1. This reference is to a quotation from a now obscure 19th Century economist, Karl Marx, who coined the phrase in 1848. See KARL MARX & FRIEDRICH ENGELS, MANIFESTO OF THE COMMUNIST PARTY (Int'l

and explains the role of legal variables. Recent research on corporate governance has found systematic differences among nations in ownership concentration, capital market development, the value of voting rights, and the use of external finance.<sup>2</sup> More importantly, these differences seem to correlate closely with the strength of the legal protections given minority investors.<sup>3</sup> In turn, this level of legal protection seems to depend upon, and vary systematically with, the nature and origins of each nation's legal system. In particular, common law legal systems seem to vastly outperform civil law legal systems (and particularly French civil law systems) in providing investor protections and, in turn, encouraging capital market growth and ownership dispersion. Most importantly, this new scholarship has found that the size, depth, and liquidity of securities markets correlates directly with the quality of the legal protections given to shareholders.<sup>4</sup> In consequence, because the nature and quality of legal protection differs widely across nations, the corporate world subdivides today into rival systems of dispersed ownership and concentrated ownership, with different structures of corporate governance characterizing each.<sup>5</sup>

A paradigm shift is now underway in the manner in which financial economics views corporate governance, with the new scholarship emphasizing both the centrality of legal protections for minority shareholders and the possibility that regulation can outperform private contracting.<sup>6</sup> Although this Article recognizes the importance of this transition, it is far more skeptical about whether this new scholarship has identified the critical elements that have given the "common law" nations a comparative advantage over the "civil law" world. Here, a mystery remains. One possibility is that substantive differences in corporate law may matter far less than differences in enforcement practice. In turn, enforcement may depend more upon the strength of the incentives to assert legal remedies than upon the availability of legal remedies themselves. Even this hypothesis, however, oversimplifies, because once one examines closely the differences among various systems of corporate governance, the assumed homogeneity of even common law

---

Publishers 1948) (observing that the specter of Communism was haunting Europe). Younger scholars are not expected to be familiar with this material.

2. The principal efforts have been by four financial economists, writing jointly, called by some "the Gang of Four," but hereafter referred to more neutrally as "LLS&V." See, e.g., Rafael La Porta, Florencio Lopez-de-Silanes, and Andrei Shleifer, *Corporate Ownership Around the World*, 54 J. FIN. 471 (1999); La Porta, Lopez-de-Silanes, Shleifer & Robert Vishny, *Law and Finance*, 106 J. POL. ECON. 1113 (1998); La Porta, Lopez-de-Silanes, Shleifer & Vishny, *Legal Determinants of External Finance*, 52 J. FIN. 1131 (1997). For another provocative effort in this same vein, see Simon Johnson et al., *Corporate Governance in the Asian Financial Crisis, 1997-1998* (Jan. 1999) (working paper, on file with author).

3. For the latest commentary by LLS&V on this theme, see La Porta, Lopez-de-Silanes, Shleifer & Vishny, *Investor Protection and Corporate Governance* (June 1999) (working paper, on file with author).

4. See sources cited *supra* notes 2 and 3.

5. Although these systems may seem static, individual firms can migrate from one to the other, principally by listing on a stock exchange in a "dispersed ownership" nation. I have suggested elsewhere that such migration and the need for global scale is destabilizing the traditional concentrated ownership system. See John C. Coffee, Jr., *The Future as History: The Prospects for Global Convergence in Corporate Governance and Its Implications*, 93 NW. U. L. REV. 641 (1999).

6. Financial economics, as a field, has long been skeptical of regulation. For an indication that this attitude is changing, see, e.g., Simon Johnson & Andrei Shleifer, *Coase v. The Coasians: The Regulation and Development of Securities Markets in Poland and the Czech Republic* (Sept. 1999) (working paper, on file with author).

legal systems begins to break down. Another possibility is that differences in substantive corporate law are less important than the differences in the level of regulation that different nations impose on their securities markets.<sup>7</sup> Under this latter hypothesis, the focus shifts from the minority shareholder to the investor generally. The critical question becomes: Does local law establish adequate disclosure and market transparency standards, restrict insider trading, and regulate takeovers and corporate control contests adequately? If it does, then arguably the exposure of shareholders to unfair self-dealing transactions at the corporate level may have only a second-level significance. This Article finds considerable evidence in the Polish and Czech experiences to be consistent with this hypothesis. Inadequate securities regulation plays the primary role in explaining privatization failures, but the Article also finds some evidence to suggest that deficiencies in Czech corporate law contributed to the systematic looting of Czech companies by their controlling shareholders.

Even if the critical protections upon which minority shareholders depend have not yet been clearly identified, the available data still strongly support the interpretation that law matters; that in some not yet well-understood manner, certain legal systems have encouraged dispersed ownership, while other systems have rendered it an unstable and transient phenomenon. This new emphasis on legal variables has potentially subversive implications for at least some aspects of neo-classical corporate finance theory. Much of the modern “law and economics” literature on corporate governance has assumed that financial market regulation was unnecessary and that the role of corporate law was simply to offer a model form contract to investors to enable them to economize on contracting costs. This conclusion that regulation was superfluous (or worse) rested on twin premises: (1) sophisticated parties could write financial contracts that were far more detailed, sophisticated, and fine-tuned to their specific circumstances than any body of standardized regulations could hope to be,<sup>8</sup> and (2) entrepreneurs had adequate incentives to minimize agency costs (in part by bonding themselves and otherwise limiting their discretion) in order to maximize the value for their stock when they brought their fledgling firm to the capital markets.<sup>9</sup> In short, because, under the standard Jensen and Meckling model of the firm,<sup>10</sup> entrepreneurs bore the weight of agency costs, they had good reason to surrender any discretion to expropriate wealth from their investors and to bond themselves to serve their shareholders faithfully; hence, regulation seemed unnecessary. From this perspective, the survival of regulation could be explained best by reference to public choice theories about interest groups and rent-seeking.<sup>11</sup>

---

7. This possibility was first implicitly noted in Coffee, *supra* note 5, and has been explicitly advanced in convincing detail by Katharina Pistor. See Katharina Pistor, *Law as a Determinant for Equity Market Development: The Experience of Transition Economies* (Mar. 1999) (working paper, on file with author).

8. Essentially, the sentence in the text is a very short summary of the arguments advanced by Judge Easterbrook and Dean Fischel for why much corporate and securities regulation is unnecessary. See FRANK EASTERBROOK & DANIEL FISCHEL, *THE ECONOMIC STRUCTURE OF CORPORATE LAW* (1991). For an earlier statement of this view, see George J. Stigler, *Public Regulation of the Securities Market*, 37 J. BUS. 117 (1964).

9. See Michael Jensen & William Meckling, *Theory of the Firm: Managerial Behavior, Agency Costs, and Ownership Structure*, 3 J. FIN. ECON. 305 (1976).

10. *Id.*

11. For well-known such efforts, see Jonathan Macey & Geoffrey Miller, *Toward An Interest-Group Theory of Delaware Corporate Law*, 65 TEX. L. REV. 469 (1987); Roberta Romano, *The Political Economy of*

This claim that financial contracting largely renders regulation irrelevant cannot explain, however, the close correlation between a given country's level of capital market development and the nature of its legal system. The more logical conclusion is that law does matter, and regulation can somehow better promote economic efficiency than can reliance on financial contracting alone. By themselves, private contracting and the voluntary incentives for disclosure seem incapable of producing the level of continuing disclosure necessary to sustain active securities markets.

More importantly, standard economic models of financial contracting within firms do not fit the privatization context. Chiefly, this is because privatized firms do not evolve over time from smaller firms, beginning with the usual incubation period at the venture capital stage and progressing through the initial public offering, but instead are created Minerva-like by governmental fiat. Typically, voucher privatization (which has been the preferred technique) simply distributes shares (or coupons to purchase shares) to all or most of the adult citizens in the country. Dispersed ownership is more transient and vulnerable in this context, because it arrives overnight at the outset of the firm's existence. Hence, managers neither contract with shareholders nor pledge a reputational capital that they have carefully built up over years of service; rather, managers and shareholders are thrown together as legal strangers.<sup>12</sup>

This point has important implications for a policy debate that has begun among scholars who have studied the transitional process: Should privatization be "fast" or "slow"?<sup>13</sup> Should policymakers adopt a "Damn the torpedoes, full speed ahead" approach that accepts the inevitability of some overreaching by controlling shareholders, but justifies this cost as necessary to realize and expedite the efficiency gains incident to privatization? Or should privatization proceed more cautiously because of the risks of market failure and political corruption that may result when control seekers are tempted to bribe and seduce the judicial and regulatory systems to achieve the private benefit of control? These tempting private benefits arise, of course, precisely to the extent that privatization preceded the creation of an adequate legal foundation. The cases examined in this Article illustrate this tension and lead it to favor a prudential course of phased privatization, which does not make a hasty and potentially corrupting scramble to control the likely consequence of creating a dispersed ownership structure.

This Article will proceed through four stages. Part II examines some of the difficulties in attempting to distinguish common law from civil law systems in terms of any critical factors that lead one to outperform the other. Part III then focuses on the Czech and Polish experiences, along with earlier, more tentative efforts at privatization, in order to understand what has chiefly gone wrong. Part IV focuses on the techniques

---

*State of Takeover Statutes*, 73 VA. L. REV. 111 (1987); Jonathan Macey, *Administrative Agency Obsolescence and Interest Group Formation: A Case Study of the SEC at Sixty*, 15 CARDOZO L. REV. 909 (1994).

12. Neo-classical economic theory views the firm as a "nexus of contracts." See Jensen & Meckling, *supra* note 9., at 310-311. Yet privatization often short-circuits this contracting process by simply creating a dispersed shareholder base. A stable equilibrium is thus not reached. The result is that the shareholders have less-well-defined legal rights and are more vulnerable to opportunistic actions by those in control.

13. For examples of this new critique of "fast" privatization, see John Nellis, *Time to Rethink Privatization in Transitional Economies?*, FIN. & DEV., June 1999, at 16, 16-19; BERNARD BLACK ET AL. RUSSIAN PRIVATIZATION AND CORPORATE GOVERNANCE: WHAT WENT WRONG? (Stanford Law School Working Paper No. 178, 1999).

recently used for expropriating value from privatized firms and suggests that these techniques reveal some deficiencies in the corporate governance norms of civil law systems. Finally, Part V suggests functional reforms and priorities, but these proposals will not give primary emphasis to specific doctrinal rules. Indeed, their premise will be that wholesale adoption of U.S. or U.K. legal rules is not feasible and might not be effective in any event.

## II. ARE COMMON LAW SYSTEMS HOMOGENOUS?

The new comparative research on corporate governance has found that some legal systems give minority shareholders greater protection from fraud and expropriation than others and has assumed that the critical differences largely inhere in the statutory law of these rival systems.<sup>14</sup> This assumes, however, what is to be proven. For example, differences in substantive law could be far less important than differences in enforcement practice. But once we focus on enforcement practice, a blunt, but overlooked, truth quickly confronts us: Common law legal systems may not be that much alike. Thus, while it has been an implicit premise of this new learning that the U.S. and the U.K., as the two leading common law systems and the two leading economies characterized by dispersed share ownership, are highly similar, this premise is very debatable. To be sure, both systems share a common legal history. But to stop at this point is to ignore volumes of more recent and highly relevant history over which their two paths have diverged. For much of the late 19th Century “Robber Baron” era in the United States, controlling shareholders regularly overreached and plundered minority shareholders and creditors. Colorful rogues—such as Jay Gould, Jim Fisk, and Daniel Drew—regularly manipulated the market and perfected the legal technology for “watering” the stock of minority shareholders.<sup>15</sup> Meanwhile, these predators battled for control of railroad empires against even more imperious barons, such as Commodore Vanderbilt, with each side buying and corrupting local judges.<sup>16</sup> Much of this era seems to have been recently replayed in Russia and Central Europe. Throughout this 19th Century era, the common law proved a frail reed upon which minority shareholders could not safely rely. Over time, investment bankers (most notably, the House of Morgan) and the New York Stock Exchange brought some semblance of law and order to this Wild West environment, and legal standards

---

14. See sources cited *supra* notes 2 and 3. LLS&V run regression analyses that rank the minority protections given shareholders in different countries in terms of the presence (or absence) of certain specified statutory protections and then relate these rankings to the size of each country's securities market. While they find a strong relationship between weak protections and weak markets, such studies remain vulnerable to the problem of multicollinearity (that is, the true predictive variable may escape detection because it was not tested in the sample but overlapped with the independent variable that seems to show predictive power). For example, a statutory provision that seems to show predictive power may overlap with a softer and untested factor (such as a strong and independent judiciary). Necessarily, empiricists measure the data that is available, and in the case of “softer” variables (such as judicial style and judicial independence), little data is available. Hence, these softer variables may be ignored.

15. Gould, Fisk, and Drew engaged in a famous battle with Commodore Vanderbilt for control of the Erie Railroad. When Vanderbilt sought to buy control by acquiring Erie's shares in the open market, his three antagonists used their control over the Erie board to dump an endless stream of watered stock on the market. Both sides bribed judges and state legislators. See MAURY KLEIN, *THE LIFE AND LEGEND OF JAY GOULD* 80-86 (1986); cf. LAWRENCE FRIEDMAN, *A HISTORY OF AMERICAN LAW* 447-48 (1973).

16. See Klein, *supra* note 15, at 80-86.

(particularly those applicable to stock issues and fiduciary standards) were consciously tightened by courts and state legislatures. Still, as of 1900, little suggested that shareholders in the United States received greater protection than shareholders in, say, France.

