Progressive resistance strength training for improving physical function in older adults

Chiung-ju Liu¹ and Nancy K Latham²

¹Department of Occupational Therapy, Indiana University at Indianapolis, Indianapolis, Indiana, USA

²Health and Disabilty Research Institute, School of Public Health, Boston University, Boston, MA, USA

Abstract

Background—Muscle weakness in old age is associated with physical function decline. Progressive resistance strength training (PRT) exercises are designed to increase strength.

Objectives—To assess the effects of PRT on older people and identify adverse events.

Search methods—We searched the Cochrane Bone, Joint and Muscle Trauma Group Specialized Register (to March 2007), the Cochrane Central Register of Controlled Trials (*The Cochrane Library* 2007, Issue 2), MEDLINE (1966 to May 01, 2008), EMBASE (1980 to February 06 2007), CINAHL (1982 to July 01 2007) and two other electronic databases. We also searched reference lists of articles, reviewed conference abstracts and contacted authors.

Contributions of Authors: For the first version of the review (completed 2002), Dr Nancy Latham, Dr Craig Anderson, Dr Derrick Bennett and Dr Caroline Stretton contributed to the development of the protocol, the analysis and interpretation of the data and the write-up of the review. Dr Nancy Latham took the lead in conducting the analyses and writing the protocol and review. In addition, Dr Latham and Dr Stretton conducted the searches, identified the trials, conducted the quality assessments and extracted the data. Dr Bennett provided methodological and statistical guidance for the review. Dr Anderson served as the adjudicator when a consensus about data issues could not be reached between the two reviewers, and provided guidance about the methods and interpretation of the review.

The review was substantially updated in 2009 by Dr Chiung-ju Liu and Dr Nancy Latham. Dr Liu took the lead in conducting the update, which included undertaking the searches, screening search results, organizing retrieval of papers, screening retrieved papers against inclusion criteria, appraising quality of papers, extracting data, contacting authors for additional information, entering data into RevMan, doing the analyses and writing up. The project was completed when Dr Liu was a post-doctoral research fellow at the Health and Disability Research Institute at Boston University. Dr Latham assisted in identifying the trials, conducting the quality assessments, extracting the data, interpreting the results and writing the review.

Both Dr Chiung-ju Liu and Dr Nancy Latham are guarantors for the review.

Declarations of Interest: Dr. Latham is an author for two trials. The trials were rated independently by other reviewers in the first review.

Notes: Substantial updates of reviews such as this one often take a considerable time to prepare and then take through the editorial process. They can therefore seem 'out of date' before publication, particularly in research active areas. However, although an updated search made in May 2008 revealed nine more potentially eligible trials (which await assessment, pending the next update), it is unlikely that the review's main findings will be substantively changed by these. [Comment by Helen Handoll, Co-ordinating Editor, May 2009]

^{*}Indicates the major publication for the study

Selection criteria—Randomised controlled trials reporting physical outcomes of PRT for older people were included.

Data collection and analysis—Two review authors independently selected trials, assessed trial quality and extracted data. Data were pooled where appropriate.

Main results—One hundred and twenty one trials with 6700 participants were included. In most trials, PRT was performed two to three times per week and at a high intensity. PRT resulted in a small but significant improvement in physical ability (33 trials, 2172 participants; SMD 0.14, 95% CI 0.05 to 0.22). Functional limitation measures also showed improvements: e.g. there was a modest improvement in gait speed (24 trials, 1179 participants, MD 0.08 m/s, 95% CI 0.04 to 0.12); and a moderate to large effect for getting out of a chair (11 trials, 384 participants, SMD -0.94, 95% CI -1.49 to -0.38). PRT had a large positive effect on muscle strength (73 trials, 3059 participants, SMD 0.84, 95% CI 0.67 to 1.00). Participants with osteoarthritis reported a reduction in pain following PRT (6 trials, 503 participants, SMD -0.30, 95% CI -0.48 to -0.13). There was no evidence from 10 other trials (587 participants) that PRT had an effect on bodily pain. Adverse events were poorly recorded but adverse events related to musculoskeletal complaints, such as joint pain and muscle soreness, were reported in many of the studies that prospectively defined and monitored these events. Serious adverse events were rare, and no serious events were reported to be directly related to the exercise programme.

Authors' conclusions—This review provides evidence that PRT is an effective intervention for improving physical functioning in older people, including improving strength and the performance of some simple and complex activities. However, some caution is needed with transferring these exercises for use with clinical populations because adverse events are not adequately reported.

Background

Description of the condition

Muscle strength is the amount of force produced by a muscle. The loss of muscle strength in old age is a prevalent condition. Muscle strength declines with age such that, on average, the strength of people in their 80s is about 40% less than that of people in their 20s (Doherty 1993). Muscle weakness, particularly of the lower limbs, is associated with reduced walking speed (Buchner 1996), increased risk of disability (Guralnik 1995) and falls in older people (Tinetti 1986).

Description of the intervention

Progressive resistance training (PRT) is often used to increase muscle strength. During the exercise, participants exercise their muscles against some type of resistance that is progressively increased as strength improves. Common equipment used for PRT includes exercise machines, free weights, and elastic bands.

How the intervention might work

Contrary to long held beliefs, the muscles of older people (i.e. people aged 60 years and older) continue to be adaptable, even into the extremes of old age (Frontera 1988). Trials have revealed that older people can experience large improvements in their muscle strength, particularly if their muscles are significantly overloaded during training (Brown 1990; Charette 1991; Fiatarone 1994).

Why it is important to do this review

Despite evidence of benefit from PRT in terms of improving muscle strength, there is still uncertainty about how these effects translate into changes in substantive outcomes such a reduction in physical disability (Chandler 1998). Most studies have been under-powered to determine the effects of PRT on these outcomes or have included PRT as part of a complex intervention. In addition, there is uncertainty about the effects of PRT when more pragmatic, home or hospital-based programmes are used, and the safety and effectiveness of this intervention in older adults who have health problems and/or functional limitations. Finally, there is uncertainty about the relative benefits of PRT compared with other exercise programmes, or the effectiveness of varying doses of PRT (i.e. programmes of varying intensity and duration). This update of our review (Latham 2003a) has continued to assess and summarise the evidence for PRT.

Objectives

To determine the effects of progressive resistance strength training (PRT) on physical function in older adults through comparing PRT with no exercise, or another type of care or exercise (e.g. aerobic training). Comparisons of different types (e.g. intensities, frequencies, or speed) of PRT were included also. We considered these effects primarily in terms of measures of physical (dis)ability and adverse effects, and secondary measures of functional impairment (muscle strength & aerobic capacity) and limitation (e.g. gait speed).

Methods

Criteria for considering studies for this review

Types of studies—Any randomised clinical trials meeting the specifications below were included. All non-randomised controlled trials (e.g. controlled before and after studies) were excluded. Also excluded were trials for which details were provided that indicated these used quasi-randomised methods, such as allocation based on date of birth.

Types of participants—Older people, resident in institutions or at home in the community. Trials were included if the mean age of participants was 60 or over, but

excluded if participants aged less than 50 were enrolled. The participants could include frail or disabled older people, people with identified diseases or health problems, or fit and healthy people.

Types of interventions—Any trial that had one group of participants who received PRT as a primary intervention was considered for inclusion. PRT was defined as a strength training programme in which the participants exercised their muscles against an external force that was set at specific intensity for each participant, and this resistance was adjusted throughout the training programme. The type of resistance used included elastic bands or tubing (i.e. therabands), cuff weights, free weights, isokinetic machines or other weight machines. This type of training could take place in individual or group exercise programmes, and in a home-based or gymnasium/clinic setting. Studies that utilised only isometric exercises were excluded. Studies that included balance, aerobic or other training as part of the exercise intervention (and not simply part of the warm-up or cool-down) were also excluded.

We found the following comparisons between groups in the trials:

- PRT versus no exercise (greatest difference between groups was expected)
- Different types of PRT: high intensity versus low intensity, high frequency versus low frequency, or higher speed (power training) versus regular speed (greatest effect expected in the higher intensity groups). Power training refers to the type of PRT that emphasizes speed.
- PRT versus regular care (including regular therapy or exercise)
- PRT versus another type of exercise (smaller difference between groups expected)

Types of outcome measures

Primary outcomes: This review assessed physical function in older adults at the level of impairment, functional limitation and disability. The primary outcome of this review was physical disability. This was assessed as a continuous variable. The outcomes were categorized based on the Nagi model of health states (Nagi 1991). In this model, disability is considered to be a limitation in performance of socially defined roles and tasks that can relate to self-care, work, family etc. In this review, the primary assessment of physical disability included the evaluation of self-reported measures of activities of daily living (ADL, i.e. the Barthel Index) and the physical domains of health-related quality of life (HRQOL, i.e. the physical function domain of the SF-36). Data from these measures were pooled for the main analysis of physical disability. However, because these two types of measures (ADL and physical domains of HRQOL) evaluate different health concepts, they were also evaluated in separate analyses. The Nagi model also includes firstly, the domain of 'functional limitations' which are limitations in performance at the level of the whole person and includes activities such as walking, climbing or reaching, and secondly, 'impairments' that are defined as anatomical or physiological abnormalities.

Since the protocol of this review was written, the International Classification of Functioning, Disability and Handicap (ICF) has been released (WHO 2001). Under this system, disability

is an umbrella term for impairments, activity limitations and participation restrictions. Using the ICF, the outcome measures evaluated in this review fall under the domains of impairments, limitations in simple activities (similar to 'functional limitations' in Nagi's system) and limitations in complex activities (similar to some aspects of disability in Nagi's model).

Secondary outcomes

Measures of impairment (outcome comparisons 2 and 3): The following secondary outcomes were assessed as continuous variables:

- muscle strength (e.g. 1 repetition maximum test, isokinetic and isometric dynamometry)
- aerobic capacity (e.g. 6 minute walk test, VO2 max: maximal oxygen uptake during exercise)

Measures of functional limitation (simple physical activities): The following secondary outcomes were assessed as continuous variables:

- balance (e.g. Berg Balance Scale, Functional Reach Test)
- gait speed, timed walk
- timed 'up-and-go' test
- chair rise (sit to stand)
- stair climbing (added in 2008)

The balance outcome is also reviewed in a separate Cochrane review (Howe 2007).

Other outcomes: The dichotomous secondary outcomes assessed were adverse events, admission to hospital and death. The effect of PRT on falls was also evaluated, although these outcomes are considered in a separate Cochrane review (Gillespie 2003). Pain and vitality measures were evaluated as continuous outcomes, and were used to provide additional information about the potential adverse effects or benefits of PRT.

Outcomes removed after the protocol: In the original protocol for this review, measures of fear of falling and participation in social activities were also included as outcomes. However, when the size and complexity of this review became apparent, the authors decided to limit this review to assessments of physical disability as this was the prespecified primary aim of the review. Therefore, these outcomes are not included in the current review. In addition, the protocol also stated that assessments of disability using the Barthel Index and Functional Independence Measure (FIM) would be dichotomised. However as no trials included the FIM as an outcome and only three trials used the Barthel Index, the decision was made to report these data as continuous outcomes only.

Search methods for identification of studies

Electronic searches—We searched the Cochrane Bone, Joint and Muscle Trauma Group Specialised Register (March 2007), the Cochrane Central Register of Controlled Trials (*The*

Cochrane Library 2002, Issue 2; February 2007), MEDLINE (1966 to May 01, 2008), EMBASE (1980 t February 06, 2007), CINAHL (1982 to July 01, 2007), SPORTDiscus (1948 to February 07, 2007), PEDro - The Physiotherapy Evidence Database (accessed February 07, 2007) and Digital Dissertations (accessed February 01, 2007). No language restrictions were applied.

In MEDLINE (OVID Web) the subject specific search strategy was combined with the first two phases of the Cochrane optimal search strategy (Higgins 2006). This search strategy, along with those for EMBASE (OVID Web), *The Cochrane Library* (Wiley InterScience), CINAHL (OVID Web), SPORTDiscus (OVID Web) and PEDro, can be found in Appendix 1.

Searching other resources—We contacted authors and searched reference lists of identified studies, and reviews (Anonymous 2001; Buchner 1993; Chandler 1996; Fiatarone 1993; Keysor 2001; King 1998; King 2001; Mazzeo 1998; Singh 2002).

We also handsearched the following conference proceedings:

- 16th International Association of Gerontology World Congress; 1997; Adelaide (Australia).
- 17th International Association of Gerontology World Congress; 2001; Vancouver (Canada).
- Proceedings of the 13th World Congress of Physical Therapy; 1995; Washington (DC).
- Proceedings of the 14th World Congress of Physical Therapy; 1999; Japan.
- New Zealand Association of Gerontology Conferences -1996 Dunedin, 1999
 Wellington and 2002 Auckland (New Zealand).
- The 60th annual scientific meeting of the Gerontological Society of America; 2007, San Francisco, CA.
- The American Congress of Rehabilitation Medicine -American Society of Neurorehabilitation Joint Conference; 2006, Boston, MA.

Data collection and analysis

Selection of studies—For this update (Issue 3, 2009), one author (CJL) conducted the searches. Both listed authors (CJL, NL) reviewed the titles, descriptors or abstracts identified from all literature searches to identify potentially relevant trials for full review. A copy of the full text of all trials that appeared to be potentially suitable for the review was obtained. Both authors independently used previously defined inclusion criteria to select the trials. In all cases, the reviewers reached a consensus when they initially disagreed about the inclusion of a trial. Before this update, the same method of identifying and assessing studies was used, although other members of the previous review team assisted (Latham 2003a).

Data extraction and management—Two authors independently extracted the data and recorded information on a standardised paper form. They considered all primary and

secondary outcomes. If the data were not reported in a form that enabled quantitative pooling, the authors were contacted for additional information. If the authors could not be contacted or if the information was no longer available, the trial was not included in the pooling for that specific outcome.

Assessment of risk of bias in included studies—The methodological quality of each trial was independently assessed by two authors (NL, CS in the first review; CJL, NL in the update) using a scoring system that was based on the Cochrane Bone, Joint and Muscle Trauma Group's former evaluation tool. The review authors were blinded to the trial authors' institution, journal that the trial was published in and the results of the trial. A third review author (CA) was consulted in the first review if a consensus about the trial quality could not be reached. No third review author was involved in the review update. The criteria for assessing internal and external validity can be found in Table 1.

Assessment of heterogeneity—The chi² test was used to assess heterogeneity. In future updates, we will also assess heterogeneity by visual inspection of the forest plots and consideration of the I^2 statistic.

Data synthesis—Where it was thought appropriate, the results from the studies were combined. Data synthesis was carried out using MetaView in Review Manager version 5.0. For continuous outcomes, mean differences (MD) and 95% confidence intervals (CI) were calculated when similar measurement units were used. To pool outcomes using different units, standardised units (i.e. standardised mean differences, SMD) were created as appropriate. We calculated risk ratios and 95% CI for dichotomous outcomes, where possible. If minimal statistical heterogeneity (P < 0.1) existed, fixed-effect meta-analysis was performed.

For trials that compared two or more different dosages of PRT versus a control group, data from the higher or highest intensity group were used in the analyses of PRT versus control.

Subgroup analysis and investigation of heterogeneity—If substantial statistical heterogeneity existed, the review authors looked for possible explanations. Specifically, we considered differences in age and baseline disability of the study participants, the methodological quality of the trials and the intensity and duration of the interventions. If the statistical heterogeneity could be explained, we considered the possibility of presenting the results as subgroup analyses. If the statistical heterogeneity could not be explained, we considered not combining the studies at all, using a random-effects model with cautious interpretation or using both fixed-effect and random-effects models to assist in explaining the uncertainty around an analysis with heterogeneous studies.

Sensitivity analysis—Sensitivity analyses were conducted to assess the effect of differences in methodological quality. These included allocation concealment, blinding of outcome assessors, statements of intention-to-treat analysis and use of attention control.

Results

Description of studies

See: Characteristics of included studies; Characteristics of excluded studies.

Results of the search—Please see the 'Characteristics of included studies'.

One hundred and twenty-one trials with 6700 participants at entry were included in this review. Four studies were published only as abstracts and/or theses (Collier 1997; Fiatarone 1997; Moreland 2001; Newnham 1995).

Included studies—There was variation across the trials in the characteristics of the participants, the design of the PRT programmes, the interventions provided for the comparison group and the outcomes assessed. More detailed information is provided in the 'Characteristics of included studies'; however, a brief summary is provided here.

Language: All reviewed trials were published in English.

<u>Location:</u> Sixty-eight trials were conducted in the USA, 13 in Canada, 9 in Australia or New Zealand, and 31 in various European countries.

<u>Study size:</u> Most of these studies were small, with less than 40 participants in total, but 14 studies had 100 or more participants in total in a PRT group and a control group (Buchner 1997; Chandler 1998; Chin A Paw 2006; de Vos 2005; Ettinger 1997; Jette 1996; Jette 1999; Judge 1994; Latham 2003; Maurer 1999; McCartney 1995; Mikesky 2006; Moreland 2001; Segal 2003).

Participants

Health status: The participants in 59 trials were healthy older adults. In the remaining 62 trials, the participants had a health problem, functional limitation and/or were residing in a hospital or residential care. Thirty-two trials included older people with a specific medical condition, including diabetes (Brandon 2003), prostate cancer (Segal 2003), osteoarthritis (Baker 2001; Ettinger 1997; Foley 2003; Maurer 1999; Mikesky 2006; Schilke 1996; Topp 2002), osteoporosis/osteopenia (Liu-Ambrose 2005), peripheral arterial disease (Hiatt 1994; McGuigan 2001), recent stroke (Moreland 2001; Ouellette 2004), congestive heart failure (Brochu 2002; Pu 2001; Selig 2004; Tyni-Lenne 2001), chronic airflow limitation (Casaburi 2004; Kongsgaard 2004; Simpson 1992), clinical depression (Sims 2006; Singh 1997; Singh 2005), low bonemineral density (Parkhouse 2000), hip replacement due to osteoarthritis (Suetta 2004), hip/lower limb fracture (Mangione 2005; Miller 2006), obesity (Ballor 1996), chronic renal insufficiency (Castaneda 2001; Castaneda 2004) and coronary artery bypass graft surgery three or more months before exercise training (Maiorana 1997). Nineteen other trials recruited participants who did not have a specific health problem, but were considered frail and/or to have a functional limitation (Bean 2004; Boshuizen 2005; Chandler 1998; Fiatarone 1994; Fiatarone 1997; Fielding 2002; Hennessey 2001; Jette 1999; Krebs 2007; Latham 2003; Manini 2005; McMurdo 1995; Mihalko 1996; Miszko 2003; Newnham 1995; Skelton 1996; Sullivan 2005; Topp 2005; Westhoff 2000). In nine trials, the participants

resided in a resthome or nursing home (Baum 2003; Bruunsgaard 2004; Chin A Paw 2006; Fiatarone 1994; Hruda 2003; McMurdo 1995; Mihalko 1996; Newnham 1995; Seynnes 2004). In addition, two trials included participants who were in hospital at the time the exercise programme was carried out (Donald 2000; Latham 2001). In the other trials, most or all of the participants lived in the community.

Gender: Most studies included both men and women, although 10 trials included men only (Fatouros 2002; Hagerman 2000; Haykowsky 2000; Hepple 1997; Izquierdo 2004; Katznelson 2006; Kongsgaard 2004; Maiorana 1997; Segal 2003; Sousa 2005) and 22 trials included women only (Bean 2004; Brochu 2002; Charette 1991; Damush 1999; Fahlman 2002; Flynn 1999; Frontera 2003; Haykowsky 2005; Jones 1994; Kallinen 2002; Liu-Ambrose 2005; Macaluso 2003; Madden 2006; Nelson 1994; Nichols 1993; Parkhouse 2000; Pu 2001; Rhodes 2000; Sipila 1996; Skelton 1995; Skelton 1996; Taaffe 1996).

Age: In 49 studies the mean or median age of the participants was between 60 and 69 years old; in 57 studies, the mean/median age was between 70 and 79 years old; and in 20 studies, it was 80 years old or over.

Lifestyle: Fifteen studies specifically recruited participants with a sedentary lifestyle (Ades 1996; Beneka 2005; Charette 1991; Fatouros 2002; Fatouros 2005; Frontera 2003; Kalapotharakos 2005; Katznelson 2006; Malliou 2003; Mihalko 1996; Parkhouse 2000; Pollock 1991; Rhodes 2000; Topp 1996; Tsutsumi 1997).

PRT Programmes

Settings: Most training programmes took place in gym or clinic settings with all sessions fully supervised. Ten studies were entirely home-based (Baker 2001; Chandler 1998; Fiatarone 1997; Jette 1996; Jette 1999; Katznelson 2006; Krebs 2007; Latham 2003; Mangione 2005; McMurdo 1995), while 12 additional studies carried out some of the training at home and some in gym/clinic settings (Boshuizen 2005; Ettinger 1997; Jones 1994; Mikesky 2006; Simoneau 2006; Skelton 1995; Skelton 1996; Topp 1993; Topp 1996; Topp 2002; Topp 2005; Westhoff 2000).

