PERFORMANCE AND LOADS DATA FROM A HOVER TEST OF A FULL-SCALE XV-15 ROTOR

Fort F. Felker, Mark D. Betzina, and David B. Signor
Ames Research Center

SUMMARY

A hover test of a full-scale XV-15 rotor was conducted at the Outdoor Aerodynamic Research Facility at Ames Research Center. The primary objective of the test was to obtain accurate measurements of the hover performance of the original, metal-blade XV-15 rotor system. Data were acquired for rotor tip Mach numbers ranging from 0.60 to 0.73. This report presents data on rotor performance, rotor wake downwash velocities, and rotor loads.

NOMENCLATURE

A	rotor disc area, πR^2 , m ²
a	speed of sound, m/s
C_P	rotor power coefficient, $C_P = C_Q$
$C_{P,\text{corrected}}$	rotor power coefficient corrected for wind, $C_{P,\text{corrected}} = C_{Q,\text{corrected}}$
C_{PM}	rotor pitching moment coefficient, pitching moment/ ρARV_{tip}^2
C_Q	rotor torque coefficient, torque/ ρARV_{tip}^2
$C_{Q,\text{corrected}}$	rotor torque coefficient corrected for wind, See text for equations
C_T	rotor thrust coefficient, thrust/ ρAV_{tip}^2
C_Y	rotor side force coefficient, side force/ ρAV_{tip}^2
C_{YM}	rotor yawing moment coefficient, yawing moment/ ρARV_{tip}^2
C_Z	rotor normal force coefficient, normal force/ ρAV_{tip}^2
FM	rotor figure of merit, $C_T^{3/2}/C_Q\sqrt{2}$
$FM_{\text{corrected}}$	rotor figure of merit corrected for wind, $C_T^{3/2}/C_{Q,\text{corrected}}\sqrt{2}$
M_{tip}	rotor tip Mach number, V_{tip}/a
q	dynamic pressure, $\rho V^2/2$, N/m ²
R	rotor radius, m

r	blade radial station, m
V_h	ideal induced hover velocity, $V_{tip}\sqrt{C_T/2}$, m/s
V_i	ideal induced velocity, m/s
V_{tip}	rotor tip speed, ΩR , m/s
V_w	wind speed, m/s
λ_h	ideal induced hover velocity ratio, V_h/V_{tip}
λ_i	ideal induced velocity ratio, V_i/V_{tip}
μ_y	lateral wind velocity ratio, $-V_w \sin \psi_w / V_{tip}$
μ_z	axial wind velocity ratio, $V_w \cos \psi_w / V_{tip}$
ρ	air density, kg/m ³
σ	rotor solidity ratio
ψ_w	wind direction relative to rotor axis
Ω	rotor rotation speed, radians/sec

INTRODUCTION

Hovering flight is a critical operating condition for VTOL aircraft, since the hover performance usually determines the aircraft's maximum payload. The payload is typically 30% of the aircraft's gross weight, and small changes in the hover performance can have a large effect on the size of the payload. Hover performance is particularly important for tilt-rotors, since their basic rotor design (disc loading, solidity ratio, etc.) is a compromise between the requirements of hovering and cruise flight. Analytical predictions of tilt-rotor hover performance have not been sufficiently validated to provide a high level of confidence in the predicted performance.

An experimental investigation was recently conducted at Ames Research Center to accurately measure the hover performance of three tilting prop-rotors (ref. 1). The rotors tested in this investigation were the original metal blades for the XV-15 Tilt Rotor Research Aircraft; a set of composite, Advanced Technology Blades (ATB) for the XV-15; and a 0.658-scale model of the proposed V-22A Osprey (JVX) rotor. All rotors had three blades, and had a diameter of 7.62 m.

This report presents the data obtained with the XV-15 metal blades. Data is presented on rotor aerodynamic forces and moments, rotor wake downwash velocities, and rotor loads.

The authors gratefully acknowledge the efforts of the many people at Ames Research Center, Boeing Vertol Co., and Bell Helicopter, Textron, who made this test possible. Thanks are also due to Rob Faye, for his assistance in the preparation of this report.

DESCRIPTION OF TEST APPARATUS

Outdoor Aerodynamic Research Facility

The test was conducted at the Ames Outdoor Aerodynamic Research Facility, which consists of a 30 m square concrete pad, a below-ground-level frame for attaching model support struts, and an underground control room with a complete data acquisition system. The facility is sufficiently remote from other buildings so that there is no aerodynamic interference (except with the ground), and accurate near- and far-field acoustic data can be obtained. An aerial photograph of the Outdoor Aerodynamic Research Facility with the Prop Test Rig installed is shown in figure 1.

