each disability group (speech and language impairments, developmental delay, and all other disability categories) versus each other group, across 8 measures (WJLW, WJAP, PPVT, ABAS, PKBS-Social, PKBS-Problem Behavior, ABAS-Self Care, and ABAS-Self Direction), resulting in 24 hypotheses.

Chapter 4 – School Age

Exhibit 4.1. National number of school-age children identified for services under IDEA, by age (2005)

Exhibit 4.1 presents unmodified numbers of children of each single year of age who were identified for services under IDEA in 2005. The numbers are aggregated counts of children identified for services under IDEA, based on enrollment numbers at a single time point between October 1, 2005 and December 1, 2005. These annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represents all 50 states, the District of Columbia, and Bureau of Indian Education (BIE) schools. Data were retrieved on December 7, 2007 from www.ideadata.org/PartCChildCount.asp for children ages birth through 2 and www.ideadata.org/PartBChildCount.asp for children ages 3 through 21 (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B and C, 2005). The ages of school-age children eligible to receive services under IDEA are 6 through 21 years.

Exhibit 4.2. National number and percentage of school-age children identified for services under IDEA, by age group (1997–2005)

Exhibit 4.3. Trends in national percentage of school-age children identified for services under IDEA, by age group (1997–2005)

Exhibit 4.2 presents the percentages for 6- through 17-year-olds, 6- through 9-year-olds, 10- through 13-year-olds, and 14- through 17-year-olds for the years 1997 through 2005. Exhibit 4.3 presents the percentages of these age groups in graphical form. For 6- through 17-year-olds, the number is the unmodified count of 6- through 17-year-olds identified for services under IDEA in each year. For 6- through 9-year-olds, 10- through 13-year-olds, and 14- through 17-year-olds, the unmodified counts for the relevant single years of age were summed to create the aggregated count for each age group. In general, the percentage is calculated by dividing the unmodified count of children ages 6 through 17 identified for services under IDEA by the national enrollment counts in grades 1-12 and multiplied by 100. To align with the 6- through 9-year olds, 10- through 13-year-olds, 14- through 17-year olds, enrollment counts in grades 1 through 4, grades 5 through 8, and grade 9 through 12 were used. For example, to calculate percentages in 2005:

$$\left(\frac{\text{DANS count of all children in age group identified for services under all IDEA classifications in 2005}}{\text{CCD count of total enrollment in corresponding grade levels in 2005}} \right) \times 100$$

For 6- through 9-year-olds, 10- through 13-year-olds, and 14- through 17-year-olds, the percentages are calculated by dividing the unmodified counts of children identified for services under IDEA in each age group by the national enrollment counts in grades 1 through 4, 5 through 8, and 9 through 12, respectively, and multiplying the results by 100. Data represents all 50 states, the District of Columbia, and Bureau of Indian Education (BIE) schools. BIE schools were not included in 1997 CCD enrollment data for grades 1-12 as BIE schools were included starting in 1998-1999.

DANS data were retrieved on December 7, 2007 from <https://www.ideadata.org/docs/PartBTrendData/B2C.xls> (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997-2006). Data for student enrollment were retrieved on December 10, 2007 from the U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), 1997-98 to 2005-06, www.nces.ed.gov/ccd/bat/.

Exhibit 4.4. National number and percentage of 6- through 21-year-olds identified for services under IDEA, by race/ethnicity (1998–2005)

Exhibit 4.5. Trends in national percentage of 6- through 21-year-olds identified for IDEA services, by race/ethnicity (1998–2005)

Exhibit 4.4 presents the number and percentage for five racial/ethnic groups of 6- through 21-year-olds for the years 1998 to 2005. Exhibit 4.5 presents the percentages of these groups in graphical form. The numbers are unmodified counts of 6- through 21-year-olds identified for services under IDEA at a single point between October 1 and December 1 of each year. These

annual counts include both children newly identified in the year represented by the count and children identified in earlier years who continue to receive services under IDEA. Data represents all 50 states, the District of Columbia, and Bureau of Indian Education (BIE) schools. BIE schools were not included in 1997 CCD enrollment data for grades 1–12 as BIE schools were included starting in 1998-1999. For each racial/ethnic group, the percentage is calculated by dividing the unmodified count of 6- through 21-year-olds identified for services under IDEA in each year by the unmodified national enrollment count for the racial/ethnic group in grades 1 through 12, and multiplying the result by 100. For example, to calculate percentages in 2005:

$$\left(\frac{\text{DANS count of all 6- through 21-year-olds in racial/ethnic group identified for services under all IDEA classifications in 2005}}{\text{CCD enrollment count in grades 1-12 for racial/ethnic group in 2005}} \right) \times 100$$

Counts of children identified for services under IDEA by race/ethnicity were retrieved on February 22, 2008 from <https://www.ideadata.org/docs/PartBTrendData/B3B.xls> (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997-2005). Student enrollment data were retrieved on December 10, 2007 from the U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), 1997-98 to 2005-06, www.nces.ed.gov/ccd/bat/.

