## 1. General Information

General Laboratory Procedures. All moisture-sensitive reactions were performed under an atmosphere of nitrogen in flame-dried round bottom flasks or glass vials fitted with rubber septa and/or septa equipped screw caps. For reactions run at low temperatures the caps were wrapped with Teflon® tape and parafilm to minimize the introduction of adventitious water. Stainless steel syringes were used to transfer air or moisture-sensitive liquids.

Materials and Instrumentation. All chemicals were purchased from Sigma-Aldrich and were used as received unless otherwise stated. All solvents, excluding methyl tert-butyl ether (MTBE), were purchased from Fischer Scientific and further dried using Glass Contour Solvent System by SG Waters USA LLC. Unless stated differently, all reactions were performed under inert atmosphere (Argon) and previously dried using common anhydrous techniques. Reactions were monitored by TLC and visualized by a dual short wave/long wave UV lamp and stained with $\mathrm{I}_{2}$. All compounds were purified via flash column chromatography using 230-400 mesh silica gel. NMR spectra were recorded on Varian Unity Plus 500 and Varian Mercury 400 spectrometers. Chemical shifts for ${ }^{1} \mathrm{H}$-NMR were reported as $\delta$, parts per million ( ppm ), relative to the signal of $\mathrm{CHCl}_{3}$ at $7.26(\mathrm{~s}) \mathrm{ppm}$. Chemical shifts for ${ }^{13} \mathrm{C}$-NMR were reported as $\delta$, parts per million, relative to the signal of the $\mathrm{CDCl}_{3} 77.0$ ( t ) ppm. Proton and carbon assignments were established using spectral data of similar compounds. The abbreviations s, br. s, d, dd, br. d, ddd, t, q, br. $\mathrm{q}, \mathrm{p}, \mathrm{m}$, and br. m stand for the resonance multiplicity singlet, broad singlet, doublet, doublet of doublets, broad doublet, doublet of doublet of doublets, triplet, quartet, broad quartet, pentet, multiplet and broad multiplet, respectively. IR spectra were recorded on an Avatar 360 FT-IR spectrometer. Mass spectra were recorded in the Mass Spectrometry Facility at the Department of Chemistry of Boston University in Boston, MA on a Waters Q-Tof API-US with ESI high-resolution mass spectrometer. The enantiomeric purity was determined by Chiral HPLC analysis performed on a Waters system using either a CHIRALPAK AD-H or a CHIRALCEL OD-H column from CHIRAL TECHNOLOGIES, INC with $i$ $\mathrm{PrOH} /$ hexane as the eluent. HPLC traces were compared to racemic samples prepared by performing the Oxidative Mannich Reaction in acetonitrile at room temperature, without the presence of the thiourea catalyst. Optical rotations were measured on a AUTOPOL III automatic polarimeter from RUDOLF RESEARCH ANALYTICAL. Concentration refers to removal of solvent under reduced pressure (house vacuum at ca. 20 mmHg ). 1,2,3,4-Tetrahydroisoquinoline derivatives and 6,7-dimethoxy-1,2,3,4tetrahydroisoquinoline were prepared according to published literature procedures. ${ }^{1}$

Abbreviations used: ee = enantiomeric excess, HPLC = high pressure liquid chromatography, EDC hydrochloride $=N$-(3-Dimethylaminopropyl)- $N^{\prime}$-ethylcarbodiimide hydrochloride, $\mathrm{Et}_{3} \mathrm{~N}=$ triethylamine, $\mathrm{EtOAc}=$ ethyl acetate, $\mathrm{AcOH}=$ acetic acid, $\mathrm{DCM}=$ dichloromethane, $\mathrm{HCl}=$ hydrogen chloride, $\mathrm{HOBt}=$ 1-Hydroxybenzotriazole hydrate, $\mathrm{NaHCO}_{3}=$ sodium bicarbonate, $\mathrm{Boc}=$ tert-butoxycarbonyll, $\mathrm{LiCl}=$ lithium chloride, $\mathrm{NaOAc}=$ sodium acetate, $\mathrm{NaOMe}=$ sodium methoxide, $\mathrm{MeOH}=$ methanol, DIPEA $=$ $N, N$-diisopropylethylamine, MTBE = methyl tert-butyl ether, THF = tetrahydrofuran.