Another aspect of this puzzle emerges if we look at the legal system in contemporary Russia. Although the Russian legal environment seems even closer to the Hobbesian state of nature with the looting of corporations and financial institutions being a fairly common event, Russian corporate law has largely borrowed (in a simplified fashion) the principal features and protections of U.S. and U.K. corporate law.<sup>17</sup> Apparently, expropriation can occur even when the law “on the books” is nearly optimal. Perhaps this should not surprise us, as the legal realists have taught us for most of the 20th Century that the “law on the books” is often different from, and less important than, the “law in practice.”

One likely answer to this puzzle of when law matters (and why) may lie in the hypothesis that what really counts is not the content of the substantive law, but the adequacy of the enforcement mechanisms that underlie it.<sup>18</sup> The concept of enforcement mechanism needs, however, to be understood in a broader sense than simply the availability of specific legal remedies. For example, the one characteristic that the Robber Baron era in the United States shares with contemporary Russia is that in both, the central government was weak and largely unable to enforce its commands in outlying areas. In the late 19th Century, the federal government in the United States was almost powerless to control private business entities; no centralized body (such as the SEC) had jurisdiction over investor protection, and business rivals could establish strong political fiefdoms in one state and largely ignore the commands of judges in a different state. In contemporary Russia, the central government appears similarly unable to control local provincial administrators, who may confiscate or extort assets from corporations operating in their area of effective control.<sup>19</sup>

If we focus on enforcement, however, it immediately becomes clear that the differences between the U.S. and the U.K. are probably as great as between the U.S. and France (a nation generally thought to enforce its investor protection laws only weakly). In the U.S., class and derivative actions are permitted, and plaintiffs’ attorneys may charge contingent fees, which are usually awarded by the court based on a percentage of the recovery that the attorney obtains for the class. Under the standard “American Rule,” each side bears its own legal fees (which means that the plaintiff’s attorney faces only the

---

17. Russian company law has borrowed heavily from U.S. and U.K. sources and, in its current version, was heavily influenced by a model developed by two American law professors. See Bernard Black & Reinier Kraakman, *A Self-Enforcing Model of Corporate Law*, 109 HARV. L. REV. 1911 (1996).

18. There is already some empirical support for this modest revision of the LLS&V thesis. See *infra* notes 87-90 and accompanying text.

19. For example, the foreign (and largely institutional) shareholders of Far Eastern Shipping Company, Russia’s largest commercial shipping line, have protested that the provincial governor of Vladivostok objected to their large ownership stake (42%) in Far Eastern and demanded that they surrender 7% of their shares to him. Otherwise, he allegedly threatened to reduce their voting rights by provincial decree. See Neela Banerjee, *Shareholders Charge Extortion in Russian Far East*, N.Y. TIMES, June 16, 1999, at C3. For a discussion of other instances in which regional barons and local political groups have extorted value from foreign investors in privatized Russian firms, see Merritt B. Fox & Michael A. Heller, *Lessons from Fiascos in Russian Corporate Governance* (Sept. 1999) (unpublished manuscript, on file with author).

loss of time and expenses invested in the action if the action is unsuccessful and is not generally liable for the winner's legal expenses).<sup>20</sup> In the U.K., the reverse is generally true. Class actions and contingent fees are not authorized, and the losing side must normally compensate the winning side for its expenses. When the individual plaintiff sues the large corporate defendant, the latter will likely incur the larger legal fees, and this disproportion logically turns the prospect of fee-shifting under the English rule into a prohibitive deterrent to litigation. As a result, while in the United States a highly entrepreneurial system of private enforcement has evolved that largely overcomes the collective action problems that dissuade individual investors from suing,<sup>21</sup> nothing comparable exists in the United Kingdom.

Another sharp contrast involves the level of judicial activism in the two countries. For common law systems to behave similarly, it would seem logically necessary for them to accord a similar role to the judge. But it is not clear that they do. Although the U.S. and the U.K. share a common law tradition, judges in these two systems appear to behave quite differently. Comparative law scholars rate U.S. courts near the top of the scale in terms of "judicial daring"—that is, the willingness of judges to create new legal rules in the absence of legislation—but place the U.K. near the bottom of this same scale.<sup>22</sup> In short, the more that one looks at the supposedly obvious differences between common law and civil law countries, the more that those differences begin to blur.

On the other hand, the U.K. has other institutions—most notably, its Takeover Panel—which appear to be highly effective and which lack any close parallel in the United States. In general, takeover defensive tactics are much more restricted in the U.K. than in the U.S. Finally, given the more concentrated character of the British financial community (both in terms of institutional ownership and physical location in the City of London), reputational effects may matter more in the U.K. than in the U.S. These differences may be important, but they have little to do with the line between the common law and the civil law.

The point here is not to compare the enforcement mechanisms of the U.S. and the U.K., but only to indicate that they may be very different. In turn, this implies a conceptual problem with the new academic research that broadly and boldly contrasts common law countries with civil law countries. Although real differences are clearly observable in terms of ownership concentration, the depth of markets, and the value of control, the presumed legal homogeneity of either common law or civil law countries may be more illusory than real. For example, many of those substantive legal rules that the U.S. and the U.K. share may have only trivial significance (or may have importance

---

20. See *Alyeska Pipeline Serv. Co. v. Wilderness Soc'y*, 421 U.S. 240, 247 (1975) ("In the United States, the prevailing litigant is ordinarily not entitled to collect a reasonable attorneys' fee from the loser.").

21. This is not to claim that the U.S. system is optimal. Class actions could in principle result in over-deterrence; conversely, the availability of liability insurance could nullify the legal threat. But at least one can understand why such legal remedies might create socially desirable deterrence.

22. For a survey of comparative law scholars who rated U.S. courts as second in "judicial daring" (after Israel) and U.K. courts as third from last (out of fourteen industrialized countries), see Robert Cooter & Tom Ginsburg, *Comparative Judicial Discretion: An Empirical Test of Economic Models*, 16 INT'L REV. L. & ECON. 295, 300 (1996). Professors Cooter and Ginsburg suggest that differences in political structure and the role of dominant political parties best explain these national differences. See *id.* at 296-300.

in one legal system and not the other<sup>23</sup>). Thus, to return to a distinction that I have made in earlier work, formal legal convergence may be less important than functional convergence.<sup>24</sup> Although the U.S. and the U.K. (and other common law countries) have similar legal systems that share a common origin, their common history may be less important than the fact that they have developed quite different mechanisms for dealing with the same “agency cost” problems that in the end achieve functionally similar results. For example, the issuance of a materially false financial statement may cause a significant drop in the company’s stock price upon its discovery in both nations. In the U.S., it may elicit a class action; in the U.K., institutional investors may protest to the board and demand corrective action. However, in both countries, responsible senior management may lose their jobs in consequence over about the same period. Similarly, in both countries, a chief executive officer whose company’s stock price and earnings underperform the industry averages for a given number of successive quarters will likely be removed from office—although the mechanism of removal (a board coup d’etat or a hostile takeover) may differ between the two countries.<sup>25</sup>

In short, the danger in focusing on legal commonality is that it may obscure very different functional mechanisms that are in fact more responsible for the similar ownership structure and market characteristics of two economies. Also, the recent research on comparative corporate governance has largely focused on the firm level, examining specific characteristics of corporate and bankruptcy law that were thought to generate higher levels of investor protection in “common law” legal systems. Although important, this focus slights the importance of securities markets themselves. The one feature that the U.S. and the U.K. clearly share is strong securities markets, with high disclosure and transparency standards. Rather than attribute the strength of these markets to the alleged commonality of U.S. and U.K. corporate law, it may make more sense to look at the even clearer commonality of U.S. and U.K. securities law.<sup>26</sup> Their similar listing, disclosure, and corporate governance standards may be more important in producing functional convergence (at least for larger companies) than the legal remedies available to individual shareholders. Nonetheless, the indicators used by LLS&V<sup>27</sup> in their provocative comparisons of common law and civil law systems have largely focused on the corporate level and ignored the differences in securities market regulation.<sup>28</sup> Not

---

23. Preemptive rights, for example, play an important role in constraining managements in the U.K., but almost no role in the United States. See Bernard Black & John Coffee, *Hail Britannia?: Institutional Investor Behavior Under Limited Regulation*, 92 MICH. L. REV. 1997, 2079 (1994).

24. See Coffee, *supra* note 5, at 679-80.

25. Indeed, this is what several empirical studies seem to show about practices across the leading industrial nations. See Steven Kaplan, *Top Executive Rewards and Firm Performance: A Comparison of Japan and the U.S.*, 102 J. POL. ECON. 510 (1994); Steven Kaplan, *Top Executive Turnover and Firm Performance in Germany*, 10 J.L. ECON. & ORG. 142 (1994).

26. It is noteworthy, for example, that the Securities Act of 1933 was modeled after the earlier English Companies Act of 1900, which ironically was, itself, intended to reverse the common law’s tolerance for fraud. For a discussion of the different philosophies underlying the Securities Act of 1933 and the eventual triumph of a disclosure philosophy over a more regulatory philosophy, see JOEL SELIGMAN, *THE TRANSFORMATION OF WALL STREET: A HISTORY OF THE SECURITIES AND EXCHANGE COMMISSION AND MODERN CORPORATE FINANCE* 39-42 (1982).

27. See La Porta et al., *Corporate Ownership Around the World*, *supra* note 2.

28. This point has been earlier emphasized by Pistor. See Pistor, *supra* note 7.

only have the differences among nations in securities regulation been material, but equally important, international convergence is today proceeding more rapidly at the securities market level than at the corporate level.<sup>29</sup> Indeed, functional convergence among securities markets seems more attainable than formal legal convergence at the corporate law level, both because large firms can migrate between markets and because securities markets themselves face global competitive pressures that may lead them to change and adapt, even when their national governments are resistant to change.

Much recent comparative corporate governance research has been focused on reform. In particular, the recent comparative studies seem to have come as a natural progression from the earlier efforts (and frustrations) of many of these same scholars in attempting to implement viable corporate governance systems in transitional economies that were just emerging from their socialist cocoons. That experience quickly showed two strong tendencies: first, securities markets are fragile and could collapse, and second, expropriation by managers and controlling shareholders could (and did) occur on a massive scale. The response of some scholars to this experience has largely been to call for legislative reform to implement the principal features of the "common law" systems. Such reform may be desirable, but calls for legislative reform or formal legal change often go unheeded. In a path-dependent world, it may simply be politically impossible to get from here to there, even when it is clear to most that such a transition would be efficient and would yield significant economic growth.

### III. FALLACIES AND BLUNDERS: A SHORT HISTORY OF MASS PRIVATIZATION

In 1995, the Prague Stock Exchange had 1716 listings.<sup>30</sup> Blessed with relatively low inflation and nearly full employment, the Czech Republic's strong macroeconomic position made it seem the country in Central or Eastern Europe most likely to make a smooth transition into a market-oriented economy. Yet by early 1999, the number of listings on the Prague Stock Exchange had fallen by more than 80% to 301, and observers estimated that fewer than a dozen of these enjoyed any liquidity.<sup>31</sup> Correspondingly, over the same period, the value of an investment in an index of the leading 50 stocks on the Prague Stock Exchange fell by over 60%.<sup>32</sup> Trading dried up, and the viability of the Prague Stock Exchange was itself threatened. Where there had been 1486 brokers in 1997, there were only 358 in mid-1999.<sup>33</sup>

What happened? The fundamental fallacy in Czech privatization was that securities markets would develop spontaneously, simply because voucher privatization would create an initially dispersed ownership structure. By widely distributing the stock in privatized companies to a broad segment of the Czech adult population, Czech planners

---

29. See Coffee, *supra* note 5, at 663-76.

30. See Peter S. Green, *Prague Exchange's Failed Reform Efforts Leaves Some Predicting Its Demise*, INT'L HERALD TRIB., Mar. 17, 1999, at 16.

31. *Id.* It must be acknowledged that the Prague Stock Exchange (PSE), itself, delisted many of these companies and imposed higher listing standards during this period as part of its struggle to survive. See Pistor, *supra* note 7. At the outset of Czech privatization, there were no real listing standards, and the vast majority of privatized companies were listed. Still, the decision to delist these stocks was not truly voluntary. Their continued trading on the PSE would likely have left that market without any credibility.

32. Green, *supra* note 30, at 16. Specifically, the PX-50 index fell from 1000 to 371.

33. *Id.*

expected that an active secondary market would develop naturally. The militantly laissez-faire attitude of the initial Czech government also made it highly resistant to any regulation of this market.

In fact, for an initial period of high optimism, which lasted into 1995, share prices did rise. But then, after a series of scandals, the Czech bubble began to burst. First, foreign portfolio investors began to flee the Czech market. Foreign direct and portfolio investment dropped from \$103 million in 1995 to \$57 million in 1996 and then turned negative in 1997.<sup>34</sup> By 1998, the Czech economy entered a general recession.<sup>35</sup> In its wake, momentum gathered to reform the Czech securities market, and reform legislation was adopted in 1998 that established a Czech SEC and curbed some of the more egregious abuses.

Behind this massive disinvestment in the Czech market lay a pervasive loss of investor confidence, as small, dispersed owners witnessed widespread looting of Czech investment funds and the systematic exploitation of the remaining minority shareholders in Czech firms once any faction acquired a controlling position. In consequence, small shareholders systematically divested their shares and moved savings to other forms of investment. At the outset of mass privatization in the Czech Republic, over seven million Czech citizens purchased shares through voucher privatization, but by 1999, the number of Czech shareholders had fallen to "barely five million."<sup>36</sup>

If the Czech experience then seems a paradigm of a market failure caused by inadequacies in the legal system, it is still important to identify what precisely went wrong. After a period of initial optimism, investors clearly lost confidence in the Czech market, causing it to decline sharply, even though the underlying macroeconomic conditions remained relatively stable on a regional basis. Moreover, the apparent Czech failure contrasts sharply with the experience of neighboring Poland, where the privatization process was slower and where stronger disclosure and governance standards were established as preconditions. This section will therefore move from a brief review of this seemingly natural experiment to a more detailed assessment of what differentiated these two efforts and then a broader look at other privatization programs.

