ABSTRACT

Science and Engineering Education data and information are presented in six chapters, each chapter containing detailed statistical charts and tables. Resources data contained in chapter 1 are grouped into four categories: K-12, higher education, funding, and informal education. Resources may take the form of capital, personnel, and teaching materials and may be expressed in types of educational programs offered, curricula used, and amount of time spent on them. Chapter 2 presents data on how many and what kinds of people participate in science, mathematics, and technology education and what form that participation takes. Chapter 3 focuses on student, faculty, and public attitudes, goals, and needs concerning science and mathematics education. Test data are examined in chapter 4. Degree data in chapter 5 are grouped into three categories: total number of earned degrees by subject and level, percent distribution of earned degrees by subject and level, and degree and distribution data for women and minorities. Science/engineering employment data (focusing on employment and salaries) are presented in chapter 6. Each chapter begins with an introduction and highlights of the data presented therein. Alphonse Buccino
Paul Evans
George Tressel

Acknowledgement

This report is largely based upon, and updates, the "Science Education Databook" (SE 80-3). The revisions and new information have been added in an attempt to provide the most current information and data about the state of science and engineering education in the U.S.

In the various tasks of gathering, formulating and evaluating data for this report, the Office appreciates the assistance of many individuals. In particular we thank Lida Barrett, Jerry Bellon, Robert Boldt, Mary Boyden, John Bradley, Garrett Briggs, William Coffield, Elmer Collins, Larry Conaway, Thomas Cooney, Sharon Crumpton, Douglas DePriest, Charleen DeRidder, Charles Dickens, Marie D. Eldridge, James Gates, Kevin Gilmartin, Evelyne M. Graham, Vance Grant, Lawrence Haaby, Charles Hucka, Maury Hurt, Carlos Kruytbosch, Wayne Martin, Jean McCauley, Stafford Metz, Jay Noell, Robert Parke, Ronald Pedone, Don Ploch, Len Ramist, Robert J. Rossi, Jack Scopino, Lee Shulman, George Springer, Tong Soo Song, Marilyn Suydam, Peter Syverson, Michael Templeton, Paul Terwilliger, Harry Tunis, Betty Vetter, Alfred Willcox and Robert Wright.

We also thank the Panel on Science Education Indicators that convened in the spring of 1978 and its members: George Hall, Robert McGinnis, Roberta B. Miller, Roger G. Olstad, David Rindskopf and Thomas Rowan. Special thanks go to Donald Dessart, Howard Levine, and Mary Rivkin for developing the "Science Education Databook" on which this document is based.

We are particularly indebted to those persons who have patiently assisted us with the manuscript and the development of new materials: Joel Aronson, Sue Kemnitzer, Margrete Klein, Fran Kiley, Carolyn Piper and Agatha Cunningham.

Paul Evans was responsible for overall manuscript review and the final editing of this document.

Introduction

Although there is general agreement that science and technology are critical to the welfare and future of the United States, and there is also agreement that the quality of precollege education in these fields is a matter for serious concern, there remain a great many questions regarding the priorities, urgency and potential for improvement. Questions have been raised regarding such issues as the quality and supply of teachers, comparisons with other technological societies, dependence on foreign talent, science understanding among decision makers and the general public, insufficient instructional equipment, the lack of programs for the gifted and talented, and opportunities and motivation for women and minorities.

The need to establish a national consensus and plan for action is the reason that the National Science Board has asked for an eminent Commission to examine the problems. The Board and the National Science Foundation hope that this Commission will be able to weigh and balance the evidence and issues and arrive at recommendations for priorities and actions that can guide educational planners and decision makers.

To aid the process, we have assembled this compendium of information and data regarding resources, participation, achievement, attitudes and employment in science and engineering at all educational levels. Although not offered as a definitive collection, we have tried to make it as broad and comprehensive as possible, so that it can form a "baseline" of facts about the status of science and engineering education at this time. We have organized the material in areas of general interest, and have preceded each area by a brief discussion that summarizes the salient facts and information about the area. Generally, entries consist of charts, and/or tables, accompanied by brief explanatory remarks and an indication of the source for the material.

