Prevalence of Obesity and Severe Obesity Among Adults: United States, 2017–2018

Craig M. Hales, M.D., Margaret D. Carroll, M.S.P.H., Cheryl D. Fryar, M.S.P.H., and Cynthia L. Ogden, Ph.D.

Key findings

Data from the National Health and Nutrition Examination Survey

- In 2017–2018, the age-adjusted prevalence of obesity in adults was 42.4%, and there were no significant differences between men and women among all adults or by age group.
- The age-adjusted prevalence of severe obesity in adults was 9.2% and was higher in women than in men.
- Among adults, the prevalence of both obesity and severe obesity was highest in non-Hispanic black adults compared with other race and Hispanic-origin groups.
- The prevalence of severe obesity was highest among adults aged 40–59 compared with other age groups.
- From 1999–2000 through 2017–2018, the prevalence of both obesity and severe obesity increased among adults.

Obesity is associated with serious health risks (1). Severe obesity further increases the risk of obesity-related complications, such as coronary heart disease and end-stage renal disease (2,3). From 1999–2000 through 2015–2016, a significantly increasing trend in obesity was observed (4). This report provides the most recent national data for 2017–2018 on obesity and severe obesity prevalence among adults by sex, age, and race and Hispanic origin. Trends from 1999–2000 through 2017–2018 for adults aged 20 and over are also presented.

What was the prevalence of obesity among adults in 2017–2018?

The age-adjusted prevalence of obesity among U.S. adults was 42.4% in 2017–2018. The prevalence was 40.0% among younger adults aged 20–39, 44.8% among middle-aged adults aged 40–59, and 42.8% among older adults aged 60 and over. There were no significant differences in prevalence by age group (Figure 1).

Figure 1. Prevalence of obesity among adults aged 20 and over, by sex and age: United States, 2017–2018

Notes: Estimates for adults aged 20 and over were age adjusted by the direct method to the 2000 U.S. Census population using the age groups 20–39, 40–59, and 60 and over. Crude estimates are 42.5% for total, 43.0% for men, and 42.1% for women. Access data table for Figure 1 at: https://www.cdc.gov/nchs/data/databriefs/db360_tables-508.pdf#1. Source: NCHS, National Health and Nutrition Examination Survey, 2017–2018.
Among men, the prevalence of obesity was 40.3% among those aged 20–39, 46.4% among those aged 40–59, and 42.2% among those aged 60 and over. Among women, the prevalence of obesity was 39.7% among those aged 20–39, 43.3% among those aged 40–59, and 43.3% among those aged 60 and over. None of the differences by age were significant.

There was no significant difference in the prevalence of obesity between men and women overall or by age group.

**Were there differences in the prevalence of obesity among adults by race and Hispanic origin in 2017–2018?**

The prevalence of obesity was lowest among non-Hispanic Asian adults (17.4%) compared with non-Hispanic white (42.2%), non-Hispanic black (49.6%), and Hispanic (44.8%) adults. Non-Hispanic black adults had the highest prevalence of obesity compared with all other race and Hispanic-origin groups.

Among men, the prevalence of obesity was lowest in non-Hispanic Asian (17.5%) compared with non-Hispanic white (44.7%), non-Hispanic black (41.1%), and Hispanic (45.7%) men, but there were no significant differences among non-Hispanic white, non-Hispanic black, and Hispanic men (Figure 2). The prevalence of obesity was lowest among non-Hispanic Asian women (17.2%) compared with non-Hispanic white (39.8%), Hispanic (43.7%), and non-Hispanic black (56.9%) women, and prevalence among non-Hispanic black women was higher than all other groups.

NOTES: Estimates were age adjusted by the direct method to the 2000 U.S. Census population using the age groups 20–39, 40–59, and 60 and over. Access data table for Figure 2 at: [https://www.cdc.gov/nchs/data/databriefs/db360_table-508.pdf](https://www.cdc.gov/nchs/data/databriefs/db360_table-508.pdf).

Non-Hispanic black women had a higher prevalence of obesity than non-Hispanic black men. There were no significant differences in prevalence between men and women among non-Hispanic white, non-Hispanic Asian, or Hispanic adults.