#### *A. Poland Versus the Czech Republic: Divergent Approaches to Privatization*

In geopolitical terms, Poland and the Czech Republic share much in common, as similar Central European countries with a common Slavic culture and a common historical experience as former members of the Soviet bloc. But their approaches to privatization could not have been more divergent. The Czech Republic rushed into privatization in the early 1990s, with regulatory controls being developed on an ex post basis in response to a series of crises and scandals.<sup>37</sup> Determined to move assets into the

35. Czech GDP contracted by more than 2.5% in 1998 (whereas neighboring countries experienced a 4-5% annual growth). See Nellis, *supra* note 13, at 16-19.

36. Green, *supra* note 30.

37. I have discussed the contrasting experiences of these two nations at greater length elsewhere. See John C. Coffee, Jr., *Inventing a Corporate Monitor for Transitional Economies The Uncertain Lessons from the Czech and Polish Experiences*, in *COMPARATIVE CORPORATE GOVERNANCE: THE STATE OF THE ART AND EMERGING RESEARCH* 67, 122-25 (Klaus J. Hopt et al. eds., 1998).

private sector as quickly as possible, Czech authorities privatized some 1491 joint stock companies in the first wave of Czech privatization, and another 861 in the second wave—thereby increasing the private sector share of Czech Gross Domestic Product from 12% in 1990 to 74% by 1996.<sup>38</sup> In fairness, this was a considerable logistical achievement.

In contrast, Poland moved far more slowly and equivocally, privatizing only some 500 firms and only pursuant to a procedure that assigned a state-created investment fund as the controlling shareholder of each privatized firm. Rather than assuming that a secondary market would develop spontaneously, Poland designed voucher investment funds as a mechanism to solve the perceived powerlessness of the individual shareholder in a mass privatization program. To assure that these state-created investment funds would control the privatized firms, Poland neither permitted the creation of private investment funds (which had sprung up overnight in the Czech Republic) nor initially allowed citizens to invest directly in the stock of the newly privatized firms. Rather, Polish law mandated that citizens could invest their voucher certificates only in state-created financial intermediaries, known as National Investment Funds (NIFs), which were to serve as controlling shareholders of the to-be-privatized firms.<sup>39</sup> At the outset, only 15 NIFs were chartered, with each being assigned a controlling 33-1/3% stake in its share of the 500 privatized firms. The balance of the stock in each firm was held by other NIFs and by the state. Each NIF then hired a management company to advise on restructuring those companies in which the NIF held a controlling stake; in fact, a number of Western investment banking firms were hired to perform this role, sometimes in preference to Polish commercial banks.

In short, viewing continued state ownership as the greater danger, Czech authorities rushed into privatization and gave relatively little attention to problems of regulation, while in Poland state planners took the reverse view of the relative dangers, and therefore moved slowly and cautiously to implement a limited privatization program that effectively substituted state-created monitors (in which citizens could invest) for direct state ownership.

Some results of these two very different approaches were easily predictable: the Czech Republic quickly developed an active securities market, while the Polish securities market developed haltingly with only very thin trading (which actually declined between 1994 and 1996).<sup>40</sup> In the Czech Republic, private investment funds appeared as a spontaneous, unplanned market development, with over 600 funds being formed during the two Czech privatization waves. Necessarily, these funds could only be regulated on an after-the-fact basis. In contrast, in Poland, privatization was delayed repeatedly by

38. See Saul Estrin et al., *The Impact of Privatization Funds on Corporate Governance in Mass Privatization Schemes: The Czech Republic, Poland and Slovenia*, in *THE GOVERNANCE OF PRIVATIZATION FUNDS: EXPERIENCES OF THE CZECH REPUBLIC, POLAND AND SLOVENIA* 137, 142 (Marko Simoneti et al. eds., 1999).

39. For a detailed description of the NIF, which essentially resembled closed-end mutual funds and were created by the Polish Ministry of State Treasury to hold controlling stakes in privatized firms, see Janna Lewandowski & Roman Szyszko, *The Governance of Privatization Funds in Poland*, in *THE GOVERNANCE OF PRIVATIZATION FUNDS*, *supra* note 38.

40. See Eva Thiel, *The Development of Securities Markets in Transitional Economies: Policy Issues and Country Experience*, 70 *FIN. MARKET TRENDS* 111 (June 1998), available in LEXIS, News Library, Curnws File.

political infighting over a variety of issues, including selection of the management companies that would run the NIFs.

Both systems encountered serious problems, but of a very different character. Three distinct problems compromised Czech privatization, and each was at bottom attributable to legal failures. First, and most noticeable, was the near total lack of transparency in the Czech securities market. Because trading was not centralized and trading off the Prague Stock Exchange did not require contemporaneous price reporting, only the prices of those transactions that the trading participants wished to disclose (and so transacted on the Exchange) were reported. In fact, it appears that the majority of all trading transactions occurred off the Prague Stock Exchange,<sup>41</sup> with the minority of transactions that did occur on the exchange being widely thought to have been at inflated prices. In effect, current securities prices were revealed only when the traders wanted to post a price—either to influence western portfolio investors or inflate the value of a privatization fund's portfolio. For this and other reasons, including the absence during this period of any SEC-like authority with power to regulate trading or require contemporaneous price disclosure, foreign investors quickly grew skeptical that the reported prices on the Prague Stock Exchange reflected real values. Moreover, in this non-transparent world, informed trading predictably flourished because it was more profitable than in an efficient market.<sup>42</sup>

A second problem quickly arose that further compromised restructuring efforts. During the course of the two Czech privatization waves, some six hundred investment funds were created, and they competed vigorously to convince individual investors to convert their privatization vouchers into their shares. Potentially, such vehicles could have become effective corporate monitors because they aggregated large stakes in Czech corporations and thereby potentially solved the collective action problem that the dispersed ownership resulting from voucher privatization necessarily implied. However, the largest investment funds were established by the principal Czech commercial and savings banks, which had obvious reputational advantages in convincing Czech citizens to deposit their vouchers with them.<sup>43</sup> Owning only small stakes in their own investment funds, the banks had little incentive to undertake costly restructuring activities. Instead, many sought to use their investment fund's influence over its portfolio companies to secure banking clients for themselves. Rather than concentrating their holdings (and thus maximizing their influence), most bank-administered funds sought to diversify their holdings in order to hold stakes in as many firms as possible—in part to solicit banking

---

41. According to Thiel, only 3% of actual trades were executed on the Prague Stock Exchange. See Thiel, *supra* note 40, at 111. In part, this was attributable to the existence of a Nasdaq-like alternative system, which also disclosed prices contemporaneously. Still, investment funds could trade on a face-to-face basis off the exchange and use the exchange only for transactions at inflated prices.

42. Emerging markets appear in general to have very different characteristics from mature, efficient markets. In particular, stocks in emerging markets exhibit strong "momentum," meaning that one period's performance tends to predict the next period's performance; also, high beta stocks do not outperform low beta stocks. See K. Geert Rouwenhorst, *Local Return Factors and Turnover in Emerging Markets*, 54 J. FIN. 1439, 1441 (1999).

43. Of the 13 largest investment funds in the first wave of Czech privatization, 11 were created by financial institutions. See Saul Estrin et al., *supra* note 38, at 151. This was probably predictable, because citizens were already familiar with the local savings, commercial, or postal banks that sponsored these funds.

clients for their parents.<sup>44</sup> Also, to protect their banking parents from potential hostile takeovers, the bank-run funds cross-invested heavily in the common stocks of the other major banks and in that of their own banking parent. An incestuous web of cross-ownership quickly developed to insulate the major banks from hostile takeovers. Finally, most privatization funds (both bank-related funds and non-bank funds) found it more profitable to concentrate on trading than on restructuring often-inefficient portfolio companies. The combination of a non-transparent market and their privileged position as insiders made such activities profitable, but constantly filled the media with news of recurring insider trading scandals.

If the bank-related funds were passive, the non-bank funds were far worse. A subsequent study by the Czech Ministry of Finance found a negative correlation between a privatized firm's performance and the percentage of its shares held by non-bank investment funds.<sup>45</sup> In the first wave of Czech privatization, 3% of the funds became insolvent and were placed into "forced administration,"<sup>46</sup> but, in the second wave, the rate of insolvency accelerated, and some ten funds accounting for over 21% of market capitalization in that wave were placed in "forced administration."<sup>47</sup> The common cause appears not to have been excessive leverage or investment failures, but "tunneling out"—the fraudulent siphoning off of assets.

The ease with which funds could be looted is shown by the similar ease with which they could escape regulation. Although Czech law did regulate the operation of investment funds, it did not restrict the ability of an investment fund to elect to deregister and become an unregulated holding company. Symptomatic of the civil law's literal narrow-mindedness, the difference between an investment company and a holding company under Czech law was formal, not functional. Simply by surrendering one's license to operate as an investment company, an investment fund could escape virtually all regulation. Because share ownership of investment companies was extremely dispersed, a small control group, holding as little as 10% of the voting stock of an investment fund, could usually dominate shareholder meetings and pass a resolution to convert the fund into a holding company. Once unregulated, all forms of self-dealing were effectively made possible, and the entity might reincorporate outside the Czech Republic (as some did).

The extent of such conversions seems extraordinary. In terms of market share, fully 28% of the investment privatization funds in the first wave of Czech privatization and 21% of the funds in the second wave were converted into unregulated holding companies.<sup>48</sup> Although this may sound as if the rate of conversion declined, it must be remembered that an additional 21% of the funds in the second wave were placed in

---

44. Other motivations can also explain this failure to concentrate holdings (which continued in secondary market trading as well as in the original privatization auctions). For example, in non-transparent markets, trading in the stocks of newly privatized firms may be highly profitable for informed traders with seats on the boards of their portfolio company.

45. See *Czech Ministry of Finance*, *supra* note 34.

47. *Id.*

48. *Id.* at 30.

“forced administration” by the Czech authorities.<sup>49</sup> On this basis, nearly half of the funds in the second wave of Czech privatization either failed or escaped regulation by converting into unregulated entities. Although major bank-run funds generally stood apart from this race to convert, the banks’ motives, while non-fraudulent, seemed to have been in part to use their funds as vehicles by which to attract banking clients and other business for themselves.

The eventual upshot of these repeated scandals was that the administration of investment funds became a contentious political issue in the Czech Republic and helped result in the downfall of the Vaclav Klaus Government (which had generally opposed market regulation) and the passage of reform securities legislation in 1998. But by then, public confidence in the securities market had been largely eroded.<sup>50</sup>

The Polish experience was in many respects the reverse of the Czech experience. Privatization was delayed and delayed again, as demanding disclosure rules and fiduciary standards for directors were drafted. Polish citizens were given only one choice: which NIF (of the fifteen originally created) to invest in, as direct investment in either portfolio firms or private investment funds was not initially permitted. Trading was centralized on the Warsaw Stock Exchange, and price transparency appears never to have been a serious issue. Polish disclosure standards also won high marks from most observers, and the EBRD Transition Report rated Poland and Hungary as the two Central European countries that had most closely approximated IOSCO standards.<sup>51</sup>

Still, while the Polish authorities planned a carefully integrated program of market reforms and privatization, their success in actually developing their securities market arguably presents a closer question. Advocates of “fast” privatization might point to the fact that, as of late 1998, only some 253 companies were listed on the Warsaw Stock Exchange<sup>52</sup> (much less than the number in the considerably smaller Czech Republic). Indeed, the Polish mass privatization program was limited to some 500 enterprises, representing only 10% of Polish Gross Domestic Product.<sup>53</sup> Similarly, while it remains debatable whether the state-created financial intermediaries in Poland (the NIFs) have functioned as effective monitors, some commentators believe the NIFs have at least been more active than the Czech investment funds in encouraging efficient restructuring.<sup>54</sup>

---

49. *Id.*

50. For a similar assessment that emphasizes the “very visible exploitation of opportunities for wealth creation by collusion and arbitrage,” see Thiel, *supra* note 40, at 111.

51. See *EBRD Transition Report*, Nov. 1998, available in LEXIS, News Library, Curmws File. The EBRD Transition Report evaluates the progress of transitional economies toward a free market system in a variety of different areas (e.g., banking, bankruptcy, and securities market reforms) using a common 5-point index rating system. In 1998, it awarded Poland a rating of 3+ (and the Czech Republic a rating of 3) for their efforts at securities market reform.

52. See *Securities Commission Head Displeased with 1998*, PAP News Wire (Poland), Dec. 28, 1998, available in LEXIS, News Library, Curmws File.

53. See Marko Simoneti & Paul Estrin, *Introduction*, in *THE GOVERNANCE OF PRIVATIZATION FUNDS*, *supra* note 38, at 1, 5; see also *EBRD Transition Report*, *supra* note 51. On the other hand, the Polish securities markets have been able to support at least some IPOs. In 1997, Polish IPOs issued stock having a value equal to 1% of Polish GDP. *Id.*

54. These commentators have argued that only in Poland did the investment privatization funds acquire sufficiently large stakes to attempt active management and restructuring. See Marko Simoneti & Andreja Böhm, *The Governance of Privatization Funds: Open Issues and Policy Recommendations*, in *THE GOVERNANCE OF PRIVATIZATION FUNDS*, *supra* note 38, at 163, 166.