Much of the material in this report is based upon the "Science Education Databook" published in 1980, which has been updated and supplemented to provide as current and authoritative information as possible. Additional data and interpretive information can be found in the original sources, as noted.

Chapter I: RESOURCES

Chapter I
RESOURCES

INTRODUCTION

Resources may be provided by personnel acting as teachers, or by institutions offering courses of instruction, or by society making tax-dollars available to support colleges and museums. Resources may take the form of capital, personnel, and teaching materials and may also be expressed in the types of educational programs offefed, the curricula used, and the amount of time spent on them.

The resources data contained in this chapter are grouped into four categories: K-12, higher education, funding, and informal education.

HIGHLIGHTS

K-12

1 The fraction of all secondary teachers spending the largest portion of their time in science, mathematics, or social studies increased by almost 22% from 1961 to 1976. (Chart I-1).

2 State supervisors from most states feel that there are shortages of teachers in mathematics, physics, chemistry and earth science (Tables I-4 A & B).

3. The supply of individuals with new degrees in mathematics and science education has been falling since 1972 (Table I-5).

4. Slightly more than half of all grade 10-12 science teachers were using one or more of the Federally funded science curriculum materials during the 1976-1977 school year. (Chart I-7)

5 Students in K-3 spend an average of less than 20 minutes a day on science. (Chart I-8)

6 Approximately 90% of the grade 7-12 science classes make use of the metric system. (Chart I-9)

7 Relatively few schools have separate budgets for scientific equipment and supplies (Chart I-10)

8 Over one-third of K-6 classrooms have no science facilities (Chart I-11)

9 There has been an increase in the proportion of students participating in individualized instruction and computer aided instruction. (Chart I-13)

Higher Education

1. Between 1969 and 1975 the number of mathematical and physical sciences faculty, as a percentage of total college teaching faculty, decreased by 50%. (Chart I-14)

2. Between 1969 and 1975, the number of biological science faculty, as a percentage of total teaching faculty, increased by 50%. (Chart I-14)

3. Since 1965, the full time faculty in higher education has increased by 89% and the part-time faculty by 76%, however, the student faculty ratio has also increased. (Table I-14A)

4 Faculty in computer science university departments (+ 25%) and in private college mathematics departments (+ 16%) have increased since 1975. (Table I-14B)

5 The number of teaching assistants doubled from 1975 to 1980 in computer science and private college mathematics departments. (Table I-14C)

6. 10% of all engineering faculty positions were unfilled as of September 1980. (Table I-16)

7 The greatest number of engineering faculty moves were in the field of computer engineering. (Table I-17)

8. Nearly 25% of all junior faculty teaching engineering in the U.S. received their baccalaureate outside the U.S. (Table I-18)

9. Engineering faculty salaries show a mean range of $34,500 for full professors to $20,000 for assistant professors. (Table I-19)

10 The percent of public and private college faculty holding doctorates declined (74% to 69% and 69% to 64%) during the five year period (Chart I-17)

11 The number of women on mathematical science faculties has increased from 10% to 14%, with median age for women faculty about five years less than that for men (Chart I-18)

12 For mathematics in two-year colleges, part-time faculty now outnumber full-time faculty (Chart I-19)

13 It is not likely that the educational qualifications of part-time mathematics faculty will increase in the near future (Chart I-20)

14 The percent of higher educations with access to computers doubled between 1969 and 1977 (Chart I-21)

Funding

1 The average amount requested for instructional scientific equipment shows a continual rise between 1976 and 1981. (Chart I-22)

2 NSF has shifted support over time among students, faculty, institutions, and R&D. (Chart I-23)

3 In regard to levels of education NSF has also shifted priorities over time. (Chart I-24)

Continuing and Informal Education

1 During 1975-76 there were almost 3500 degree credit courses in continuing education for scientists and engineers. There were about 4900 non-credit activities in continuing education. (Charts I-25-26)