## 2. Catalyst Preparation and Characterization Data

The catalysts shown in table 1 were synthesized following the general reaction sequence shown below:

S3

$5 g$

7-bromobenzothiophene (S1).
To a solution of 2.29 g ( 42.31 mmol ) NaOMe in 25 mL of MeOH was added 5.0 g ( 26.44 mmol ) of 2-bromothiophenol and 3.42 mL of bromoacetoaldehyde dimethylacetal at $0^{\circ} \mathrm{C}$. After 20 minutes at $0^{\circ} \mathrm{C}$, the mixture was refluxed for 4 hours. The mixture was then evaporated to yield a crude oil. Water ( 50 mL ) was added to this residue and the aqueous layer was extracted with 50 mL of $\mathrm{Et}_{2} \mathrm{O}$ (3 times). The combined organic layers are washed with brine and subsequently dried using $\mathrm{MgSO}_{4}$ and evaporated. The crude material was then added to a mixture of 0.5 g polyphosphoric acid in 50 mL of chlorobenzene and heated to reflux in a pressure tube for 12 hours. After 12 hours, the supernatant of the reaction mixture was separated and evaporated. The residue was purified by column chromatography using hexane as eluent to yield the desired product $\mathbf{S 1}(4.03 \mathrm{~g}, 72 \%$ yield) as a colorless oil. The spectroscopic data was in agreement with that reported in the literature. ${ }^{2}{ }^{1} \mathbf{H} \mathbf{N M R}(500 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \boldsymbol{\delta} 7.73(\mathrm{dd}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.47-7.45(\mathrm{~m}, 2 \mathrm{H}), 7.41(\mathrm{~d}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.21(\mathrm{t}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H})$; HRMS calcd for $\mathrm{C}_{8} \mathrm{H}_{6} \mathrm{BrS}$ : 212.9374; found: 212.9378 .
(R)-tert-butyl 2-(benzothiophen-7-yl)pyrrolidine-1-carboxylate (S2).

The preparation follows a procedure described by Campos and coworkers for the Palladium-catalyzed $\alpha$-arylation of $N$-Boc-pyrrolidines. ${ }^{4}$ To a solution of $N$-Bocpyrrolidine ( $2.0 \mathrm{~mL}, 11.4 \mathrm{mmol}$ ) and (-)-sparteine ( $2.6 \mathrm{ml}, 11.4 \mathrm{mmol}$ ) in MTBE ( 24 mL ) at $-78^{\circ} \mathrm{C}$ was added s-BuLi ( $9.6 \mathrm{~mL}, 11.4 \mathrm{mmol}, 1.2 \mathrm{M}$ in cyclohexane) via syringe pump over the course of 60 minutes. The resulting solution was stirred at $-78^{\circ} \mathrm{C}$ for 3 hours. A solution of $\mathrm{ZnCl}_{2}$ ( $6.4 \mathrm{~mL}, 6.8 \mathrm{mmol}, 1.0 \mathrm{M}$ in $\mathrm{Et}_{2} \mathrm{O}$ ) was added to the reaction via syringe pump over the course of one hour. Stirring at $-78^{\circ} \mathrm{C}$ was continued for 30 minutes and the resulting suspension was subsequently warmed to room temperature. Arylbromide $\mathbf{S 1}(2.01 \mathrm{~g}, 9.5 \mathrm{mmol})$ was subsequently added followed by $\mathrm{Pd}(\mathrm{OAc})_{2}(102 \mathrm{mg}, 0.46 \mathrm{mmol})$ and $t \mathrm{Bu}_{3} \mathrm{P}-\mathrm{HBF}_{4}(164 \mathrm{mg}, 0.57 \mathrm{mmol})$. Stirring at room temperature was continued for 12 hours. $\mathrm{NH}_{4} \mathrm{OH}$ solution ( 1 ml ) was then added and stirring was continued for one hour. To this mixture was then added $1 \mathrm{M} \mathrm{HCl}(100 \mathrm{~mL})$ and the aqueous phase was extracted twice with DCM $(100 \mathrm{~mL})$. The combined organic phases were washed with brine, dried using $\mathrm{Na}_{2} \mathrm{SO}_{4}$ filtered and concentrated. The crude material was purified using column chromatography and hexane/EtOAc (4:1) as eluent to yield $\mathbf{S} 2\left(2.04 \mathrm{~g}, 71 \%\right.$ yield) as a colorless oil. $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{23}=+29.2^{\circ}\left(\mathrm{c}=0.50, \mathrm{CHCl}_{3}\right)$; Compound $\mathbf{S} 2$ is characterized as a mixture of rotamers. ${ }^{1} \mathbf{H} \mathbf{N M R}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=7.71(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.44-$ $7.40(\mathrm{~m}, 2 \mathrm{H}), 7.37(\mathrm{~d}, J=5.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.32(\mathrm{t}, J=7.6 \mathrm{~Hz}, 4 \mathrm{H}), 7.13(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}), 5.04(\mathrm{t}, J=6.3$