Prop Test Rig

The Ames Prop Test Rig was used to power the rotors, with a maximum power output of 1864 kW at 625 rotor RPM. A three-view drawing of the Prop Test Rig with the XV-15 rotor system installed is shown in figure 2, and a photograph of the Prop Test Rig with the XV-15 rotor installed is shown in figure 3. The rotor axis of rotation was horizontal to minimize interference effects between the ground and the rotor. The rotor shaft was 6.71 m above the ground (1.76 rotor radii). Note that the Prop Test Rig and its supporting structure provide very little blockage of the rotor wake. This minimizes the influence of the test apparatus on the rotor wake, and ensures that high-quality isolated-rotor performance data can be acquired.

Balance Systems

A new rotor balance system was designed and built for this test program. The general arrangement of the balance system is shown in figure 4. This balance system was designed to be very sensitive to rotor thrust and torque, with minimal interactions on the indicated thrust and torque caused by other forces, moments, or thermal effects. An instrumented drive shaft was installed inside the rotor balance, between the gearbox and the rotor mast, to accurately measure shaft torque. This design provided two load paths for thrust: through the rotor balance, and through the instrumented drive shaft. The drive shaft was not as stiff in the axial direction as the rotor balance, and only about 3% of the rotor thrust was carried by the shaft. The shaft was instrumented to measure this axial load. The gages on the balance system were thermally-compensated to minimize errors which were due to thermal effects. (The rotor balance and instrumented drive shaft were designed by J. Mayer and H. Silcox of the Boeing Vertol Co.)

Careful laboratory calibrations were performed on the balance system. The rotor

thrust balance was accurate to within 50 N up to 50,000 N (0.1% error), with no significant interactions caused by other forces or moments. The shaft axial force gage was also accurate to within 50 N, and was corrected for interactions caused by shaft torque. The instrumented drive shaft was accurate to within 70 N-m of torque, which is less than 0.3% of the shaft's maximum capacity of 28,500 N-m. The shaft torque data were corrected for interactions caused by shaft axial load. Because there were two bearings between the instrumented drive shaft and the rotor, the bearing torque was measured by the rotor balance and subtracted from the shaft torque to obtain the actual rotor torque.

A redundant set of load cells were installed between the Prop Test Rig and its support system (see fig. 2). These loads cells were not as accurate as the primary balance system, and were used as a backup. The measurements of the two balance systems were compared throughout the test to ensure that both systems were working properly at all times.

Check loads were performed periodically during the test to assess installed balance system accuracy under simultaneous thrust and torque loading, and to check for adverse effects caused by operational thermal loads. These check loadings demonstrated that the installed balance system was accurate to within 200 N of thrust (0.3% of maximum thrust of test) and 70 N-m of torque (0.3% of maximum torque of test).

Rotor System

The rotor was tested on a Bell Helicopter Model 300 rotor mast and gimbaled hub (similar to the XV-15 aircraft's mast and hub). The XV-15 rotor system had three blades with a diameter of 7.62 m. A summary of the rotor system characteristics is provided in table 1. The rotor blades were identical to the flight hardware used on the XV-15 aircraft. This rotor system had a solidity ratio of 0.0891. The twist distribution, thickness distribution, chord distribution, and airfoils used on this rotor system are shown in figures 5, 6, 7, and 8, respectively. Further information on the characteristics of this rotor system are provided in ref. 2.

Wake Rake

The distribution of total pressure and static pressure in the rotor wake was measured with a wake rake. The location of the rake relative to the rotor was chosen to be similar to the location of the wing of a typical tilt-rotor aircraft. The wake rake is visible behind the rotor in figure 3. The dynamic pressure and velocity distributions in the rotor wake were computed from the total and static pressure data. Two types of pressure probes were used on the wake rake: pitot-static probes, and 5-port directional probes. There were 13 pitot-static probes and 9 directional probes. The static pressure data obtained with the pitot-static probes are more accurate than that obtained with the directional probes.

Therefore, the dynamic pressures and velocities computed from data obtained with the pitot-static probes are more accurate than those computed from data obtained with the directional probes. Data obtained with both sets of probes are presented in this report.

TEST CONDITIONS

Data were obtained with rotor tip Mach numbers ranging from 0.6 to 0.73. Cyclic pitch was used to trim the rotor to gimbal angles of 0.1° or less for all data points. Most of the data were obtained with winds of 1.5 m/s or less, with a maximum wind speed of 3.5 m/s. The air density was computed from measured values of temperature, pressure, and humidity. A phototach was driven at the rotor speed and generated 1,024 pulses per revolution. The rotor rotation speed was computed from this signal.