2 In 1979, museums received less than one-fourth of their total operating income from private sources, such as foundations, corporations, individual contributions, and other sources. Art museums received the greatest relative percentage of their total operating income from private sources (25 percent) and parks and visitor centers the least (6 percent). On the whole, museums received approximately the same financial support (4 percent of total operating income) from each of foundations, individuals, and other sources. Financial support from corporations made up only an estimated 2 percent of total operating income. (Table I-26)

3 Museums with higher operating income were more likely to have increasing educational roles. Conversely, those institutions with the lowest operating incomes were more likely to indicate that their educational roles were staying the same. (Table I-27)

4. An estimated 66 percent of all museums offered some type of specific program in fiscal year 1979. Children's museums (83 percent) and art and science museums (78 percent) were more likely to have specific programs than other types of museums. (Chart I-27)

5 Approximately one-fourth of the museums offered teacher training periodically or on a regular basis on how to use museum resources. An estimated 65 percent of the children's museums offered teacher training. Around 40 percent of science museums and art museums offered such training, only 16 percent of the specialized museums offered some type of teacher training. (Chart I-29)

6 Between 1972 and 1978, science and technology centers and museums received slightly over $30 million in Federal funds. (Chart I-30)

Chart I-1. Public secondary school teachers, by subject taught, spring 1961 to spring 1976

The fraction of all secondary teachers spending the largest portion of their time in teaching science, mathematics, or social studies increased by almost 22% from 1961 to 1976.

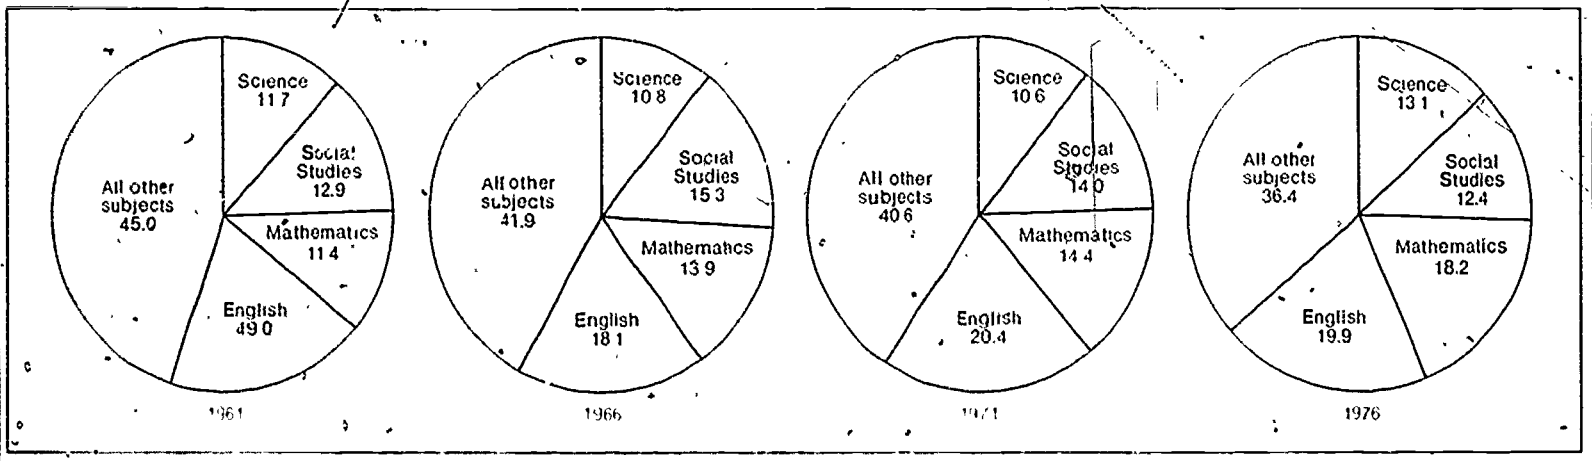

Table I-1: Public secondary school teachers, by subject taught, spring 1961 to spring 1976