## 3. Substrate Preparation

All substrates were either commercially available and used without further purification or were prepared according to literature procedures. ${ }^{4,5}$

## 4. General Reaction Procedure

A mixture of tetrahydroisoquinoline ( 0.05 mmol ), $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right] \mathrm{Cl}_{2}(0.32 \mathrm{mg}, 1 \mathrm{~mol} \%)$ and acetonitrile $(0.5$ mL ) was degassed by three cycles of freeze-pump-thaw. $\mathrm{CCl}_{4}(19.4 \mu \mathrm{~L}, 0.2 \mathrm{mmol}, 4$ equiv) was added and the mixture was stirred overnight under an inert atmosphere at room temperature while irradiated by blue LEDs (at a distance of approximately 10 cm so that the reaction mixture did not heat up during the reaction). Full conversion of the tetrahydroisoquinoline was ensured by either TLC or analyzing an aliquot of the reaction mixture with ${ }^{1} \mathrm{H}-\mathrm{NMR}$. The reaction mixture with the so formed iminium specie was transferred to a glass vial equipped with a septum screw cap using additional acetonitrile ( 1 mL ) to assure complete transfer. The solution (or suspension depending on which tetrahydroisoquinoline derivative was used) was concentrated with stirring under high vacuum at $-30^{\circ} \mathrm{C}$. The solid residue was kept under high vacuum for approximately 30 minutes at room temperature, which produced a red glassy solid. To the solid was added the thiourea catalyst ent-5g ( $5.9 \mathrm{mg}, 0.01 \mathrm{mmol}, 20 \mathrm{~mol} \%$ ) whereupon the glass vial was sealed and then evacuated and refilled with argon three times. MTBE ( 1 mL ) was added and the mixture was agitated with a vortex for a few seconds. The reaction mixture was then stirred at -60 ${ }^{\circ} \mathrm{C}$ for 30 minutes before the addition of the nucleophile, 1-(tert-butyldimethylsilyloxy)-1methoxyethylene ( $21.8 \mu \mathrm{~L}, 0.1 \mathrm{mmol}, 2$ equiv). The reaction mixture was stirred overnight ( 16 h ) and was then filtered through a plug of silica gel using $\mathrm{DCM}(3 \times 2 \mathrm{~mL})$ and a mixture of $\mathrm{DCM} / \mathrm{Et}_{2} \mathrm{O}(1: 1,3 \times 2$ $\mathrm{mL})$. The product was isolated by Flash chromatography using $10 \% \mathrm{Et}_{2} \mathrm{O}$ in hexanes as eluent.

## 6. Generation of Racemic Reference Compounds

Racemic material of all products was prepared as reference for $e e$ determination using HPLC. The transformation was performed in two steps; visible light mediated photoredox activation conducted at room temperature followed by nucleophillic addition also conducted at room temperature.

## Step 1. Oxidative activation:

A mixture of tetrahydroisoquinoline ( 0.05 mmol ), $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right] \mathrm{Cl}_{2}(0.32 \mathrm{mg}, 1 \mathrm{~mol} \%)$ and $\mathrm{MeCN}(0.5 \mathrm{~mL})$ was degassed by three cycles of freeze-pump-thaw. $\mathrm{CCl}_{4}(19.4 \mu \mathrm{~L}, 0.2 \mathrm{mmol}, 4$ equiv) was added and the mixture was stirred over night under an inert atmosphere at room temp while irradiated by blueLEDs (at a distance of approximately 10 cm so that the reaction mixture did not heat up during the reaction). Full conversion of the tetrahydroisoquinoline was ensured by either TLC or analyzing an aliquot of the reaction mixture with ${ }^{1} \mathrm{H}-\mathrm{NMR}$.

## Step 2: Nucleophilic addition:

To the reaction mixture with the so formed iminium species was added the nucleophile, 1-(tert-butyldimethylsilyloxy)-1-methoxyethylene ( $21.8 \mu \mathrm{~L}, 0.1 \mathrm{mmol}, 2$ equiv). The reaction mixture was stirred over night ( 16 h ) and was then filtered through a plug of silica using DCM ( $3 \times 2 \mathrm{~mL}$ ) and a mixture of $\mathrm{DCM} / \mathrm{Et}_{2} \mathrm{O}(1: 1,3 \times 2 \mathrm{~mL})$. The product was isolated by Flash chromatography using a mixture of $\mathrm{Et}_{2} \mathrm{O}$ in hexanes as eluent.

