# Policies and Impact: An Analysis of Village-Level Microfinance Institutions

Joseph Kaposki (Ohio State) and Robert Townsend (Chicago)

March 2005

Joseph Kaposki (Ohio State) and Robert Tow

## **Objectives and Challenges**

- To see how the impact of membership in an MFI on household outcomes depends on
- $\hookrightarrow$  type of MFI
- $\hookrightarrow$  policies followed by MFIs: those associated with actual success vs. those predicted by theory
  - Two types of selection problem
- $\hookrightarrow$  participation by households depends on unobservables which are correlated with outcomes
- $\hookrightarrow$  presence of MFI in village depends on unobservables which are correlated with outcomes

## Institutional Survey

- Household and institution level surveys in four provinces of Thailand
- $\hookrightarrow$  semi-urban: Chachoengsao and Lopburi
- $\hookrightarrow$  rural: Sisaket and Buriram
  - 161 village-level MFIs across 192 villages
  - Typical loan: size=3500 baht (\$140), duration= 1year, interest = 14-19%, no collateral
- Many MFIs require savings, pledged or optional
   → median annual size: 500 baht (\$20), interest = 8%

## Types of MFI

- Production credit groups (PCGs): offer savings services and lend cash
- $\hookrightarrow$  members less likely to be poorest, but more likely to be women
  - Rice banks: make small emergency loans of rice (consumption-smoothing)
- $\,\hookrightarrow\,$  relatively high interest rates, members are likely to be poor
  - Women's groups: offer array of financial services
- $\hookrightarrow$  often linked with training/funding for entrepreneurship
  - Buffalo banks: lend out cattle, repayment when calf born
  - Success depends on specific policies (Table 1)

Correlations with membership growth		Correlations wit	Correlations with savings growth		th lending growth
Positive	Negative	Positive	Negative	Positive	Negative
Offer lending services	Saving is optional	Require minimum initial deposit	Standard savings accounts	Provide agricultural training	Institution is a buffalo bank
Require minimum initial deposit		Have membership application forms	Time deposit savings	Make cash loans	Make rice loans
		Pledged savings accounts Provide nonagricultural consultation or advice Provide emergency	Only villagers can be members	Amount of savings used as evaluation criteria	
		assistance			

TABLE 1. Summary of significant correlations between relevant institution types policies and growth failure.

Note: Other policies that were tested include among others: collateral required, guarantors required, payment frequency of six months or less, monitoring frequency of six months or less, borrowers who default can't reborrow, and all borrowers are monitored. These did not have significant relationships with growth.

## Household Survey

- 2880 Thai households (15 per village) stratified, random sample
- household level data (Table 2)
- Village-level data (Tables 3 and 4)

	No. of obs.	Mean or fraction	Stand. Dev.

TABLE 2. Summa	ry statistics	s of relevant	Townsend	Thai hou	sehold-level data.
----------------	---------------	---------------	----------	----------	--------------------

Notes: \* Binary variable.

<sup>†</sup> Wealth is made up of the value of household assets, business assets, agricultural assets, and land. Nonbusiness wealth excludes business assets. Wealth levels were divided by 1,000,000 to rescale estimates into convenient numbers. The sample excludes the top 1% of households by wealth.

\* Formal financial institutions include commercial banks, the government savings bank, insurance companies, and finance companies.

All variables are for the year 1990 except for the impact variables (as noted) and the demographic variables, which are 1997.

All borrowers are monitored*	26	0.577	0.503

#### TABLE 3. Summary statistics of relevant Townsend Thai village-level data.

Notes: \* Binary variable.

<sup>†</sup> Wealth is made up of the value of household assets, business assets, agricultural assets, and land. Levels were divided by 1,000,000 to rescale estimates into convenient numbers. The sample excludes the top 1% of households by wealth. All variables are for the year 1990 except for average years of schooling–head of household. Given the average age of these heads of household (51.4), this 1997 schooling variable is likely quite close to its 1990 counterpart.

	No. of obs.	Mean or fraction	Stand. dev.

#### TABLE 4. Summary statistics of relevant CDD village-level data.

Notes: \* Binary variable. \*\* Qualitative variable with 1 = above average, 2 = average, and 3 = below average. \* From over 650 variables, these 19 village control variables were examined (see Section 4). All variables are for the year 1990.

## Impact by Type of Institution

• Difference-in-difference estimator:

$$\Delta y_n = \boldsymbol{\alpha} \mathbf{X}_n + \boldsymbol{\tau} \mathbf{Z}_n + \boldsymbol{\beta} M_n + \boldsymbol{u}_{y,n}$$

where

$$\Delta y_n =$$
 change in outcome for houshold *n* (1991-1997)

$$X_n =$$
 vector of household-specific variables

$$Z_n$$
 = vector of village-level contols for household  $n$ 

 $M_n = \begin{cases} 1 & \text{if household is member of particular type of MFI} \\ 0 & \text{otherwise} \end{cases}$ 

- Primary Selection Problem:
- $\hookrightarrow$  membership may depend on unobservable household characteristics that are correlated with  $u_{y,n}$

## Two-stage least squares approach

- Use "presence of MFI in 1991" as an instrument for  $M_n$
- First-stage regression:

$$M_n = \gamma \mathbf{X}_n + \boldsymbol{\phi} \mathbf{Z}_n + \delta I_n + u_{m,n}$$

#### where

$$I_n = \begin{cases} 1 & \text{if MFI of particular type is present in village} \\ 0 & \text{otherwise} \end{cases}$$

Rho (Error correlation)	_		0.8336	0.0669	

Notes: Shading indicates significance at the 5% level. Occupation dummy variables were included in the regressions above, but the results are omitted for the sake of presentation.