(Percentage distribution)

Teaching field in which largest portion of time was spent	1961	1966	1971	1976

Chart I-2. Percent of male and female science, mathematics, and social studies teachers, by grade range

Most elementary school teachers are women. They usually teach science, mathematics, and social studies as well as other subjects. Most high school teachers of mathematics, science, and social studies are men and they usually teach within one subject field.

Chart I-3: Employed teachers and teacher layoffs and shortages by field as percent of total employed teachers and teacher layoffs and shortages

While 23 percent of teacher shortages were in elementary education, an even larger proportion of layoffs were in that field in 1979. Fields in which the number of shortages exceeded the number of layoffs were bilingual education, industrial arts, physical sciences, and special education.

[1]Includes all full-time and part-time classroom teachers in public and private elementary/secondary schools during the 1979-80 school year.
[2]A layoff represents a teacher whose contract was not renewed at the end of the 1978-79 school year because of budget limitations, and whose position was not subsequently filled.
[3]A shortage represents a teaching position opening (budgeted new position or position vacancy) occurring from spring 1979 to fall 1979 (for the 1979-80 school year) for which teachers were sought but were unable to be hired because no qualified candidate was available
[4]These figures represent unduplicated counts of teachers among fields. Teachers in more than one field were reported only in the field in which they spent most of their teaching time. The exception was that any teacher engaged in bilingual or special education was counted in either of those areas regardless of the time spent in other areas.
[5]Less than 100 positions.
Note: Details may not add to totals because of rounding.

Table I-4 B: Estimated supply of secondary science and mathematics teachers: 1980 and 1981

State supervisors from most states feel that there are shortages of teachers in mathematics, physics, chemistry and earth science. The perceived shortages became more extreme between the 1980 and 1981 surveys.

Summary of State-by-State Responses

Response	Biology		Chemistry		Physics		General Science		Earth Science		Math	
	1980	1981	1980	1981	1980	1981	1980	1981	1980	1981	1980	1981
1	6	6	3	0	3	0	4	4	3	1	3	0
2	13	10	2	2	0	1	5	5	1	1	1	1
3	24	26	13	8	6	4	27	23	14	13	10	3
4	4	4	21	28	19	15	11	9	23	22	16	25
5	2	1	10	9	21	27	2	5	8	10	16	18
NR	4	6	4	6	4	6	4	7	4	6	7	6

Responses: 1 = Surplus; 2 = Slight Surplus; 3 = Adequate Supply; 4 = Shortage; 5 = Critical Shortage; NR = No Response.

Table I-5: Supply of individuals with mathematics education and science education degrees granted: 1971-72 to 1979-80

The supply of individuals with new degrees in mathematics and science education has been falling since 1972 although total degrees granted in all fields have risen. The decline in numbers has been greater for men than for women.

A. Bachelors Degrees Requiring 4 or 5 Years

	Total All Fields	Mathematics Education			Science Education		
		Total	Male	Female	Total	Male	Female
1971 72	887,273	2,425	1,144	1,281	1,064	577	487
1973 74	945,776	2,037	921	1,116	941	542	399
1975 76	934,443	1,442	594	848	792	451	341
1977 78	921,204	1,048	439	609	755	416	339
1979-80	929,417	762	310	452	672	309	363

B. Masters Degrees

	Total, All Fields	Mathematics Education			Science Education		
		Total	Male	Female	Total	Male	Female
1971 72	251,633	764	413	351	758	446	312
1973 74	277,033	828	447	381	904	604	300
1975 76	313,001	746	335	411	737	421	316
1977 78	311,620	598	230	368	775	406	369
1979-80	298,081	512	211	301	591	328	263

Chart I-7: Percent of teachers using Federally funded curriculum materials in each subject by grade range[1]

Use of Federally funded curricula tends to increase with increasing grade level. Slightly more than half of all grade 10-12 science teachers were using one or more of the Federally funded science curriculum materials during the 1976-77 school year.

