I BACKGROUND

1	Introduction	3
1.1	The physical process of radiation trapping	3
1.2	Historical overview	6
1.3	Applications of radiation trapping	9
1.4	Outline of the book	12
2	Atomic Lineshapes	15
2.1	The Einstein theory of radiation	15
2.2	Broadening mechanisms	20
2.2.1	Natural broadening	20
2.2.2	Doppler broadening	20
2.2.3	Pressure broadening	22
2.2.4	Voigt lineshapes	24
2.3	Strength rules for fine and hyperfine splitting	30
3	Collisions, quenching, and particle diffusion	33
3.1	Collisional cross-sections	33
3.2	Collisions between atoms of the same kind	35
3.3	Collisions between atoms of different kinds	35
3.4	Collisions with electrons; ionization and recombination	36
3.5	Particle diffusion	37
3.6	Hyperfine-structure intermixing	41
3.7	Fine-structure intermixing	42
II THE CLASSICAL RADIATION TRAPPING PROBLEM		
4	Formulation of the classical problem	49
4.1	The Milne equation	50
4.2	The Holstein equation	51
4.2.1	Derivation of the Holstein equation	51
4.2.2	Idealized geometries	56
4.2.3	Simplifying assumptions in the derivation of the Holstein equation	59
4.3	The multiple-scattering representation	64
4.4	The equation of radiative transfer	67
4.5	The escape factor	69

5	Mathematical methods for the Holstein equation	79
5.1	The variational technique	79
5.2	Exact solutions in the high-opacity case	86
5.2.1	Van Trigt's solution	86
5.2.2	The geometrical quantization technique	87
5.2.3	The Fourier transform technique	88
5.3	The piecewise-constant approximation	89
5.4	The propagator function method	91
5.5	Other computation methods	92
6	Methods for the multiple-scattering representation	94
6.1	Monte Carlo simulations	94
6.2	Analytical solutions	100
7	Fitting equations and physical interpretation	103
7.1	Doppler and Lorentz lines	103
7.2	Voigt lines	111
7.3	Hyperfine split lines	113
7.4	Higher-order modes	118
7.5	Steady-state solutions of the Holstein equation	120
7.6	The emergent spectrum	124
8	The Milne and Eddington approximations	128
8.1	The original Milne theory	128
8.2	The angle approximation	131
8.3	The generalized Eddington approximation	134
8.4	The frequency approximation	136
9	Mathematical methods for the transfer equation	140
9.1	Discrete ordinate solution	140
9.2	The Feautrier technique	142
9.2.1	The basic Feautrier technique	143
9.2.2	Modified finite-differencing equations	148
9.2.3	Choice of the boundary conditions	149
9.3	The variable Eddington factor technique	149
9.4	Modified Feautrier approaches	154
9.4.1	The Rybicki reorganization	154
9.4.2	The core saturation method	156
9.4.3	The implicit integral method	157
9.4.4	Splitting algorithms	157
9.4.5	Quadrature perturbation	158
9.4.6	The discontinuous finite-element (DFE) method	158

III GENERALIZED TRAPPING PROBLEMS

10 Simple generalizations	165
10.1 Branching and quenching	165
10.2 Three-level atoms	167
10.3 Reflecting walls	171
10.3.1 Diffusely reflecting walls	171
10.3.2 Specularly reflecting walls	173
10.4 Particle diffusion	179
10.4.1 Formulation and direct solution	179
10.4.2 The modal combination technique	181
10.4.3 The discrete-ordinate technique	186
10.4.4 Results	192
10.5 Inhomogeneous distribution of absorbers	193
10.6 Two- and three-dimensional geometries	197
10.6.1 The finite cylinder	197
10.6.2 The parallelepiped	201
10.6.3 The torus and the hollow cylinder	201
11 Partial frequency redistribution	204
11.1 The physical picture of PFR	204
11.1.1 Redistribution functions in the atomic rest frame	205
11.1.2 Redistribution functions in the laboratory rest frame	208
11.1.3 Angle-averaged redistribution functions	210
11.1.4 Pure Doppler broadening	211
11.1.5 Doppler plus natural broadening	214
11.1.6 Doppler plus collisional broadening	218
11.1.7 Doppler, natural, plus collisional broadening	219
11.1.8 Branching transitions	220
11.1.9 The Holstein equation with PFR	221
11.2 Variational solution	223
11.3 The velocity distribution of excited atoms	230
11.4 The propagator function method and the PCA method	232
11.5 Monte Carlo simulations	236
11.6 Transfer equation formulations	238
11.7 Frequency diffusion	240
11.8 Large-scale particle flow	242
12 Polarization	247
12.1 Introduction	247
12.2 Formal solution of the vector transfer equation	248