Intensity: The resistance training programmes in most trials (i.e. 83 trials) involved high intensity training. Most of these trials used specialized exercise machines for training. Thirty-six trials used low-intensity to moderate-intensity training, with most using elastic tubing or bands. All of the high-intensity training was carried out at least in part in gym or clinic based settings, with the exception of two published trials (Baker 2001; Latham 2003) and a trial published as an abstract (Fiatarone 1997).

Frequency and duration: The frequency of training was consistent across studies, with the exercise programme carried out two to three times a week in almost all trials. Two exceptions to this were the two trials conducted in hospital which carried out the exercises on a daily basis (Donald 2000; Latham 2001). In contrast, there was large variation in the duration of the exercise programmes and the number of exercises performed in each programme. Although most of the programmes (i.e. 71 trials) were eight to 12 weeks long,

the duration ranged from two to 104 weeks. In 54 trials the exercise programme was longer than 12 weeks. The number of exercises performed also varied, from one to more than 14.

Adherence: Data about adherence to the PRT programme are reported in the 'Characteristics of included studies'. These data are difficult to interpret because different definitions for adherence or compliance were used across the trials. In most trials, adherence referred to the percentage of exercise sessions attended compared with the total number of prescribed sessions and in this case the reported adherence rate is high (i.e. greater than 75%). Many trials only included participants that completed the entire trial (i.e. excluded drop-outs), while some trials reported these data with drop-outs included.

Comparison interventions: Comparisons were conducted between a PRT group and a control group and between a PRT group and a group that received other type of intervention. In addition, comparisons between high intensity or frequency and low intensity or frequency, different sets, and different types of contraction training were also conducted. Multiple comparisons within a trial were possible when the trial included more than two groups that were relevant to the review. Twenty-eight trials had three groups. Among these trials, 14 included an aerobic training group in addition to a PRT group and a control group (Ettinger 1997; Fahlman 2002; Fatouros 2002; Haykowsky 2005; Hiatt 1994; Jubrias 2001; Kallinen 2002; Madden 2006; Malliou 2003; Mangione 2005; Pollock 1991; Sipila 1996; Topp 2005; Wood 2001), and seven included two PRT groups that exercised at different intensities in addition to a control group (de Vos 2005; Fatouros 2005; Hortobagyi 2001; Hunter 2001; Kalapotharakos 2005; Seynnes 2004; Singh 2005). One trial had a PRT group, a functional training group, and a PRT with functional training group (Manini 2005). The other six trials either had a balance training group (Judge 1994), functional training group (Chin A Paw 2006; de Vreede 2007), an endurance training group (Sipila 1996), a mobility training group (McMurdo 1995), or a power training group (Miszko 2003) in addition to a PRT group and a control group. One trial had three groups that exercised at three different frequencies in addition to a control group (Taaffe 1999).

PRT versus controls: One hundred and four trials compared PRT with a control group. The control group might receive no exercise, regular care, or attention control (i.e. the control group receives matching attention as the intervention group).

Comparisons of PRT dosage

High intensity versus low intensity: Ten studies compared PRT programmes at high intensity versus low intensity (Beneka 2005; Fatouros 2005; Harris 2004; Hortobagyi 2001; Seynnes 2004; Singh 2005; Sullivan 2005; Taaffe 1996; Tsutsumi 1997; Vincent 2002).

Different frequencies of PRT: Two trials (DiFrancisco 2007; Taaffe 1999) compared PRT performed at different frequencies (i.e. once, twice, or three times per week).

Different sets: One study compared PRT at different sets, i.e. 3-sets versus 1-set (Galvao 2005). One set of exercise means several continuous repeated movements.

Concentric versus eccentric training: One study (Symons 2005) compared PRT at two types of contraction training: concentric versus eccentric training. During concentric training, speed was added at concentric contraction phase and vise versa for eccentric training.

PRT versus aerobic training: PRT was compared with aerobic (endurance) training in 17 trials (Ballor 1996; Buchner 1997; Earles 2001; Ettinger 1997; Fatouros 2002; Hepple 1997; Hiatt 1994; Izquierdo 2004; Jubrias 2001; Kallinen 2002; Madden 2006; Malliou 2003; Mangione 2005; Pollock 1991; Sipila 1996; Topp 2005; Wood 2001).

PRT versus balance training: One study compared PRT with balance training (Judge 1994). Balance training included training on a computerized balance platform and non-platform training (i.e. balancing on different surfaces, with varying bases of support, with different perturbations). Both exercise programmes were performed in a research center three times per week for three months.

PRT versus functional training: Three studies compared PRT to functional training (Chin A Paw 2006; de Vreede 2007; Manini 2005). Functional training involves game-like activities or exercise movements in various directions. In Chin A Paw 2006, functional training involved game-like or cooperative activities; and in de Vreede 2007, functional training involved moving with a vertical or horizontal component, carrying an object, and changing position between lying, sitting, and standing.

PRT versus flexibility training: One study compared PRT with flexibility training (Barrett 2002).

Power training: Power training refers to the type of PRT that emphasizes speed. Three studies applied this type of training (de Vos 2005; Macaluso 2003; Miszko 2003).

Outcomes: A variety of outcomes were assessed in these studies: the primary outcomes of physical function and secondary outcomes of measures of impairment and functional limitation.

Excluded studies—The excluded studies and their reasons for exclusion are listed in the 'Characteristics of excluded studies'. The main reasons for exclusion were that the study was not a randomised controlled trial or that the study design caused serious threats to its internal validity (57 trials); the studies used a combination of exercise interventions (i.e. not resistance training alone) (51 trials); the strength training programme did not use a progressive resistance approach (32 trials); and some participants were not elderly (i.e. did not have a mean age of at least 60 years and/or included some participants below 50 years of age) (25 trials).

Studies awaiting assessment: Nine trials were identified on a search update to May 2008, and a further trial was added after a referee's comment.

Risk of bias in included studies

Methodological quality scores of each item for all included studies are given in Table 2. A summary of the findings of key indicators of internal validity are listed below.

Allocation concealment—Eleven studies provided some information about the method of randomisation that suggested that randomisation was probably concealed (i.e. the use of concealed envelopes or the randomisation was generated by an independent person) (Baker 2001; Chin A Paw 2006; Donald 2000; Foley 2003; Jette 1999; Latham 2001; Latham 2003; McMurdo 1995; Moreland 2001; Sims 2006; Sullivan 2005). Nineteen studies used randomisation list/table but allocation concealment was unclear (Barrett 2002; Baum 2003; Buchner 1997; de Vos 2005; de Vreede 2007; DiFrancisco 2007; Ettinger 1997; Krebs 2007; Liu-Ambrose 2005; Maurer 1999; Miller 2006; Schilke 1996; Segal 2003; Singh 1997; Singh 2005; Skelton 1995; Suetta 2004; Vincent 2002; Wieser 2007).

Loss to follow-up—Some trials had high drop-out rates, with several studies reporting more than 20% of their participants were lost to follow-up (Bruunsgaard 2004; Chin A Paw 2006; DeBeliso 2005; Donald 2000; Katznelson 2006; Kongsgaard 2004; Mangione 2005; Mikesky 2006; Topp 1996). In some studies there was clear evidence of bias associated with the deliberate exclusion of patients such as those who failed to adhere to the exercise programme (Izquierdo 2004; Madden 2006; Topp 1996; Vincent 2002) or those who had adverse responses (Hagerman 2000).

Intention-to-treat analysis—Twenty-two studies stated that they used intention-to-treat analysis (Baker 2001; Barrett 2002; Baum 2003; Buchner 1997; Chin A Paw 2006; Ettinger 1997; Fiatarone 1994; Foley 2003; Judge 1994; Katznelson 2006; Latham 2003; Liu-Ambrose 2005; Macaluso 2003; Mikesky 2006; Miller 2006; Moreland 2001; Nelson 1994; Ouellette 2004; Pu 2001; Segal 2003; Sims 2006; Sullivan 2005).

Blinded outcome assessment—Thirty-three studies stated that they used a blinded assessor for all outcome measures (Barrett 2002; Baum 2003; Bean 2004; Boshuizen 2005; Buchner 1997; Casaburi 2004; Castaneda 2004; Chin A Paw 2006; de Vreede 2007; Ettinger 1997; Foley 2003; Haykowsky 2005; Jette 1996; Jette 1999; Jones 1994; Judge 1994; Kalapotharakos 2005; Katznelson 2006; Krebs 2007; Latham 2003; Liu-Ambrose 2005; Mangione 2005; Maurer 1999; McMurdo 1995; Mikesky 2006; Miller 2006; Moreland 2001; Newnham 1995; Segal 2003; Sims 2006; Singh 2005; Sullivan 2005; Westhoff 2000).

Eight additional studies used a blinded outcome assessor for some, but not all outcome assessments (Baker 2001; Castaneda 2001; de Vos 2005; Fiatarone 1994; Ouellette 2004; Pu 2001; Singh 1997; Suetta 2004).

Blinding of participants—Blinding of participants is difficult in studies of exercise interventions. However, the use of attention control groups can help to minimise bias. Thirty-six studies used some type of attention programme for the control group (Baker 2001; Baum 2003; Bean 2004; Brochu 2002; Bruunsgaard 2004; Castaneda 2001; Castaneda 2004; Chin A Paw 2006; Damush 1999; Ettinger 1997; Fiatarone 1994; Fiatarone 1997; Foley 2003; Judge 1994; Kongsgaard 2004; Latham 2003; Liu-Ambrose 2005; Mangione 2005;

Maurer 1999; McCartney 1995; McMurdo 1995; Mihalko 1996; Mikesky 2006; Miller 2006; Miszko 2003; Moreland 2001; Newnham 1995; Ouellette 2004; Pu 2001; Seynnes 2004; Simons 2006; Sims 2006; Singh 1997; Suetta 2004; Topp 1993; Topp 1996). In 10 of these studies, the control group received 'sham' exercise programmes (Bean 2004; Brochu 2002; Castaneda 2001; Castaneda 2004; Kongsgaard 2004; Liu-Ambrose 2005; Mikesky 2006; Ouellette 2004; Pu 2001; Seynnes 2004).

Duration of follow-up—Five studies continued to follow up the participants after intervention had ended (Buchner 1997; Fiatarone 1994; Moreland 2001; Newnham 1995; Sims 2006). Two of these followed up falls for more than one year (Buchner 1997; Fiatarone 1994).

Effects of interventions

Eleven studies did not report final means and standard deviations for some or all of their outcome measures but instead reported baseline mean scores and mean change in scores from baseline (Baum 2003; Bean 2004; Buchner 1997; Chandler 1998; Fiatarone 1994; Hiatt 1994; Jette 1996; Lamoureux 2003; Madden 2006; Sullivan 2005; Topp 1996). If additional data could not be obtained from the investigators, the final mean score was estimated by adding the change in score to the baseline score, and the standard deviation of the baseline score was used for the final score.

Four studies did not report standard deviations for some or all of their outcome measures but instead reported standardized errors (Ouellette 2004; Seynnes 2004; Suetta 2004; Topp 2002). The standard deviations were estimated based on reported standardized errors and sample sizes.

Eight studies did not report numerical results of outcomes of interest for the purpose of this review and additional data were not provided by the investigators (Castaneda 2004; Fielding 2002; Harris 2004; Haykowsky 2005; Krebs 2007; Miller 2006; Topp 2005; Wieser 2007).

PRT versus control

Measures of physical (dis)ability/HRQOL (complex physical activities): The main function (disability) measures from trials that had appropriate data were pooled using the standardised mean difference (SMD) and a fixed-effect model. Because studies measured function in scales with different directions, a higher score indicates either less disability/ better function or more disability/poor function, a transformation was conducted to make all the scales point in the same direction. Mean values from trials in which a higher score indicates more disability/poor function were multiplied by -1. There is a significant effect of PRT in decreasing disability (see Figure 1; Analysis 1.1: 33 trials, 2172 participants; SMD 0.14, 95% CI 0.05 to 0.22). When the physical function domain of SF-36 or SF-12 was pooled from 14 studies (n = 778) using a fixed-effect model, no difference was found (Analysis 1.2: SMD 0.07, 95% CI -0.08 to 0.21). No difference was found from the pooled results of three trials for activity of daily living measures (Analysis 1.3). A number of studies had function measures (i.e. measures of activity, function or HRQOL) that could not be pooled. The available data from these measures are reported in Table 3.

Measures of impairment

Strength: Many different muscle groups were tested and a number of methods were used to evaluate muscle strength in these trials. To minimise clinical heterogeneity, data were pooled from one muscle group. The leg extensor group of muscles was selected since this group was the most frequently evaluated. The effect size was calculated using standardised mean difference (SMD) to allow the pooling of data that used different units of measurement. Seventy-three studies involving 3059 participants reported the effect of resistance training on a lower-limb extensor muscle group and provided data that allowed pooling. A moderate-to-large beneficial effect was found (Analysis 1.5: SMD 0.84, 95% CI 0.67 to 1.00, random-effects model; fixed-effect model: SMD 0.53, 95% CI 0.46 to 0.61).

Supplementary analyses: Significant statistical heterogeneity was apparent in these data (P < 0.0001). Since a large number of studies assessed this outcome, it was possible to explore this heterogeneity by stratifying the data. Differences in treatment effects due to the quality of the trials were investigated. We also explored subgroups of trials that were based on the design of the treatment programmes and the characteristics of the participants.

To explore the effect of data quality on treatment effects, data were stratified by four design features that are associated with internal validity. These are allocation concealment; blinded assessors; intention-to-treat analysis (ITT); and attention control groups. The fixed-effect model was used throughout in order to obtain the results for the test for subgroup differences. The effect was smaller in the few studies with clear allocation concealment (6 trials, 607 participants) compared with studies with unknown concealment of allocation (67 trials, 2452 participants): Analysis 10.1: test for subgroup differences: $Chi^2 = 32.69$, df = 1 $(P \le 0.00001)$. The effect was also smaller in studies that used blinded assessors (19 trials, 1523 participants) compared with studies that did not use blinded assessors (54 trials, 1536 participants): Analysis 10.2: test for subgroup differences: $Chi^2 = 70.56$, df = 1 (P < 0.00001). This was also true for studies that used intention-to-treat analysis (ITT) (12 trials, 1041 participants) versus no ITT (61 trials, 2018 participants): Analysis 10.3: test for subgroup differences: $\text{Chi}^2 = 49.74$, df = 1 (P < 0.00001). It is noticable that trials that applied better design features tend to be the larger trials. The effect was smaller when attention control groups were used (attention control: 24 studies, 1408 participants, no attention control: 49 studies, 1651 participants): Analysis 10.4: test for subgroup differences: $Chi^2 = 25.04$, df = 1 (P < 0.00001).

Subgroup analyses were conducted to explore the effect of PRT when the design of the exercise programme and the characteristics of the participants differed. The effect of differences in the exercise programme was explored by examining effect estimates in studies that used different intensity and duration. High intensity strength training was compared with low to moderate intensity training. This analysis suggests that while both training approaches are probably effective in improving strength, higher intensity training (54 trials, 2026 participants) has a larger effect on strength than low to moderate intensity training (19 trials, 1033 participants): Analysis 10.5: test for subgroup differences: $Chi^2 = 7.24$, df = 1 (P = 0.007). Longer duration programmes (i.e. greater than 12 weeks) were also compared with shorter duration programmes (less than 12 weeks). The duration of the trial appeared to have

minimal effect on the strength outcome (< 12 weeks: 20 trials, 828 participants; > 12 weeks: 36 trials, 1736 participants): Analysis 10.6: test for subgroup differences: $Chi^2 = 0.04$, df = 1 (P = 0.85).

Treatment effects in older people with and without a chronic disease (or functional limitation) were also assessed. Again, resistance training appeared to be effective in improving strength in both groups of older people, but there was statistical heterogeneity in the effects. Studies that included participants who had specific health problems and/or functional limitations were compared with studies that included only healthy older people. The effect in older adults who were healthy has a larger effect size than older adults with specific health problems (healthy older adults: 46 trials, 1502 participants; older adults with specific health problems: 19 trials, 926 participants): Analysis 10.7: test for subgroup differences: $Chi^2 = 19.85$, df = 1 (P < 0.00001). In addition, PRT in studies that included older adults who had a physical disability or functional limitation appeared to be less effective than in those that included older adults who did not have functional limitations (people with functional limitations: 13 studies, 784 participants; people with no functional limitations: 41 studies, 1349 participants): Analysis 10.8: test for subgroup differences: Chi² = 29.33, df = 1 (P < 0.00001). However, this result could be confounded by the intensity of the PRT programmes, as almost all programmes that included people with functional limitations were carried out at a low to moderate intensity. There were insufficient data available to compare the results by gender (men only: 5 trials with 107 participants; women only: 15 trials with 486 participants).

Aerobic capacity: The main measure of aerobic capacity was pooled from 29 studies (n = 1138) using a random-effects model. These results suggest that PRT has a significant effect on aerobic capacity (Analysis 1.6: SMD 0.31, 95% CI 0.09 to 0.53). Further analyses were performed for three specific measures of aerobic capacity: VO2 max (ml/kg/min), peak oxygen uptake (L/min) and the six-minute walk test (meters). A consistent significant effect was found for VO2 max (Analysis 1.7: 18 trials, n = 710, MD 1.5 ml/kg/min, 95% CI 0.49 to 2.51). Similarly, a significant positive effect was found for the six-minute walk test (Analysis 1.8: 11 trials, n = 325, MD 52.37 meters, 95% CI 17.38 to 87.37).

Measures of functional limitations (simple physical activities)

Balance/postural control: Results from all balance performance measures were pooled using SMD and a fixed-effect model. Data pooled from 17 studies with 996 participants showed a small but non-significant benefit (higher score indicates better balance) for balance (Analysis 1.9: SMD 0.12 (95% CI 0.00 to 0.25).

Gait speed: Two different measures of walking speed were used: gait speed (measured in meters per second) and timed walk (i.e. time to walk a set distance, measured in seconds). A higher gait speed score indicates faster mobility, while a higher timed walk score indicates slower mobility. Because of this difference, these data were analyzed separately. Data for gait speed were available from 24 studies that included 1179 participants (Analysis 1.11: MD 0.08 m/s, 95% CI 0.04 to 0.12, random-effects). This indicated that PRT has a modest but significant beneficial effect on gait speed. Only eight trials measured the timed walk

(seconds) as an outcome measure and no evidence of an effect was found (Analysis 1.12; 204 participants, MD -0.23 seconds, 95% CI -1.07 to 0.62, fixed-effect).

Timed up-and-go: Timed up-and-go (i.e. time to stand from a chair, walk three meters, turn, and return to sitting, measured in seconds) was analysed using a fixed-effect model. Data, available from 12 trials and a total of 691 participants, showed the PRT group took significantly less time to complete this mobility task (Analysis 1.13: MD -0.69 seconds, 95% CI -1.11 to -0.27).

Timed chair rise: Time to stand up from a sitting position data were available in 11 studies (n = 384). Because different numbers of sit-to-stand were counted, SMD and a random-effects model was used to pool these results. These showed a significant, moderate to large effect on this task in favour of the PRT group (Analysis 1.14: SMD -0.94, 95% CI -1.49 to -0.38).

Stair climbing: Time to climb stairs data, which were available from eight trials, also favoured PRT (Analysis 1.15). However, these results were highly heterogenous.

Falls: Thirteen studies collected data about the effect of resistance training on falls or reported the incident of falls, but the outcomes reported did not allow pooling of the data. The available data is reported in Table 4. Three of these studies (Buchner 1997; Fiatarone 1994; Judge 1994) were part of the FICSIT trial, a prospective preplanned meta-analysis to determine the effectiveness of exercise to prevent falls in older people (Province 1995). The data were extracted from the main FICSIT paper, because papers published about the individual exercise programmes did not provide useful data about the effect of resistance training alone on falls. One additional trial investigated the effect of resistance training on falls in older people while they were in hospital (Donald 2000). Another trial also assessed the effect of PRT on frail older people following discharge from hospital (Latham 2003). There is a more comprehensive review of the effect of exercise on falls in a separate Cochrane review (Gillespie 2003).

With the exception of Latham 2003, all of these trials were small (i.e. less than 80 participants in the resistance training and control groups). Only Donald 2000 found a significant reduction in falls, but there were few fall events in this trial.

Adverse events: Adverse events are reported for all trials in the review at the end of the results section.

<u>Vitality:</u> The vitality (VT) domain of the SF-36 health status measure was assessed in 10 studies involving 611 participants. For this measure, a higher score indicates better health (i.e. more vitality): there was no evidence of an effect of PRT from the pooled data (Analysis 1.17: MD 1.33 95% CI -0.89 to 3.55).

<u>Pain:</u> Data of bodily pain (BP) domain of the SF-36 health status measure were provided by 10 studies involving 587 participants. For this measure, a higher score indicates better health (i.e. less pain), there was no evidence that PRT had an effect on bodily pain (Analysis 1.18:

MD 0.34, 95% CI -3.44 to 4.12). In contrast, six studies with 503 participants included pain measures where a higher score indicates more pain, and found evidence to support a modest reduction in pain following PRT (Analysis 1.19: SMD -0.30, 95% CI -0.48 to -0.13). These six studies all included participants with osteoarthritis and used pain measures designed specifically for this population, which could have increased their sensitivity to change.