WIND CORRECTIONS

Even very light winds can have significant effects on rotor hover performance (ref. 3). To minimize errors in the performance data caused by winds, all performance testing was conducted in winds of 1.5 m/s or less. Also, the measured rotor torque was corrected for the effect of the wind using a correction procedure based on momentum theory. (The correction procedure was developed by W. Johnson of Ames Research Center and M. A. McVeigh of Boeing Vertol.) The wind speed and direction were measured by a sensor located on the inflow side of the rotor plane approximately 16 rotor radii from the rotor hub at the same height as the rotor axis, and at an angle of 45° from the rotor axis. The location of the wind sensor relative to the rotor, and the sign conventions for the wind speed and direction are shown in figure 9. The following equations describe the wind correction procedure that was used:

$$C_{Q,\text{corrected}} = C_Q + (\mu_x C_T + \mu_y C_Y) - K(\lambda_i - \lambda_h)C_T$$
$$\lambda_i^2(\mu_y^2 + (\lambda_i - \mu_x)^2) = \lambda_h^4$$

Note that μ_y is positive in the same direction as C_Y , and μ_x is positive in the same direction as C_T . K is the ratio of actual induced power to ideal induced power: 1.16 was used here.

The magnitude of the correction on C_Q was typically less than 3% for winds of less than 1.5 m/s. The correction procedure reduces scatter in the performance data caused

by winds varying from data point to data point, and reduces any bias in the performance data caused by consistent prevailing winds throughout the test. Rotor figure of merit as a function of thrust coefficient for the XV-15 rotor system, with and without wind corrections, is shown in figure 10. Data obtained with winds of 0.5 m/s or less are presented in figure 10(a), data obtained with winds of 1.5 m/s or less are presented in figure 10(b), and all the data are shown in figure 10(c). The reduction in data scatter caused by the wind corrections can be seen in these figures. Both corrected and uncorrected data are presented in this report.

RESULTS

Performance and Loads Data

Rotor performance and loads data are tabulated in Appendix A. A dictionary of the parameters in Appendix A is provided in table 2. The data are organized by run number, and an index of the test conditions in each run is provided in table 3. Figure 11 shows the orientation of balance forces and moments, and the positive directions of the forces and moments. Thrust and side force are horizontal, and normal force is vertical.

The effect of tip Mach number on corrected rotor figure of merit is shown in figures 12 and 13. $C_P, \text{corrected}/\sigma$ as a function of C_T/σ is shown in figure 14. $C_P, \text{corrected}$ as a function of C_T is shown in figure 15. $C_P, \text{corrected}$ as a function of $C_T^{3/2}$ is shown in figure 16. The curves shown in these figures are polynomial curve fits of the data. There is very little effect on rotor performance due to tip Mach number variations for the range of tip Mach numbers covered in this test.

C_T/σ as a function of collective pitch is shown in figure 17. The collective pitch data were obtained from the collective actuator position, and some errors caused by control system geometric nonlinearities are present in the data. These errors are estimated to be less than $\pm 1^\circ$. The effect of rotor thrust on hub spindle flap bending moment is shown in figure 18. The hub spindle flap bending moment gage was at $r/R = 0.06$. The effect of rotor thrust on blade flap bending moment at $0.3R$ is shown in figure 19. The effect of rotor thrust on pitch link load is shown in figure 20. The distance from the pitch link to the blade pitch axis was 0.24 m. The effect of rotor torque on hub spindle chord bending moment is shown in figure 21. The hub spindle chord bending moment gage was at $r/R = 0.06$. The effect of rotor torque on blade chord bending moment at $0.3R$ is shown in figure 22.

Wake Rake Data

Data obtained with the rotor wake rake are presented in Appendix B. The location of the pressure taps is presented in table 4. A dictionary of the parameters in Appendix B is provided in table 5. The data are organized by run number. Plots of wake dynamic pressure as a function of radius for several rotor thrusts are presented in figure 23.

16 Abstract A hover test of a full-scale XV-15 rotor was conducted at the Outdoor Aerodynamic Research Facility at Ames Research Center. The primary objective of the test was to obtain accurate measurements of the hover performance of the original, metal-blade XV-15 rotor system. Data were acquired for rotor tip Mach numbers ranging from 0.60 to 0.73. This report presents data on rotor performance, rotor wake downwash velocities, and rotor loads.