Exhibit 4.6. National percentage of school-age children identified for services under IDEA, by age group and disability category (1997 and 2005)

Exhibit 4.6 presents unmodified counts of 6- through 9-year-olds, 10- through 13-year-olds, and 14- through 17-year-olds who were identified for services under each IDEA disability category in 1997 and 2005 and the percentage change between the two years. The unmodified counts for each single year of age were summed to create the aggregated count for each age group. As states or local education agencies may elect to identify children ages 3 through 9 under the developmental delay category, there were 6 states that reported counts under this category in 1997 and 48 states in 2005. Data represents all 50 states, the District of Columbia, and Bureau of Indian Education (BIE) schools. BIE schools were not included in 1997 CCD enrollment data for grades 1-12 as BIE schools were included starting in 1998-1999. The percentage is calculated by dividing the number of children identified for services under IDEA for a given IDEA category in

$$\left(\frac{\text{DANS count of all 6- through 9-year-olds identified for services under given IDEA category in 2004}}{\text{CCD enrollment count in grades 1 through 4 in 2004}} \right) \times 100$$

a given year and age group by the total number of enrollment for a given age group and year, and multiplying the result by 100. For example, to calculate percentages in 2004 for 6- through 9-year-olds:

Relative changes in the identification percentages from 1997 to 2005 were calculated as follows:

$$\left(\frac{\begin{array}{l} \text{2005 identification percentage of all} \\ \text{children in age group identified for} \\ \text{services under given IDEA category} \end{array} - \begin{array}{l} \text{1997 identification percentage of all} \\ \text{children in age group identified for} \\ \text{services under given IDEA category} \end{array}}{\begin{array}{l} \text{1997 identification percentage of all children in age} \\ \text{group identified for services under given IDEA} \\ \text{category} \end{array}} \right) \times 100$$

Counts of children identified for services under IDEA by disability category were retrieved on February 15, 2008 from <https://www.ideadata.org> (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997-2005). Enrollment data were retrieved on February 10, 2008 from the U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), 1997-98 to 2005-06, www.nces.ed.gov/ccd/bat/.

Exhibit 4.7. Percentage of 6- through 17-year-olds identified for services under IDEA, national average for 50 states and DC, and in 50 states and the District of Columbia (1997, 1998–2004 average, and 2005)

Exhibit 4.7 presents the state percentages for 6- through 17-year-olds for the years 1997 and 2005, and the average of the percentages for 1998 through 2004. National data represent the counts for the 50 states and the District of Columbia, excluding Bureau of Indian Education (BIE) schools. The percentage is calculated by dividing the unmodified state count of 6- through 17-year-olds identified for services under IDEA in each year by the unmodified state-reported count of total enrollment in grades 1-12, and multiplying the result by 100, as follows:

$$\left(\frac{\begin{array}{l} \text{DANS count for state of all 6- through 17-year-olds identified} \\ \text{for services under all IDEA classifications in a given year} \end{array}}{\begin{array}{l} \text{CCD count of total enrollment in grades 1-12 for} \\ \text{state in same year} \end{array}} \right) \times 100$$

The percentages for the average of 1998 through 2004 were calculated by summing the percentages for 1998 through 2004 and dividing the total by 7. DANS data were retrieved on December 7, 2007 from <http://www.ideadata.org/PartBChildCount.asp> (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997-2005). Data represents all 50 states, the District of Columbia, excluding Bureau of Indian Education (BIE) schools. Student enrollment data were retrieved on December 10, 2007 from the U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), 1997-98 to 2005-06, www.nces.ed.gov/ccd/bat/.