The most impressive evidence in favor of the Polish approach has been the ability of its securities market to support cash offerings of equity securities. Between 1991 and 1998, no Czech company sold equity for cash as part of its privatization program; conversely, some fifty Polish companies did.<sup>55</sup> Over the same period, no Czech company effected an initial public offering over the Prague Stock Exchange, while some 136 Polish companies did so on the Warsaw Stock Exchange.<sup>56</sup> In short, only the Polish system succeeded in developing its stock exchange so that it could perform the classic role of serving as an engine of economic growth.

Another strong contrast between the Czech and Polish experiences involves market performance during conditions of adversity: when the Asian financial crisis struck in 1998, Poland had a relatively mild experience. Between the end of 1996 and August 1998, the Polish stock index fell only 13.1%,<sup>57</sup> while the Czech market had already partially collapsed and fell further.<sup>58</sup> Up until late 1998, the NIFs listed on the Warsaw Stock Exchange seemed to be trading at or near their net asset value, while Czech funds during this period often traded at steep 20% to 70% discounts off their net asset value.<sup>59</sup>

Another measure of a securities market's success is the number and percentage of firms listed on it that migrate to foreign stock exchanges. Such dual listings may imply that the listed firm cannot raise capital on its home country exchange; alternatively, it may be a bonding mechanism by which a firm credibly pledges to comply with disclosure and corporate governance standards that are not enforced (or enforceable) in its home country.<sup>60</sup> In any event, companies in Central Europe have recently migrated to German stock exchanges (most notably the Berlin Stock Exchange). As of early 1999, one study finds that 117 stocks from Eastern Europe were listed on the Berlin Stock Exchange, of which 24 were from the Czech Republic, but only 13 from considerably larger Poland.<sup>61</sup> Prior to the onset of the Russian financial crisis in late 1998, Poland had 2% of its listed companies traded on German stock exchanges, while the Czech Republic had 5% (or more than twice as many).<sup>62</sup> This disparity should not be surprising. Having the weaker

---

55. See Johnson & Shleifer, *supra* note 6, at 26.

56. *Id.*

57. See Johnson et al., *supra* note 2, at 48. This paper groups countries by severity of stock market decline between the end of 1996 and August 1998 and places Poland in the "relatively moderate" decline category. See *id.*

58. The Czech market collapse worsened after the time of the Asian financial crisis and hit bottom following the 1998 Russian financial crisis. Between August 1998 and March 1999, the Czech market decline was 30.5%, which far exceeded the 17.5% decline on the Polish market or the very mild 5.7% decline on the Hungarian market. See Pistor, *supra* note 7, at 46. Pistor also finds that Czech market capitalization declined 35% following the 1998 Russian financial crisis, while Polish market capitalization actually increased 17.8% over this same period. See *id.*, at 47. The Prague Stock Exchange has since recovered, although this may be partly attributable to stock market reforms enacted largely in 1998.

59. See Simoneti & Böhm, *supra* note 54, at 163, 174. In addition, roughly 25% of the first 500 privatized firms are now also publicly traded. This contrast between the steep discounts in the Czech market and the absence of discounts in the Polish market is, however, subject to an important qualification: because of the absence of transparency in the Czech market, reported prices on the Prague Stock Exchange were often inflated, thereby overstating the discount. The subsequent history of the NIFs after 1998 is discussed in the text accompanying notes 63-65.

60. See Coffee, *supra* note 5, at 673-76 (discussing foreign listings as a bonding mechanism).

61. See Pistor, *supra* note 7, at 45.

62. *Id.* at 46.

legal protections, Czech companies had the greater need to list on a foreign exchange with “stronger” governance standards in order to attract foreign portfolio investors (most of whom had already fled the Czech market because of its lack of transparency).

This happy story contrasting the regulated and unregulated worlds encounters one serious difficulty that arose in late 1998. Beginning in approximately December 1998, the stock prices of the Polish NIFs fell sharply, and they currently trade at discounts to their net asset values as steep as ever existed in the Czech Republic.<sup>63</sup> Meanwhile, the surviving Czech investment funds now trade at relatively modest discounts to their net asset value (typically around 20%).<sup>64</sup>

What explains this sudden reversal? Although any answer is speculative, most NIFs experienced board control contests in 1998 that replaced their old investment managers. Until late 1998, the Polish government held the majority of the voting power in NIFs. But since then, shareholders have replaced the management company in fourteen of the original fifteen NIFs. In effect, the same fear of opportunistic control struggles that eroded investor confidence in the Czech market appears to have devastated the value of Polish NIFs. No longer the stable pawns of the state, these NIFs appear to have suffered a sharp and fairly sudden loss of investor confidence.

Still, the number of firms traded on the Warsaw Stock Exchange has continued to grow, and its overall market capitalization now exceeds that of the Prague Stock Exchange.<sup>65</sup> Nor has evidence yet surfaced indicating that privatized companies have been looted or “tunneled” in Poland. Nonetheless, the bottom line evaluation must be cautious: in transitional economies, it may take little to disturb investor confidence and produce a flight for the exits. As they have been “deregulated” (or, perhaps more accurately, “privatized”), the Polish NIFs may be repeating the sorry history of the Czech funds.

### *B. What Really Distinguishes the Czech and Polish Experiences?*

To this point, the Czech and Polish experiences have been differentiated in terms of the highly spontaneous character of Czech privatization versus the carefully planned—indeed, constrained—character of Polish privatization. But both nations share one common fact that is troubling for the new scholarship that emphasizes the importance of differences in substantive corporate law: they each had a corporation law heavily based on the German civil law structure. Put simply, their experiences were very different, but their corporate laws were largely the same. As a result, because the corporate laws of

---

63. Data showing these discounts as of the fall of 1999 has been provided to me by Professor Andrew Weiss, an economist at Boston University. He informs me that, as of late September, 1999, the average discount on the Polish NIFs relative to their net asset value had grown to 60%, which was as great or greater than the standard discount on Czech funds earlier in the decade.

64. Professor Weiss points to the example of the Restitution Fund, which is the largest Czech fund and which now trades at 1300 (as of late September, 1999) and has a net asset value of 1550 (or less than a 20% discount). In 1994, it traded for between 500 and 600. Another example is SPIF Cesky, which now trades at 1346 and was trading at 400 in December, 1994. One possible reason for this resurgence may have been reform legislation, which was adopted in 1998. Pursuant to this legislation, many Czech funds converted to a basically open-end status. Open-end funds do not, of course, have the same discount as a closed-end fund because their shares can be redeemed.

65. See Pistor, *supra* note 7, at 48.

Poland and the Czech Republic each provide only weak protection for minority shareholders,<sup>66</sup> their different experiences cannot be used to corroborate the claim that differences in substantive corporate law are the key causal factors that determine the success or failure of privatization.

Yet if Poland and the Czech Republic had similar corporate laws, their approaches to securities regulation were entirely different. Not only did Poland impose high disclosure standards from the outset (including quarterly reporting), it also created an SEC-like agency to enforce its laws from the beginning of its privatization experience.<sup>67</sup> In addition, Poland adopted ownership disclosure provisions that resembled section 13(d) of the United State's Williams Act in order to require ownership transparency—that is, the disclosure by substantial shareholders and potential acquirers of their beneficial ownership of specified levels of a company's shares.<sup>68</sup> Finally, Poland (but not the Czech Republic) followed the British model of takeover regulation by requiring any shareholder who acquired more than a specified level of stock to make a mandatory bid for the remaining shares.<sup>69</sup> In sum, as Pistor has shown, Poland had “weak” corporate law, but “strong” securities law.<sup>70</sup>

In overview, these restrictions on the undisclosed acquisition of control and the mandatory requirement that a control acquirer offer to purchase the remaining shareholders may have been responsible for some of the differences in the Czech and Polish experiences. Seemingly, these restrictions precluded (or at least slowed) the frantic scramble for control that occurred in the Czech Republic. To the extent that this is true, the Polish experience may suggest the need for refinements in the “minority protection” model developed by those scholars of corporate governance who have focused, somewhat single-mindedly, on differences in substantive corporate law as the primary determinant of ownership structure.<sup>71</sup> In comparing systems of corporate governance, many of the most important differences may lie at the level of securities regulation. Here, rules prohibiting insider trading, requiring ownership transparency, and restricting coercive takeover bids may do more to protect minority shareholders from expropriation than do the same jurisdiction's substantive corporate law rules. Indeed, as earlier suggested, the most important common denominator between the “protective” legal regimes in the U.S. and the U.K. may be their highly similar securities laws, not their common law origins.

---

66. For a closer assessment of the similarities and differences in Czech and Polish corporate law during the period, see Pistor, *supra* note 7, at 35-44. Pistor notes that the Czech Republic did have a considerably lower quorum requirement (30%), which may have facilitated some fraud, and a higher (and hence less protective) mandatory bid requirement, but overall she finds that both countries provided only weak protections in their corporate law for minority shareholders.

67. *See id.* at 37-38.

68. *Id.* at 37 (noting that Polish law has required ownership disclosure at the 10% and 25% levels). Section 13(d) of the Securities Exchange Act of 1934 requires shareholders of a “reporting company” to disclose to both the issuer and the SEC their identity, sources of financing, plans and intentions, and certain other information when—either alone or as a part of a group—they acquire more than 5% of any class of equity security of such an issuer. Securities and Exchange Act of 1934 § 13(d), 15 U.S.C. § 78m(d) (1994).

69. Poland adopted a 33% threshold (originally, it was 50%), while the Czech Republic introduced this reform (but only at the 50% level) only more recently. Pistor, *supra* note 7, at 37-38.

70. *Id.*

71. *See sources cited supra* notes 2 and 3.

Another hypothesis, however, must also be noted: more important than these legal differences may have been the creation of the Polish NIFs. By holding controlling stakes, these state-created financial intermediaries blocked the path of entrepreneurs who otherwise might have competed to seize control of newly privatized companies. A critical, if possibly unintended, role of the NIFs was to provide an assurance to smaller shareholders that they need not fear the potential expropriation of their investment in a privatized company, at least because of its vulnerability to a predatory control seeker.<sup>72</sup> Indeed, much of the scramble for control in the Czech Republic seems to have been defensively motivated: each large shareholder essentially realized that if it did not acquire control, someone else would, with resulting injury to them. Each shareholder would know that the acquisition of control by some other shareholder would imply a sharp decline in the value of its minority position. As a result, the fear of loss may have provided a greater incentive to compete for control than the expectation of any synergistic or opportunistic gain.

In this light, the inefficient exposure to loss that the Czech system imposed on minority shareholders may also explain the earlier noted absence of equity offerings for cash in the Czech Republic as contrasted with their frequency in Poland.<sup>73</sup> Because an offering of equity securities inherently dilutes existing shareholders, it exposes them to an increased risk of exploitation; correspondingly, it also potentially disrupts any equilibrium that may have been achieved among large shareholders. Having acquired a majority position, a controlling shareholder might prefer to rely on high-cost bank financings rather than utilize dilutive equity financing, because dilution of its ownership could interfere with its ability to realize the private benefits of control. This fear was not a danger in the Polish context, where the NIFs gave all shareholders greater assurance of continuity for at least an interim period. Thus, one implication of the Czech experience may be that unregulated control contests and the rapid transition from dispersed to concentrated ownership can give rise to externalities—both political and economic.

Correspondingly, the sharp decline in the stock prices of Polish NIFs, once shareholders were permitted to take control of them from the government, also reinforces the interpretation that unregulated control contests expose minority investors to the risk of expropriation and result in reduced share prices.<sup>74</sup> Had the Polish government provided for a more phased transition (such as through transitional ownership ceilings or use of staggered boards), the severity of this decline might have been reduced.

### *C. Other Privatization Experiences: Do Securities Markets Develop Naturally?*

Although the Czech and Polish experiences probably supply the closest approximation to a natural experiment that can be found in this area, their experiences are not unique. A brief review of earlier privatization efforts finds similar cases in which

---

72. Lucian Bebchuk has theorized that these competitive struggles for a controlling position are predictable whenever the private benefits of control are large and control is not locked up by special charter provisions. See LUCIAN A. BEBCHUK, *A RENT-PROTECTION THEORY OF CORPORATE OWNERSHIP AND CONTROL* (National Bureau of Econ. Research Working Paper No. 7203, 1999). These conditions would seem usually to be satisfied when voucher privatization is used in a transitional economy, because it exposes control to acquisition and the private benefits of control are necessarily high when judicial controls are undeveloped.

73. See *supra* notes 55-56 and accompanying text.

74. See *supra* notes 63-65 and accompanying text.

emerging securities markets collapsed after a loss of investor confidence, including cases in the United States. Although in the public mind the term “privatization” first probably came into popular usage with the decision of the Thatcher government in Great Britain in 1979 to sell off government-owned enterprises, important earlier instances can be identified. The first large-scale privatization offering to public investors seems to have occurred in 1961, when the Konrad Adenauer government in the Federal Republic of Germany sold a majority stake in Volkswagen in a public offering that was aimed at small investors in Germany.<sup>75</sup> This was followed by an even larger offering in 1965 of the government-owned shares of VEBA A.G., a German heavy mining company. Both offerings were initially successful, but share prices fell dramatically thereafter, forcing the Adenauer government to develop “a rescue operation . . . aimed at protecting small shareholders.”<sup>76</sup> The experience appears to have dissuaded both Germany and other European governments from embarking on similar programs until the Thatcher administration initiated its ideologically motivated wave of privatizations in 1979.