Health service use, hospitalization and death: Five studies provided data about hospitalization rates, length of stay and/or outpatient visits. Donald 2000 reported that people who received PRT in addition to regular in-hospital physiotherapy had a length of stay of 27 days compared with 32 days for the control group. Latham 2003 found that 42/120 people in the PRT group were admitted to hospital over six months compared to 35/123 in the control group. The third trial by Singh 1997 reported that, over a 10 week period, people in the PRT group had mean 2.1 (SD 0.4) visits to a health professional and mean 0.24 (SD 0.2) hospital days compared to controls mean of 2.0 (SD 0.5) visits and mean 0.53 (0.4) hospital days. The fourth study by Singh 2005 reported visits to a health professional over the study (average numbers per person): high intensity group, 2 (2); low intensity group, 2 (1.8); controls, 5 (1.8). The fifth study by Miller 2006 reported participants' discharge destinations but did not specify the group: 52 participants were discharged to a rehabilitation programme, 12 were transferred to a community hospital, 16 were discharged to higher level care, and 20 returned directly to their pre-injury admission accommodation. An additional study, Buchner 1997, provided data about health service use, but only reported data that were pooled to include participants in aerobic training, combined aerobic training and PRT and PRT alone. This study found no change in hospital admissions between those in the exercise and control groups, but an increased number of outpatient visits by those in the control group. Finally, two studies stated that there was no difference in health care visits (Fiatarone 1997) or hospitalization (Pu 2001) but no specific data were provided.

Thirteen studies provided data about participant deaths that allowed pooling (Baum 2003; Boshuizen 2005; Chin A Paw 2006; Donald 2000; Ettinger 1997; Fiatarone 1994; Kallinen 2002; Latham 2003; Mangione 2005; Miller 2006; Moreland 2001; Newnham 1995; Selig 2004). The risk ratio of death in the PRT group was not significantly different from the control group (Analysis 1.20: 20 deaths versus 21 deaths; RR = 0.89, 95% CI 0.52 to 1.54).

Comparisons of PRT dosage—Thirteen trials investigated the effects of different doses of PRT. Note that data from medium intensity were not examined in the following.

High versus low intensity PRT

Physical function, pain and vitality: Of the 10 studies comparing high versus low intensity PRT, only two (Singh 2005; Tsutsumi 1997), evaluated physical function, pain and vitality using the domains of the SF-36. No significant difference was found for physical function (Analysis 2.1) or pain (Analysis 2.4), but vitality scores were statistically significantly higher for high intensity (Analysis 2.5: MD = 6.54, 95% CI 0.69 to 12.39).

Strength: Data from all nine studies (n = 219) were available to examine the effect of high versus low intensity PRT on lower limb strength (Beneka 2005; Fatouros 2005; Harris 2004; Hortobagyi 2001; Seynnes 2004; Sullivan 2005; Taaffe 1996; Tsutsumi 1997; Vincent 2002). The results indicate that high intensity training results in greater lower limb strength, as a moderate effect was seen (Analysis 2.2: SMD = 0.48, 95% CI 0.03 to 0.93; random-effects model).

Aerobic capacity: Three studies compared the effect of high versus low intensity PRT on aerobic capacity (Fatouros 2005; Tsutsumi 1997; Vincent 2002). These studies (n = 101) did not show greater benefit from high intensity compared with low intensity training (Analysis 2.3: MD 1.82 ml/kg/min, 95% CI -0.79 to 4.43; higher score favours high-intensity group).

High intensity versus variable intensity PRT: One trial (Hunter 2001) comparing high intensity PRT with variable intensity PRT showed no statistically significant differences for strength (Analysis 3.1: n = 24, MD = 0.61, 95% CI -0.21 to 1.44) and aerobic capacity (Analysis 3.2).

<u>Frequency:</u> Taaffe 1999 and DiFrancisco 2007 compared PRT at different frequencies, respectively three times a week versus once a week, and twice a week versus once a week. Both studies recruited few participants and applied high intensity intervention. There were no significant differences between the two exercise frequencies in muscle strength (Analysis 4.1: MD = 0.40, 95% CI -0.44 to 1.25; MD = -0.46, 95% CI -1.40 to 0.48).

<u>Sets:</u> Galvao 2005 compared PRT at 3-sets versus 1-set in 28 participants. No significant differences between the two groups were found for muscle strength (Analysis 5.1), six minute walk test (Analysis 5.2), sit-to-stand (Analysis 5.4) and stair climbing (Analysis 5.5). However, participants who exercised at 3-sets walked significantly faster than those who exercised at 1-set (Analysis 5.3: MD = -29.6 seconds, 95% -54.23 to -4.97).

PRT versus aerobic training

Physical function: Five studies evaluated the effect of PRT compared with aerobic training on physical function. Four studies (Buchner 1997; Earles 2001; Hiatt 1994; Mangione 2005) used outcomes in which a higher score indicates less disability (n = 125), and found no significant difference (see Analysis 6.1: SMD -0.21, 95% CI -0.56 to 0.15; lower score favours the aerobic training group). The other study (Ettinger 1997) (n = 237) also found no significant difference between the groups for function (see Analysis 6.2: SMD 0.05, 95% CI -0.21 to 0.30; higher score favours aerobic group).

Strength: Data on lower extremity strength were available from 10 studies (n = 487) (Ballor 1996; Buchner 1997; Earles 2001; Ettinger 1997; Fatouros 2002; Izquierdo 2004; Malliou 2003; Pollock 1991; Sipila 1996; Wood 2001). These data when pooled using a randomeffects model showed that PRT had a significant benefit compared with aerobic training on strength (see Analysis 6.3: SMD 0.44, 95% CI 0.08 to 0.80; higher score favours PRT).

<u>Aerobic capacity:</u> Aerobic capacity was evaluated in eight studies involving 423 participants (Ballor 1996; Buchner 1997; Ettinger 1997; Hepple 1997; Hiatt 1994; Kallinen

2002; Madden 2006; Pollock 1991). This was measured using VO2 max in ml/kg/min. Using the random-effects model, aerobic training had a non-significant benefit compared to PRT for this outcome (Analysis 6.4: MD -1.13 ml/kg/min, 95% CI -2.63 to 0.38; higher values favours PRT).

<u>Gait speed:</u> Mangione 2005 reported on gait speed (m/s) and found no significant difference between groups (Analysis 6.6: MD -0.08 m/s, 95% CI -0.30 to 0.14; higher speed favours PRT group)

Pain: Ettinger 1997 found no significant difference between groups in pain (Analysis 6.7: MD 0.12; 95% CI -0.14 to 0.37; lower score favours PRT).

PRT versus balance: One study (Judge 1994) compared PRT with balance retraining (n = 55). This study found that strength improved in the PRT group, but not in the balance training group. Chair rise time and gait speed did not improve in any group, with gait speed actually declining in the balance training group. However, balance improved in the balance training group compared with the PRT group.

PRT versus functional training—Three studies compared PRT with functional training (Chin A Paw 2006; de Vreede 2007; Manini 2005). No significant differences between the two interventions were found for the reported outcomes (see: Analysis 7.1 physical function; Analysis 7.2 strength; Analysis 7.3 timed up and go; Analysis 7.4 vitality; Analysis 7.5 pain).

PRT versus flexibility training—Barrett 2002 (n = 40) compared a group of older adults who undertook PRT with a control group who did mainly stretching for the major muscle groups (flexibility training). No statistically significant differences were found for any of the reported outcomes (see: Analysis 8.1: SF-36 physical function; Analysis 8.2: strength; Analysis 8.3: timed walk; Analysis 8.4: chair stand; Analysis 8.5: vitality; Analysis 8.6: pain).

Power training—Two studies (de Vos 2005; Miszko 2003) (n = 76) compared power training with a control group. de Vos 2005 and another study (Macaluso 2003) also compared different intensities of power training. While the data for muscle strength for de Vos 2005 favoured high intensity power training, data pooling was inappropriate given the substantial and significant heterogeneity (see Analysis 9.1).

Adverse events—Among 121 studies that were reviewed, 53 studies provided no comment at all about adverse events associated with the training programme. Of the remaining 68 studies, 25 reported no adverse events and 43 reported some adverse reaction to the exercise programme. An additional eight studies did not report adverse events as such, but it is possible that an event occurred since these studies reported drop-outs from the exercise group secondary to increasing pain or specific injuries (Chandler 1998; Charette 1991; Fiatarone 1997; Hagerman 2000; Hortobagyi 2001; Jette 1996; Maurer 1999; Topp 1993). Given that there were considerably more drop-outs from the PRT group than from the

control group (see methodological quality section above), it is possible that the number of cases of adverse events reported here are an underestimate.

Only nine studies provided an a priori definition of an adverse event in the study methods or objectives (Earles 2001; Ettinger 1997; Judge 1994; Kallinen 2002; Latham 2003; Liu-Ambrose 2005; Moreland 2001; Pollock 1991; Singh 1997). Eight of these nine studies detected adverse events (Earles 2001; Ettinger 1997; Judge 1994; Kallinen 2002; Latham 2003; Liu-Ambrose 2005; Moreland 2001; Pollock 1991). However, there was little consistency in the definition that was used, with some studies only reporting serious events that the investigators thought were possibly related to the exercise programme (i.e. Ettinger 1997) while other studies reported all adverse events that occurred in each group. Most adverse events were musculoskeletal problems. Serious adverse events were rare, and none appeared to be directly related to the exercise programme. One study reported one death of myocardial information in the PRT group (Kallinen 2002). Another two studies reported one death in the PRT group but the reason of death was not reported (Baum 2003; Chin A Paw 2006). Further details about all adverse events reported in these trials can be found in Table 5.

Discussion

Summary of main results

This review identified, graded and synthesized the available literature regarding the effect of a specific exercise intervention, PRT, on a particular population, older people. To increase the generalisability of these data, the trials included participants with a range of health problems, and the dose and delivery of the PRT programmes varied. This made it possible to assess overall effects of the intervention on older people, with a potential for exploring the effects on subgroups (i.e. in different groups of older people or with different doses of PRT). Overall, this review suggests that PRT has a small but significant effect on improving physical function (complex activities), a small to moderate effect on decreasing some impairments and functional limitations, and a large effect on increasing strength. Adverse events were poorly reported in most studies, which limits the ability of this review to assess the risks associated with this intervention. Additionally, there is some preliminary evidence that suggests that PRT might reduce pain in older people with osteoarthritis. The effect of exercise on reducing pain in people with osteoarthritis is reported in another Cochrane review (Brosseau 2003). The sparse data did not allow an adequate assessment of the effect of PRT on fall risk. However, a separate Cochrane review (Gillespie 2003) has reviewed fall prevention.

Overall completeness and applicability of evidence

This review update highlights the fact that exercise training in older adults continues to be a dynamic area of research, with the number of included studies doubling in the five years since the previous review. A quick update extending the MEDLINE search to May 2008 identified nine further studies. However, the majority of the trials continue to be studies with small sample sizes.

This review deliberately used broad inclusion criteria and multiple strategies to try to identify as many studies as possible that used PRT training with older adults. Despite these efforts, given the broad coverage of our review it is inevitable that we have missed some trials. It is particularly challenging to identify unpublished trials in this area because the studies could have been presented at many different types of conferences (stoke, OA, CHD etc). We acknowledge that it was not possible to hand search all of the potential conferences where studies in this area could be presented, and it is therefore possible that we missed some studies that had negative or neutral results and are more difficult to get published. Although we attempted to contact authors when there was any uncertainty about data, it is also likely that data could also have been missed both from the excluded trials (i.e. the outcomes may have been recorded but not reported) and the included trials (i.e. data not reported and/or data not available for pooling).

Quality of the evidence

The 121 studies in this review were generally of poor methodological quality, as most of the studies did not use design features that are known to increase internal validity, such as concealed randomisation; intention-to-treat analysis, blinded outcome assessors, or attention control groups. Only 11 studies used concealed randomisation; 22 studies used intention-to-treat analysis; and 33 studies used blinded outcome assessors for all outcomes. Therefore, caution is required when drawing conclusions from these data. When data were stratified by indicators of study quality for the outcome muscle strength, results from the high quality trials continued to support the positive effect of resistance training on strength. However, these data also indicate that low quality trials, usually small studies, that comprise the majority of the studies in the review probably overestimate the effect of resistance training because of random chance effects from small studies. The long-term outcome of PRT is unclear because the majority of studies stopped following up participants once the intervention had ended.

PRT versus control—PRT shows small positive effect on measures of physical function (disability). PRT also appears to have a positive effect on aerobic capacity and most measures of functional limitations, including gait speed, timed "Up-and-Go" and, the time to stand up from a chair. All of these effects were statistically significant, although the effect sizes tended to be small to moderate, and the clinical significance of these effects is unclear. PRT appears to have a large positive effect on strength and aerobic capacity in older people. However, there was a large amount of statistical heterogeneity associated with the estimate in strength. This variation was reduced, but not eliminated, by investigating differences in outcome in different groups of participants, types of intervention and in trials that used different quality indicators. Please note that results from such exploratory analysis are tentative. In exploratory subgroup analyses, it appeared that training intensity has the greatest effect on strength (i.e. high intensity training has a greater effect on strength than lower intensity training), while the duration of the training appears to have a reduced effect. The magnitude of the effect was influenced by participants' health status or functional status. PRT in healthy participants had a greater effect than in those with a chronic disease or functional limitation. In other words, it appeared that people with a pre-existing health condition or with functional limitations had smaller gains in strength. Additionally, men had

larger gains in strength than women; although there were fewer trials in men. These subgroup analyses must be interpreted with caution as the number of participants is reduced which decreases the precision of these estimates. In addition, it is possible that study size is a source of heterogeneity, as several of the largest and highest quality trials included people with function limitations and/or lower intensity training programmes, and study quality appears to reduce the effect estimates. Overall, the effect of PRT on function is positive for older adults; although the effect seems diminished when it transfers from muscle strength to functional limitations and disability.

It was not possible to pool fall data because falls were reported differently in the five studies that measured this outcome. These data might suggest a trend towards PRT reducing falls, since four of the five studies found that participants in the PRT group had fewer falls than those in the control group. However, the effect of PRT alone on falls is still not clear.

Adverse events were poorly monitored and reported in most of these trials. This makes it difficult to assess the risk of injury or other adverse events associated with resistance training. The finding that several studies reported drop-outs from the exercise programme due to pain or injury, yet failed to report any adverse events, suggests that adverse events might have been under-reported in some trials. This hypothesis is further supported by the finding that the studies with a clear definition of adverse events in their study methods were more likely to detect these events than those with no definition. The large number of dropouts from the PRT group compared to controls also raises the possibility that people are experiencing adverse effects from PRT that are not identified in these trials. However, it is reassuring that participant's pain and vitality were not affected by PRT, and in fact PRT appeared to decrease pain in people with osteoarthritis. Furthermore, there was no evidence of increased risk of hospitalization. A few studies reported decreased use of health care services in the PRT group. Finally, there were a few reports of serious adverse events (i.e. myocardial infarction or death) in the PRT group but there was no evidence that these events were directly associated with the intervention. There was also no evidence of increased risk of death in the PRT group when compared with the control group.

Comparison of PRT dosage—There are currently few randomized data available to guide the dose and prescription of PRT. Trials investigated different aspects of this issue were all small studies and most were of poor quality. When high intensity training was compared with low intensity training, data from 10 trials show that high intensity training has a greater effect on strength than lower intensity training. Among these 10 trials, three show that high intensity training has a greater effect on aerobic capacity. Eight of the 10 trials were healthy older people who participated in highly supervised, gym-based programmes. Therefore, it is not clear if high intensity PRT is more beneficial than low intensity training in less fit or healthy older people and/or in home or hospital based programmes. Limited evidence are available for exercise frequencies and sets.

PRT versus other training—Overall, no significant differences were found between the different types of training. When PRT is compared to aerobic training, PRT tended to produced larger gains in strength than aerobic training. However, these two types of training are not different in aerobic capacity. This finding is to be expected, given that the strength

outcome is more specific to PRT. There are fewer data available to determine the comparative effect of these types of training on physical disability, but the available data suggest that the two training programmes have a similar effect on this outcome. There are too few data to draw conclusions about other forms of training such as balance or mobility training compared to PRT.

Authors' Conclusions

Implications for practice

Doing PRT two to three times a week can improve physical function in older adults, including reducing physical disability, some functional limitations (i.e. balance, gait speed, timed walk, timed 'up-and-go', chair rise; and climbing stairs) and muscle weakness in older people. Therefore, it would appear to be an appropriate intervention for many older people to improve performance of some simple physical tasks. The training also shows a reduction in pain in people with osteoarthritis. However, some caution is warranted with this intervention as in many studies adverse effects have been poorly monitored. Nonetheless, serious adverse events appear to be rare. When used in clinical practice, clinicians should monitor for adverse effects, particularly when older people who might be at higher risk of injury (i.e. frail or recently ill older people) are undertaking PRT. Additionally, there is no information regarding how long these effects can be maintained because the majority of the studies did not follow up the effect after the training had ended.

Implications for research

We recommend that future trials investigating the effect of PRT in older people should:

- minimise bias by using concealed randomisation, blinded outcome assessors, intention-to-treat analysis and attention control groups;
- recruit an adequate number of participants so that a precise estimate of the effect of the intervention can be determined (should have a priori power calculations);
- include a careful assessment of adverse events in both treatment groups, so that both the benefits and risks of PRT are fully evaluated;
- follow up participants after the programmes have completed to examine the longterm effects of PRT.

Future trials should include participants and interventions that are similar to those in health care settings (i.e. frail or recently ill older people), so that, if proven to be effective, resistance training can be incorporated into routine health care services. Well-designed trials are also required to determine the most appropriate dose of PRT to use with different participants and in different settings.

Acknowledgments

The authors would like to thank the editorial team of the Cochrane Bone, Joint and Muscle Trauma Group, particularly Lindsey Elstub, Lesley Gillespie, Joanne Elliott and Leeann Morton, for their assistance throughout the review process. In particular, thanks to Lesley and Joanne for searching the Cochrane registers and assistance with developing the search strategies. Thank you to Leeann and Lindsey for their advice and guidance about the

procedures and content. We would also like to thank the Review Group's editors and the external referees, Prof John Campbell, Dr Keith Hill and Professor David Stott for their helpful comments on earlier drafts of this review.

The reviewers would like to thank Craig Anderson, Derrick Bennett, and Caroline Stretton for their contribution for the first review. The reviewers also would like to thank the National Institute of Disability and Rehabilitation Research (NIDDR) for a post-doctoral fellowship to the first author (H133P001) through Boston University and Switzer research fellowship (H133F060030) and National Institute of Aging (P30 AG031679) to the second author for supporting the review update. In addition, the second author received support for this review through a Pepper Center Trainee award from Boston Pepper Center funded by the National Institute of Aging (1P30Ag031679-01).

