Contents

Preface *ix*

Notation *xiii*

1 Introduction and Prerequisites *1*

1.1 A Nonmathematical Introduction *1*

1.2 Fundamentals of Stationary Points and Stability (ODEs) *4*

1.2.1 Trajectories and Equilibria *4*

1.2.2 Deviations *6*

1.2.3 Stability *8*

1.2.4 Linear Stability; Duffing Equation *10*

1.2.5 Degenerate Cases, Parameter Dependence *18*

1.2.6 Generalizations *20*

1.3 Fundamentals of Limit Cycles and Waves *21*

1.3.1 Van der Pol Equation *22*

1.3.2 Waves *25*

1.4 Some Fundamental Numerical Methods *29*

2 Basic Nonlinear Phenomena *35*

2.1 A Preparatory Example *35*

2.2 Elementary Definitions *38*

2.3 Buckling and Oscillation of a Beam *40*

2.4 Turning Points and Bifurcation Points: The Geometric View *44*

2.5 Turning Points and Bifurcation Points: The Algebraic View *52*

2.6 Hopf Bifurcation *60*
2.7 Convection Described by Lorenz's Equation *66*
2.8 Hopf Bifurcation and Stability *71*
2.9 Generic Branching *78*
2.10 Bifurcation in the Presence of Symmetry *91*

3 Practical Problems *93*
3.1 Readily Available Tools and Limited Results *93*
3.2 Principal Tasks *94*
3.3 What Else Can Happen *97*
3.4 Marangoni Convection *101*
3.5 The Art and Science of Parameter Study *106*

4 Principles of Continuation *109*
4.1 Predictors *111*
4.1.1 ODE-Methods; Tangent Predictor *111*
4.1.2 Polynomial Extrapolation; Secant Predictor *113*
4.2 Parameterizations *114*
4.2.1 Parameterization by Adding an Equation *114*
4.2.2 Arclength and Pseudo Arclength *116*
4.2.3 Local Parameterization *116*
4.3 Correctors *119*
4.4 Step Controls *122*
4.5 Continuation Subject to Constraints *124*
4.6 More Practical Aspects *125*

5 Calculation of the Branching Behavior of Nonlinear Equations *129*
5.1 Calculating Stability *129*
5.2 Branching Test Functions *132*
5.3 General Methods for Calculating Branch Points *137*
5.3.1 Indirect Methods *137*
5.3.2 Direct Methods *144*
5.3.3 An Electrical Circuit *150*

5.3.4 A Family of Test Functions *154*
5.3.5 Temperature Distribution in a Reacting Material *157*
5.3.6 Direct Versus Indirect Methods *161*
5.4 Branch Switching *162*
5.4.1 Constructing a Predictor via the Tangent *163*
5.4.2 Predictors Based on Interpolation *166*
5.4.3 Correctors with Selective Properties *169*
5.4.4 Symmetry Breaking *172*
5.4.5 Coupled Cell Reaction *173*
5.4.6 Parameterization by Irregularity *178*
5.4.7 Other Methods *179*
5.5 Methods for Calculating Specific Branch Points *182*
5.5.1 A Special Implementation for the Branching System *183*
5.5.2 Regular Systems for Bifurcation Points *186*
5.5.3 Methods for Turning Points *187*
5.5.4 Methods for Hopf Bifurcation Points *187*
5.5.5 Other Methods *189*
5.6 Concluding Remarks *189*
5.7 Two-Parameter Problems *190*

6 Calculating Branching Behavior of ODE Boundary-Value Problems *195*
6.1 Enlarged Boundary-Value Problems *196*
6.2 Calculation of Branch Points *206*
6.2.1 Branching System *206*
6.2.2 Catalytic Reaction *207*
6.2.3 Initial Approximation and Branching Test Function *209*
6.3 Stepping Down for an Implementation *211*
6.4 Branch Switching and Symmetry *213*
6.5 Trivial Bifurcation *222*
6.6 Testing Stability *226*
6.7 Hopf Bifurcation in PDEs *229*

7 Stability of Periodic Solutions *235*
- 7.1 Periodic Solutions of Autonomous Systems *236*
- 7.2 The Monodromy Matrix *240*
- 7.3 The Poincaré Map *242*
- 7.4 Mechanisms of Losing Stability *248*
  - 7.4.1 Branch Points of Periodic Solutions *250*
  - 7.4.2 Period Doubling *255*
  - 7.4.3 Bifurcation into Torus *263*
- 7.5 Calculating the Monodromy Matrix *267*
  - 7.5.1 A Posteriori Calculation *267*
  - 7.5.2 Monodromy Matrix as By-product of Shooting *269*
  - 7.5.3 Numerical Aspects *270*
- 7.6 Calculating Branching Behavior *272*
- 7.7 Further Examples and Phenomena *280*

8 Qualitative Instruments *283*
- 8.1 Significance *283*
- 8.2 Singularity Theory for One Scalar Equation *284*
- 8.3 The Elementary Catastrophes *293*
  - 8.3.1 The Fold (Requires One Parameter, γ) *293*
  - 8.3.2 The Cusp (Requires Two Parameters, δ, ζ) *294*
  - 8.3.3 The Swallowtail (Requires Three Parameters, γ, δ, ζ) *295*
- 8.4 Zeroth-Order Reaction in a CSTR *297*
- 8.5 Center Manifolds *300*

9 Chaos *305*
- 9.1 Flows and Attractors 305
- 9.2 Examples of Strange Attractors *311*
- 9.3 Routes to Chaos *316*
  - 9.3.1 Route via Torus Bifurcation *316*
  - 9.3.2 Period Doubling Route *317*
  - 9.3.3 Intermittency *317*

9.4 Characterization of Strange Attractors *318*
9.4.1 Fractal Dimension *318*
9.4.2 Liapunov Exponents *321*
9.4.3 Power Spectra *326*

Appendixes *329*
Appendix 1. Some Elementary Facts from ODEs *329*
Appendix 2. Implicit Function Theorem *331*
Appendix 3. Some Basic Facts from Linear Algebra *332*
Appendix 4. Runge-Kutta-Fehlberg Methods *333*
Appendix 5. Transformation into Standard Form *334*
Appendix 6. Numerical Software and Packages *336*
Appendix 7. Basic Groups *337*