During the early 1970s, the Pinochet government in Chile sought to reprivatize industries that had earlier been nationalized by the Allende government. Sales were made at extremely discounted prices, and when the Chilean economy later entered a debt and payment crisis in the early 1980s, it renationalized many of these same industries. Not until the late 1980s (at roughly the same time as the Thatcher government) did Chile effect a more successful privatization program through the public sale of shares in state-owned enterprises.<sup>77</sup> However, the key event in this later, successful privatization was the 1990 privatization of Telefonos de Chile, which was largely targeted at U.S. investors through the use of American Depositary Receipts. Mexico’s very large and successful privatization program in the 1990s has similarly been effected through privatizations of large, state-owned companies that were directly listed on the New York Stock Exchange.<sup>78</sup>

Mass privatization efforts that have not been implemented through established exchanges have fared less well. The most notable example is, of course, Russia. By virtually all accounts, Russian privatization has involved a spectacular series of blunders and been thwarted by pervasive corruption. As a result, most recent discussions of privatization have been largely preoccupied with the Russian experience.<sup>79</sup> But the lessons from the Russian failure are more difficult to draw because the Russian privatization effort was flawed from the outset by critical design failures and macroeconomic conditions that were not present in either Poland or the Czech Republic. First, Russian privatization had a significantly different design than Czech privatization in that substantial blocks of stock were allocated to the incumbent managers as a political

accommodation that was essential to the implementation of privatization. The result was probably easily predicted: within two to three years after mass privatization, most minority shareholders had sold their shares to the insiders, thereby producing the same highly concentrated ownership structures that are the norm elsewhere.<sup>80</sup> Second, in contrast to other recent privatization experiences, the Russian government lacked control over its outlying regions. In these regions, privatized companies have been at least as subject to expropriation by the local government (or coalitions led by, or affiliated with, it) as by controlling shareholders.<sup>81</sup> Third, the legal system in Russia was almost uniquely primitive, indeed to the point that few contractual obligations could be routinely enforced, and resort to extra-legal means (most notably, violence) was the norm, not the exception. Finally, the macroeconomic condition in Russia proved to be particularly perverse.<sup>82</sup> As a result, in 1998, the Russian government defaulted on its domestic and international debt, and the RTS stock market index fell almost 90% from its level eleven months earlier.<sup>83</sup> When an experiment fails from multiple causes, it is difficult to attribute primary responsibility to any one cause.

In contrast, what makes the Czech story more interesting than the Russian story is that the same transition from dispersed to concentrated ownership occurred even without the built-in bias for insider ownership or the poor macroeconomic conditions that characterized the Russian context. Nor is the Czech experience unique. To the extent that Czech privatization malfunctioned, lack of regulation would appear to play a greater causal role, because other explanations are simply not as available. More generally, except when companies have been privatized through offerings listed on international stock exchanges, the Czech progression to concentrated ownership seems to be the dominant pattern, with the exceptions being few in number. Poland appears to be the most notable exception, but its story has not yet played out fully. As discussed next, this pattern raises the question of whether this transition is an inevitable progression.

#### *D. The Reappearance of Concentrated Ownership*

Both in Russia and in the Czech Republic, mass-privatization through the sale or distribution of privatization vouchers to the citizenry inevitably created a highly dispersed ownership structure—but only for a transitory period. Over time, concentrated ownership re-emerged. Because numerous studies have concluded that privatized firms become more efficient,<sup>84</sup> it is not surprising that some studies attribute this increased

Starr Center Working Paper No. 98-14, 1998) (summarizing other studies); MEGGINSON & NETTER, *supra* note 83.

efficiency to the emergence of concentrated ownership. For example, one detailed study that examined the performance over the period from 1992 to 1995 of a sample of 706 Czech firms that were privatized in 1991-1992 concluded that the greater the ownership concentration, the greater the improvement in profitability and market valuation.<sup>85</sup> Unfortunately, this study examined a period that ended in 1995, prior to the subsequent free fall in price levels on the Prague Stock Exchange. Possibly, the higher stock market valuations at this initial stage were a transitory phenomenon which reflected the prospective control fights that were already looming.

Still, let us assume for a moment that newly privatized firms with concentrated ownership do initially outperform comparable firms with dispersed ownership. Does this then imply that an economy characterized by concentrated ownership will be more efficient than one characterized by dispersed ownership—at least in the case of transitional economies? The problem with any such conclusion is that the benefits from concentrated ownership may prove to be short-lived, while the costs surface only at a delayed point. Even if concentrated ownership implies superior monitoring of management, these benefits have to be balanced against the enhanced risk of expropriation by controlling shareholders. Such expropriation risks the phenomenon of securities market collapse, which in turn may result in a variety of social costs. For example, as earlier noted, Polish securities markets have been able to support IPOs and other cash offerings of equity securities, while Czech markets have not.<sup>86</sup> Economic growth then may be at risk.

The extent of this risk has only recently begun to emerge in new research that documents an apparent global pattern. The Asian financial crisis of 1997-1998 adversely affected economic development in most emerging markets, but to varying degrees. Although most analysts have assumed that its causes lay in macroeconomic and banking policies, one provocative new study concludes that “the weakness of legal institutions for corporate governance had an important effect on the extent of [exchange rate] depreciations and stock market declines in the Asian crisis.”<sup>87</sup>

Essentially, this study argues that the rate of expropriation increases when the rate of return on investment falls. In short, managers and controlling shareholders tend to steal more in bad times than in good times—and investors expect this. Hence, given any adverse shock to the financial system of a region (or the world generally), the relative decline will be worst in those countries with legal systems that confer the weakest protections to minority shareholders. Using as its sample the twenty-five emerging markets that are currently open to significant capital flows (and hence are the most vulnerable to speculative attack), this study concluded that “weak enforcement of shareholder and creditor rights had first-order importance in determining the extent of exchange rate depreciation in 1997-98.”<sup>88</sup> Indeed, three indices of legal institutions—which it termed “efficiency of the judiciary,” “corruption,” and the “rule of law”—were found to “predict the changes in exchange rates in emerging markets better than do the

88. *Id.* at 4.

standard macro measures.”<sup>89</sup> Other measures reflecting the strength of shareholder rights also correlated closely with the severity of the financial crisis, but only “as long as these measures reflect how rights are actually enforced.”<sup>90</sup> To sum up, the strength of legal protections (as measured by actual enforcement practice) appeared to be the independent variable that best predicted the dependent variable of severity of financial crisis.

At this juncture, it is useful to return to the Czech experience. As noted earlier, a number of studies have found that privatized firms became more profitable to the extent that their ownership was more concentrated.<sup>91</sup> But is this advantage sustainable over time? The subsequent sharp decline in stock prices on the Prague Stock Exchange suggests that some financial shock (from whatever source) destabilized the economy and caused a withdrawal of investor capital. Why was the market decline so extreme in the absence of any major macroeconomic change in the Czech economy? Perhaps investors were aware of their potential vulnerability, but expected that managers would constrain their rate of expropriation during “boom” times. At the first sign of “bust,” however, investors race for the exits because they expect the rate of expropriation to increase.

Whether or not one accepts this premise that the rate of expropriation rises with any decline in return on investment, the critical factor in this scenario is that investor loss of confidence will be greatest in those economies where they believe they are least protected legally. In truth, assumptions about the relationship of the rate of expropriation to the return on investment are probably unnecessary to drive this model. All that one need hypothesize is that investors will ignore legal risks and their vulnerability to expropriation by controlling shareholders during “boom” times, possibly on the premise that managers and controlling shareholders will not risk disrupting the momentum that is benefiting them all. Essentially, the Czech experience seems consistent with this pattern.

Although such data can be read to mean that legal development has a decisive influence on the viability of securities markets, the true independent variable in such a model may be investor confidence, and the level of such confidence may be influenced by factors other than the strength of legal protections. Investors may learn that a particular venue (whether a country or a stock exchange) has frequently experienced scandals—and decide to avoid it.

Even within the United States, there is evidence consistent with this hypothesis. In 1992, the Amex launched the Emerging Company Marketplace (ECM) to trade the stocks of small, high growth companies.<sup>92</sup> By 1995, it was forced to close this market after a series of scandals had “damaged the ECM’s reputation for monitoring the quality of its listings. . . .”<sup>93</sup> Yet investors in the ECM had the same legal rights as investors trading on the NYSE. Although other factors also inhibited the growth of the ECM,<sup>94</sup> the role of scandal seems critical. Investors are neither legal scholars nor comparativists; they learn principally from experience, not theory. Moreover, they may expect any apparent pattern

90. *Id.*

91. See *supra* notes 84-85 and accompanying text.

92. For a detailed discussion of the ECM, see Reena Aggarwal & James J. Angel, *The Rise and Fall of the Amex Emerging Company Marketplace*, 52 J. FIN. ECON. 257 (1999).

93. *Id.* at 283.

94. Aggarwal and Angel in fact give greater weight in their account to an adverse selection problem: “good” firms matured from the ECM to the Amex, while “bad” firms remained behind. *Id.* at 263.

that they observe to continue (even if it was in fact simply an unconnected series of random events). Hence, scandal predicts future scandals, and investors expect more expropriation. This expectation of continuity may explain the relatively high failure rate of “emerging company” or “incubator” stock exchanges.<sup>95</sup>

The bottom line then may be that anything that invites public scandal (including weak legal protections) creates a negative externality. If so, public policies intended to protect market integrity and preserve investor confidence can be easily justified, even if they may sometimes impede the ability of small and non-fraudulent firms to raise capital.

#### IV. THE TECHNOLOGY OF EXPROPRIATION

Although a variety of tactics were used to expropriate wealth from Czech companies and investment funds, the best known strategy was popularly referred to as “tunneling.” Essentially, this practice involved the sale or transfer of a controlled firm’s products or assets at below market prices to another company, which was controlled by the same controlling group as controlled the original firm. Gradually, through a series of transactions that might involve a number of such shell companies, the controlled corporation’s assets could be hollowed out (hence, the term “tunneling”); alternatively, its expected future cash flow could be transferred to the shell company by causing the controlled firm to enter into long-term production contracts under which most of its output was effectively sold at cost (or less) to one or more shell companies.

Variations on this basic pattern were numerous. For example, an entrepreneur might borrow funds to buy a controlling stake in a Czech company, using a personally owned corporation as the vehicle that borrowed the acquisition debt from a bank. Once control of the firm was acquired, the entrepreneur could merge the personally controlled firm into the privatized firm, in order to make the latter liable for the entrepreneur’s personal acquisition indebtedness.<sup>96</sup> As a result, the entrepreneur forces the other shareholders to bear much of the cost of the entrepreneur’s acquisition of control.

Such unfair self-dealing is not particularly novel or imaginative. But, precisely for that reason, the fact that it worked so effectively in the Czech Republic suggests there must be some characteristic weakness or vulnerability in Czech law and (because Czech corporate law was largely patterned after German law) in the civil law generally. A key reason why “tunneling” was successful involved the availability of legal techniques by which it could be insulated from judicial scrutiny. A 1997 study by the Czech Ministry of Finance examined a variety of tactics for looting privatized companies and reported that:

“[T]unneling” into companies is a frequent phenomenon. Current ‘corporate raiders’ have discovered a risk-free method of removing money from

---

95. Aggarwal and Angel observe that:

During the 1980s, virtually every stock market in Europe established a special section for companies that were too small to meet the normal listing requirements. . . . Many of these markets appeared to prosper for a short time, but ultimately they all suffered from severe illiquidity and attracted few companies or investors.

*Id.* at 281. Amsterdam closed its Official Parallel Market in 1993, and London closed its Unlisted Securities Market in 1996. *Id.*

96. For these and other examples, see Coffee, *supra* note 37, at 113-14.

companies. This method consists of holding a general meeting of shareholders in which the 'raiders' have a voting majority; this meeting passes a decision on a transaction involving corporate property . . . and the Board of Directors of the company then carries out this operation, with consequent damage to the company. No (minority) shareholder can blame the Board of Directors of the company for this operation as it is bound by the decision of the general meeting.<sup>97</sup>

In short, if the self-dealing transaction were approved by a majority of the shareholders, the directors were effectively insulated from legal liability. Although minority shareholders could sue to challenge action taken at the shareholders' meeting, they would receive little disclosure about the terms of the transaction and hence were not in a position to raise an effective challenge.

To the extent this assessment is accurate, it reveals a sharp contrast between the constraints of Czech and those of common law jurisdictions. For example, although U.S. law gives considerable weight to shareholder ratification, U.S. law generally does not permit a self-interested shareholder to ratify a transaction between the corporation and itself (or an affiliate).<sup>98</sup> Typically, only the vote of a disinterested majority of the shareholders can have this impact. Thus, the practical consequence of this difference is to accord the majority shareholder (or shareholder group) far greater power to impose self-dealing transactions on the minority and hence to create a far stronger incentive for a shareholder or group seeking control to obtain a majority interest. Although German corporate law (and hence Czech law, as a legal system substantially based on that model) permits the shareholder to attack the results of a shareholder meeting, this is an uphill battle, because it asks the court to overrule the majority of the shareholders, not simply the board of directors.

Majority ratification was not, however, the only technique by which "tunneling" could be effected. Well before achieving an absolute majority, a shareholder or a shareholder group might achieve *de facto* control of the board and thus be in a position to approve the same self-dealing transactions without shareholder ratification, based rather on board approval. Directors who approved a clearly unfair self-dealing transaction might face some risk of legal liability, but this risk is mitigated by two key factors that characterize many civil law systems. First, shareholders will not necessarily learn of the self-dealing transaction. Under the German corporate law, an elaborate body of law regulates the relationship between the companies that belong to a holding structure, or "Konzern." This body of law permits a majority shareholder to dominate its subsidiary, but expects the majority to compensate the minority for any detriment that they suffer.<sup>99</sup> Although the firm's auditors must report on such intercompany dealings, they report only

---

97. See *Current Aspects of the Czech Capital Market*, Czech Ministry of Finance (internal report dated 1997).

98. Some U.S. statutes specifically sterilize the votes of interested shareholders in establishing the procedures by which a conflict of interest transaction may be approved by the board or shareholders so as to overcome the presumption against fiduciary self-dealing. See, e.g., CAL. CORP. CODE § 310 (West 1990). Others, including Delaware, have reached a similar result by judicial decision. See *Fleigler v. Lawrence*, 361 A.2d 218, 222 (Del. 1976) (shareholder approval merely removes "cloud" and does not sanction unfairness).