Buchner 1997

| Methods | RCT: with four groups: strength training alone, endurance training alone, strength and endurance training and control group Method of randomisation: variation of randomly permuted blocks Assessor blinding: yes Participant blinding: no Loss to follow-up: 4 (from PRT/control) Intention to-treat analysis: yes Post-program follow up: exercisers assessed at 9 months, all participants monitored for falls for median 1.42 years (max 2.35 years) |
|---------------|---|
| Participants | Location: USA N = 105 total (55 in PRT vs control) Sample: older people with muscle weakness, recruited from primary care physicians in a HMO Age: mean 75 years Inclusion criteria: between 68 and 85 years of age; unable to do an eight-step tandem gait without errors; below the 50th percentile in knee extensor strength for the subject's height and weight Exclusion criteria: active cardiovascular, pulmonary, vestibular and bone diseases; positive cardiac stress test; body weight >180% of ideal; major psychiatric illness; active metabolic diseases; chronic anemia; amputation; chronic neurological or muscle disease; inability to walk; dependency in eating, dressing transfer or bathing; inability to speak English or fill out written forms |
| Interventions | PRT versus control 1. PRT Type of Ex: 2UL, 9LL, 1Tr Equipment: machines (Cybex) Intensity: high (set 1: 50-60% of 1RM; set 2: 75% of 1RM) Frequency: Ex3 Reps/Sets: 10/2 Program Duration: 24-26 weeks Setting: gym Supervision: not reported Adherence: 95% excluding drop-outs; 81% including drop-outs 2. Control Group: maintained usual activity levels, allowed to join exercise program after 6 months |
| Outcomes | Aerobic capacity |

| | Strength (isokinetic) Balance Gait SF-36 Sickness Impact Profile Lawton IADL scale Stair climbing Falls Health care use Comments on adverse events: yes | |
|-------------------------|---|-------------|
| Notes | Data from PRT and control group were compared Data from PRT and aerobic training group were compared | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B – Unclear |

Casaburi 2004

| Methods | RCT Method of randomisation: not reported Assessor blinding: yes Participant blinding: not reported Loss to follow-up: 1/12-Tx, 1/12-Control Intention-to-treat analysis: no Post-program follow up: no | |
|-------------------------|---|-------------|
| Participants | Location: USA N=24 (12 for each group) Sample: people with COPD Age: mean 68.9 years (SD=9.8) Inclusion criteria: age 55 to 80 years, FEV1 of 60% predicted or less, and FEV1 to vital capacity ratio of 60% or less. Screening serum testosterone was 400 ng/dl or less Exclusion criteria: significant cardiovascular or orthopedic impairments, body weight of less than 75% or more than 130% of ideal, symptomatic benign prostatic hypertrophy, prostate cancer history, serum prostate specific antigen of more than 4 ?g/L, or hemoglobin of more than 16 ug/dl | |
| Interventions | PRT versus control 1. PRT Type of Ex: 5 LL with eumetabolic diet Equipment: not reported Intensity: first 4 weeks, 60% of 1RM then increased to 80% of 1 RM Frequency: Ex3 Reps/Sets: first 4 weeks, 12/3 then increased to 8-10 /4 Duration: 10 weeks Setting: not reported Supervision: full by an exercise trainer Adherence: at least 25 of 30 scheduled sessions 2. Control Group: no training | |
| Outcomes | Muscle strength VO2max Comments on adverse events: yes | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Castaneda 2001

| Methods | RCT both groups were also on a low-protein diet (run-in period for 6 weeks to evaluate this); comparison was between low-protein diet alone or low-protein diet plus resistance training Method of randomisation: not reported Assessor blinding: blind for all assessments except strength Participant blinding: yes, sham-exercises Loss to follow-up: no Intention-to-treat analysis: not stated Post-program follow up: no | | | |
|-------------------------|---|-------------|--|--|
| Participants | Location: USA N = 26 Sample: patients with moderate chronic renal insufficiency, recruited from nephrology clinics Age: mean 65 years (SD 9) Inclusion criteria: older than 50 years of age; serum creatinine concentrations between 133-422 umol/L (1.5 and 5.0 mg/dL); physician approval to follow a low protein diet; nephrologist confirmed diagnosis of chronic renal insufficiency Exclusion criteria: myocardial infarction within the last 6 months; any unstable chronic condition; dementia; alcoholism; dialysis or previous renal; current resistance training; recent involuntary weight change (+/- 2kg); albumin level less than 30g/L; proteinuria greater than 10g/d; abnormal stress test on screening | | | |
| Interventions | PRT versus control 1. PRT plus low-protein diet Type of Ex: 2UL, 3LL Equipment: machines (Keiser) Intensity: 80% of 1RM Frequency: Ex3 Reps/Sets: 8/3 Duration: 12 weeks Setting: gym at research centre Supervision: full Adherence: 91% 2. Control Group: on low-protein diet; performed 5-8 sham exercises (gentle movements while standingsitting and bending) for upper and lower body | | | |
| Outcomes | Strength (1RM), Peak oxygen consumption Comments on adverse events: yes | | | |
| Notes | | | | |
| Risk of bias | | | | |
| Item | Authors' judgement | Description | | |
| Allocation concealment? | Unclear | B - Unclear | | |

Castaneda 2004

| Methods | RCT Method of randomisation: not reported Assessor blinding: yes Participant blinding: yes Loss to follow-up: 0 Intention-to-treat analysis: no Post-program follow up: no |
|---------------|--|
| Participants | Location: USA N = 26 (14 in PRT) Sample: chronic kidney disease but not on dialysis therapy Age: mean 65 years (SD = 9) Inclusion criteria: older than 50 years old with moderately severe chronic kidney disease and not on dialysis therapy, serum creatinine concentrations from 1.5 to 5.0 mg/dL and to be able to take a low protein diet Exclusion criteria: not reported |
| Interventions | PRT versus control 1. PRT |

| | Type of Ex: 2UL/3 LL Equipment: Keiser Sports Health Equipments Intensity: 80% of 1 RM Frequency: Ex3 Reps/Sets: 8/3 Duration: 12 weeks Setting: research center (Gym?) Supervision: full Adherence: not reported 2. Control group: stretching and flexibility exercise | |
|-------------------------|---|-------------|
| Outcomes | Muscle strength (1 RM) Comments on adverse events: yes | |
| Notes | Reported whole body muscle strength (data were not pooled) | |
| Risk of bias | | |

Chandler 1998

| Methods | RCT Method of randomisation: block randomised and stratified by 2 levels of functioning Assessor blinding: some measures Participant blinding: no Loss to follow-up: 13 Intention-to-treat analysis: no Post-program follow-up: no | |
|-------------------------|--|-------------|
| Participants | Location: USA N = 100 Sample: community-dwelling older people with functional limitations Age: mean 77.6 years Inclusion criteria: community-dwelling; aged 64 or above; unable to descend stairs step over step without holding onto the railing Exclusion criteria: > or = 3 on Reuben's Advanced Activities of Daily Living; terminal illness (i.e. not expected to survive 6 months); severe unstable cardiac disease including MI in the past 6 months; severe fixed or progressive neurologic disease; complete blindness; lower extremity amputation; score below 18 on MM SE and unable to follow a 3-step command | |
| Interventions | PRT versus control 1. PRT Type of Ex: 8LL Equipment: Theraband Intensity: progressively increased (8 RM to 2 sets of 10RM) Frequency: Ex3 Reps/Sets: 10/2 Duration: 10 weeks Setting: home-based Supervision: not reported Adherence: not reported 2. Control Group: could begin exercise after 10 weeks, one friendly phone call at 5 weeks | |
| Outcomes | HRQoL (SF-36) Lower limb strength (Cybex) 6-minute walk test Chair rise Functional reach Falls Self-Efficacy (/100) Comments on adverse events: no | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B- Unclear |

Charette 1991

| Methods | RCT Method of randomisation: not reported Assessor blinding: no Participant blinding: no Loss to follow-up: 8 Intention-to-treat analysis: no Post-program follow-up: no | |
|-------------------------|--|-------------|
| Participants | Location: USA N = 27 Sample: healthy, sedentary women Age: mean 69 years Inclusion criteria: aged 64-86; healthy; female, Palo Alto community Exclusion criteria: pre-existing disability or illness that would preclude participation in a weight training program of moderate intensity | |
| Interventions | PRT versus control 1. PRT Type of Ex: 7LL Equipment: weight training machines Intensity: 65-75% of 1RM Frequency: Ex3 Reps/Sets: 6/3, increased to 6 sets for leg extension and press after 2 weeks Program Duration: 12 weeks Setting: gym Supervision: full Adherence: 90% completed all sessions 2. Control Group: maintain normal activities, asked not to start an exercise program. Could undertaketraining at the end of the program. Contacted to make appointments/ maintain interest | |
| Outcomes | Strength (1RM) Comments on adverse events: no | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Chin A Paw 2006

| Methods | RCT with 4 groups: PRT, control, functional training, and combined training Method of randomisation: the random allocation sequence was generated by computer by two independent students Assessor blinding: yes Participant blinding: not reported Loss to follow-up: 21/57 in PRT; 22/60 in function-skills; 17/56 in combined training; 23/51 in controls Intention-to-treat analysis: yes. Data analysed: 40 in PRT, 44 in function-skills, 44 in combined training, 31 in controls Post-program follow up: no |
|---------------|--|
| Participants | Location: Netherlands N = 108 (57 in PRT) Sample: elders lived in long-term care facilities Age: mean 81.3 (SD = 4.4) Inclusion criteria: 1) aged 65 or older; 2) living in a nursing home or residential care facility; 3) able to walk 6 m or more (with or without a walking aid); 4) able to comprehend the study procedures; 5) no medical contraindication for study participation; 6) no rapidly progressive or terminal illness; 7) and not moving away from the home within the 6-months intervention period Exclusion criteria: not reported |
| Interventions | PRT versus control, versus functional training, and versus combined training 1. PRT Type of Ex: 3UL/2LL |

| | Equipment: TechnoGym equipment, dump bells and ankle/wrist weights Intensity: high (60-80% of 1 RM) Frequency: Ex2 Reps/Sets: 8-12/2 Duration: 24 weeks Setting: long-term care facility (Gym?) Supervision: full by a physical therapist and an assistant Adherence: 78 % 2.Control group: mean age =81, educational program (group discussion about topics of interest) 3. Functional training group: N=60, mean age = 82 years, game-like or cooperative activities 4. Combined training group: N=56, mean age = 81 years, one strength training and one functional trainingper week | |
|-------------------------|---|--------------|
| Outcomes | Primary: physical activities/ADL disability Secondary: muscle strength, vitality plus scales, balance, gait speed, chair rise Comments on adverse events: yes | |
| Notes | Comparisons: PRT versus control, PRT versus functional training | |
| Risk of bias | | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Yes | A - Adequate |

Collier 1997

| N. d. d. | D.CT. | |

Damush 1999

| Methods | RCT Method of randomisation: not reported | |
|-------------------------|---|-------------|
| | Assessor blinding: no Participant blinding: no, attention control group used | |
| | Loss to follow-up: 9 | |
| | Intention-to-treat analysis: no Post-program follow up: no | |
| Participants | Location: USA N = 71 Sample: community-dwelling women, recruited through media-based promotion Age: mean 68 years (SD 5.6) Inclusion criteria: age 55+, living in retirement residential community, clearance from GP Exclusion criteria: GP-identified contraindications to exercise | |
| Interventions | PRT versus control 1.PRT Type of Ex: 4UL, 3LL Equipment: Theraband Intensity: low to moderate (4/10 on Borg scale) Frequency: Ex3 Reps/Sets: 1 set, as many reps to reach 4/10 on Borg Program Duration: 8 weeks Setting: gym, group-based Supervision: full Adherence: 88% 2. Control Group: attended all of the exercise sessions to allow social contact | |
| Outcomes | HRQoL (SF-36) Strength (3RM) Grip strength Comments on adverse events: no | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B – Unclear |

de Vos 2005

| Methods | RCT with 4 groups: high intensity, medium intensity, and low intensity, and control Method of randomisation: computerized randomisation program, stratified by gender Assessor blinding: only for tests at baseline Participant blinding: blinded to the research hypothesis Loss to follow-up: 12 (4-high intensity, 3-medium intensity, 3-low intensity, 2-control) Intention-to-treat analysis: no Post-program follow up: no |
|---------------|--|
| Participants | Location: Australia N = 28-HI; N = 28-MI; N = 28-LI; N = 28-control Sample: independent living older adults Age: mean 69 years Inclusion criteria: > 60 years old, living independently in the community, willingness to be randomized and to commit to the study requirements Exclusion criteria: participation in resistance/power training in the last 6 months, acute or terminal illness, had myocardial infarction in the past 6 months, unstable disease or physical status would interfere with exercise, limb amputation/fraction in the past 3 months, currently symptomatic hernias or hemorrhoids, or cognitive impairment |
| Interventions | PRT (high intensity, medium intensity, and low intensity) versus control 1. PRT Type of Ex: rapid concentric and slow eccentric Equipment: Keiser machines Intensity: high (80% of 1RM), medium (50% of 1 RM), low (20% of 1RM) Frequency: Ex2 Reps/Sets: 8/3 |

| | Duration: 8-12 weeks (M = 10 weeks) Setting: not reported Supervision: Experienced exercise trainers Adherence: > 90% for each training group 2. Control Group: maintain current level of activities | |
|-------------------------|--|--|
| Outcomes | Dynamic muscle strength Muscle power Muscle endurance Balance Comments on adverse events: yes | |
| Notes | Involved power training | |
| Risk of bias | | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Unclear B - Unclear | |

de Vreede 2007

| | Method of randomisation: by computer using a random numbers table Assessor blinding: yes Participant blinding: not reported | |
|-------------------------|--|-------------|
| | Loss to follow-up: 6/34 in PRT group Intention-to-treat analysis: no | |
| Postational | Post-program follow up: no | |
| Participants | Location: Netherlands N = 65 (34 in PRT) Sample: community-dwelling older adults Age: mean 74.8 years (SD = 4) Inclusion Criteria: age over 70 years | |
| | Exclusion Criteria: recent fractures, unstable cardiovascular or metabolic disease, musculoskeletal condition or chronic illness, severe airflow obstruction, recent depression or emotional distress, loss of mobility for more than one week in the previous months, exercised at a sports club more than 3 times a week | |
| Interventions | PRT versus control and versus functional task exercise 1. PRT Type of Ex: 5UL, 9LL Equipment: weights, elastic tub Intensity: 7-8 on a 10-point rated perceived exertion scale Frequency: Ex3 Reps/Sets: 10/3 Duration: 12 weeks Setting: a local leisure center Supervision: at least two experienced instructors Adherence: 74% (SD = 34.6%) 2. Control Group: to keep normal activity level 3. Functional task exercise group: N = 33, moving with a vertical component, moving with a horizontal component, carrying an object, and changing position between lying, sitting, and standing. Practice phase for 2 weeks, variation phase for 4 weeks, and daily tasks for 6 weeks | |
| Outcomes | Primary: SF-36 Secondary: TUAG Comments on adverse events: yes | |
| Notes | Data of SF-36 were provided by the trial authors Data from PRT and functional training group were compared | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

DeBeliso 2005

| Methods | RCT Method of randomisation: not reported-stratified by gender and strength Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 8/21 in control; 5/18 in fixed repetition group; 4/21 in periodised group Intention-to-treat analysis: no Post-program follow up: no | |
|-------------------------|--|-------------|
| Participants | Location: USA N = 18-fixed repetition; N = 21-periodised repetition; N = 21-control Sample: independent and community dwelling older adults Age: fixed repetition, mean 71.4 years (SD = 5.4); periodised, mean = 70.6 years (SD = 4.7) Inclusion Criteria: no previous background in resistance training Exclusion Criteria: not reported | |
| Interventions | PRT (fixed repetition and periodised repetition) versus control 1. PRT Type of Ex: 5UL/3LL Equipment: Flex machines Intensity: fixed repetition-9 RM; periodised-week 1 to 6, 15 RM; week 7 to 12, 9 RM; week 13 to 18, 6 RM Frequency: Ex2 Reps/Sets: fixed repetition-9/3; periodised-week 1 to 6, 15/2; week 7 to 12, 9/3; week 13 to 18, 6/4 Duration: 18 weeks Setting: training facility (Gym?) Supervision: full by trainers Adherence: fixed repetition group 77%; periodised group 62% 2. Control group: maintain current recreational activities | |
| Outcomes | Muscle strength (1 RM) Comments on adverse events: yes | |
| Notes | Notes | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

DiFrancisco 2007

| Methods | RCT Method of randomisation: a table of random numbers Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 0 Intention-to-treat analysis: no Post-program follow up: no |
|---------------|--|
| Participants | Location: USA N = 9 for each group Sample: see below Age: mean = 77.3 years (SD = 0.7) Inclusion criteria: convenience sample from Academic Health Care Center Exclusion criteria: participated in a strength-training programme within 6 months, pre- existing orthopaedic complications that would have affected any of the exercise, cardiac and respiratory conditions |
| Interventions | PRT (once a week versus twice a week) Type of Ex: 3UL/3LL Equipment: Cybex machines Intensity: high (75% of 1RM) Frequency: Ex2 versus Ex1 Reps/Sets: 10-15/1 for each exercise Duration: 9 weeks Setting: gym Supervision: not reported |

| | Adherence: not reported | |
|-------------------------|--|-------------|
| Outcomes | Strength (1RM) Comments on adverse events: yes | |
| Notes | Date from 2 times a week and one time a week were compared | |
| Risk of bias | Risk of bias | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Unclear | B - Unclear |

Donald 2000

| Participants | N = 58 Sample: hospitalised older people Age: mean 81 years | |
|-------------------------|--|--------------|
| | Inclusion criteria: admitted to elderly care rehabilitation ward from Feb to Sept 1996 consent from patient and carers Exclusion criteria: not reported | |
| Interventions | PRT versus control 1. PRT Type of Ex: 2 LL Equipment: not reported Intensity: high (maximum weight the patient could manage) Frequency: twice daily Reps/Sets: 10/3 Program duration: not reported (length of hospital stay) Setting: hospital Supervision: full Adherence: not reported 2. Control Group: regular in-hospital daily physiotherapy | |
| Outcomes | Falls (during hospital stay) Barthel Index (ADL measure) Strength (hand-held dynamometer, hand-grip strength) Comments on adverse events: no | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Yes | A - Adequate |

Earles 2001

| Methods | RCT, PRT vs moderate aerobic exercise Method of randomisation: randomised, with subjects blocked for gender and residence Assessor blinding: no Participant blinding: no Loss to Follow-up: 3 Intention-to-treat analyses: no Post-program follow up: no |
|--------------|--|
| Participants | Location: USA N = 43 |

| | Sample: independent community volunteers Age: mean 77 years (SD 5) in PRT group Inclusion criteria: age greater than 70 years; score of 8 or higher on the Short Physical Performance Battery; ability to travel (by using public or private transportation) to the retirement community where exercise sessions were held; willingness to attend exercise sessions for 12 weeks Exclusion criteria: myocardial infarction in the past 6 months; heart failure (New York Heart Association classification <1); angina with moderate activity; chronic obstructive pulmonary disease or shortness of breath while walking at a normal pace; stroke with residual motor deficits; poorly controlled hypertension (>174mmHg systolic, >100mmHg diastolic); cancer with chemotherapy or radiation in the past year; physical performance limited by arthritis; on any of the following medications: neuroleptics, oral steroids, testosterone or growth hormones | |
|-------------------------|--|------------|
| Interventions | PRT versus aerobic 1. PRT Type of Ex: 2 LL; also did step-ups, chair rises and plantar flexion exercises in standing Equipment: Pneumatic resistance machines Intensity: high for leg press- started at 50% of 1RM, increased by 10% during each week of training; moderate for other exercises Frequency: Ex3 Reps/Sets: 10/3 Duration: 12 weeks Setting: gym at retirement center Supervision: full Adherence: 90% 2. Aerobic training group: moderate intensity exercise 30 minutes daily, 6 days weekly | |
| Outcomes | Short physical performance battery (SPPB) Balance (semi-tandem stance, single leg stance) Chair rise (5) 8-foot walk Aerobic capacity (6-minute walk) Muscle strength Comments on adverse events: yes | |
| Notes | Data from PRT and aerobic training group were compared | |
| Risk of bias | | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Unclear | B- Unclear |
| | | |

Ettinger 1997

| Methods | RCT with 3 groups: PRT, aerobic training and health education (attention control) Method of randomisation: stratified, variable block randomisation, computer generated Assessor blinding: yes Participant blinding: attention control group used Loss to follow-up: 75 total (48 from PRT and control group) at 18 months Intention-to-treat analysis: yes Post-program follow up: participants followed after initial supervised sessions (3 months) to home-based sessions (3-18 months) |
|--------------|---|
| Participants | Location: USA N = 439 total (295 in PRT versus control) Sample: community-dwelling people with osteoarthritis resulting in functional limitation Age: mean 68 years (SD 6) in PRT group Inclusion criteria: age 60 years or more, pain on most days in 1 or more knees, difficulty with at least 1 of the following due to knee pain: walking a quarter mile, climbing stairs, getting in and out of a car, lifting and carrying groceries, getting out of bed, getting out of the bathtub or performing shopping, cleaning or self-care activities; radiographic evidence of knee osteoarthritis in the tibial-femoral compartment. Exclusion criteria: person has a medical condition that precluded safe participation in the exercise program or prevented completion of the study (myocardial infarction or stroke in the past 3 months, evidence of ischemia during the exercise treadmill test, congestive heart failure, severe chronic obstructive pulmonary disease, active treatment for cancer, insulin dependent diabetes mellitus, hemoglobin less than 110g/L, creatinine greater than 176.8 umol/L, severe systemic disease or major psychiatric disease), inflammatory arthritis (i.e., rheumatoid or psoriatic), exercised regularly (defined as aerobic activity or resistance training more than 1 time per week for 20 minutes or longer), planned to move from the area or be admitted to a long-term care facility in the next 2 years; unable to walk at least |

| | 420 feet in 6 minutes without a cane or assistive device; unable to walk on a treadmill without an assistive device; participating in another research study; resided in a long-term care facility | |
|-------------------------|---|-------------|
| Interventions | PRT versus control and versus aerobic 1. PRT Type of Ex: 4UL, 4LL, 1Tr Equipment: cuff-weights, dumb bells Intensity: moderate to high (2 sets of 12 reps max) Frequency: Ex3 Reps/Sets: 12/2 Duration: 78 weeks Setting: facility-based group for 3 months, then home- based for 15 months Supervision: high for gym-based, telephone contact and visits during home based phase (diminishing contact over time) Adherence: 70% at 18 months 2. Control Group: health education program (meetings and telephone contact) 3. Aerobic Training Group: walking program for 40 minutes 3 times per week at 50-70% of HR reservegroup facility based for 3 months then home-based for 15 months (same contact as PRT) | |
| Outcomes | Primary: self-report physical disability (23 item scale developed for use in this trial) Secondary: 6 minute walk test, stair climbing, lifting object, timed task in and out of car, graded sub maximal aerobic treadmill test, strength (isokinetic dynamometer), knee x-rays, knee pain Comments on adverse events: yes | |
| Notes | Data from PRT and aerobic training group were compared | |
| Risk of bias | | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Unclear | B - Unclear |