Exhibit 4.8. Percentage of 6- through 12-year-olds identified for IDEA services in December 1999 who were declassified by spring 2002, by disability category

Exhibit 4.8 presents the percentages of 6- through 12-year-olds who were identified for services under IDEA in December 1999 who had been declassified by spring 2002. The percentages and standard errors used to compute the confidence intervals were taken from

exhibit 2, page 5 in *Declassification—Students Who Leave Special Education. A Special Topic Report From the Special Education Elementary Longitudinal Study* (SEELS 2005).

Exhibit 4.9. Mean WJ III reading and mathematics scores of 6- to 17-year-old children identified for IDEA services, by classification status (2002)

Exhibit 4.9 presents standard scores on the Woodcock-Johnson III (WJ III) letter-word identification, passage comprehension, calculation and applied problems subtests (Woodcock, McGrew, and Mather 2001) for 6- to 17-year-old children who are identified for services under IDEA. The data compare students declassified from IDEA services as of spring 2002 with those continuing to receive services. Results are new analyses calculated based on 2002 student assessment data of the Special Education Elementary Longitudinal Study (SEELS), available at www.seels.net.

Exhibit 4.10. Mean reading and mathematics scale scores of fourth- and eighth-grade students identified and not identified for services under IDEA (2003, 2005, and 2007)

The data presented in exhibit 4.10 are average scale scores and confidence intervals on the National Assessment of Educational Progress (NAEP) grades 4 and 8 reading and mathematics tests in 2003, 2005, and 2007. They are presented for children identified and not identified for services under IDEA at each year. The data are presented in their original metrics, as retrieved on March 18, 2008 from the NAEP Data Explorer (<http://nces.ed.gov/nationsreportcard/nde>). Pairwise comparisons were conducted using *t*-tests for year-to-year changes within, and differences between children identified and not identified for IDEA services. The Benjamini-Hochberg method was applied within grade level comparisons to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 4.11. Mean reading scale scores of fourth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

The data presented in exhibit 4.11 are average scale scores and confidence intervals on the NAEP grade 4 reading test in 2007. They are presented for children identified and not identified for services under IDEA by state. The data are presented in their original metrics as retrieved on March 18, 2008 from the NAEP Data Explorer (<http://nces.ed.gov/nationsreportcard/nde>). Pairwise comparisons were conducted using *t*-tests for children identified and not identified for services under IDEA against their respective national means, as well as for differences between them. The Benjamini-Hochberg method was applied within grade level comparisons to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 4.12. Mean reading scale scores of eighth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

The data presented in exhibit 4.12 are average scale scores and confidence intervals on the NAEP grade 8 reading test in 2007. They are presented for children identified and not identified for services under IDEA by state. The data are presented in their original metrics as retrieved on March 18, 2008 from the NAEP Data Explorer (<http://nces.ed.gov/nationsreportcard/nde>). Pairwise comparisons were conducted using *t*-tests for children identified and not identified for services under IDEA against their respective national means, as well as for differences between them. The Benjamini-Hochberg method was applied within grade level comparisons to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 4.13. Mean mathematics scale scores of fourth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

The data presented in exhibit 4.13 are average scale scores and confidence intervals on the NAEP grade 4 mathematics test in 2007. They are presented for children identified and not identified for services under IDEA by state. The data are presented in their original metrics as retrieved on March 18, 2008 from the NAEP Data Explorer (<http://nces.ed.gov/nationsreportcard/nde>). Pairwise comparisons were conducted using *t*-tests for children identified and not identified for services under IDEA against their respective national means, as well as for differences between them. The Benjamini-Hochberg method was applied within grade level comparisons to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 4.14. Mean mathematics scale scores of eighth-grade students identified and not identified for services under IDEA, by state and compared with national averages (2007)

The data presented in exhibit 4.14 are average scale scores and confidence intervals on the NAEP grade 8 mathematics test in 2007. They are presented for children identified and not identified for services under IDEA by state. The data are presented in their original metrics as retrieved on March 18, 2008 from the NAEP Data Explorer (<http://nces.ed.gov/nationsreportcard/nde>). Pairwise comparisons were conducted using *t*-tests for children identified and not identified for services under IDEA against their respective national means, as well as for differences between them. The Benjamini-Hochberg method was applied within grade level comparisons to identify comparisons that were statistically significant at the 5 percent level.