## Simultaneous Equation Maximum Likelihood Estimation

- Problem:  $M_n$  and sometimes  $y_n$  are binary variables
- Least squares estimation assumes dependent variables are drawn from continous distribution
- Alternative approach addresses for this

## Secondary Selection Problem

- Presence of an institution in village may depend on unobservable village characteristics
- Can predict  $I_n$  using geographic (GIS) variables:

Modified system:

$$\begin{aligned} \Delta y_n &= \alpha \mathbf{X}_n + \tau \mathbf{Z}_n + \eta \tilde{l}_n + \beta M_n + \varepsilon_{y,n} \\ M_n &= \gamma \mathbf{X}_n + \boldsymbol{\phi} \mathbf{Z}_n + \delta l_n + u_{m,n} \\ &= \gamma \mathbf{X}_n + \boldsymbol{\phi} \mathbf{Z}_n + \delta \tilde{l}_n + \delta e_n + u_{m,n} \end{aligned}$$

 $\,\hookrightarrow\,$  only the unpredictable component is used as instrument

TABLE 6. Continued

Notes: Shading indicates significance at the 5% level. Occupation dummy variables were included in the regressions above, but the results are omitted for the sake of presentation.

## Results

- Impact of (exogenous variation in) membership on various household oucomes
- $\hookrightarrow$  asset growth
- $\hookrightarrow$  whether household is forced to reduce consumption or input in bad year
- $\hookrightarrow$  starting a business
- $\hookrightarrow$  changing jobs
- $\hookrightarrow$  becoming a customer of a moneylender
  - Results depend on type of institution (Tables 8 and 9)

Membership by institution type	Number of members	Asset growth	Reducing consumption or input use in bad year	Starting a business	Changing jobs	Becoming moneylender customer

TABLE 8. Membership impact estimates using Townsend Thai key informant data, by type of institution.

Outcome variable

Notes: Shading indicates significance at 5% level.<sup>‡</sup> Estimate is significant, but MLE yielded an insignificant error correlation that approached perfect positive or negative correlation. The impact estimate is the coefficient on the membership variable in 1990. "Outcome variables" are the dependent variables in the outcome equation. Impacts are measured from 1991 to 1997. Other independent variables used as controls are head of household characteristics (age; age squared; years of education, sex); household characteristics (numbers of adult males, adult females, and children; total assets, total assets squared; membership/customer of commercial bank, agricultural bank, money lender) and village characteristics (average wealth; average wealth squared; average years education of household heads; fraction of households in rice farming as primary occupation, in multiple occupations, and in agriculture only; presence of a hall for village assembly; economic status relative to other villages in the *tambonl*subdistrict; and the relative level of government assistance that the village receives). In addition, the "asset growth" and reducing consumption" equations contain occupation dummies for the household head. The "becoming moneylender customer" excludes customer of moneylender as a right-hand side regressor. The wealth controls for "starting a business" use non-business wealth. The membership equation contains all of the control variables in the outcome equation as well as a dummy variable for the presence of the institution in the village in 1990 from the Townsend data.

Membership by institution type	Number of members	Asset growth	Reducing consumption or input use in bad year	Starting a business	Changing jobs	Becoming moneylender customer

TABLE 9. Membership impact estimates using CDD and GIS-constructed data, by type of institution.

Outcome variable

Notes: Shading indicates significance at 5% level. <sup>‡</sup> Estimate is significant, but MLE yielded an insignificant error correlation that approached perfect positive or negative correlation. The impact estimate is the coefficient on the membership variable in 1990. "Outcome variables" are the dependent variables in the outcome equation. Impacts are measured from 1991 to 1997. The list of controls variables are those contained in the notes to Table 8. The additional control used is the GIS estimates for the predicted probability of a village having a relevant institution based on its geographic location. The membership equation contains all of the control variables in the outcome equation as well as a dummy variable for the presence of the institution in the village in 1990 from the CDD data.

## Impact by Type of Policy

- Same broad framework as before
- Now

$$I_n = \begin{cases} 1 & \text{if some institutions in village follow policy} \\ 0 & \text{if no institutions in village follow policy} \end{cases}$$

- Two sets of policies
- $\hookrightarrow$  growth/failure related policies (Table 10)
- $\hookrightarrow$  traditional microfinance policies (Table 11)

Outcome variable			Reducing			Becoming

TABLE 11. Impact estimates by policies of institutions-(traditional microfinance policies).

Impact variable

Notes: Light shading indicates significance at 5% level. Dark shading indicates significance at the 10% level. Impact estimates are the OLS estimate of the coefficient on the dummy variable for all institutions in the village in 1990 having/not having the relevant policy. "Outcome variables" are the dependent variables. The other independent variables are the list of controls variables contained in the notes to Table 8.

## **Broad Conclusions**

- Strong positive effects on asset growth of PCGs and women's groups
- Strong negative effects on asset growth of rice and buffalo banks
- Importance of rice and buffalo banks in consumption smoothing
- Importance of women's groups in reducing reliance on moneylenders
- Important role of (pledged) savings policies in consumption smoothing and reducing reliance on moneylenders
- Relative lack of importance of collateral requirements, payment frequency and monitoring