Fahlman 2002

| Methods | RCT with 3 groups: PRT, control, and aerobic group Method of randomisation: not reported Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 0 Intention-to-treat analysis: N/A Post-program follow-up: no |
|---------------|--|
| Participants | Location: USA N = 30 (15 in each group) Sample: highly active and functioning women Age: mean 73 years (SD = 3) Inclusion criteria: not reported Exclusion criteria: dementia screened by MMSE, did not meet the criteria of the American College of Sports Medicine, the presence of activity-limiting arthritis; being bedridden within 3 months of the study; the presence of central or peripheral nervous system disorders, stroke, acute or chronic infection, major affective disorder, human immunodeficiency virus infection or autoimmune disorders, or metabolic disorders (type I diabetes mellitus); being a smoker or smokeless tobacco user; participating in regular aerobic or resistance training within the previous 3 months; using oral steroids or medications known to have an effect on blood lipids except hormone replacement therapy; having surgery within the previous 3 months; and consuming caffeine in excess of the equivalent of 4 cups of coffee per day |
| Interventions | PRT versus control and aerobic 1. PRT Type of Ex: 7 LL Equipment: not reported Intensity: 8RM Frequency: Ex3 Reps/Sets: 8/3 Duration: 10 weeks Setting: not reported Supervision: not reported Adherence: > 95 % 2. Control Group: maintain normal activity level |

| | 3. Aerobic training group: stretching and walking exercise at 70% heart rate reserve, duration increasedfrom 20 minutes to 30 minutes through out the program | | |
|-------------------------|---|-------------|--|
| Outcomes | Muscle strength (1RM) 1-minet walk (no data available for the PRT group) VO2 max Comments on adverse events: no | | |
| Notes | Comparisions: PRT versus control, and PRT versus aerobic | | |
| Risk of bias | Risk of bias | | |
| Item | Authors' judgement Description | | |
| Allocation concealment? | Unclear | B - Unclear | |

Fatouros 2002

| Methods | RCT with 3 groups: PRT, control, and aerobic group Method of randomisation: not reported Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 0 Intention-to-treat analysis: no Post-program follow-up: no | |
|-------------------------|--|-------------|
| Participants | Location: Greece N = 8 in each group Sample: inactive elder men Age: mean 71.8 years (SD = 2.5) Inclusion criteria: completely inactive prior to the study, VO2 max below 25 ml/kg/min, no anemia, hepatic complications, thyroid disorders or kidney problems, normal blood pressure Exclusion criteria: respiratory complications or BP > 240/110 mmHg during the exercise test | |
| Interventions | PRT versus control and versus aerobic (cardiovascular training) 1. PRT Type of Ex: 5 UL/3 LL Equipment: Universal resistance exercise machines Intensity: Week 1-4 (55%-60% of 1 RM); Week 5-8 (60%-70% of 1 RM); week 9-12 (70%-80% of 1 RM); week 13-16 (80% of 1 RM) Frequency: Ex3 Reps/Sets: Week 1-4 (12-14/2); Week 5-8 (10-12/3); week 9-12 (8-10/3); week 13-16 (8/3) Duration: 16 weeks Setting: not reported Supervision: not reported Adherence: required the participants not miss more than 4 training sessions, 2. Control Group: no exercise 3. Cardiovascular training group: walking, jogging on a treadmill, the intensity was increased through out the training | |
| Outcomes | Muscle strength (1 RM) Comments on adverse events: no | |
| Notes | Data from PRT and aerobic training group were compared | |
| Risk of bias | | |

Fielding 2002

| Methods | RCT Method of randomisation: not reported Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 3/15 in high velocity group, 2/15 in low velocity group Intention-to-treat analysis: no Post-program follow up: no | |
|-------------------------|---|--------------------|
| Participants | Location: USA N = 30 (15 in high velocity, 15 in low velocity) Sample: community dwelling elderly with self reported disability Age: high velocity-mean 73.2 years (SD = 1.2); low velocity-mean 72.1 years (SD = 1.3) Inclusion criteria: at least of 65 years of age, community dwelling, could walk with or without an assistive device, reported 2 or more deficits on the physical function subscale of SF-36 Exclusion criteria: acute or terminal illness, myocardial infarction in the past 6 months, unstable cardiovascular disease or other medical condition, upper extremities or lower extremities fractures in the past 6 months, amputations, cognitive impairments, current participations in regular exercise sessions, and unwilling to be randomised | |
| Interventions | PRT (high velocity versus low velocity) Type of Ex: 2LL, leg press & knee extension Equipment: machines (Keiser pneumatic resistance training equipment) Intensity: high velocity group-70% of 1 RM, extension as fast as possible during concentric phase, then maintain full extension for 1 second, and eccentric phase of each repetition over 2 seconds; low velocity group- extension concentric phase, maintain full extension, and eccentric phase of each repetition 2, 1, 2 seconds Frequency: Ex3 Reps/Sets: 8/3 Duration: 16 weeks Setting: human physiology lab Supervision: exercise trainers Adherence: 95% for high velocity group, 94% for low velocity group | |
| Outcomes | Muscle strength Chair rise Stair climbing Comments on adverse events: yes | |
| Notes | No reported results can be pooled (missing M and | SD for each group) |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Flynn 1999

| Methods | RCT Method of randomisation: not reported Assessor blinding: no Participant blinding: no Loss to follow-up: not reported Intention-to-treat analysis: no Post-program follow up: no |
|--------------|--|
| Participants | Location: USA N = 29 Sample: healthy older women Age: mean 73 years Inclusion criteria: older community-dwelling women Exclusion criteria: dementia, exclusion criteria of the American College of Sports Medicine, arthritis, bedridden within 3 months of the study, central or peripheral nervous system disorders, stroke, use of antidepressant medications, acute or chronic infection, major affective disorder, human immunodeficiency virus infection or autoimmune disorders, metabolic disorders (type I diabetes mellitus), oral steroid use, cigarette or smokeless tobacco use, regular aerobic or resistance training within previous 3 months, |

| | surgery within the previous 3 months, caffeine consumption in excess of four cups of coffee per day, adequate flexibility and mobility (screened with performance tests) | |
|-------------------------|--|-------------|
| Interventions | PRT versus control 1. PRT Type of Ex: 8 LLEquipment: not reportedIntensity: high (70-80% of 1RM) Frequency: Ex3 Reps/sets: 8/3 Duration: 10 weeks Setting: gym Supervision: not reported Adherence: not reported 2. Control Group: asked to maintain their normal activity level | |
| Outcomes | Strength (1RM - ? data collected for controls) Comments on adverse events: no | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear B - Unclear | |

Foley 2003

| Participants | Location: Australia N = 70 (35 in each group) Sample: community living adults v Age: mean 69.8 years (SD = 9.2) | vith OA of the hip or knee |
|-------------------------|--|--|
| | Inclusion criteria: read, write, and stransport to attend the training sess Exclusion criteria: had received ph | ysiotherapy or hydrotherapy in the past 6 weeks, ses; joint replacement surgery within the past 12 months |
| Interventions | PRT versus control 1. PRT Type of Ex: 1UE/4 LL Equipment: weighted gaiters Intensity: 10 RM Frequency: Ex3 Reps/Sets: not reported Duration: 6 weeks Setting: gym Supervision: not reported Adherence: 75 % 2. Control Group: telephone calls t injuries | o record any changes in their condition drug use or |
| Outcomes | Primary: SF-12, Adelaide Activities profile, WOMAC Secondary: muscle strength, Arthritis Self-Efficacy Questionnaire Comments on adverse events: yes | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Yes A - Adequate | |

Frontera 2003

| Methods | RCT Method of randomisation: not reported Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 0 Intention-to-treat analysis: N/A Post-program follow up: no | |
|-------------------------|---|-------------|
| Participants | Location: USA N = 14 (7 in each group) Sample: community-dwelling healthy women Age: mean 73.7 years (SD = 3.4) Inclusion criteria: not involved in regular exercise Exclusion criteria: had conditions that could interfere with neuromuscular function | |
| Interventions | PRT versus control 1. PRT Type of Ex: knee extensors/flexors, each leg was trained separately Equipment: Keiser Sports Health Equipment Intensity: (80% of 1 RM) Frequency: Ex3 Reps/Sets: 8/4 Duration: 12 weeks Setting: not reported Supervision: not reported Adherence: 98% 2. Control Group: not reported | |
| Outcomes | Muscle strength (1RM, isokinetic strength of knee extension) Comments on adverse events: no | |
| Notes | • | |
| Risk of bias | | |

Jones 1994

| Methods | RCT: (note: data reported by dominant and non-dominant leg. Data for dominant leg used in analyses) |
|---------|---|
| | Method of randomisation: not stated Assessor blinding: yes |
| | Participant blinding: no Loss to follow-up: 4 |

| | Intention-to-treat analysis: no Post-program follow up: no | |
|-------------------------|--|-------------|
| Participants | Location: USA N = 46 Sample: women from a community senior center Age: mean 67.4 years Inclusion criteria: female, from a community senior centre, age>60, independently ambulatory Exclusion criteria: unstable cardiovascular disease, orthopaedic or neurological dysfunction, any other uncontrolled chronic conditions that would interfere with the safety and conduct of the training protocol | |
| Interventions | PRT versus control 1.PRT Type of Ex: 7 LL Equipment: velcro leg weights Intensity: started low, progressed to moderate Frequency: Ex3 Reps/Sets: 3 of 14 by end of program Duration: 16 weeks Setting: group at local community centre (2 days/week) and home (1 day/week) Supervision: full in group, none at home Adherence: 86-93% 2. Control Group: no intervention - contacted to monitor health and activity level | |
| Outcomes | Strength and muscular endurance (isokinetic dynamometer) Comments on adverse events: yes | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Jubrias 2001

| Methods | RCT with 3 groups: PRT, aerobic training and control Method of randomisation: not reported Assessor blinding: no Participant blinding: no Loss to follow-up: no Intention-to-treat analysis: no Post-program follow up: no |
|---------------|---|
| Participants | Location: USA N = 40 total (n = 26 in PRT and control) Sample: healthy, active older people Age: 69.2 years (SD = 0.6) Inclusion criteria: healthy (screened with physical exam, exercise testing), physically active, not engaged in PRT or aerobic training before this study Exclusion criteria: not reported |
| Interventions | PRT versus control and versus aerobic 1. PRT Type of Ex: 1LL, 2 UL Equipment: resistance training machines Intensity: phase 1-60-70% of 1RM; phase 2-70-85% of 1RM Frequency: Ex3 Reps/Sets: phase 1: 10-15/3; phase 2: 4-8/ 3-5 Duration: 24 weeks Setting: gym Supervision: not reported Adherence: 94.2% attendance 2. Control Group: continued normal activities, asked not to begin PRT or aerobic training during thetrial 3. Aerobic Training Group: training began at 60% heart rate reserve for 10-20 minutes, progressed to 80-85% HR reserve for a total of 40 minutes, three times per week |
| Outcomes | Muscle size Energy and fibre properties |

| | Comments on adverse events: yes | | |
|-------------------------|-------------------------------------|-------------|--|
| Notes | | | |
| Risk of bias | | | |
| Item | Item Authors' judgement Description | | |
| Allocation concealment? | Unclear | B - Unclear | |

Judge 1994

| Methods | RCT with factorial design: PRT alone, balance training alone, PRT and balance, control Method of randomisation: balance block design (blocks of 4 subjects) Assessor blinding: yes Patient blinding: no, but control group received educational sessions Loss to follow-up: 3 from PRT and control group Intention-to-treat analysis: yes Post-program follow up: yes, monitored for 6 months after intensive program while participants undertook tai chi. Falls monitored for median 0.88 years, max 1.86 years | |
|-------------------------|---|-------------|
| Participants | Location: USA N = 110 total (55 in PRT vs control) Sample: ambulatory older people from voter registration list Age: mean 80 years Inclusion criteria: age 75 years or greater, the ability to walk without an assistive device for 8 meters, MMSE > 24 Exclusion criteria: symptomatic cardiovascular disease, poorly controlled hypertension (>160/96), history or physical findings of focal neurological deficit, Parkinson disease, peripheral neuropathy of the legs, hip or knee joint replacement, hip fracture, cancer (metastatic or under active treatment), taking neuroleptic, prednisolone > 5mg/day, benzodiazepines, significant hip or knee arthritis that requires a cane for ambulation | |
| Interventions | PRT versus control 1. PRT Type of Ex: 6 LL Equipment: cuff-weights and exercise machines Intensity: 60-75% for exercises with machines; low to moderate for other Frequency: 3 times per week Reps/Sets: 3 sets to failure with machines; 13/2 with sandbags; 10/2 with body weight Duration: 12 weeks Setting: group exercise Supervision: full Adherence: 82% 2. Control group: 5 education sessions 3. Balance training: 3 times per week, 45 minute sessions, one-on-one with exercise leader includingbalance platform and floor-based exercises (eyes open and closed on different surfaces, with pertubationsand base of support changes) | |
| Outcomes | Strength (isokinetic dynamometer) Side effects of training (musculoskeletal or neurologic complaints) Gait velocity Chair rise Balance Comments on adverse events: yes (a priority outcome of study) | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Kalapotharakos 2005

| | RCT Method of randomisation: not reported Assessor blinding: yes |
|--|--|
|--|--|

| | Participant blinding: not reported Loss to follow-up: 1 in the high resistance group, 1 in the control group Intention-to-treat analysis: no Post-program follow up: no | |
|-------------------------|--|-------------|
| Participants | Location: Greece N = 12- HI; N = 12-MI; N = 11-control Sample: healthy, inactive but independent living older adults Age: HI-mean 64.6 years (SD = 5.1); MI-mean 65.7 years (SD = 4.2) Inclusion criteria: non smokers, free of medication, no symptoms of cardiovascular, orthopedic, or neuromuscular disease, and physically inactive before Exclusion criteria: MMSE < 24, depression (GDS > 5) | |
| Interventions | PRT (high intensity and moderate intensity) versus control 1. PRT Type of Ex: 4UL/2 LL Equipment: Universal gym machines Intensity; high intensity group: 80% of 1 RM; moderate intensity group: 60% of 1 RM Frequency: Ex3 Reps/Sets: 8/3 for high intensity group; 15/3 for moderate intensity group Duration: 12 weeks Setting: not reported Supervision: not reported Adherence: 98.5% 2. Control Group: no exercise | |
| Outcomes | Muscle strength (1-RM) 6-min walk Chair rise Vertical jump 1-leg standing time, Walking speed Stair climb Comments on adverse events: no | |
| Notes | | |
| Risk of bias | | |

Kallinen 2002

| Methods | RCT with 3 groups: PRT, control, and aerobic group Method of randomisation: manually perform by drawing lots Assessor blinding: No Participant blinding: not reported Loss to follow-up: 4 in PRT group, 3 in endurance group (aerobic) Intention-to-treat analysis: yes done at the 30th month Post-program follow up: no |
|---------------|---|
| Participants | Location: Finland N = 27 (16 in PRT) Sample: elder women Age: range 76-78 years Inclusion criteria: no severe diseases or functional impairments Exclusion criteria: not reported |
| Interventions | PRT versus control and versus aerobic (Note: participants in all groups were given 600mg calcium per day) 1. PRT Type of Ex: 4UL, 4LL Equipment: resistance training machines Intensity: high - completed 8RM Frequency: Ex3 Reps/Sets: 8/3 Program Duration: 2 years Setting: gym Supervision: full Adherence: 74% 2. Control Group: non-exercise group |

| | 3. Aerobic Fitness Group: N = 15; 3 sessions per week, performed same exercises as PRT group but withno resistance, plus added stationary cycling for 40 second stations | |
|-------------------------|--|-------------|
| Outcomes | PeakVO2 Peak Power Comments on adverse events: yes | |
| Notes | Data from PRT and aerobic training group were compared | |
| Risk of bias | | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Unclear | B - Unclear |

Katznelson 2006

| Methods | RCT Method of randomisation: by a block design Assessor blinding: yes Participant blinding: yes Loss to follow-up: 4/19- placebo + ex; 1/17- place | placebo only |
|-------------------------|--|--------------|
| Participants | Location: USA N = 26 (19 in PRT) Sample: men with relative testosterone insufficiency, sedentary and community dwelling Age: mean 72 years (SD = 5.4) Inclusion criteria: a single fasting serum free-testosterone value < 14.5 pg/ml and BMI is between 18-32; sedentary status Exclusion criteria: clinically unstable coronary artery or cerebrovascular disease, osteoarthritis of the lower extremity that could limit ambulation, clinically significant benign prostatic hypertropy (BPH), prostate cancer, an elevated prostate-specific antigen (PSA) value, hematocrit>52%, disorders known to affect body composition including hypokalemia, renal insufficiency, liver dysfunction, diabetes mellitus, hypothyroidism, alcoholism, thromoboembolic disease or coagulopathy, supraphysiologic glucocorticoid medication during the previous 12 months, androgen medications including supplements during the past 5 years, clinically significant psychiatric disease, or known pituitary disease, or radiation of the hypothalamus or pituitary gland | |
| Interventions | PRT versus control 1. PRT Type of Ex: 11 resistance exercises adapted from the Strong for Life video Equipment: elastic bands Intensity: used the next level of elastic band when the perceived exertion was less than moderate Frequency: 3 to 4 times a week Reps/Sets: 10/1 Duration: 12 weeks Setting: home Supervision: returned for an out-patient visit every two weeks and phone calls Adherence: 90% 2. Control Group: non exercise intervention | |
| Outcomes | SF-36 Comments on adverse events: yes | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Kongsgaard 2004

| Methods | PCT |
|---------|-----|
| Methods | RCT |

| Method of randomisation: not reported Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 3/9 in the ex group; 2/9 in the c Intention-to-treat analysis: no Post-program follow up: no | ontrol group |
|---|---|
| Location: Denmark $N=18$ (9 in each group) Sample: home-dwelling elder men with COPD Age: mean 71 years (SD = 1.3) Inclusion criteria: can transport to the hospital Exclusion criteria: fractures of the lower extremities within the last 6 months, neurological disease, cardiovascular diseases, dependence on more than one walking device and cognitive dysfunction | |
| PRT versus control 1. PRT Type of Ex: 3 LL Equipment: Technogym Intensity: 80% of 1 RM Frequency: Ex2 Reps/Sets: 8/4 Duration: 12 weeks Setting: not reported (Gym?) Supervision: full Adherence: extending the training period until a total of 24 training sessions were finished 2. Control Group: daily non-supervised breathing ex | |

Liu-Ambrose 2005

| Methods | RCT Method of randomisation: computer-generalized li Assessor blinding: yes Participant blinding: not reported Loss to follow-up: 2/34 in PRT, 2/34 in stretching Intention-to-treat analysis: yes Post-program follow up: no | st |
|-------------------------|--|--|
| Participants | Location: Canada N = 68 (34 in each group) Sample: elder women with osteoporosis or osteoporates and 79.6 years (SD = 2.1) Inclusion criteria: age between 75-85 years with locosteoporosis/osteopenia Exclusion criteria: living in care facilities, non-Catimes a week, illness or condition that would affec | w bone mass and diagnosed with acasian, exercise regularly more than 2 |
| Interventions | PRT versus control 1. PRT Type of Ex: 4 UL, 5LL Equipment: machines (Keiser Pressurized Air system) or free weights Intensity: progressed from 50-60 % of 1 RM to 75-85% of 1 RM in 4 weeks Frequency: Ex2 Reps/Sets: 10-15/2 (first 3 weeks); 6-8/2 (after week 3) Duration: 25 weeks Setting: community center Supervision: certified fitness instructors Adherence: 85% for PRT, 79% for stretching (control) 2. Control Group: general stretching, deep breathing and relaxation | |
| Outcomes | Primary: health related quality of life, general physical function Secondary: muscle strength, gait speed, fall risk assessment Comments on adverse events: yes | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Macaluso 2003

| Methods | RCT Method of randomisation: the principal investigator drew numbers from a bowl that had been thoroughly mixed Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 7 Intention-to-treat analysis: yes Post-program follow up: no |
|---------|---|
|---------|---|

| Participants | Location: UK N = 10-speed group (LI), N= 10-Strength group (HI) Sample: healthy elder women Age: mean = 69 years (SD = 2.7) Inclusion criteria: not reported Exclusion criteria: not "medical stable" for exercise studies | |
|-------------------------|---|-------------|
| Interventions | PRT (speed versus strength) Type of Ex: pedal Equipment: mechanically braked cycle ergometer Intensity: speed group (LI)-40% of 2 max resistance to complete 2 revolutions (2RM); strength group (HI)-80% of 2 RM Frequency: Ex3 Reps/Sets: Speed group (LI)-16 pedal revolutions/8 sets; Strength group (HI)-8 pedals revolutions/8sets Duration: 16 weeks Setting: not reported (gym?) Supervision: not reported Adherence: speed group (LI)-93%; strength group (HI)-89% | |
| Outcomes | Strength measure Max treadmill walking speed Box-stepping test Vertical jump Comments on adverse events: yes | |
| Notes | Involved power training, no control group | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Madden 2006

| Methods | RCT with 3 groups: PRT, control, and endurance (aerobic) group Method of randomisation: not reported Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 5 in the endurance training group Intention-to-treat analysis: no Post-program follow up: no |
|---------------|---|
| Participants | Location: USA N = 30 (15 in each group) Sample: healthy elder women Age: mean 69.8 years (SD = 1.5) Inclusion criteria: a normal blood pressure, a normal physical exam, normal resting ECG, normal M-mode and two-dimensional echocardiograms showing no more than mild valvular regurgitation, a normal Bruce protocol treadmill maximal exercise stress test, and a normal hematocrit, fasting blood glucose, total cholesterol, and creatinine. Exclusion criteria: any history of angina, myocardial infarction, stroke, hypertension, chronic pulmonary disease, diabetes, current medication use (prescription or over the counter), current smoking, or exercise-limiting orthopedic impairment |
| Interventions | PRT versus control and versus endurance (aerobic) 1. PRT Type of Ex: 10 UL and LL Equipment: not reported (weight?) Intensity: 85% 1RM Frequency: 5 times/week Reps/Sets: 8-12/3 Duration: 24 weeks Setting: not reported (Gym?) Supervision: full-certified trainer Adherence: required participants to attend 90% of all training sessions to remain enrolled in the study 2. Control Group: no training 3. Endurance Ex (aerobic) Group: N=15, mean age=70 years (SD = 2.6), using cycle ergometer, 50-60%Max HR to 80-85% Max HR, 5 times a week |
| Outcomes | VO2max |

| | Comments on adverse events: no | |
|-------------------------|---|-------------|
| Notes | Baseline + relative change score Data from PRT and aerobic training group were compared | |
| Risk of bias | | |