**What was the prevalence of severe obesity among adults in 2017–2018?**

The age-adjusted prevalence of severe obesity among U.S. adults was 9.2% in 2017–2018. Women had a higher prevalence of severe obesity (11.5%) than men (6.9%). The prevalence was highest among adults aged 40–59 (11.5%), followed by adults aged 20–39 (9.1%) and adults aged 60 and over (5.8%). Non-Hispanic black adults had the highest prevalence of severe obesity (13.8%), and non-Hispanic Asian adults had the lowest (2.0%) (Figure 3).

What are the trends in obesity and severe obesity among adults?

From 1999–2000 through 2017–2018, the age-adjusted prevalence of obesity increased from 30.5% to 42.4%, and the prevalence of severe obesity increased from 4.7% to 9.2%. The observed changes in prevalence of obesity and severe obesity between 2015–2016 and 2017–2018 were not significant (Figure 4).

Summary

The age-adjusted prevalence of obesity was 42.4%, and the age-adjusted prevalence of severe obesity was 9.2% among adults aged 20 and over in the United States in 2017–2018. The overall prevalence of obesity was similar among men and women, but the prevalence of severe obesity was higher among women. Adults aged 40–59 had the highest prevalence of severe obesity.

The prevalence of obesity was highest among non-Hispanic black adults compared with other race and Hispanic-origin groups, overall and among women. However, among men, the prevalence of obesity was not significantly different between non-Hispanic white, non-Hispanic black, and Hispanic men. Overall, and among men and women, obesity was lowest among non-Hispanic Asian adults. Non-Hispanic black adults had the highest prevalence of severe obesity, and non-Hispanic Asian adults had the lowest.

From 1999–2000 through 2017–2018, the prevalence of obesity and severe obesity increased, but the observed increase in the prevalence of obesity and severe obesity between 2015–2016 and 2017–2018 was not significant.

Monitoring the prevalence of obesity and severe obesity is relevant for public health programs that focus on reducing or preventing obesity and its consequences. In the United States, the prevalence of obesity among adults has moved further away from the Healthy People 2020 goal of 30.5% (5).

Definition

Obesity and severe obesity: Body mass index (BMI) was calculated as weight in kilograms divided by height in meters squared, rounded to one decimal place. Obesity in adults was defined as a BMI of greater than or equal to 30 and severe obesity as a BMI of greater than or equal to 40.
Data source and methods

NHANES is a cross-sectional survey designed to monitor the health and nutritional status of the civilian noninstitutionalized U.S. population (6). The survey consists of interviews conducted in participants’ homes and standardized physical examinations conducted in mobile examination centers.

The NHANES sample is selected through a complex, multistage probability design. In 2011–2018, non-Hispanic black, non-Hispanic Asian, and Hispanic persons, among other groups, were oversampled to obtain reliable estimates for these population subgroups. Race- and Hispanic-origin-specific estimates reflect individuals reporting only one race; those reporting more than one race are included in the total but are not reported separately.

Although obesity was defined using BMI, this index does not measure body fat directly. The relationship between BMI and body fat depends on body composition and varies by sex, age, and race and Hispanic origin (7,8). Health risks may vary among different race and Hispanic-origin groups at the same BMI.

Examination sample weights, which account for the differential probabilities of selection, nonresponse, and noncoverage, were incorporated into the estimation process. All variance estimates accounted for the complex survey design by using Taylor series linearization. Pregnant women were excluded from analyses.

Age-adjusted prevalence estimates were adjusted using the direct method to the 2000 projected U.S. Census population using the age groups 20–39, 40–59, and 60 and over to compare prevalence estimates between subgroups that differ with respect to their age distributions. Differences between groups were tested using a univariate $t$ statistic at the $p < 0.05$ significance level. All differences reported are statistically significant unless otherwise indicated. Adjustments were not made for multiple comparisons. Data management and statistical analyses were conducted using SAS System for Windows version 9.4 (SAS Institute, Inc., Cary, N.C.), SUDAAN version 11.0 (RTI International, Research Triangle Park, N.C.), and R version 3.5.2, including the R “survey” package (9), to account for the complex sample design.