Exhibit 4.15. Percentage of fourth-grade students identified for IDEA services performing at “basic or above” and “proficient or above” in reading, by state (2003)

Exhibit 4.16. Percentage of eighth-grade students identified for services under IDEA performing at “basic or above” and “proficient or above” in reading, by state (2003)

Exhibit 4.17. Percentage of fourth-grade students identified for services under IDEA performing at “basic or above” and “proficient or above” in mathematics, by state (2003)

The data presented in exhibits 4.15, 4.16, and 4.17 are percentages of children whose performance was at the “basic and above” and “proficient and above” levels on the NAEP reading and mathematics tests in 2003, and the percentage who were “proficient and above” on state accountability tests in 2003. They are presented for children identified for services under IDEA by state. The data are presented in their original metrics, as retrieved on March 18, 2008, from the NAEP Data Explorer (<http://nces.ed.gov/nationsreportcard/nde>) and as obtained on February 5, 2008, from the National Center on Educational Outcomes (NCEO), Research to Practice Division, Office of Special Education Programs, U.S. Department of Education. Analyses were counts of states with averages that fell above or below the confidence intervals associated with the two NAEP scales.

Exhibit 4.18. Mean WJ III reading scores of school-age children identified for services under IDEA: ages 7 through 14 (2001) and 16 through 18 (2002 and 2004), by disability category

Exhibit 4.19. Mean WJ III mathematics scores of school-age children identified for services under IDEA: ages 7 through 14 (2001) and 16 through 18 (2002 and 2004), by disability category

Exhibit 4.18 presents standard scores by disability category on the Woodcock-Johnson III (WJ III) letter-word identification, synonym-antonym, and passage comprehension subtests (Woodcock, McGrew, and Mather 2001). Exhibit 4.19 presents standard scores on the Woodcock-Johnson III (WJ III) calculation and applied problems subtests (Woodcock, McGrew, and Mather 2001). Disability category differences are presented. All data for children ages 7 through 14 come from data tables on the Special Education Elementary Longitudinal Study (SEELS) and for children ages 16 through 18 from the National Longitudinal Transition Study-2 (NLTS2) websites. No transformations were performed.

SEELS comparisons. The Benjamini-Hochberg method was applied across all comparisons to identify those that were statistically significant at the 5 percent level: each disability category (except deaf/blind) versus a nominal value of 100, across four measures (letter-word identification standard score, passage comprehension standard score, calculation standard score, and applied problems standard score) resulting in 44 hypotheses.

NLTS2 comparisons. The Benjamini-Hochberg method was applied across all comparisons to identify comparisons that were statistically significant at the 5 percent level: each disability category versus a nominal value of 100, across four measures (letter-word identification standard score, passage comprehension standard score, calculation standard score, and applied problems standard score) resulting in 48 hypotheses.

Exhibit 4.20. National percentage of youth identified for services under IDEA no longer in high school, by exit type (1998–2005)

Exhibit 4.20 displays the percentage of youth who had been identified for services under IDEA and who had exited high school by graduating with a regular diploma, receiving a certificate of completion, reaching the maximum age for services, or dropping out. For a given year, the percentage of students in each exit classification was calculated by dividing the number of students in the respective exit classification by the sum of the number of students in each of the four exit classifications and multiplying the quotient by 100. The numbers for each exit classification were retrieved from DANS for all 50 states on June 10, 2008, from <https://www.ideadata.org> (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997–2005).

Exhibit 4.21. National percentage of school-age youth who had been identified for services under IDEA and were no longer in high school, by exit type and disability category (2005)

Exhibit 4.21 displays the percentage of youth who had been identified for services under IDEA and who had exited high school in 2005 by graduating with a regular diploma, receiving a certificate of completion, reaching the maximum age for services, or dropping out for all youth with disabilities and by disability category. For each disability category, the percentage of students in each exit classification was calculated by dividing the number of students in the respective exit classification by the sum of the number of students in each of the four exit classifications and multiplying the quotient by 100. The numbers for each exit classification were retrieved from DANS for all 50 states on June 10, 2008 from <https://www.ideadata.org> (U.S.

Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997-2005).

Exhibit 4.22. National percentage of school-age youth identified for services under IDEA exiting high school with a diploma, by disability cluster and category (2003 through 2005)

Exhibit 4.22 displays the percentage of youth who had been identified for services under IDEA and who had exited high school by graduating with a regular diploma, by disability cluster and disability category for the years 2003, 2004, and 2005. Disability clusters are based on the recommendations from the President's Commission on Excellence in Special Education (PCESES 2002). For each year and each disability cluster, the percentage of exiters who graduated was calculated by dividing the number of students receiving a regular diploma by the sum of the number of students in each of the four exit classifications as the denominator and multiplying the quotient by 100. The numbers for each exit classification were retrieved from DANS for all 50 states on June 10, 2008 from <https://www.ideadata.org> (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997–2005).