## 7. Determination of Absolute Configuration

## (R)-methyl 2-(2-acetyl-1,2,3,4-tetrahydroisoquinolin-1-yl)acetate (7) ${ }^{7}$

A solution of CAN ( $169.9 \mathrm{mg}, 0.31 \mathrm{mmol}, 5 \mathrm{eq}$ ) and $\mathrm{H}_{2} \mathrm{O}(3 \mathrm{~mL})$ was added to a solution of $\left[\mathrm{Fe}(\mathrm{bpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}(252.4 \mathrm{mg}, 0.31 \mathrm{mmol}, 5$ equiv) in $\mathrm{MeCN}(3 \mathrm{~mL})$. The resulting blue solution was added dropwise to a solution of methyl 2-(2-(2-methoxyphenyl)-1,2,3,4-tetrahydroisoquinolin-1-yl)acetate ( $19.3 \mathrm{mg}, 0.062 \mathrm{mmol}$ ), $\mathrm{MeCN}(2 \mathrm{~mL})$ and water ( 1 $\mathrm{mL})$ at room temperature. The reaction immediately turned red. The reaction was allowed to stir for 45 minutes and was then quenched with sat. $\mathrm{Na}_{2} \mathrm{CO}_{3}(10 \mathrm{~mL})$. The resulting mixture was extracted with EtOAc ( $3 \times 15 \mathrm{~mL}$ ) and the combined organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. The so obtained solid crude was dissolved in a minimum amount of DCM (approx. 1 mL ) followed by addition of $\mathrm{Et}_{2} \mathrm{O}(5 \mathrm{~mL})$ to precipitate the metal salts. The crude dearylated product was obtained by filtration using a cotton plugged pipette followed by evaporation of the solvent.
$\mathrm{AcCl}(7 \mu \mathrm{~L}, 0.093 \mathrm{mmol}, 1.5$ equiv) was added to a solution of the crude amine and pyridine $(3 \mathrm{~mL})$ at ambient temperature. The reaction mixture was stirred for 2 h and then quenched with $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$. The mixture was extracted with DCM ( 10 times 3 mL ) and the combined organic phases was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and then concentrated in vacuo. The crude was triturated with $\mathrm{Et}_{2} \mathrm{O}$ and the suspension was allowed to rest at $-18{ }^{\circ} \mathrm{C}$ over night. The solvent was decanted and concentrated in vacuo to give the acetylated product as a white solid in $87 \%$ yield ( 13 mg ) and $95 \% e e$. Chiral HPLC (CHIRALCEL OD-H, $15 \% \mathrm{IPA}$ in hexanes, $1.0 \mathrm{~mL} / \mathrm{min}, \lambda=254 \mathrm{~nm}) t_{\mathrm{R}}($ minor $)=6.7 \mathrm{~min}, t_{\mathrm{R}}($ major $)=9.6 \mathrm{~min} ;[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{26}=+32.7^{\circ}$ $(\mathrm{c}=0.36, \mathrm{DCM})$. All spectral data was in accordance with published data.

(R)-methyl 2-(1,2,3,4-tetrahydroisoquinolin-1-yl)acetate was isolated from an aliquot of the crude reaction mixture in the oxidative dearylation of $(R)$-Methyl 2-(2-(2-methoxyphenyl)-1,2,3,4-tetrahydroisoquinolin-1-yl)acetate (6) utilizing reverse phase chromatography (GILSON PLC 2020 system with a SunFire prep C18 ODB ${ }^{\text {TM }}$ column). Comparing with the literature $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{26}$ value for (+)-methyl $(R)-2-(1,2,3,4$-tetrahydroisoquinolin-1-yl)acetate confirmed the absolute configuration of the tetrahydroisoquinoline derivative to be $R$-enantiomer. ${ }^{8}[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{26}=+40.7^{\circ}(\mathrm{c}=$ $0.1, \mathrm{DCM}, 95 \% \mathrm{ee})$. Literature: $[\boldsymbol{\alpha}]_{\mathrm{D}}{ }^{26}=+95.2^{\circ}\left(\mathrm{c}=1.0, \mathrm{CHCl}_{3}, 95 \% e e\right)$