99. For a brief overview, relating the application of this law to transitional economies, see Pistor, *supra* note 7, at 17-18.

to the controlled firm's supervisory board, not to its minority shareholders. German commentators have candidly acknowledged that this non-transparent approach to the regulation of self-dealing leaves at least a potential loophole in the civil law's system of corporate governance: shareholders cannot challenge transactions of which they are unaware.<sup>100</sup>

More generally, German corporate law views the shareholders' meeting as the appropriate forum at which different issues are to be debated and resolved. This may work adequately in a system of concentrated ownership, where large shareholders can be expected to attend the meetings. But privatization inherently creates dispersed shareholders with small stakes, and they are less likely to be informed or to attend such a meeting. In addition, management can schedule the meeting at remote sites on little notice, which tactic will work to discourage at least small shareholders. Moreover, Czech law exacerbated this problem by establishing a particularly low quorum requirement (30%) that effectively permitted as few as two large funds to satisfy this requirement and vote through action at a hastily convened meeting.<sup>101</sup>

In transitional economies, these dangers are further aggravated by the greater likelihood that the supervisory board may not be independent or may simply be too inexperienced or passive to evaluate the transaction's fairness. Second, the judicial systems in transitional economies have not been able to develop remedies or standards on their own to reduce the risk of expropriation. Third, even if shareholders do learn of the transaction, they may lack the incentive to take action or sue. Here, the standard collective action problem surfaces: small shareholders will seldom have sufficient economic reason to undertake costly litigation. In addition, once a control block is formed, it is rare to find any other substantial shareholder group;<sup>102</sup> instead, other potential competitors for control appear to exit quickly once de facto control has been achieved by a rival. Thus, few individual shareholders will face a sufficiently substantial loss to justify the cost of litigation on an individual basis. In the U.S., this collective action problem is at least partially solved by (1) the existence of the contingent fee agreement (which is essentially a risk-shifting device by which the small shareholder transfers the risks of the litigation to an entrepreneurial plaintiff's attorney), and (2) the prevailing legal rule in the United States that a successful plaintiff in a derivative action is entitled to have the corporation pay its reasonable attorney's fees. Absent similar enforcement mechanisms, minority shareholders in transitional economies will predictably remain passive, even if they learn that they have been defrauded.

#### V. POLICY LESSONS FROM THE PRIVATIZATION EXPERIENCE

Several common denominators are discernible in the early efforts to privatize state-

---

100. See, e.g., Herbert Wiedemann, *The German Experience with the Law of Affiliated Enterprises*, in *GROUPS OF COMPANIES IN EUROPEAN LAW: LEGAL AND ECONOMIC ANALYSIS ON MULTINATIONAL ENTERPRISES* (Klaus J. Hopt ed., 1982); Ulrich Immenga, *The Law of Groups in the Federal Republic of Germany*, in *GROUPS OF COMPANIES IN THE EEC 85* (Eddy Wymeersch ed., 1993).

101. See Pistor, *supra* note 7, at 35-44. These techniques were in fact used in practice by one notorious Czech entrepreneur. See Charles Wallace, *The Pirates of Prague*, *FORTUNE*, Dec. 23, 1996, at 78 (discussing the career of Victor Kozeny); Coffee, *supra* note 37, at 115.

102. See La Porta et al., *Corporate Ownership Around the World*, *supra* note 2, at 505 (in 75% of cases, no other large shareholder exists when there is a controlling shareholder).

owned enterprises and to develop securities markets in transitional economies. First, most recent studies of the privatization process have reported that the most obvious corporate monitors (namely institutional investors and, in particular, privatization investment funds) have shown little interest in monitoring. Either they have been clearly ill-equipped for such a role, or, more typically, they have used their “insider” positions to engage in informed trading in thin and non-transparent markets or to pursue other self-interested ends. While the circumstances vary, the underlying cause seems the same: restructuring is a costly undertaking in which the gains are necessarily shared with other shareholders. In contrast, so long as markets are non-transparent and minority protections largely non-existent, it may be easier and more profitable to expropriate wealth than to create it. Second, to the extent that large shareholders are active, their primary focus seems to be on obtaining a controlling position—either to exploit the private benefits of control or as a defensive measure to protect themselves from expropriation, or both. Once this scramble for control produces a victor, “tunneling” begins. Third, emerging securities markets seem vulnerable to sudden collapses. Once a market becomes stigmatized, the decline is fast, not slow, because a sudden exogenous shock can cause both foreign and domestic investors to race for the exits—if they lose confidence.

To remedy these problems, some have called for the wholesale reform of corporate and securities laws in order to introduce the more protective features of Anglo-American law into the typically civil law codes of most transitional countries. This sounds desirable, but closer analysis reveals a problem in this approach: little consensus exists as to precisely what are the most important and protective features of Anglo-American law. For example, preemptive rights play an important role in the U.K., but virtually no role in the U.S.<sup>103</sup> In contrast, class actions may generate a desirable level of deterrence in the U.S., but are unknown in the U.K. Although some research seems to show that common law systems outperform civil law systems in protecting minority shareholders,<sup>104</sup> a satisfactory explanation for the common law’s apparent superiority remains elusive. Other commentators have stressed that the development of strong securities markets requires high disclosure standards and protection for minority shareholders from expropriation (both of information and property) by insiders.<sup>105</sup> This seems clearly valid, but it still leaves open the considerable problem of how to get to such an ideal state from the existing starting points.

In overview, possible reforms can be grouped under three headings: (1) judicial reforms (which respond either to the underdeveloped state of the judiciary in transitional economies or to special problems relating to the alleged rigidity of the civil law); (2) structural reforms (which may require legislation but do not involve legal rules); and (3) legislative reforms (which might relate to either substantive corporate law or securities regulation). This section will begin with judicial reforms because it seems necessary to assess frankly what can and cannot be expected of the judiciary in developing countries. Thereafter, it will consider both structural reforms and possible legislative revisions.

### A. Judicial Reforms

Although it is conclusory to simply assume that common law systems necessarily offer greater protection to minority shareholders than do civil law systems, the evidence is strong that dispersed ownership persists primarily in common law legal regimes.<sup>106</sup> Potentially, this could be the result of statutory provisions that are generally found in common law systems. However, to date, proponents of the common law's superiority have not been able to provide a convincing explanation of the critical statutory deficiencies of the civil law or the common law's features that better protect minority shareholders. Alternative hypotheses need therefore to be considered.

#### 1. A Hypothesis of the Common Law's Advantages

One plausible hypothesis is that the real superiority of common law systems lies in the distinctive role of the common law judge. A considerable "law and economics" literature views the corporate charter as a highly incomplete contract.<sup>107</sup> Necessarily, there are gaps in this contract that must be filled. "Law and economics" theorists have disagreed over the years as to what principle or formula the court should use in seeking to fill these gaps,<sup>108</sup> but consensus exists that the common law judge can and should fill these gaps. In contrast, the civil law judge may not have the same authority or the same expansive understanding of the judicial role. To the extent that the civil law distrusts judicial activism or views it as a usurpation of the legislature's role, the civil law judge is confined to the narrower role of interpreting what comprehensive civil codes have actually specified. Thus, at least at the margin, the common law encourages gap-filling, while the civil law tends to impede it.

Any summary description of the differences between the civil law and the common law will necessarily omit much and risks stereotyping legal systems that have considerable subtlety and variation. Nonetheless, the role of the judge does appear significantly different under the two systems.<sup>109</sup> If it overstates to say that the civil law judge is simply a bureaucrat whose job it is to interpret and apply a written body of statutes, it is still true that the civil law jurist lacks the same freedom and discretion as the common law judge to search through a vast storehouse of legal precedents to find the rule best suited for the case before the court.<sup>110</sup> By definition, the inventory of potentially

---

106. Japan is the marginal case because it has dispersed ownership (along with a unique control structure). It is primarily a civil law country, but with American securities laws imposed in the aftermath of World War II. This pattern may suggest that securities laws are more important than common law remedies, or it may just be that Japan has developed unique institutions by which to preserve investor confidence.

107. For standard statements of this perspective, see EASTERBROOK & FISCHER, *supra* note 8, at 1-39; see also Jonathan R. Macey, *Corporate Law and Corporate Governance: A Contractual Perspective*, 18 J. CORP. L. 185 (1993).

108. Compare Ian Ayres & Robert Gertner, *Filling Gaps in Incomplete Contracts: An Economic Theory of Default Rules*, 99 YALE L.J. 87 (1989) (recommending "information forcing" rule), with EASTERBROOK & FISCHER, *supra* note 8 (preferring wealth maximizing rule).

109. See, e.g., RENE DAVID & JOHN E.C. BRIERLEY, *MAJOR LEGAL SYSTEMS IN THE WORLD TODAY* 339 (2d ed. 1978).

110. See MIRJAN R. DAMASKA, *THE FACES OF JUSTICE AND STATE AUTHORITY* (1986) (emphasizing the technocratic role of common law judges); see also MARTIN SHAPIRO, *COURTS: A COMPARATIVE AND POLITICAL ANALYSIS* 136 (1981).

applicable precedents that the common law creates confers greater discretion upon the legal decision-maker.

This distinction has even greater force in the area of private law. On the one hand, civil law codes tend to be especially comprehensive in this area and thus arguably leave less room for gap-filling. Conversely, the common law (and particularly corporate law) does not view statutes as the only (or even principal) source of law. Under the common law, legal duties can arise that are independent of any statutory source. The most important example for corporate law is the concept of fiduciary duty. Fiduciary duties can develop out of a course of dealing or a relationship involving trust and confidence where neither side has contractually assumed any duty to the other.<sup>111</sup> In corporate law, the best example of how the concept of fiduciary duty invites common law judges to fill gaps involves the duty of loyalty. Although some American states do define the duty of care by statute, the broader duty of loyalty is generally left to the common law process of judicial interpretation. There, it rests on a common law foundation consisting of several centuries of judicial precedent. Even before the modern corporation arose, the law of agency and the law of trusts held the servant accountable to the master for secret profits obtained from use of the master's property. These decisions were later applied to hold corporate officials—including officers, directors, and controlling shareholders—to similar standards. In Delaware, the foundational decision defining the contours of this duty is *Guth v. Loft*,<sup>112</sup> which in broad and somewhat rhetorical prose instructs corporate fiduciaries that they are held to an “uncompromising duty of loyalty.”<sup>113</sup> Equally famous decisions in New York and elsewhere have used similarly broad language, including, of course, Justice (then Judge) Cardozo's famous phrase that a fiduciary must observe not merely the “morals of the marketplace . . . but the punctilio of an honor the most sensitive.”<sup>114</sup> Sophisticated judges today recognize that such broad norms must be applied in a context-specific fashion, and this may lead them to de-emphasize the rhetorical flourishes of an earlier generation and instead consider the hypothetical bargain into which shareholders and corporate fiduciaries have entered. But attempts to “contract out” from the duty of loyalty through broad exculpatory charter provisions have generally failed.<sup>115</sup>

The immediately relevant point is that the common law's concept of fiduciary duty both enables and instructs the common law judge to fill in the gaps in an incomplete contract. Indeed, the fiduciary concept both tells the court that implied and non-cancelable conditions must be read into the corporate contract and provides a rich repository of illustrations in the form of cases to guide the court. No similar deep inventory of legal precedents existing apart from the statutory law of the corporations

---

111. The law of insider trading has shown how complex this issue can be when a fiduciary duty arises, but the key criteria are (1) the possession of discretion to act for the beneficiary by the party to be charged with the duty, and (2) dependence by the beneficiary. *See, e.g., United States v. Chestman*, 947 F.2d 551, 569 (2d Cir. 1991).

112. 23 Del. Ch. 255, 5 A.2d 503, 510 (Del. 1939).

113. *Id.* at 510-11.

114. *Meinhard v. Salmon*, 164 N.E. 545, 546 (N.Y. 1928).

115. *See, e.g., Irwin v. West End Dev. Co.*, 342 F. Supp. 687, 701 (D. Colo. 1972) (“Exculpatory provisions of corporate articles create no license to steal.”), *modified on other grounds*, 481 F.2d 34 (10th Cir. 1973).

code arms the civil law judge. To be sure, some modest steps towards recognizing a fiduciary duty to minority shareholders have been taken in some civil law jurisdictions (most notably, Germany<sup>116</sup>), but the concept has been stated only in the abstract and lacks any effective enforcement mechanism. As a result, although the differences between the civil law and the common law can easily be overstated, the civil law essentially views the corporations code as the law and confines the judge to, more or less, mechanically applying it, while for the common law judge, corporate law is a complex amalgam of statutes and judicial decisions. Rather than replacing or superseding earlier judicial precedents, the statutory corporations code can be seen as attempting to codify those precedents.

This hypothesis that the common law tends to encourage gap-filling, while the civil law discourages it, certainly remains open to challenge. Some empirical evidence finds British judges, for example, to be less “daring” than their civil law counterparts in France or Germany.<sup>117</sup> But whatever the overall level of caution of British judges, the context of corporate law may be distinctive. There, the concept of fiduciary duty—with its clear statement that there exists a legal duty, independent of statute or contract, to be fair to minority shareholders—invites and prods courts to fill in apparent gaps in the corporate contract.