Manini 2005

| Methods | RCT with 3 groups: PRT, functional training, and PRT with functional training Method of randomisation: not reported Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 25 Intention-to-treat analysis: no Post-program follow up: no | |
|-------------------------|--|-------------|
| Participants | Location: USA N = 9-PRT Sample: functional limited older adults (low isometric knee extension strength) Age: mean 72 years (SD =10) Inclusion criteria: bilateral isometric knee extension strength test < 3Nm/Kg; pass physician's clearance Exclusion criteria: had cardiac or pulmonary difficulty | |
| Interventions | PRT versus functional training and versus PRT with functional training 1.PRT Type of Ex: 3 LL Equipment: Life-Fitness Inc. Intensity: 10 RM Frequency: Ex2 Reps/Sets: 8/2 Duration: 10 weeks (8-10 weeks of control period before intervention) Setting: not reported (Gym?) Supervision: not reported Adherence: not reported A. Functional training group: N=7, rising from a chair, rising from kneeling, stair ascending/descending 3. PRT and functional training group: N = 8, 1/week PRT training and 1/week of functional training | |
| Outcomes | Muscle strength Max. knee isometrics Comments on adverse events: yes | |
| Notes | Data from PRT and functional training group were compared | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Maurer 1999

| Methods | RCT Method of randomisation: random number generator, stratified by disease severity Assessor blinding: yes Participant blinding: no, but attention control group Loss to Follow-up: 15 Intention-to-treat analysis: no Post-program follow up: yes - at 12 weeks (after 8 weeks of training) |
|--------------|---|
| Participants | Location: USA |

| | N = 113 Sample: people with diagnosed OA of the knee Age: mean 66.3 years (SD 8.8) in treatment group Inclusion criteria: met current American College of Rheumatology criteria for OA, between 50-80 years, receiving no drugs for their arthritis other than stable doses of analgesics or NSAIDs, had mild to moderate knee pain for at least the previous 3 months, scored 1-3 on the Kellgren radiographic scale Exclusion criteria: concurrently receiving physical therapy, actively involved in any other pharmaceutical or exercise study or had undergone isokinetic strength training within the previous 3 years, had significant cardiovascular disease, more than mild knee swelling, large popliteal cysts, knee instability, major hip or knee surgery on the side to be treated, systemic disease other than OA that might affect muscle function, severe osteopenia, history of fracture in the area of the joint to be treated, paresis of the lower extremity | |
|-------------------------|---|-------------|
| Interventions | PRT versus control 1. PRT Type of Ex: 1 LL Equipment: isokinetic dynamometer Intensity: appears high Frequency: Ex3 Reps/Sets: 3 reps at 3 speeds (total 9 reps) in 3 sets Program Duration: 8 weeks Setting: gym Supervision: not reported Adherence: not reported 2. Control Group: four classes on OA education and self-management | |
| Outcomes | Primary: WOMAC, SF-36 Secondary: strength (isokinetic dynamometer), AIMS index Comments on adverse events: yes | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

McCartney 1995

| Methods | RCT. All results broken down into four groups by sex and age (60-70 or 70-80, only results for women aged 70-80 - the largest group - used for pooled comparisons in review) Method of randomisation: not reported Assessor blinding: no Participant blinding: no, but attention/exercise control group Loss to follow-up: 23 Intention-to-treat analysis: no Post-program follow up: no, but exercise program had 2 year duration |
|---------------|--|
| Participants | Location: Canada N = 142 Sample: healthy volunteers Age: mean 64 years (SD 2.4) for exercise group Inclusion criteria: approval of family physician, successful completion of cycle ergometer test, aged 60-80 years, no prior resistance training experience Exclusion criteria: evidence of coronary artery disease, chronic obstructive or restrictive lung disease, osteoporosis, major orthopaedic disability, smoking, body weight greater than 130% of ideal |
| Interventions | PRT versus control 1. PRT Type of Ex: 3UL, 3LL, 1Tr Equipment: weight-lifting machines Intensity: 50-80% 1RM Frequency: Ex2 Reps/Sets: 10-12/3 Program Duration: 42 weeks Setting: gym Supervision: not reported Adherence: 88% (at 1 year) 2. Control Group: 2 times per week low-intensity walking |

| Outcomes | Strength (1RM) Maximum cycle ergometry Treadmill testing Stair climbing ergometric muscle cross-sectional area Comments on adverse events: yes | | | |
|-------------------------|--|-------------|--|--|
| Notes | Notes | | | |
| Risk of bias | Risk of bias | | | |
| Item | n Authors' judgement Description | | | |
| Allocation concealment? | Unclear | B - Unclear | | |

McGuigan 2001

| Methods | RCT Method of randomisation: not reported Assessor blinding: no Participant blinding: no Loss to follow-up: 4 Intention-to-treat analysis: no Post-program follow up: no | |
|-------------------------|--|-------------|
| Participants | Location: Australia N = 20 Sample: people with peripheral arterial disease Age: mean 66 years (SD 6) exercise group Inclusion criteria: PAD diagnosed by a vascular surgeon Exclusion criteria: leg pain at rest, ischemic ulceration or gangrene, inability to walk at lest 2km/h on a treadmill, limited exercise capacity by factors other than claudication, vascular surgery or angioplasty in previous year, smoking of cigarettes | |
| Interventions | PRT versus control 1. PRT Type of Ex: 8 exercise that included UL, LL, Tr, combination varied in each session (1-3) per week Equipment: machines Intensity: used linear periodization, intensity varied with reps Frequency: Ex3 Reps/Sets: 8-15/2 Program Duration: 24 weeks Setting: gym Supervision: full Adherence: not reported 2. Control Group: no intervention | |
| Outcomes | Strength (10 RM) 6 minute walk test Treadmill walk time Hemodynamic measures Comments on adverse events: no | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Unclear | B - Unclear |

McMurdo 1995

| Methods | RCT with three groups, PRT, mobility exercise programme and attention control Method of randomisation: sealed envelopes in sequence, computer generated random |
|---------|--|
| | number tables generated the sequence |
| | Assessor blinding: yes |
| | Participant blinding: no, but attention control used |
| | Loss to follow-up: 7 from PRT and control group |

| | Intention-to-treat analysis: no Post-program follow up: no, but program 6 months long |
|---------------|---|
| Participants | Location: UK N = 86 total (55 in PRT vs control) Sample: residents of sheltered housing complexes Age: mean 82 years Inclusion criteria: age 75 years and over, limited mobility requiring the use of a walking aid, dependence in functional activities of daily living requiring the assistance of home help at least once per week Exclusion criteria: major neurological disease, unstable cardiovascular disease, severe cognitive impairment |
| Interventions | PRT versus control and versus mobility 1. PRT Type of Ex: 24 (UL, LL, trunk) Equipment: theraband, progressive thickness Intensity: low-moderate Frequency: daily Reps/Sets: 5-10/1 Program Duration: 26 weeks Setting: home Supervision: low - visited at home every 3-4 weeks Adherence: not reported 2. Control Group: health education visits every 3-4 weeks 3. Mobility Group: same 24 exercises, but with no resistance |
| Outcomes | TUAG Sit to stand test (time to complete 10 full stands) Grip strength Functional reach ADL (Barthel Index) Comments on adverse events: yes |
| Notes | |
| Risk of bias | |

Description

Mikesky 2006

| Methods | RCT Method of randomisation: not reported-stratified Assessor blinding: yes Participant blinding: not reported Loss to follow-up: 36% in PRT, 24% in Control (range of motion) Intention-to-treat analysis: yes, done at the 30th month Post-program follow up: no | |
|-------------------------|---|-------------|
| Participants | Location: USA N = 221 (113 in PRT) Sample: knee OA Age: mean = 69.4 years (SD = 8) Inclusion criteria: not clearly described Exclusion criteria: cannot walk without assistance, amputation of either lower extremity, knee or hip replacement, history of stroke, myocardial infarction, CHF, uncontrolled hypertension, fibromyalgia | |
| Interventions | PRT versus flexibility (control) 1.PRT Type of Ex: 2UL/2LL Equipment: CYBEX machines at gym; Elastic bands at home, Intensity: 8-10 RM Frequency: Ex3; first 3 months (2/week in the gym, 1/week at home), month 4-6 (1/week in the gym, 2/week at home), month 7-9 (2/month in the gym, 3/week at home); month 10-12 (1/month in the gym, 3/week at home) Reps/Sets: from 8-10/ 3 to 12/2 Duration: 1 year Setting: gym and home Supervision: full-1 fitness trainer in the gym Adherence: attending gym (PRT-59%, control/ROM-64%); home ex (PRT-56%, control/ROM-62%) 2. Flexibility exercise group: N=108, mean age = 68.6 years (SD = 7.5), flexibility ex, 3 times/week | |
| Outcomes | Primary: SF-36 (at the 30 month), WOMAC Secondary: Strength measure (1RM) Comments on adverse events: yes | |
| Notes | SF-36 was not pooled because it was not measured right after the training | |
| Risk of bias | | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Unclear | B - Unclear |

Miller 2006

| Methods | RCT Method of randomisation: computer generated sequence, stratified and block randomization |
|---------|--|
| | Assessor blinding: yes |
| | Participant blinding: not reported |
| | Loss to follow-up: 3 withdrawn (1 in control), 4 death (2 in PRT) |

| | Intention-to-teat analysis: yes Post-program follow up: no | | |
|-------------------------|--|-------------|--|
| Participants | Location: Australia N = 51 (25 in PRT) Sample: fall-related lower limb fracture Age: mean 84.8 years Inclusion criteria: at least 70 years old, fall-related lower limb fracture Exclusion criteria: (1) did not reside within southern Adelaide, (2) were unable to comprehend instructions relating to positioning of the upper arm for eligibility assessment, (3) were unable to fully weight bear on the side of the injury for more than seven days post admission, (4) were not independently mobile prefracture, (5) were medically unstable more than 7 days post admission, (6) were suffering from cancer, chronic renal failure, unstable angina or unstable diabetes or (7) were not classified as malnourished | | |
| Interventions | PRT versus control 1. PRT Type of Ex: 5 LL Equipment: elastic band Intensity: was appropriate to baseline strength, pain level and range of motion Frequency: Ex3 Reps/Sets: increased to 8/2 if exercise could be completed in good form Duration: 12 weeks Setting: a teaching hospital Supervision: full-pysiotherapist Adherence: > 86% 2. Control group: attention control, week 1-6: tri-weekly home visits, week 7-12: weekly home visit; discussion of general information during the visit | | |
| Outcomes | Primary: SF-12 Secondary: strength measure, gait speed Comments on adverse events: no | | |
| Notes | Reported Median & 95%CI. Data from participants who took nutrition supplementation were not extracted | | |
| Risk of bias | | | |
| Item | Authors' judgement Description | | |
| Allocation concealment? | Unclear | B - Unclear | |

Miszko 2003

| Methods | RCT with 3 groups: PRE, control, and power exercise Method of randomisation: stratified by sex Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 4/17 in PRT, 7/18 in power Intention-to-treat analysis: no Post-program follow up: no |
|---------------|---|
| Participants | Location: USA N = 28 (13 in PRT) Sample: older adults with below average leg extensor power Age: mean 72.8 years (SD = 5.4) Inclusion criteria: below-average leg extensor power Exclusion criteria: poorly controlled or unstable cardiovascular disease or diabetes, recent unhealed bone fracture (within the past 12 months), severe hypertension while resting quietly in the supine position, leg or arm amputation, excessive alcohol intake (more than three drinks per day), a classic anterior compression fracture, neuromuscular disorders, being nonambulatory, or having recent (within 6 months) involvement in a strength-training or running or jogging program |
| Interventions | PRT versus control and versus power exercise 1.PRT Type of Ex: 4UL/4LL & squats Equipment: Keiser Inc. Intensity: 50% -> 70% of 1RM by week 8, 80% of 1RM the last 8 weeks Frequency: Ex3 Reps/Sets: 6-8/3 Duration: 16 weeks Setting: not reported (Gym?) |

| | Supervision: not reported Adherence: not reported 2. Control Group: maintain usual activity and attend 3 educational presentations over the study period 3. Power Ex Group: N=11, mean age = 72.3 years (SD = 6.7), the same exercise as the PRT group butdid jump squats instead of squats, 6-8 repetition at 40% of 1RM, move as fast as possible | |
|-------------------------|---|--|
| Outcomes | Primary: Continuous Scale Physical Functional Performance Secondary: strength measure (1 RM) Comments on adverse events: yes | |
| Notes | Involved power training | |
| Risk of bias | | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Unclear B - Unclear | |

Moreland 2001

| Allocation concealment? | Yes A - Adequate | |
|-------------------------|--|--|
| Item | Authors' judgement Description | |
| Risk of bias | | |

| Outcomes | Primary: Chedoke-McMaster Stroke Assessment Secondary: 2-minute walk test Comments on adverse events: yes | |
| Interventions | PRT versus control 1.PRT Type of Ex: UL, LL Equipment: not reported Intensity: not reported Frequency: not reported Reps/Sets: not reported Program Duration: until hospital discharge Setting: hospital Supervision: full Adherence: not reported 2. Control Group: regular therapy | |
| Participants | Location: Canada N = 133 (68 in PRT) Sample: people post-stroke Age: mean 69 years Inclusion criteria: not reported Exclusion criteria: not reported | |
| Methods | RCT Method of randomisation: concealed, phoned central office Assessor blinding: yes Participant blinding: not reported Loss to follow-up: 10 Intention-to-treat analysis: yes Post-program follow up: yes, at the 6th month | |

Nelson 1994

| Methods | RCT Method of randomisation: not reported |
|---------|--|
| | Assessor blinding: no Participant blinding: no |
| | Loss to follow-up: 1 |

| | Intention-to-treat analysis: yes Post-program follow up: no, but program had 1-year duration | |
|-------------------------|---|-------------|
| Participants | Location: USA N=40 Sample: healthy females post-menopause Age:mean 61.1 years (SD 3.7) Inclusion criteria: at least 5 years post-menopausal but not older than 70, do not engage in any regular physical training, weigh less than 130% of ideal body weight, currently nonsmoking, do not have more than one crush fracture of the spine, no history of other osteoporotic fractures, have not taken estrogen or other medications known to affect bone for 12 months, passed physical screening (including ECG during strength training session) Exclusion criteria: not reported | |
| Interventions | PRT versus control 1.PRT Type of Ex: 2 LL, 1 UL, 2Tr Equipment: pneumatic resistance machines (Keiser) Intensity: 80% of 1RM Frequency: Ex2 Reps/Sets: 8/3 Program Duration: 52 weeks Adherence: 87.5% Setting: gym Supervision: full 2. Control Group: asked to maintain normal level of activity, could receive the exercise program at the end of the trial | |
| Outcomes | Strength (1RM) Balance (backward walking) Physical activity (Harvard Alumini Questionnaire, kJ/week) Comments on adverse events: yes | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Unclear | B - Unclear |

Newnham 1995

| Methods | RCT Method of randomisation: not reported Assessor blinding: yes Participant blinding: no, but attention control Loss to follow-up: 6 Intention-to-treat analysis: no Post-program follow up: yes, at the 24 week |
|--------------|--|
| Participants | Location: Canada N = 30 Sample: residents of long-term care facility Age: mean 81.7 years (SD 5.6) Inclusion criteria: age 70+, independent in ambulation (with or without walking aid) over 40m at <0.9m/s, 20+ on TUAG; at least 90 degrees of available ROM at knee, can follow a 3-step command Exclusion criteria: have Parkinsons Disease or CVA; participation in strength training in the past year; unstable medical conditions |

| Interventions | PRT versus control 1. PRT Type of Ex: UL, LL Equipment: pullies Intensity: 80% of 1RM Frequency: Ex3 Reps/Sets: 10/3 Program Duration: 12 weeks Setting: gym in nursing home Supervision: full Adherence: 86% 2. Control Group: attention control | |
|-------------------------|---|-------------|
| Outcomes | Strength (1RM) Gait velocity TUAG Balance (Berg) Comments on adverse events: no | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Nichols 1993

| Methods | RCT Method of randomisation: stratified into rank-orde | ered pairs and randomised |
|-------------------------|--|---|
| | Assessor blinding: no | rea paris and randomised |
| | Participant blinding: no Loss to follow-up: 6 | |
| | Intention-to-treat analysis: no Post-program follow up: no, but 6 month duration | of program |
| Participants | Location: USA N = 36 | |
| | Sample: active healthy women | |
| | Age: mean 67.8 years (SE 1.6) Inclusion criteria: greater than 60 years, active for | at least 6 months prior to the trial with |
| | exercise at least 3 times per week, physician's consent Exclusion criteria: previous weight training, history of cardiovascular disease, taking | |
| | thyroid or cardiac medications, nonestrogen reple | |
| Interventions | PRT versus control 1. PRT | |
| | Type of Ex: 4UL, 2LL, 1Tr Equipment: variable resistance machines (Polaris) | |
| | Intensity: 80% 1RM | |
| | Frequency: Ex3 Reps/Sets: 8-10/3 | |
| | Program Duration: 24 weeks Setting: gym | |
| | Adherence: 87% of sessions | |
| | Supervision: full 2. Control Group: maintain current routine | |
| Outcomes | Strength (1RM) | |
| | Activity performance Blair Seven Day Recall | |
| | Comments on adverse events: yes (safety a priorit | y objective) |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |

Ouellette 2004

| Methods | RCT Method of randomisation: not reported Assessor blinding: not reported Participant blinding: not reported Loss to Follow-up: 0 Intention-to-treat analysis: yes Post-program follow up: no | |
|-------------------------|---|-------------|
| Participants | Location: USA N = 42 (21 in each group) Sample: single mild to moderate stroke Age: mean 65.8 years (SD = 2.5) Inclusion criteria: subjects aged at least 50 years, 6 months to 6 years following a single unilateral mild to moderate stroke with residual lower extremity hemiparesis, community dwelling, independent ambulation with or without an assistive device, report of 2 or more limitations on the physical function subscale (PF 10) of the Medical Outcomes Survey Short-Form, ability to travel to the exercise laboratory, and willingness to be randomized. Stroke was diagnosed by history and clinical examination, and confirmed via medical records review. Exclusion criteria: myocardial infarction within the past 6 months, symptomatic coronary artery disease or congestive heart failure, uncontrolled hypertension, fracture within the past 6 months, acute or terminal illness, score less than 20 on the MMSE, inability to follow a 3-step command, current participation in regular strength training or supervised physical therapy, or pain during exercise | |
| Interventions | PRT versus control 1. PRT Type of Ex: 4 LLs Equipment: Pneumatic resistance training equipment (Keiser Sports Health Equipment) and modified stack-pulley system (Therapy Systems) Intensity: 70% of 1RM Frequency: Ex3 Reps/Sets: 8-10/3 Duration: 12 weeks Setting: gym Supervision: full Adherence: 85.4%-PRT; 79.9%-controls 2. Control group: bilateral range of motion ex and upper body flexibility exercise | |
| Outcomes | Primary: Late-Life Function and Disability Instrument, sickness impact profile Secondary: strength measure (1 RM), 6-minutes walk, gait speed, stair climb, chair rise Comments on adverse events: yes | |
| Notes | SD is obtained from SE for LLFD 1 | |
| Risk of bias | | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Unclear | B - Unclear |