12.3	Trapping problems with polarization	250
12.3.1	The polarization-free approximation	250
12.3.2	The Holstein equation without magnetic field	251
12.3.3	The Holstein equation with magnetic field	253
12.4	Monte Carlo simulations	254
12.5	Physical effects	258
13	Non-linear radiation trapping	262
13.1	When do non-linearities occur?	263
13.2	Interaction of strong laser radiation with atoms	267
13.2.1	Selection of velocity groups	268
13.2.2	Burn-through and one-dimensionality	270
13.3	Steady-state solutions	271
13.3.1	Complete linearization	272
13.3.2	Operator perturbation	276
13.3.3	Direct iteration	285
13.3.4	Approximate techniques	287
13.3.5	Monte Carlo simulations	287
13.4	Transient problems	288
13.4.1	Numerical solution of the non-linear Holstein equation	288
13.4.2	Analytical approximations	291
13.4.3	Numerical solution of the transfer equation	293
13.4.4	Physical effects	294
13.4.5	Monte Carlo simulations	298
13.5	Multilevel systems	299
13.5.1	Complete linearization in the multilevel case	299
13.5.2	Operator perturbation techniques for multilevel systems	300
13.5.3	The equivalent two-level atom	301
13.5.4	Steady-state in three-level atoms	303
13.5.5	Time-dependent depletion	307
14	Combination of techniques	313
14.1	The four basic questions	313
14.2	Linear trapping with complete frequency redistribution	314
14.2.1	Solution methods for the classical Holstein equation	314
14.2.2	Inclusion of other physical effects	317
14.3	Nonlinear trapping with CFR	319
14.3.1	Taking the non-linearity into account	320
14.3.2	Multilevel atoms	320
14.3.3	Required accuracy	321
14.4	Trapping with partial frequency redistribution	321

IV APPLICATIONS

15	Measurements in chemical physics	326
15.1	Atomic lifetimes	327
15.2	Collision cross-sections	328
15.3	Ionization cross-sections	331
15.4	Quenching and intermixing cross-sections	335
15.5	Atomic beams	338
15.6	Atomic densities	339
15.7	Radiation trapping in cold atoms	340
15.8	Other measurements	344
16	Simulation of optically pumped gas lasers	346
16.1	Trapping in gas lasers	346
16.2	Low-opacity formulation	347
16.2.1	Basic formulation	347
16.2.2	Approximate solution for single-mode operation	350
16.2.3	Conclusions	352
16.3	The mercury-nitrogen laser	354
16.3.1	The operating principle	354
16.3.2	Setup of the rate equations	355
16.3.3	Conclusions	358
17	Atomic line filters	361
18	Discharge lamps and plasmas	368
18.1	Introduction	368
18.2	The theory of discharge lamps	369
18.3	Radiation trapping in discharge lamps	372
18.4	Decreasing radiation trapping in lamps	376
18.5	The optogalvanic effect	379
18.6	Plasmas	381
18.7	Concluding remarks	383

V APPENDICES

A	Atomic structure	387
A.1	Models of the atomic structure	387
A.1.1	The Bohr-Rutherford model	387
A.1.2	The Schrödinger equation	388
A.2	The hydrogen atom	388
A.3	The periodic table of elements	391
A.4	Alkali atoms	392
A.4.1	Lifting of the l -degeneracy in alkali atoms	392
A.4.2	Fine structure of alkali atoms	394
A.5	The helium atom	397

A.6	The alkaline earth elements	399
A.7	Trivalent elements	399
A.8	Hyperfine structure and isotope splitting	399
A.8.1	Hyperfine structure	399
A.8.2	Isotope splitting	401
A.9	Effects of external magnetic and electric fields	401
A.9.1	The Zeeman effect	401
A.9.2	The Stark effect	402
B	Values of the $A_{k,m}$ matrix elements for the numerical solution of the Holstein equation	403
B.1	The slab	403
B.2	The cylinder—method 1	404
B.3	The cylinder—method 2	406
B.4	The sphere	409
C	Publicly available software for the computation of radiation trapping	413
C.1	RAD-TRAP	413
C.2	McTrap	415
C.3	SLAB3	418
C.4	ALTAIR	419
C.5	TLUSTY	420
C.6	Other programs	421
D	Fitting equations for the eigenvalues and eigenfunctions of the Holstein equation	422
D.1	The slab	422
D.2	The cylinder	422
D.3	The sphere	423
E	Finite difference solution of the inhomogeneous equation of radiative transfer in a finite cylinder	427
F	The density matrix	433
F.1	The density matrix for atomic states	433
F.2	The density matrix for photons	434
F.3	Interaction of atoms and radiation	436
F.4	State multipoles	437
F.4.1	Definition of tensor operators	437
F.4.2	Definition of state multipoles	438
G	High-field effects	440
G.1	Absorption and emission coefficients of homogeneously broadened lines	440
G.2	AC-Stark splitting and Mollow triplets	441

CONTENTS

xvii

G.3	Effects of AC-Stark splitting on radiation trapping	443
G.4	The validity of the transfer equation	444