Exhibit 4.23. National percentage of school-age youth identified for services under IDEA exiting high school by dropping out, by disability cluster (2003 through 2005)

Exhibit 4.23 displays the percentage of youth who had been identified for services under IDEA and who had exited high school by dropping out, by disability cluster and disability category for the years 2003, 2004, and 2005. Disability clusters are based on the recommendations from the President's Commission on Excellence in Special Education (PCESES 2002). For each year and each disability group, the percentage of exiters who dropped out was calculated by dividing the number of students who dropped out by the sum of the number of students in each of the four exit classifications as the denominator and multiplying the quotient by 100. The numbers for each exit classification were retrieved from DANS for all 50 states on June 10, 2008 from <https://www.ideadata.org> (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997-2005)..

Exhibit 4.24. National percentage of school-age youth identified services under IDEA exiting high school by receiving a certificate of completion, by disability cluster (2003 through 2005)

Exhibit 4.24 displays the percentage of youth who had been identified for services under IDEA and who had exited high school by receiving a certificate of completion, by disability cluster and disability category for the years 2003, 2004, and 2005. Disability clusters are based on the recommendations from the President's Commission on Excellence in Special Education (PCESES 2002). For each year and each disability group, the percentage of exiters who received a certificate of completion was calculated by dividing the number of students receiving a certificate of completion by the sum of the number of students in each of the four exit classifications as the denominator and multiplying the quotient by 100. The numbers for each exit classification were retrieved from DANS for all 50 states on June 10, 2008 from <https://www.ideadata.org> (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997–2005).

Exhibit 4.25. National percentage of school-age youth identified for services under IDEA exiting high school by reaching the maximum age for service, by disability cluster (2003 through 2005)

Exhibit 4.25 displays the percentage of youth who had been identified for services under IDEA and who had exited high school by reaching the maximum age for services, by disability cluster and disability category for the years 2003, 2004, and 2005. Disability clusters are based on the recommendations from the President’s Commission on Excellence in Special Education (PCESES 2002). For each year and each disability group, the percentage of exiters who exited by reaching the maximum age for services was calculated by dividing the number of students who exited by reaching the maximum age for services by the sum of the number of students in each of the four exit classifications as the denominator and multiplying the quotient by 100. The numbers for each exit classification were retrieved from DANS for all 50 states on June 10, 2008 from <https://www.ideadata.org> (U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997–2005).

Exhibit 4.26. Averaged freshman graduation rate of school-age youth identified for services under IDEA and total population, by state (2005 and 1998–2004 average)

Exhibit 4.26 presents data on the Averaged Freshman Graduation Rate (AFGR) for students with disabilities and for the total population in 2005, as well as the average AFGR for the years 1998-2004. The AFGR provides an estimate of the percentage of high school students who graduate “on time” (i.e., four years after starting 9th grade) by dividing the number of graduates with regular diplomas by the size of the incoming freshman class 4 years earlier (Seastrom, Hoffman, Chapman, et al. 2007). The rate uses aggregate student enrollment data to estimate the size of an incoming freshman class and aggregate counts of the number of graduates four years later. For the rates for the total population, the incoming freshman class size is estimated by summing the enrollment (from CCD) in 8th grade for one year, 9th grade for the next year, and 10th grade for the year after and then dividing by 3. The averaging is intended to account for higher grade retentions in the 9th grade.

For the AFGR rates for youth identified for services under IDEA, DANS does not provide number of years of enrollment, so the denominator was the average enrollment (from DANS) for 13-year-olds in one year, for 14-year-olds in the next year, and for 15-year-olds in the following year. For the numerator, DANS provides the number of regular diplomas awarded in a given year to youth identified for special education services.

Data for students identified for services under IDEA come from U.S. Department of Education, Office of Special Education Programs, Data Analysis System (DANS), Section 618, Part B, 1997–2005, retrieved on April 19, 2008 from <http://www.ideadata.org>. Data for the total population come from National Center for Education Statistics, Common Core of Data (CCD), 1997–98 to 2005–06, retrieved December 10, 2007 from <http://www.nces.ed.gov/ccd/bat/>.