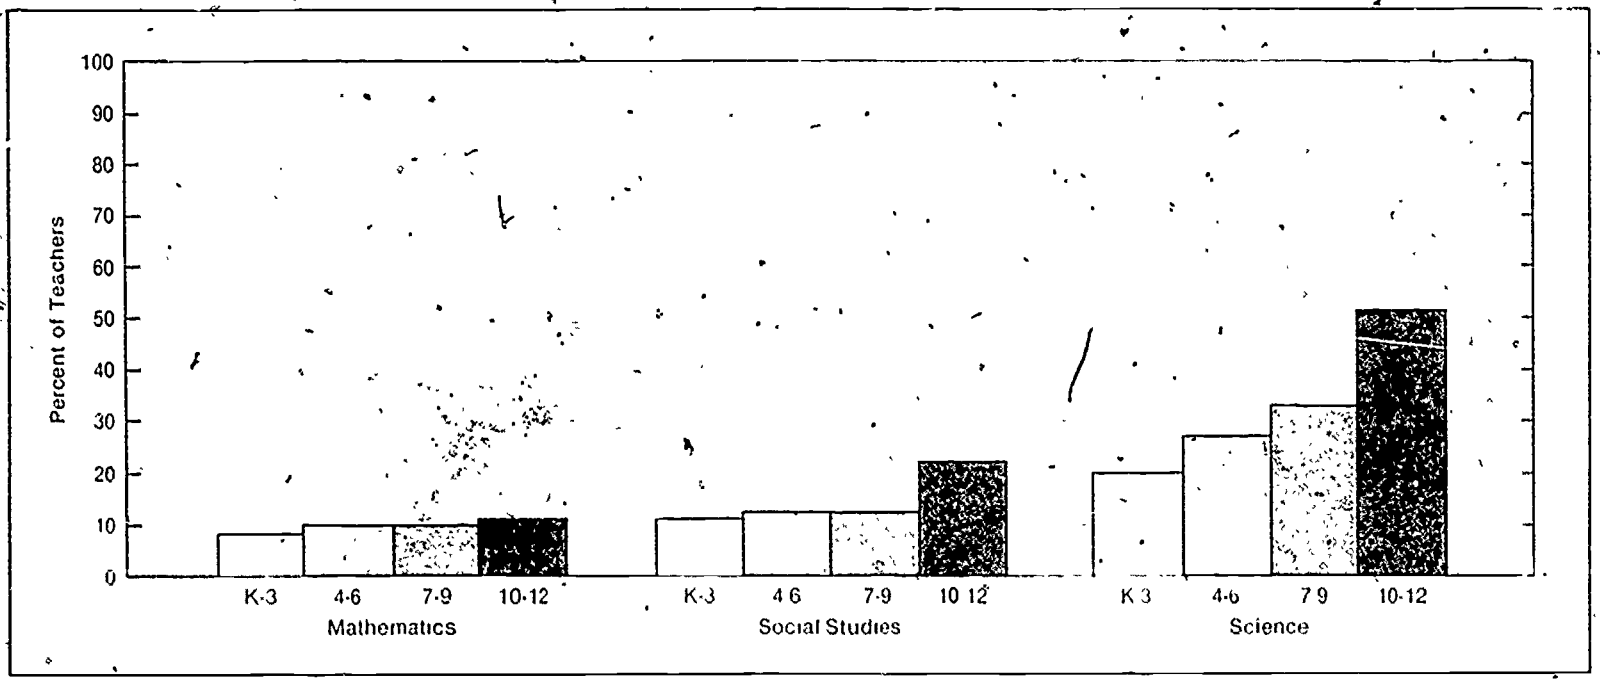

Table I-7: Percent of teachers using Federally funded curriculum materials in each subject by grade range