Parkhouse 2000

| Methods | RCT Method of randomisation: not reported Assessor blinding: no Participant blinding: no Loss to Follow-up: not reported Intention-to-treat analysis: no Post-program follow up: no |
|--------------|---|
| Participants | Location: Canada N = 22 Sample: sedentary older women with low bone mineral density Age: mean 68.1 years Inclusion criteria: community-dwelling, sedentary, post-menopausal women, aged 60-80 years, low bone mineral density |

| | Exclusion criteria: medical or orthopaedic problems that would interfere with their ability to participate in physical activity, on hormone replacement | |
|-------------------------|---|-------------|
| Interventions | PRT versus control 1. PRT Type of Ex: 9 LL Equipment: not reported Intensity: 75-80% of 1RM Frequency: Ex3 Reps/Sets: 8-10/3 Program Duration: 8 months Setting: gym Supervision: not reported Adherence: not reported 2. Control Group: not reported | |
| Outcomes | Strength (1RM) Comments on adverse events: no | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement Description | |
| Allocation concealment? | Unclear | B - Unclear |

Pollock 1991

| Methods | RCT with 3 groups: PRT, control, and aerobic training group Method of randomisation: rank ordered then randomly stratified into 3 groups, with the restriction that more would be assigned to training groups Assessor blinding: no Participant blinding: no Loss to Follow-up: 8 total (4 in PRT and control) Intention-to-treat analysis: no Post-program follow up: no, but 6 month exercise program |
|---------------------|--|
| Participants | Location: USA N = 57 in total (36 in PRT and control) Sample: sedentary men and women Age: mean 72 years Inclusion criteria: free from overt evidence of coronary heart disease or any other conditions that would limit their participation in vigorous exercise; aged 70-79, sedentary for one year Exclusion criteria: blood pressure > 160/100; ECG changes or cardiac symptoms during exercise testing |
| Interventions | PRT versus control and versus aerobic 1. PRT Type of Ex: 5UL, 2LL, 3 Tr Equipment: variable resistance machines (Nautilus) Intensity: initially light to moderate, by week 14 encouraged to train to fatigue Frequency: Ex3 Reps/Sets: 8-12/1 Program Duration: 26 weeks Setting: gym Supervision: not reported Adherence: 97.8% sessions attended (excluding drop-outs), 87% stayed with program 2. Control Group: not reported 3. Aerobic Training Group: 3 sessions per week of walk/jog program for 26 weeks, aimed for duration of35-45min minutes at 75-85% VO2 max by week 26 |
| Outcomes | Strength VO2 max Adverse events Reaction time Comments on adverse events: yes (a priority outcome, well- defined) |
| Notes | Data from PRT and aerobic training group were compared |
| Notes Risk of bias | Data from PRT and aerobic training group were compared |

| Item | Authors' judgement | Description |
|-------------------------|--------------------|-------------|
| Allocation concealment? | Unclear | B - Unclear |

Pu 2001

| Methods | RCT Method of randomisation: matched by age then randomised Assessor blinding: no Participant blinding: no Loss to follow-up: 2 Intention-to-treat analysis: yes Post-program follow up: no | |
|-------------------------|--|-------------|
| Participants | Location: USA N = 16 Sample: older women with CHF Age: mean 77 years (SE 6) Inclusion criteria: community-dwelling women; 65 years or older; mild to moderate systolic heart failure New York Heart Association (NYHA) class I to III; resting ejection fraction less than or equal to 45%, Exclusion criteria: NYHA class IV heart failure; myocardial infarction within 6 months of randomisation, hospitalization for CHF within 2 months, change of CHF therapy within 1 MO; unstable angina pectoris, fixed ventricular rate pacemaker, abdominal aortic aneurysm >4cm, major limb amputation, symptomatic abdominal or inguinal hernias, MMSE <23, signification abnormalities on treadmill or strength testing, any unstable medical conditions | |
| Interventions | PRT versus control 1. PRT Type of Ex: 2UL, 2LL Equipment: pneumatic resistance equipment (Keiser) Intensity: 80% of 1RM Frequency: Ex3 Reps/Sets: 8/3 Program Duration: 10 weeks Setting: Gym Adherence: 98% Supervision: Full 2. Control Group: sham exercise group 2 time per week of supervised, low-intensity stretches for 10 weeks | |
| Outcomes | Exercise capacity (6-minute walk) Maximal oxygen consumption Comments on adverse events: yes | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Rall 1996

| Methods | RCT: (groups of healthy young people and middle-aged people with RA not included in this review) Method of randomisation: not reported Assessor blinding: no Participant blinding: no Loss to follow-up: 0 Intention-to-treat analysis: no drop-outs, not stated Post-program follow up: no |
|--------------|--|
| Participants | Location: USA N = 14 Sample: healthy elderly Age: mean 70.3 years (SD 5) |

| | Inclusion criteria: healthy older people (ages 65-80) Exclusion criteria: obese (BMI>30), diabetes, cancer, renal disease, liver disease, cardiac artery disease, endocrine disorder, autoimmune disease | | |
|-------------------------|---|-------------|--|
| Interventions | PRT versus control 1. PRT Type of Ex: 1UL, 2LL, 2 Tr Equipment: pneumatic resistance machines (Keiser) Intensity: 80% of 1 RM Frequency: Ex2 Reps/Sets: 8/ 3 Program Duration: 12 weeks Setting: gym Supervision: full Adherence: 92% 2. Control Group: 15 minutes of water exercises | | |
| Outcomes | Strength (1RM) Aerobic capacity - VO2 max Comments on adverse events: yes | | |
| Notes | | | |
| Risk of bias | Risk of bias | | |
| Item | Authors' judgement | Description | |
| Allocation concealment? | Unclear | B - Unclear | |

Reeves 2004

| Methods | RCT Method of randomisation: not reported Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 0 Intention-to-treat analysis: not reported Post-program follow up: no | | |
|-------------------------|---|-------------|--|
| Participants | Location: UK N = 18 (9 in each group) Sample: physically active volunteers Age: mean 74.3 years (SD = 3.5) Inclusion criteria: no neurological or musculoskeletal disorder that might prevent participation Exclusion criteria: not reported | | |
| Interventions | PRT versus control 1. PRT Type of Ex: 2UL/2LL Equipment: Technogym machines Intensity: 80% of 5 RM Frequency: Ex3 Reps/Sets: 10/2 Duration: 14 weeks Setting: not reported Supervision: full Adherence: 93% 2. Control Group: to keep normal activity level | | |
| Outcomes | Muscle strength Comments on adverse events: no | | |
| Notes | | | |
| Risk of bias | | | |
| Item | Authors' judgement | Description | |
| Allocation concealment? | Unclear | B - Unclear | |

Rhodes 2000

| Methods | RCT Method of randomisation: not reported Assessor blinding: no Participant blinding: no Loss to follow-up: 6 Intention-to-treat analysis: no Post-program follow up: no, but exercise program 1 year duration | |
|-------------------------|--|-------------|
| Participants | Location: Canada N = 44 Sample: healthy, community-dwelling sedentary women Age: mean 68.8 years Inclusion criteria: aged 65-75, not actively engaged in an organised activity program, had independent community dwelling status, passed medical screening by doctor Exclusion criteria: recent hospital stay, blind, severe hearing impairment, uncontrolled hypertension and diabetes, symptomatic cardiorespiratory disease, severe renal or hepatic disease, uncontrolled epilepsy, progressive neurological disease, chronic disabling arthritis, MMSE<25/30, anaemia, marked obesity with the inability to exercise, regular exercise at the time of screening more than 3 times 30 minutes per week, current use of Beta-blockers, oral anti-coagulants or central nervous system stimulants | |
| Interventions | PRT versus control 1. PRT Type of Ex: 3UL, 3LL Equipment: weight-lifting equipment (Universal Gym) Intensity: 75% 1RM Frequency: Ex3 Reps/Sets: 8/3 Program duration: 1 year Setting: first 3 months in supervised gym, last 9 months at a recreation facility close to participants' home Supervision: supervised for first 3 months, last 9 months had occasional visits from study staff Adherence: 86% (attendance) 2. Control Group: asked to maintain normal lifestyle, could participate in exercises at the end of the trial | |
| Outcomes | Muscle strength (1RM, hand grip) Flexibility (trunk flexion test) Comments on adverse events: no | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| Allocation concealment? | Unclear | B - Unclear |

Schilke 1996

| Methods | RCT Method of randomisation: table of random numbers used Assessor blinding: no Participant blinding: no Loss to follow-up: no Intention-to-treat analysis: No dropouts, not stated ITT Post-program follow up: no |
|---------------|--|
| Participants | Location: USA N = 20 Sample: man and women with knee OA Age: mean 64.5 years in PRT group Inclusion criteria: from rheumatology clinic, no condition to preclude increased activity/ strength training, not currently involved in a scheduled program of regular of exercise and had not participated in a strength-training program in the last 6 months Exclusion criteria: not reported |
| Interventions | PRT versus control 1.PRT Type of Ex: 1LL Equipment: isokinetic dynamometer (Cybex II) |

| | Intensity: high - maximal contractions Frequency: Ex3 Reps/Sets: 5/ 6 by session 6 (the end of week 2) Program duration: 8 weeks Setting: gym Supervision: full Adherence: not reported 2. Control Group: usual activities | |
|--------------|---|-------------|
| Outcomes | Strength (isokinetic dynamometer) Timed walk Range of motion Health status (Arthritis Impact Measurement Scales; higher score = poor health status) Osteoarthritis Screening Index (OASI; modified from RheumatoidArthritis Disease Activity Index; higher score = worse health) Comments on adverse events: no | |
| Notes | | |
| Risk of bias | | |
| Item | Authors' judgement | Description |

B - Unclear

Schlicht 1999

Allocation concealment?

Unclear

| Methods | RCT Method of randomisation: not reported Assessor blinding: no Participant blinding: no Loss to follow-up: 2 Intention-to-treat analysis: no Post-program follow up: no | |
|-------------------------|--|-------------|
| Participants | Location: USA N=24 Sample: moderately active, community-dwelling men and women Age: mean 72 years (SD 6.3) Inclusion criteria: 60 years and older, community-dwelling, physician consent to participate Exclusion criteria: dependent living status, current involvement in a strength training program, physiological disorders that precluded strenuous exercise or affected vestibular function | |
| Interventions | PRT versus control 1. PRT Type of Ex: 6LL Equipment: resistance training machines (Universal, Cybex and Paramount equipment) Intensity: 75% of 1RM Frequency: Ex3 Reps/Sets: 10/2 Program Duration: 8 weeks Setting: gym Supervision: not reported Adherence: 99% (excluding drop outs) 2. Control Group: not reported | |
| Outcomes | Muscle strength (1 RM) Maximum walking speed 5-rep sit-to-stand Balance (1-leg stance with eyes shut) Comments on adverse events: yes | |
| Notes | | |
| Risk of bias | | |

| Methods | RCT Method of randomisation: not reported Assessor blinding: not reported Participant blinding: not reported Loss to follow-up: 0 Intention-to-treat analysis: N/A Post-program follow up: no | |
|-------------------------|--|-------------|
| Participants | Location: USA N = 35 Sample: adults with knee OA Age: mean = 65.57 years (SD = 1.82) estimated Inclusion criteria: knee pain due to OA (based on WOMAC); physician validated the knee pain and the diagnosis of OA Exclusion criteria: had any contraindications for exercise, including a history of uncontrolled angina, cardiomyopathy severe enough to compromise cardiac functioning, electrolyte or metabolic disturbances, disabilities that prohibited resistance training of the lower extremities, or if they were currently taking nitrates, digitalis, or phenothiazine. Individuals were also excluded if they were currently participating in an organized exercise program or exercised more than 1 hour per week | |
| Interventions | PRT versus control 1. PRT Type of Ex: 6 LL for 30 minutes Equipment: Thera-Band elastic bands Intensity: self exertion of mild fatigue after 8RM Frequency: Ex3 (2 at home 1 at gym) Reps/Sets: increasing reps and sets every week and then reached 12 reps/3sets at week 9 to 16 Duration: 16 weeks Setting: home and gym Supervision: provided in the gym Adherence: each participant had exercise log, but results were not reported 2. Control Group: no intervention | |
| Outcomes | WOMAC Knee pain Stair climbing Down and up off the floor Comments on adverse events: no | |
| Notes | Calculated SDs from reported SEMs | |
| Risk of bias | | |

Wood 2001

| Methods | RCT with 4 groups: PRT alone, aerobic training alone, combined PRT and aerobic training and control Method of randomisation: not reported Assessor blinding: no Participant blinding: no Loss to follow-up: 9 in four groups - drop outs not reported by group Intention-to-treat analysis: no Post-program follow up: no |
|---------------|--|
| Participants | Location: USA N = 45 total (16 in PRT and control) Sample: healthy older people Age: mean 69.8 years (SD 6) in PRT Inclusion criteria: aged 60-84, no diseases or conditions that would put them at high risk for adverse responses to exercise Inclusion criteria: history of surviving sudden cardiac death, recent myocardial infarction, unstable angina, poorly controlled hypertension, poorly controlled diabetes mellitus, frequent or complex ventricular ec-topy, significant cognitive dysfunction that might interfere with one's ability to adhere to exercise protocols, in the inflammatory stage of arthritis, receiving medical treatment for osteoporosis |
| Interventions | PRT versus control and versus aerobic 1. PRT Type of Ex: 5UL, 3LL Equipment: resistance training machines Intensity: 75% of 5RM at first, progressed to 8-12RM |

| | Frequency: Ex3 Reps/Sets 8-12 from progressed from 1 set to 2 sets Program Duration: 12 weeks Setting: gym Supervision: not reported Adherence: excluded those who did not have 80% or more attendance 2. Control Group: asked not to make significant changes in their physical activity and nutrition habitsover a 12-week period 3. Aerobic Training: trained on treadmills and cycle ergometers 3 times per week at 60-70% estimatedHR reserve, for 21- 45 minutes per session |
|----------|--|
| Outcomes | Strength (5RM) Submaximal aerobic capacity Co-ordination Comments on adverse events: no |
| Notes | Data from PRT and aerobic training group were compared |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------|--------------------|-------------|
| Allocation concealment? | Unclear | B - Unclear |

ADL: activities of daily living

Age: overall age of all groups. If this is not available age for progressive resistance training group alone is reported

CHF: congestive heart failure CHD:coronary heart disease

COPD: chronic obstructive pulmonary disease

Ex: exercise

Ex1: exercise once per week
Ex2: exercise twice per week
Ex3: exercise three times per week

HI: high intensity
MI: Medium intensity
LI: low intensity

LL: lower limb

METs: maximum metabolic equivalents

MMSE: the Mini-Mental State Examination

N: number of participants allocated to strength training group and control group; or number of participants allocated to additional intervention group

NA: not applicable

OA: osteoarthritis

PAD: peripheral arterial disease RCT: Randomised controlled trial

PRT: progressive resistance strength training Reps: repetitions

RM: repetition maximum

SF-36: Medical Outcome Studies 36 Item Short Form questionnaire

Tr: trunk

TUAG: timed "up-and-go" test

UL: upper limb

WOMAC: Western Ontario/McMaster Universities Arthritis Index

Characteristics of excluded studies [ordered by study ID]

| Study | Reason for exclusion |
|-----------------|--|
| Adami 1999 | Not a RCT |
| Adams 2001 | Participants too young (mean age <60) |
| Agre 1988 | Not a RCT |
| Alexander 2003 | Combined program - not PRT alone |
| Aniansson 1981 | Not a RCT |
| Annesi 2004 | Combined intervention program - not PRT alone |
| Ardman 1998 | Not a RCT |
| Ballard 2004 | Combined program - not PRT alone |
| Barbosa 2002 | Not a RCT |
| Baum 2003b | Does not meet criteria for PRT |
| Bean 2002 | Does not meet criteria for PRT |
| Bellew 2003 | Not a RCT |
| Beniamini 1997 | Participants too young (mean age <60) |
| Beniamini 1999 | Participants too young (mean age <60) |
| Berg 1998 | Not a RCT |

| | | | | |

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|-----------------------------------|----------------|---------------------|---|----------------------|
| 19 Pain (lower score = less pain) | 6 | 503 | Std. Mean Difference (IV, Fixed, 95% CI) | -0.30 [-0.48, -0.13] |
| 20 Death | 13 | 1125 | Risk Ratio (M-H, Fixed, 95% CI) | 0.89 [0.52, 1.54] |

Comparison 2. High versus low intensity PRT

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|--|----------------|---------------------|--|---------------------|
| 1 Main function measure (higher score = better function) | 2 | 62 | Std. Mean Difference (IV, Fixed, 95% CI) | -0.17 [-0.67, 0.33] |
| 2 Main lower limb (LL) strength measure | 9 | 219 | Std. Mean Difference (IV, Random, 95% CI) | 0.48 [0.03, 0.93] |
| 3 VO2 Max (ml/kg/ min) | 3 | 101 | Mean Difference (IV, Random, 95% CI) | 1.82 [-0.79, 4.43] |
| 4 Pain (higher score = less pain) | 2 | 62 | Std. Mean Difference (IV, Fixed, 95% CI) | -0.05 [-0.55, 0.45] |
| 5 Vitality (SF-36, higher score = more vitality) | 2 | 62 | Mean Difference (IV, Fixed, 95% CI) | 6.54 [0.69, 12.39] |

Comparison 3. High versus variable intensity PRT

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|--|----------------|---------------------|--|---------------------|
| 1 Main lower limb (LL) strength measure | 1 | | Std. Mean Difference (IV, Random, 95% CI) | Totals not selected |
| 2 VO2 Max (ml/kg/ min) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |

Comparison 4. PRT frequency

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|---|----------------|---------------------|--|---------------------|
| 1 Main LL strength measure | 2 | | Std. Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 1.1 Three times versus once per week | 1 | | Std. Mean Difference (IV, Fixed, 95% CI) | Not estimable |
| 1.2 Twice versus once per week | 1 | | Std. Mean Difference (IV, Fixed, 95% CI) | Not estimable |

Comparison 5. PRT: 3-sets versus 1-sets

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|--|----------------|---------------------|--|---------------------|
| 1 Main lower limb (LL) strength measure | 1 | | Std. Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 2 Six-minute walk test (meters) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 3 Timed walk (seconds) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 4 Time to stand from a chair (seconds) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 5 Stair climbing (seconds) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |

Comparison 6. PRT versus aerobic training

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|---|----------------|---------------------|--|---------------------------|
| 1 Main function measure (higher score = better function) | 4 | 125 | Std. Mean Difference (IV, Fixed, 95% CI) | -0.21 [-0.56, 0.15] |
| 2 Main function measure (lower score = better function) | 1 | | Std. Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 3 Main lower limb strength measure | 10 | 487 | Std. Mean Difference (IV, Random, 95% CI) | 0.44 [0.08, 0.80] |
| 4 VO2 max (ml/ kg.min) | 8 | 423 | Mean Difference (IV, Random, 95% CI) | -1.13 [-2.63, 0.38] |
| 5 Six minute walk test (meters) | 2 | 63 | Mean Difference (IV, Fixed, 95% CI) | -4.28 [-48.24, 39. 67] |
| 6 Gait speed (m/s) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 7 Pain (lower score = less pain) | 1 | | Std. Mean Difference (IV, Fixed, 95% CI) | Totals not selected |

Comparison 7. PRT versus functional exercise

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|---|----------------|---------------------|-------------------------------------|----------------------|
| 1 Main function measure (higher score = better function) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 2 Main lower limb strength measure | 3 | 158 | Mean Difference (IV, Fixed, 95% CI) | -6.51 [-21.05, 8.04] |
| 3 Timed "Up-and-Go" (seconds) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 4 Vitality (SF-36/ Vitality plus scale, higher = more vitality) | 2 | 147 | Mean Difference (IV, Fixed, 95% CI) | -0.07 [-2.68, 2.54] |

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|---|----------------|---------------------|-------------------------------------|---------------------|
| 5 Pain (higher = less pain, Bodily pain on SF-36) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |

Comparison 8. PRT versus flexibility training

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|---|----------------|---------------------|-------------------------------------|---------------------|
| 1 SF36 (higher score = better function) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 2 Main lower limb (LL) strength measure | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 3 Timed walk (seconds) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 4 Time to stand from a chair (seconds) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 5 Vitality (SF-36/ Vitality plus scale, higher = more vitality) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 6 Pain (higher = less pain, Bodily pain on SF- 36) | 1 | | Mean Difference (IV, Fixed, 95% CI) | Totals not selected |

Comparison 9. Power training

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|---|----------------|---------------------|--|---------------------|
| 1 Main lower limb strength measure | 3 | | Std. Mean Difference (IV, Fixed, 95% CI) | Totals not selected |
| 1.1 High intensity (power treatment) versus control (control) | 2 | | Std. Mean Difference (IV, Fixed, 95% CI) | Not estimable |
| 1.2 High intensity (treatment) versus low intensity (control) | 2 | | Std. Mean Difference (IV, Fixed, 95% CI) | Not estimable |