Still, even if the common law does better arm the judge to resist opportunism, what relevance does this contrast have for transitional economies? That is, even if common law judges have greater discretion and can fashion novel remedies, it does not follow that their style of judicial behavior can be imposed on civil law judiciaries. It is simply not a feasible reform to attempt to convert civil law judges into common law judges (it would be easier to convert financial economists into law professors, or vice versa). But such pervasive reform may not be needed, because only a small portion of the workload of most judges in either system will deal with corporate or securities law matters. The simpler course may be simply to transfer this portion of their caseload to a specialized tribunal, as next discussed.

## 2. Specialized Courts

The inflexibility of civil law courts has already led to the creation of specialized courts in some civil law countries, which specialized courts have exclusive jurisdiction over some subject matters.<sup>118</sup> One example is the German experience with labor law

---

116. The German Federal Supreme Court recognized that controlling shareholders owe a fiduciary duty of loyalty to minority shareholders in the much discussed “Linotype Case” in early 1988. See *Entscheidungen des Bundesgerichtshofs in Zivilsachen [BGHZ] [Supreme Court] 103, 184 (F.R.G.)*. See generally, Hwa-Jin Kim, *Markets, Financial Institutions, and Corporate Perspectives from Germany*, 26 *LAW & POL’Y INT’L BUS.* 371, 392-94 (1995). In addition, Germany has a separate body of law called “Konzern law” which is intended to protect both minority shareholders in, and creditors of, companies that belong to a group of companies. See also Immenga, *supra* note 100. See generally, J. Bantz Bonano, *The Protection of Minority Shareholders in a Konzern Under German and United States Law*, 18 *HARV. INT’L L.J.* 151 (1977).

Whatever the situation in Germany, far fewer rights (or remedies) that can be exercised by minority shareholder seem to be recognized elsewhere on the Continent. See Jonathan R. Macey, *Italian Corporate Governance: One American’s Perspective*, 1998 *COLUM. BUS. L. REV.* 121, 129-35.

117. See Cooter & Ginsburg, *supra* note 22, at 300-01.

118. Russia has experimented with an “economic court” system, but with mixed results at best. See Karen Halverson, *Resolving Economic Disputes in Russia’s Market Economy*, 18 *MICH. J. INT’L L.* 59 (1996). In

courts, which were created because labor law inherently requires a difficult style of decision-making.<sup>119</sup> Indeed, even common law countries have made substantial use of specialized tribunals to hear securities law disputes. For example, the federal securities laws now also contemplate their enforcement before administrative law judges.<sup>120</sup>

Thus, a practical approach to effective enforcement may lie in creating a cadre of administrative judges within an SEC-like agency, authorized to broadly enforce both disclosure obligations and certain rules against self-dealing (such as the insider trading prohibition). Such judges would be trained within the agency and empowered to impose substantial civil penalties. Their jurisdiction could be limited to enforcement cases brought by the agency, or it could be expanded to include suits by investors for restitution.<sup>121</sup> Although these judges would presumably lack criminal law jurisdiction, they could be authorized to grant bar orders that could effectively suspend or disbar an individual or entity from the functional activity of being a broker, investment adviser, accountant, or attorney, or from having any association with any entity that engaged in these activities. As a further backstop, persons who knowingly engaged in such specified activities with such a defendant after the time of the entry of the bar or suspension order might also face similar penalties. Further, appeal of such orders or decisions might only be made to the jurisdiction's court, which would be authorized to reverse it only on a finding that it was without any factual or legal support.

At this point, the agency acquires an in-house enforcement arm that lacks only the traditional judge's power to issue injunctions. Indeed, "cease and desist" orders could be authorized that partly fill even this gap. The remaining problem may be how to enforce bar or suspension orders. In transitional economies, a broker or investment adviser barred from that activity may persist in soliciting customers, effecting transactions, and giving investment advice. One answer may lie in centralizing trading on a more easily monitored exchange and penalizing persons who work with or for the suspended person. Another answer may be to allow customers and counter parties to rescind transactions (or refuse to pay for losing transactions) with any barred, suspended, or unauthorized person. Whatever the means used, enforcement problems can be solved, so long as the agency does not depend on (and cannot be nullified by) the traditional judiciary.

---

contrast to an independent economic court, the proposal here made is for a specialized court that is located within the agency in whose law the court is to specialize.

119. German labor courts date back to the Weimar Republic and were designed "to force labor-management disputes into a procedural framework similar to the political process of party competition and parliamentary decision making." See Erhard Blankenburg, *Patterns of Legal Culture: The Netherlands Compared to Neighboring Germany*, 46 AM. J. COMP. L. 1, 26 (1998). The German labor courts now have 10 divisions at the federal level and 27 judges at this level alone. *Id.* at 27.

120. As a result of recent legislative revisions, Section 21B of the Securities Exchange Act of 1934 now authorizes civil penalties in administrative proceedings in amounts up to \$500,000 (in egregious cases). Similarly, Section 21C of the same statute authorizes the SEC to impose administrative "cease and desist" orders—in effect, a type of civil injunction. Thus, even in the United States where judicial remedies are probably most available and most flexible, securities regulators believed it important to bring at least some remedies "in house" where they would be litigated before administrative law judges trained at the agency and exclusively involved with the securities law enforcement.

121. In civil law countries, there is no right to a jury trial, which is the factor probably most responsible for limiting the jurisdiction of administrative law judges in civil cases in the United States.

To sum up, civil law judges may frustrate a regulatory scheme for any of a variety of reasons, including: (1) because they are inflexible and literalistic; (2) because they are over worked and consider regulatory enforcement a non-essential task; or (3) because (in some countries) they are susceptible to corruption and bribery. Moving the enforcement mechanism at least partially “in house” into the administrative process is a practical answer to all of these problems. “In house” administrative judges can be socialized to view securities regulation through the same lens as the agency; they will not have other priorities to distract them; and they should be less corruptible (or, at least, more easily monitored and removed).

### *B. Structural Reforms*

Even if legal rules cannot be predictably or evenly enforced in transitional economies, other structural mechanisms might be used to prevent the kind of systematic expropriation that characterized the Czech experience.

#### *1. Phased Privatization*

The Polish experience with NIFs—in effect, state-created, controlling shareholders—may supply a useful model for a more gradual form of privatization. Such controlling shareholders could serve several distinct functions: (1) they prevent (or at least delay) the scramble for control that characterized the Czech experience—at least until the legal and regulatory structure has gained some experience with privatization; (2) they may constitute more active monitors than private investment funds; at a minimum, they can at least be charged with the mission of developing a restructuring plan for their portfolio companies; and (3) they serve as a means of aggregating individual shareholders and thus partially solving collective action problems.

Ultimately, however, true privatization requires that the NIF wither away—or else firms would still remain under indirect state control. Thus, a strategy for a phased downsizing of the NIF is necessary. Here, the Polish model was incomplete, because it gave the NIFs a ten-year life, but did not provide for the gradual shrinkage of their controlling blocks. Instead, a subtler approach might have been to reduce the NIF’s stakes from the 33% starting point on an annual basis: *i.e.*, down to 30% after year one; 25% after year two; 20% after year three, etc. In addition, it might be wise to stagger this schedule so that some NIFs downsized and disappeared faster than others—thereby creating a natural experiment and permitting legislative or regulatory reforms if the first generation of NIFs to disappear gave rise to a series of scandals. Such a phased reduction makes more sense than simply turning the NIFs over to private owners at a single stroke because that approach invites the same rent-seeking struggle for control as occurred with the Czech funds.

Another attraction of this approach is that it should encourage foreign portfolio investors (who will not seek control and know they cannot actually manage portfolio companies) to remain active in the equity market and possibly become a monitoring substitute that over time could collectively replace the state-created NIFs. In contrast, a scramble for control in which the winner acquires a significant control premium may cause them to flee the market because they cannot compete. Still, the overriding

attraction of this approach is that it is “self-enforcing” and does not require judicial implementation in order to discourage rent-seeking control contests.<sup>122</sup>

## 2. *Stock Exchange Listing Standards*

Long before there was an SEC in the United States, the New York Stock Exchange and the London Stock Exchange had succeeded in winning investor confidence. They did so by imposing relatively rigorous disclosure and listing standards and transparency requirements that exceeded those prevailing in other markets. Exchanges do not have ideal incentives, however, for the task of enforcement. Because they profit on trading volume, and they compete to list companies, they will not wish to delist an actively traded company, even when it misbehaves badly. Similarly, their incentives to take enforcement action against powerful broker-dealers may also be suboptimal. For these reasons, at least in a transitional economy, the control over listing standards may better belong with a government agency.

Here, the contrast between the Czech and Polish experiences is particularly instructive. As of late 1998, only 253 companies traded on the Warsaw Stock Exchange, while some 1716 firms traded in the Czech market in 1995—a nearly 7:1 ratio, despite the fact that the Polish economy dwarfs that of the considerably smaller Czech Republic.<sup>123</sup> Eventually, the Prague Stock Exchange was forced to delist over 75% of its companies, both in order to maintain its credibility and to satisfy Czech regulators.<sup>124</sup>

Of course, if exchange trading is restricted, substitutes will develop, including formalized over-the-counter markets. Such markets may be risky and characterized by dubious offerings and market practices. So be it. Their potential failure should not jeopardize the higher-quality market. Indeed, markets may naturally self-segregate into high quality and lesser-quality markets. In times of economic stress, the lower-quality market should incur the greater decline.

Such a pattern would permit significant privatization without exposing the principal securities market to the same risk of a Czech-style collapse. Enforcement resources might also be concentrated on the higher-quality market to maintain its reputational integrity. One goal of this effort would be to convince foreign portfolio investors that the higher-quality market could be trusted and to encourage their investment in it.

## 3. *The Optimal Monitor*

The Polish and Czech experiences represent polar extremes. Essentially, the Czech privatization process relied on highly entrepreneurial, but legally unconstrained, monitors in the form of investment funds that more or less spontaneously arose. In contrast, the Polish approach was to rely upon highly constrained, state-created NIFs, whose entrepreneurial skills and incentives remain unproven. Neither choice seems optimal (at least by itself). There is, however, a third, obvious candidate: the existing foreign portfolio investor. Not only do foreign institutional investors have relatively scandal-free

---

122. I use “self-enforcing” here in the same sense as that term was originally used by Professors Black and Kraakman to mean a remedy or protection that did not require judicial enforcement to be effective. *See* Black & Kraakman, *supra* note 17.

123. *See supra* notes 30, 52, and accompanying text.

124. *See* Pistor, *supra* note 7, at 39 (1301 of 1716 Czech firms delisted under pressure from regulators).

histories (and reputations that they wish to preserve), but there is evidence that they make superior monitors. One recent study by two Harvard Business School researchers examined data from India during the 1990s and concluded that foreign institutional investors significantly outperformed domestic financial institutions as corporate monitors.<sup>125</sup> Domestic financial institutions, they found, had insufficient incentives or skills to monitor management or play any effective role in corporate governance. In contrast, foreign institutional ownership proved to be positively correlated with positive changes in Tobin's Q (while domestic financial ownership was actually negatively correlated with such changes).<sup>126</sup> Such a finding that domestic financial institutions play only a modest monitoring role (and may have conflicted motives) is essentially consistent with the Czech experience and with similar findings about Russian privatization.<sup>127</sup>

Equally important, this study found that foreign institutional investment only occurs under circumstances of high transparency (for example, institutions tend to avoid investment in affiliated business groups). Hence, a stock exchange with rigorous listing requirements and high transparency seems likely to attract the most effective and experienced corporate monitors. In turn, as stock exchange listing is seen to attract foreign equity capital, the willingness of other companies to list and accept meaningful listing conditions may increase. To be sure, this strategy has its limitations: small capitalization corporations and small market countries tend to be ignored by institutional investors. But that is no reason to reject a partial answer.

More can, of course, be done to attract foreign investors. While the use of voucher privatization was politically necessary at the outset of privatization for a variety of reasons, contemporary sales of the remaining state-owned shares in partially privatized enterprises might be made through auction sales to which foreign institutional investors were specifically invited.

### C. Legislative Reform

The Czech experience with "tunneling" does suggest that at least the German civil law system of corporate governance unnecessarily exposes minority shareholders to risks of expropriation. The key problems center around disclosure and enforcement.

#### 1. Overview

Because concentrated ownership systems of corporate governance have few companies in which a majority of the shares are held by public (*i.e.*, non-controlling) shareholders, their legal rules have understandably focused on protecting the minority shareholder from the controlling shareholder, not from management. Management, it is assumed, can be controlled by the supervisory board or by powerful shareholders. Hence,

---

125. See TARUN KHANNA & KRISHNA PALEPU, EMERGING MARKET BUSINESS, FOREIGN INVESTORS AND CORPORATE GOVERNANCE (National Bureau of Econ. Research Working Paper No. 6955, 1999).

126. *Id.* at 19. "Tobin's Q" is a well-recognized financial measure that consists of the ratio of the firm's market value to the replacement cost of its assets. A low Tobin's Q (which arises if the replacement cost exceeds or approaches the firm's market value) is seen as indicating poor managerial performance. See, *e.g.*, Henri Servaes, *Tobin's Q and the Gains from Takeovers*, 46 J. FIN. 409 (1991).

127. See generally, Roman Frydman et al., *Needed Mechanisms of Corporate Governance and Finance in Eastern Europe*, in ECONOMICS OF TRANSITION 171 (1993).

German law does not authorize an American-style derivative action in which a small shareholder can cause the company to sue management. This role is instead given to the supervisory board.

But privatization inherently creates publicly held companies with dispersed ownership, and hence it gives rise to the danger of managerial expropriation because there are not necessarily any large shareholders to monitor management at the outset. In short, there is a fundamental mismatch: a system of legal rules designed to deal with concentrated ownership works less well when confronted with the new phenomenon of dispersed ownership.