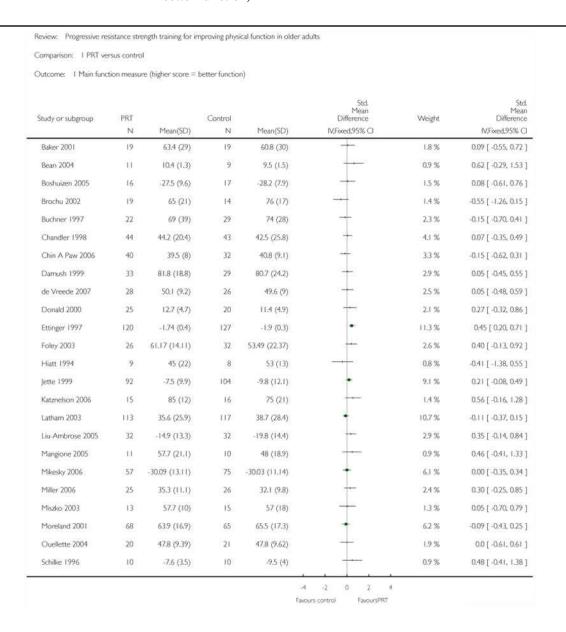

Comparison 10. PRT versus control supplementary analyses

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|--|----------------|---------------------|--|--------------------|
| 1 Strength (grouped by allocation concealment) | 73 | | Std. Mean Difference (IV, Fixed, 95% CI) | Subtotals only |
| 1.1 Allocation concealed | 6 | 607 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.12 [-0.04, 0.28] |
| 1.2 Concealment unknown | 67 | 2452 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.65 [0.56, 0.73] |

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|---|----------------|---------------------|--|-------------------|
| 2 Strength (grouped by assessor blinding) | 73 | | Std. Mean Difference (IV, Fixed, 95% CI) | Subtotals only |
| 2.1 Blinded assessors | 19 | 1523 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.23 [0.13, 0.34] |
| 2.2 Assessors were not blinded | 54 | 1536 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.88 [0.77, 0.99] |
| 3 Strength (grouped by intention-to-treat) | 73 | 3059 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.53 [0.46, 0.61] |
| 3.1 Intention-to-treat was used | 12 | 1041 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.18 [0.06, 0.30] |
| 3.2 Intention-to-treat was not used | 61 | 2018 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.74 [0.64, 0.83] |
| 4 Strength (grouped by attention control) | 73 | 3059 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.53 [0.46, 0.61] |
| 4.1 Attention control | 24 | 1408 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.34 [0.23, 0.44] |
| 4.2 No attention control | 49 | 1651 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.72 [0.61, 0.82] |
| 5 Strength (grouped by exercise intensity) | 72 | 3052 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.53 [0.45, 0.60] |
| 5.1 High intensity | 54 | 2026 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.60 [0.51, 0.70] |
| 5.2 Low-to-moderate intensity | 19 | 1026 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.39 [0.26, 0.51] |
| 6 Strength (grouped by exercise duration) | 56 | 2564 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.53 [0.45, 0.61] |
| 6.1 Less than 12 weeks | 20 | 828 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.52 [0.37, 0.66] |
| 6.2 Longer than 12 weeks | 36 | 1736 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.53 [0.43, 0.63] |
| 7 Strength (grouped by health status) | 65 | 2428 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.60 [0.52, 0.69] |
| 7.1 Healthy participants | 46 | 1502 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.77 [0.66, 0.88] |
| 7.2 Older adults with a specific health problem | 19 | 926 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.37 [0.24, 0.51] |
| 8 Strength (grouped by functional limitations) | 54 | 2133 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.60 [0.51, 0.70] |

| Outcome or subgroup title | No. of studies | No. of participants | Statistical method | Effect size |
|---------------------------------|----------------|---------------------|--|-------------------|
| 8.1 No functional limitations | 41 | 1349 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.81 [0.69, 0.93] |
| 8.2 With functional limitations | 13 | 784 | Std. Mean Difference (IV, Fixed, 95% CI) | 0.30 [0.16, 0.44] |

Plain Language Summary

Progressive resistance strength training for improving physical function in older adults

Older people generally lose muscle strength as they age. This reduction in muscle strength and associated weakness means that older people are more likely to have problems carrying out their daily activities and to fall. Progressive resistance training (PRT) is a type of exercise where participants exercise their muscles against some type of resistance that is progressively increased as their strength improves. The exercise is usually conducted two to three times a week at moderate to high intensity by using exercise machines, free weights, or elastic bands. This review sets out to examine if PRT can help to improve physical function and muscle strength in older people.

Evidence from 121 randomised controlled trials (6,700 participants) shows that older people who exercise their muscles against a force or resistance become stronger. They also improve their performance of simple activities such as walking, climbing steps, or standing up from a chair more quickly. The improvement in activities such as getting out of a chair or stair climbing is generally greater than walking speed. Moreover, these strength training exercises also improved older people's physical abilities, including more complex daily activities such as bathing or preparing a meal. PRT also reduced pain in people with osteoarthritis. There was insufficient evidence to comment on the risks of PRT or long term effects.

| | | PRT | | C | ontrol | | | Std. Mean Difference | Std. Mean Difference |

Table 1 Assessment of methodological quality scheme

| Items | Scores | Notes |
|--|--|---|
| A. Was the assigned treatment adequately concealed prior to allocation? | 2 = method did not allow disclosure of assignment. 1 = small but possible chance of disclosure of assignment or unclear. 0 = quasi-randomised or open list/tables. | |
| B. Were the outcomes of patients/ participants who withdrew described and included in the analysis (intention-to- treat)? | 2 = withdrawals well described and accounted for in analysis. 1 = withdrawals described and analysis not possible. 0 = no mention, inadequate mention, or obvious differences and no adjustment | |
| C. Were the outcome assessors blind to treatment status? | 2 = effective action taken to blind assessors. 1 = small or moderate chance of un blinding of assessors. 0 = not mentioned, or not possible. | |
| D. Were the participants blinded to the treatment status? | 2 = effective action taken to blind assessors. 1 = small or moderate chance of un blinding of assessors. 0 = not mentioned, or not possible. | |
| E. Were the treatment and control group comparable at entry? Specifically, were the groups comparable with respect to age, medical co-morbidities (one or more of history of coronary artery disease, stroke, hypertension, diabetes, chronic lung disease), pre-entry physical dependency (independent vs dependent in self-care ADL) and mental status (clinical evidence of cognitive impairment, yes or no)? | 2 = good comparability of groups, or confounding adjusted for in analysis. 1 = confounding small; mentioned but not adjusted for. 0 = large potential for confounding, or not discussed. | |
| F. Were care programmes, other than the trial options, identical? | 2 = care programmes clearly identical. 1 = clear but trivial differences. 0 = not mentioned or clear and important differences in care programmes | |
| G. Were the inclusion and exclusion criteria clearly defined? | 2 = clearly defined. 1 = inadequately defined. 0 = not defined. | |
| H. Were the interventions clearly defined? | 2 = clearly defined interventions are applied with a standardised protocol. 1 = clearly defined interventions are applied but the application protocol is not standardised. 0 = intervention and/or application protocol are poorly or not defined | |
| I. Were the outcome measures used clearly defined? | 2 = clearly defined measures and the method of data collection and scoring are clearly described 1 = inadequately defined measures 0 = not defined. | For our primary outcome, physical disability in terms of self-report measures of physical function, we considered the outcome clearly defined if a validated and standardised scale was used and the method of data collection was clearly described. Our secondary outcome measures included gait speed, muscle strength (e.g. one repetition maximum test, isokinetic and isometric dynamometry), balance (e.g. Berg Balance Scale, Functional Reach Test), aerobic capacity, and chair rise. These secondary outcomes were considered well defined if validated and standardised measures were used, and the method of data collection and scoring of any scales was clearly described |

| Items | Scores | Notes |
|---|--|-------|
| J. Was the surveillance active and of clinically appropriate duration (i.e. at least 3 months)? | 2 = active and appropriate duration (three months follow-up or greater). 1 = active but inadequate duration (less than three months follow-up). 0 = not active or surveillance period not defined. | |

Note: 2/0 indicates that different standards used to assess different outcomes in the same study

NA = not available, no full report published

Table 3 Functional or quality of life measures that could not be pooled

| Study | Outcome Measure | Treatment Group | Control Group |
|-----------------|---|---|---|
| Baum 2003 | Physical performance test at 6 month. Mean = baseline score + change score. SD was not reported | 9.2 | 8.1 |
| Buchner 1997 | mean change in number of independent IADL's | mean 0.1 (SD 0.7) | mean 0.2 (SD 0.7) |
| Donald 2000 | Barthel Index (actual data not in paper) | no significant difference | |
| Fiatarone 1994 | ankle activity monitors (counts/day) | mean change 3412 (SD 1700) | mean change -1230 (SD 1670) |
| Fiatarone 1997 | overall self-reported activity level (measure not specified) | significant improvement (p<0.05) in exercise group | NR |
| Fielding 2002 | SF-36-PF | No significant differences between high intensity and low intensity groups | |
| Jette 1996 | SF-36 - PF (actual data not reported) | no significant difference between groups (data not reported) | |
| Kongsgaard 2004 | three ADLs of a questionnaire developed by the Danish Institute of Clinical Epidemiology | Actual data not reported. The author stated that the self-reported ADL level was significantly higher in the Ex group than in the control group | |
| Krebs 2007 | SF-36. 7 people (2 in PRT, 5 in Functional training) reported improvement in the SF-36 items | | |
| Maiorana 1997 | Physical Activity Questionnaire (no reference) self report | mean 209.8 (SD 142.9) kJ/kg | mean 250.1 (SD 225) kJ/kg |
| Maurer 1999 | SF-36 PF (no SD/SE reported) | mean 50.3 | mean 49.2 |
| Maurer 1999 | WOMAC section C (no SD/SE reported) | 464.4 | 606.6 |
| Maurer 1999 | Aims Mobility (no SD/SE reported) | 1.28 | 1.21 |
| McMurdo 1995 | Barthel Index (medians reported) | median change 0 (range -1 to 2) | median change control 0 (range -1 to 1) |
| Mihalko 1996 | adapted version of Lawton and Brody's IADL scale (higher = better, not pooled because study was cluster randomised) | mean 105 (SD 12) | mean 68 (SD 25) |
| Mikesky 2006 | SF-36 physical function at 30 month (the intervention was 1 - year) | n =81, mean = 65.37 (SD = 25.05) | n = 79, mean = 63.88 (SD = 25.48) |
| Nichols 1993 | Blair Seven-day recall Caloric Expenditure (KCalories) | not significantly altered | not significantly altered |
| Schilke 1996 | AIMS mobility score (actual data not reported) | "no significant differences between or within groups" | |
| Singh 1997 | IADL (Lawton Brody Scale) | mean 23.4 (SD 0.4) | mean 23.9 (SD 0.1) |
| Skelton 1996 | Human Activity Profile - (only reported training groups % change and the P-value of the change) | 3.9% change 3.9% change | NR |
| Skelton 1996 | Human Activity Profile - Max Activity Score | 0% change | NR |
| Skelton 1995 | Human Activity Profile | no difference from baseline | no difference from baseline |
| Thielman 2004 | Rivermead Motor Assessment | Significant improvement was found for people in the control group with low-level function | |
| Tyni-Lenne 2001 | Minnesota Living with Heart Failure Questionnaire (lower score = better QOL, medians reported) | median 19 (range 0-61) | median 44 (range 3-103) |

Table 4 Falls

| Study | Fall Statistic | PRT | Control |
|------------------|---|---|-----------------|
| Buchner 1997 | 1) Cox regression analysis, time to first fall, 0.53, 95% CI 0.3-0.91 for exercise group (including endurance exercise groups) | | |
| | 2) proportion of people who fell in one year | all exercise groups: 42% | 60% |
| | 3) fall rate (falls/year) | all exercise: 0.81 falls/year | 0.49 falls/year |
| Donald 2000 | 1) number of falls | 7 (n = 32) | 4 (n = 27) |
| | 2) number of people who fell | 6 (n = 32) | 2 (n = 27) |
| * Fiatarone 1994 | 1) average falls/subject | 2.32 | 2.77 |
| | 2) covariance adjusted treatment incidence ratio (PRT vs control) | 0.95 (95% CI 0.64, 1.41) | |
| Fiatarone 1997 | Falls | no difference between groups (no data provided) | |
| * Judge 1994 | 1) Average falls/subject | 0.82 | 1.22 |
| | 2) Co-variate adjusted treatment incidence ratio (PRT vs control) | 0.61 (95%CI 0.34,1.09) | |
| * Buchner 1997 | 1) Average falls/subject | 0.68 | 1.6 |
| | 2) Co-variate adjusted treatment incidence ratio (PRT vs control) | 0.91 (95%CI 0.48,1.74) | |
| Krebs 2007 | 1 in the PRT group sustained an unrelated fall halfway through the 6-week intervention, resulting in injury of her dominate shoulder. Exercise was modified for her | 1 | 0 |
| Latham 2001 | total falls | 164 | 149 |
| Latham 2003 | 1) number of people who fell | 60 | 64 |
| | 2) fall-rate, person years | 1.02 | 1.07 |
| Liu-Ambrose 2005 | the frequency of falls (excluded falls occurred in exercise classes) | 18 (1 subject fell 7 times) | 0 |
| Mangione 2005 | Reported the number of participants fell during post-training examination (n = 1 - group was not reported) | | |
| Miszko 2003 | Report number of people | 5 | 1 |
| Singh 2005 | Numbers per person, no statistical difference between groups | .15 (.37) | 0 |

Note: Data marked with * were obtained from Province 1995

Table 5

Adverse events

| , | | | | | | ; | |
|----------------|--------------------------|--|---|---|---|--------------|-----------------------|
| Study | Any Comment re: AE | AE Occurred (y/n/nr) | Description | Dropout Fathologies | Fain | Medical Care | Deaths |
| Ades 1996 | No | | | None reported | | | |
| Baker 2001 | Yes | No | NR | Yes, 2 in treatment group (neck arthritis, prior back injury), 2 in control (illness, psoriatic arthritis) | Treatment group decreased in WOMAC, SF-36 BP no change | NR | |
| Balagopal 2001 | No | | | NR | | | |
| Ballor 1996 | No | | | NR | | | |
| Barrett 2002 | Yes | Yes | 2 in PRT group, aggravation of OA | 2 in PRT group, aggravation of OA | | | |
| Baum 2003 | Yes | Yes | | The number of illness was not reported. 13% of repeated measurements after baseline were missing because of death or patient inability to perform the test because of acute illness | | | l in the PRT group |
| Bean 2004 | Yes | No | No significant adverse events occurred | | | | |
| Beneka 2005 | No | NR | | | | | |
| Bermon 1999 | No | | | No | | | |
| Boshuizen 2005 | Yes | Yes | | 9 dropout due to illness of participant or partner | 4 reported pain during or after the exercise | | 1 in control |
| Brandon 2000 | No | | | | NR | NR | |
| Brandon 2003 | Yes | 8 members of exercise group had BP raised to over 200 mmHg systolic or 100 mmHg diastolic at some point during the exercises during 24 months; and had to stop exercising that day | | Participant's disease (diabetics) got worse; specific number was not reported | | | |
| Brochu 2002 | Yes | Yes | 2 experienced occasional significant exacerbation of arthritic conditions during the training. I experienced significant dizziness in a supine position | Yes, 3 due to medical problems that are not related to the training | 2 individuals experienced occasional significant exacerbation of arthritic | NR | NR |

| Study | Any Comment re: AE | AE Occurred (y/n/nr) | Description | Dropout Pathologies | Pain | Medical Care | Deaths |
|------------------|--------------------------|----------------------|---|---|--|--|---|
| | | | | | conditions during the training conditions during the training conditions during the training | the training the training the training | |
| Bruunsgaard 2004 | No | NR | | | | | |
| Buchner 1997 | Yes | Yes | 6 Injuries in strength training or in strength/endurance training group (not reported separately, n = 50) | Not described | no significant change in BP of SF-36 | For all exercise groups (i.e. including endurance exercise groups): stable outpatient visits in exercise group/control increased, no difference in hospitalisation rates | |
| Casaburi 2004 | Yes | No | | 5 (group?) -non protocol related health problems | NR | | |
| Castaneda 2001 | Yes | No | | No | | | |
| Castaneda 2004 | Yes | Yes | | The authors did not report the number and group of the dropouts. The statement is "reasons for early termination of the study included loss of greater than 20% of initial body weight, need for dialysis therapy or transplantation, development of a serious condition requiring hospitalization or precluding exercise and signs of malnutrition". | | | |
| Chandler 1998 | No | | | 9 dropouts due to illness, 1 due to increased hip pain, 1 refused further strength testing (not given by group) | NR | NR | |
| Charette 1991 | No | | | 1 discomfort after initial strength testing, 3 intercurrent illness not related to training | NR | NR | |
| Chin A Paw 2006 | Yes | Yes | None withdrew because of adverse effects | 9 illness in PRT; 9 illness in functional training group; 10 illness in combined training group; 6 illness in control group | | | 1 in PRT; 4 in functional training; 1 in combined training; 2 in control group |
| Collier 1997 | No | | | No | | | |
| Damush 1999 | No | | | 6 exercise drop-outs due to illness | | | |
| | | | | | | | |

| Study | Any Comment re: AE | AE Occurred (y/n/nr) | Description | Dropout Pathologies | Pain | Medical Care | Deaths |
|------------------|---------------------------|----------------------|--|--|---|--|--------|
| de Vos 2005 | Yes | Yes | 20 AEs reported in 17 participants. 16 were related to strength testing and 4 were related to power training. 8 were in high intensity group, 7 in medium, 4 in low, and 1 in control. AEs included minor strains, tendonities, and exacerbation of osteoarthritis | 4 (1 in each group) dropout-joint pain 1 inguinal hemia in medium intensity group. 1 medical reason in low intensity group | Joint pain (see dropout pathologies) | | |
| de Vreede 2007 | Yes | Yes | PRT: 1 had muscle strained. 10 reported muscle pain, 5 osteoarthritic joint pain, 3 prosthetic joint pain, and 4 lower back pain | PRT group: 1 hip fracture, 1 pneumonia, & 1 eye operation. Control: 1 wrist fracture | PRT: 10 reported muscle pain, 5 osteoarthritic joint pain, 3 prosthetic joint pain, and 4 lower back pain | | |
| DeBeliso 2005 | Yes | No | no injuries occurred during the training | | | | |
| DiFrancisco 2007 | Yes | No | Occasionally complaints of muscle soreness for 2 days after exercise, but it did not affect participants' daily routine or training | | | | |
| Donald 2000 | No | | | not clear | | | |
| Earles 2001 | Yes (a priori outcome) | Yes | 4 reported discomfort, 2 stopped program - 1 due to back pain, 1 due to lumbar disc hemiation, possibly due to study intervention | Yes | | | |
| Ettinger 1997 | Yes | Yes | PRT: 2 falls, one weight dropped on foot; Aerobic: 2 falls; Control: 1 sudden death (defined AE as death or injury requiring medical care) | NR | less for PRT group vs control | NR | NR |
| Fahlman 2002 | No | NR | | | | | |
| Fatouros 2002 | No | NR | | | | | |
| Fatouros 2005 | Yes | Yes | | 3 men stopped within the 1st week due to injury | | | |
| Fiatarone 1997 | No | | | I exercise dropout due to increased musculoskeletal pain | NR | no difference in health care visits between groups | NR |

| Study | Any Comment re: AE | AE Occurred (y/n/nr) | Description | Dropout Pathologies | Pain | Medical Care | Deaths |
|----------------|--------------------------|--------------------------------------|---|---|---|--------------|---------------------|
| Fiatarone 1994 | Yes | Yes | PRT: 2 reports of joint pain, program was altered No control info No cardiovascular events | 2 exercise drop outs, 1 due to musculoskeletal pain, 1 due to pneumonia | not measured | NR | 0 PRT and 1 control |
| Fielding 2002 | Yes | Yes | see the dropout pathologies | 4 (2 in each group) discontinued secondary to exacerbation of preexist OA. 1 in the high velocity group withdrew secondary to recurrence of chronic plantar fasciicis | | | |
| Flynn 1999 | No | | | NR | NR | NR | NR |
| Foley 2003 | Yes | Yes | Gym-based exercise group: 2 had increased pain and 1 had increased blood pressure. 1 - Dr. advised to cease program | Gym-based exercise group: 2 with increased pain, 1 with unrelated surgery, 1 with increased blood pressure, and 1 had joint replacement surgery. Control group: 2 with joint replacement surgery and 1 with illness | 2 reported increased pain the gym-based exercise group. | | |
| Frontera 2003 | No | NR | | | | | |
| Galvao 2005 | Yes | °N | I in I-set group withdrew due to illness, I due to injury sustained during part-time work, and I due to aggravation of a preexisting hip injury | | | | |
| Надегтап 2000 | N _O | | | 3 PRT and 1 control withdrew because of minor injuries or previous medical problems exacerbated by testing/training | "no complaints of excess or intolerable muscle soreness or fatigue" | NR | NR |
| Harris 2004 | Yes | No | | | | | |
| Haykowsky 2005 | Yes | Yes | | I in PRT withdrew because of shoulder discomfort and migraines. I in the combination training suffered a lower extremity injury not related to the study | | | |
| Haykowsky 2000 | Yes | No (completed without complications) | | NR | | | |
| Hennessey 2001 | No | | | NR | | | |
| Hepple 1997 | No | | | No | | | |
| Hiatt 1994 | No | | | No | | | |