## 2. Disclosure

German law does provide that a managing director is liable if the director intentionally or negligently fails to prevent the corporation from doing business to its disadvantage with a company affiliated with the director.<sup>128</sup> But German law does not obligate the director to disclose to the shareholders any personal financial interest that the director has in a proposed transaction.<sup>129</sup> Even when disclosure is required (as it is in the case of transactions between parent corporations and its majority-owned subsidiaries within a “Konzern” or affiliated group), disclosure must only be given to the supervisory board, not the shareholders. This makes any right to sue largely academic if shareholders lack the knowledge that will cause them to raise objections. This critique is by no means new and has long been raised by German academics themselves.<sup>130</sup> Yet even if disclosure were required (as surely it should), and even if a derivative action were permitted, it might have little impact unless American-style contingent fees were permitted. This seems unlikely, given the shock that civil lawyers express at such a system. As discussed below, disclosure to shareholders should be required, and might be enforced through listing standards.

## 3. Self-Dealing: Listing Standards Versus Prophylactic Rules

A consensus seems to exist that it is unrealistic to place high expectations on either the judiciary or independent directors in transitional economies.<sup>131</sup> Judges are likely to enforce satisfactorily only bright-line rules. Thus, it seems ill-advised to make proof of intent or purpose or bad faith necessary elements of any cause of action because this increases the unpredictability of results. But this premise leads to two immediate problems: (1) U.S. and U.K. law do not bar self-dealing transactions, but rather subject them to a variety of highly nuanced standards, and (2) in many transitional economies, affiliated business groups are the norm, meaning that intra-corporate transactions within

---

128. I rely here on the advice of Professor Theodor Baums of the University of Osnabruck for this proposition, who cites me to Section 93 of the German Stock Corporation Act.

129. I again rely on Professor Baums for this statement. *See also* Ekkehard Wenger & Christogh Kaserer, *The German System of Corporate Governance—A Model That Should Not Be Imitated* 27-29 (working paper, on file with author) (discussing the absence of disclosure obligations under German corporate law and weakness of German proxy system).

130. *See supra* notes 100, 116, and accompanying text.

131. For a strong and sensible statement of this view, see Black & Kraakman, *supra* note 17, at 1925-27.

such affiliated groups will be common. Yet such transactions can often be used to expropriate wealth from minority investors.

This dilemma could be addressed in a number of ways. Corporate law could simply preclude self-dealing (or make it so legally uncertain as to place a prohibitive penalty on it). This was essentially what U.S. law did as of the late 19th Century, when the U.S. was itself a transitional economy.<sup>132</sup> Potentially, such a prophylactic rule would last only for the time it took the transitional economy to mature (which is again the U.S. experience). But this approach might require dismantling of all affiliated groups, and this could be economically disruptive and politically impractical.

The other, more feasible alternative would be state-imposed listing standards that kept members of affiliated business groups off the “high quality” exchange, at least if their inter-company transactions reduced transparency. This would place a considerable cost on self-dealing (by denying members of affiliated groups easy access to the equity markets), but the cost is probably not prohibitive. Those firms that truly found membership in an affiliated group to be efficient could probably still obtain equity capital from the over-the-counter market. More importantly, this option forces a firm to choose between a “dispersed ownership” versus a “concentrated ownership” governance system, and it signals to institutional investors that a high-quality equity market is intended to accommodate only firms that elect to comply with the rules of the former system.

Supplementing this prohibition on listing members of an affiliated business group (other than the sole parent) would be listing rules precluding defined self-dealing transactions by management, controlling shareholders, or other insiders. Such rules would, of course, focus only on (1) transactions that were material to shareholders (excluding, for example, ordinary compensation), and (2) transactions that could be easily monitored (for example, purchases and sales of corporate divisions or significant corporate assets by persons affiliated with management). Some low-visibility transactions would escape the scope of these rules, and some violations would inevitably escape detection. But if the enforcement of such rules were delegated to the jurisdiction’s securities commission (rather than the exchange itself), this system could be implemented with respect to the largest and most important corporations in the jurisdiction—without relying on costly and uncertain litigation. Over time, such a system could create its own culture of compliance, with smaller firms seeking to elect in as they matured. In effect, entry into the “high quality” market would constitute a bonding device by which firms could assure investors of fair treatment and thereby lower their cost of equity capital.

#### 4. Control Acquisition

Following repeated scandals in the Czech securities market, reform legislation was adopted in 1996 that essentially introduced a key element of the British corporate governance system: namely, no person could cross a defined ownership threshold, except by making a tender offer for all the firm’s shares. Polish law interestingly already had

---

132. The shifting attitude of U.S. law and the progression from flat prohibition of fiduciary self-dealing to greater tolerance is described in Harold Marsh, Jr., *Are Directors Trustees? Conflicts of Interest and Corporate Morality*, 22 BUS. LAW. 35 (1966).

such a limitation from its outset.<sup>133</sup> Under the Czech legislation, once any person crossed any of the 50%, 66-2/3%, or 75% ownership thresholds, such a person is required to make a public tender offer for the remaining shares within 60 days thereafter at a price equal to the weighted price on the market over the prior 6 months.<sup>134</sup> Conceptually, this protects the minority, but there would seem to be serious flaws in the particular design of this system. For example, control can easily be obtained well short of the 50% level, at which point the controlling shareholder can begin to exploit the minority (by withholding dividends, engaging in self-dealing transactions, etc.). Once such conduct occurs or is signaled, the company's stock price should predictably decline. Thus, when the controlling shareholder elects to cross the 50% threshold, the stock price should already be deflated below its true "going concern" value. As a result, for this remedy to work, an earlier threshold (say, 20%) seems necessary.

Under a legal regime that allowed shareholders to aggregate shares up to 25%, but required a public tender offer for the remainder, many would stop at the 25% level. This does not seem undesirable. Some evidence suggests that such large, but noncontrolling, shareholders enhance the value of the firm by partially solving the collective action problem inherent in dispersed ownership.<sup>135</sup> In a world where legal controls are weak, drawing such a line may be the most practical reform that can be easily monitored and enforced.

Yet for these reforms to work, more must be required than simply mandating that a tender offer be made at the average price over a recent period. Such a rule allows the large shareholder to profit from undisclosed material information and may be spurned by suspicious minority shareholders who suspect that the firm has hidden value. Although full disclosure should, of course, be required in connection with this offer, full disclosure in this context can have a counter-productive, even perverse effect: if shareholders learn that the firm has greater value than the market previously had recognized, they will spurn the offer—and thereafter be exposed to exploitation by the new controlling shareholders if they are successful in obtaining a controlling interest. Accordingly, some minimum tender premium should be mandated. For example, a 20% premium over the prior average market price might be the best practical compromise, and it can be justified in part based on the reduced disclosure and regulatory costs that the company will incur once it becomes a private company after the tender offer. Any rule requiring a mandated premium may deter some shareholders from crossing the 25% ownership level that triggers a mandatory bid, who conceivably might have been more efficient corporate monitors had they been able to obtain a controlling interest. Still, it protects the public

---

133. Poland uses a 33-1/3% ceiling, which is a more meaningful definition of actual de facto control; also, this level corresponded to the amount assigned to the lead NIF in each privatized company. See Pistor, *supra* note 7, at 37-38.

134. Ironically, the Czech law already limited any investment privatization fund to a 20% ownership of the equity securities of any firm. See Coffee, *supra* note 37, at 121-22. But these rules were easily evaded, either by using multiple funds run by the same investment manager or, ultimately, by deregistering as a fund and becoming an unregulated holding company.

135. See Andrei Shleifer & Robert Vishny, *Large Shareholders and Corporate Control*, 94 J. POL. ECON. 461 (1988) (finding firm value in U.S. firms to be maximized when there is a large but noncontrolling shareholder).

minority from “rent-seeking” contests in which the participants are principally seeking to realize the private benefits of control.

Predictably, some will object that this approach is inefficient because it chills the market for corporate control and precludes some potentially efficient acquisitions. This cost seems highly speculative, but it must in any event be balanced against the economic and political externalities caused by rent-seeking control fights between contenders who are primarily seeking to realize the private benefits of control. The Czech experience suggests that the dispersed ownership created by voucher privatization encourages a “winner-take-all” control fight in which the ultimate victor obtains a *de facto* right to expropriate wealth from other shareholders. Under such circumstances, there is every reason to expect that the contestants will utilize every weapon at their disposal including bribery and corruption. Given these risks, the prudent course is to require the control seeker to offer to acquire 100% of the stock and permit others to contest for control by offering a higher bid. Such “high visibility” contests are preferable to “low visibility,” “creeping control” contests in which the participants are likely to cut secret deals and seek to use political influence.

## VI. CONCLUSION

Why do common law systems outperform civil law systems in encouraging dispersed ownership? To be assessed intelligently, this question must be broken down into its components. Although the premise that different legal systems encourage different patterns of ownership and different systems of governance seems valid, the truth is that we do not yet fully comprehend the manner in which common law systems provide superior protection for minority shareholders. Indeed, the answers may differ widely among common law systems. Nonetheless, although no simple formula seems likely to be discovered soon, a major part of the answer seems to lie not in the corporate law of common law countries, but in their shared system of securities regulation. Although the laws of the U.S. and the U.K. are far from identical, and each regulates control contests quite differently, they each seek to discourage this type of rent-seeking control contests that became endemic in the Czech Republic. The common elements of the joint U.S./U.K. system of securities regulation—*i.e.*, ownership transparency, high disclosure standards, restrictions on “creeping control” acquisitions that preclude a shareholder from assembling a controlling block without tendering for all shares, and high listing standards—were at least partially present in Poland, but were originally absent from the Czech Republic.

More generally, privatization has produced a conceptual mismatch: inherently, it produces an initially dispersed ownership, but under a legal regime intended to accommodate concentrated ownership. The result is necessarily short-lived. In this light, the critique advanced by new students of comparative corporate governance that civil law systems fail to provide adequate minority protection needs to be re-formulated.<sup>136</sup> Civil law systems may well protect minority shareholders against the forms of abuse long known in systems of concentrated ownership (most typically, domination by a controlling shareholder). But civil law systems do not address abuses that they have not witnessed

---

136. See sources cited *supra* notes 2 and 3.

(such as the theft of the control premium in an exploitative partial takeover). Hence, they leave public shareholders in a system of dispersed ownership exposed to a “winner-take-all” scramble for control, in which the losers can expect future expropriation by the winner. Privatization, of course, creates just such a system of dispersed ownership vulnerable to this form of abuse. More generally, the voting, proxy, and disclosure systems under the German civil law approach do not contemplate that small shareholders will play any active role. This premise may be valid in their environment, but when this system is applied to privatized companies, it leaves small shareholders powerless and thus helps to compel a transition to concentrated ownership. Rather than seeing this transition as inevitable, policy planners must recognize that it is a contextual product of the dominant forces in the legal and market environment. Phrased more generally, because civil law systems of corporate governance implicitly contemplate concentrated ownership, they have disdained disclosure to the market for disclosure to the supervisory board. In consequence, the civil law tends to inhibit the development of securities markets, whose growth depends upon the breaking down of informational asymmetries.

Whether differences in judicial style and performance between common law and civil law systems matter significantly for the success of privatization and the stability of dispersed ownership seems more debatable. One problem with any such comparison is that the presumed homogeneity of common law systems also seems suspect. The U.S. and the U.K. have achieved functional convergence, but not formal convergence. The effective absence of litigation remedies in the U.K. available to minority shareholders suggests that the combination of high disclosure standards and an active, unconstrained takeover market may constitute an effective functional substitute for litigation (or other remedies that are more available in the U.S.). Legally, as much may separate the U.S. and the U.K. as unites them.

To the extent that one is skeptical of the ability of the judiciary in transitional economies to restrain opportunism, the natural policy response may be to recommend reliance on “self-enforcing” remedies.<sup>137</sup> Indeed, the Polish NIFs may supply the best feasible example of such a structural reform. Nonetheless, the idea that “self-enforcing” remedies would prove sufficient by themselves has been shown to be overconfident. The primary problem is that viable securities markets will not develop or persist in the absence of some workable mechanism of regulatory enforcement. Fraud, manipulation, insider trading—these practices became endemic in the Czech Republic (for at least a period of time) under a legal system that was as *laissez-faire* oriented as has existed anywhere in recent times. To develop liquid markets, regulation must overcome those practices that will otherwise drive portfolio investors from the market. This does not necessarily mean that U.S.-style class actions are necessary or that common law judges must be imported into civil law jurisdictions (nor do such reforms seem feasible), but it does suggest that other enforcement techniques (such as specialized courts and administrative enforcement proceedings) need to be seriously explored.

Academic attitudes are changing today. Where not long ago concentrated ownership was seen as efficient and dispersed ownership was taken by some to imply over-

---

137. For precisely this reason, Professors Black and Kraakman recommended use of “self-enforcing” remedies. See Black and Kraakman, *supra* note 17, at 1925-27.

regulation of institutional investors,<sup>138</sup> today concentrated ownership is now being viewed by others as a measure of weak protection for minority shareholders. Predictably, academic fashions will change again, but the critical issue is an applied one: how to establish strong securities markets? Here the data from the aftermath of the Asian financial crisis suggests that minority protection appears to be a necessary, but not a sufficient, condition to the emergence of viable securities markets.<sup>139</sup>

The bottom line, as usual, is that those ignorant of history are destined to repeat it. "Fast" privatization unaccompanied by minority protection and adequate disclosure standards will produce expropriation and rent-seeking. To call this inevitable, however, is only to claim that ignorance is inevitable.