Grade Range	Subject: Mathematics Yes	Mathematics No	Mathematics Unknown/ Inconsistent	Social Studies Yes	Social Studies No	Social Studies Unknown/ Inconsistent	Science Yes	Science No	Science Unknown/ Inconsistent	Total Yes	Total No	Total Unknown/ Inconsistent

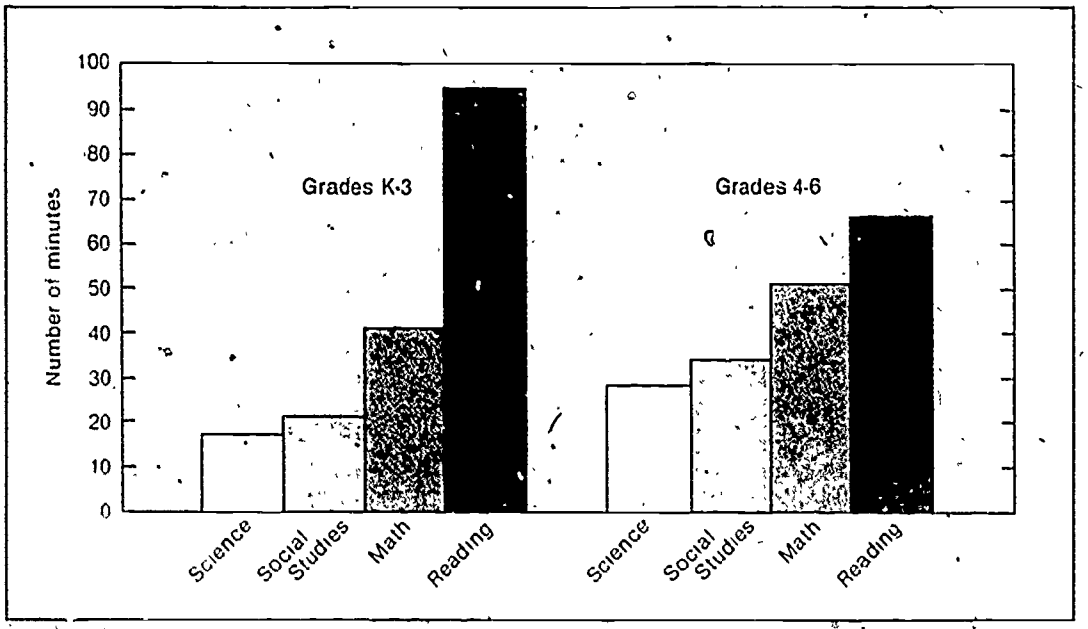
Chart I-8: Average number of minutes per day spent teaching each subject in self-contained classes, by grade range[1]



Students in Grades K-3 spend an average of about 20 minutes each day on science and on social studies. The difference between the amount of time spent on reading and that spent on other subjects decreases from K-3 to 4-6.

Table I-8: Average number of minutes per day spent teaching each subject in self-contained classes, by grade range[1]

Subject	Grade Range: K-3 Average Number of Minutes	K-3 Standard Error	4-6 Average Number of Minutes	4-6 Standard Error	Total Average Number of Minutes	Total Standard Error

[1]Teachers self-reported these data

NOTE Only teachers who indicated they teach mathematics, science, social studies, and reading to one class of students were included in these analyses.

Source Weiss, Iris R., *Report of the 1977 National Survey of Science, Mathematics, and Social Studies Education*, p. 51.

Chart I-9: Percent of mathematics and science classes that use metric concepts by subject and grade range.

The use of metric concepts increases with increasing grade level in science classes; approximately 90% of the 7-9 and 10-12 science classes make use of the metric system.

In mathematics classes, use is higher in the lower grades; by grades 10-12 only 56% of mathematics classes use metric concepts.

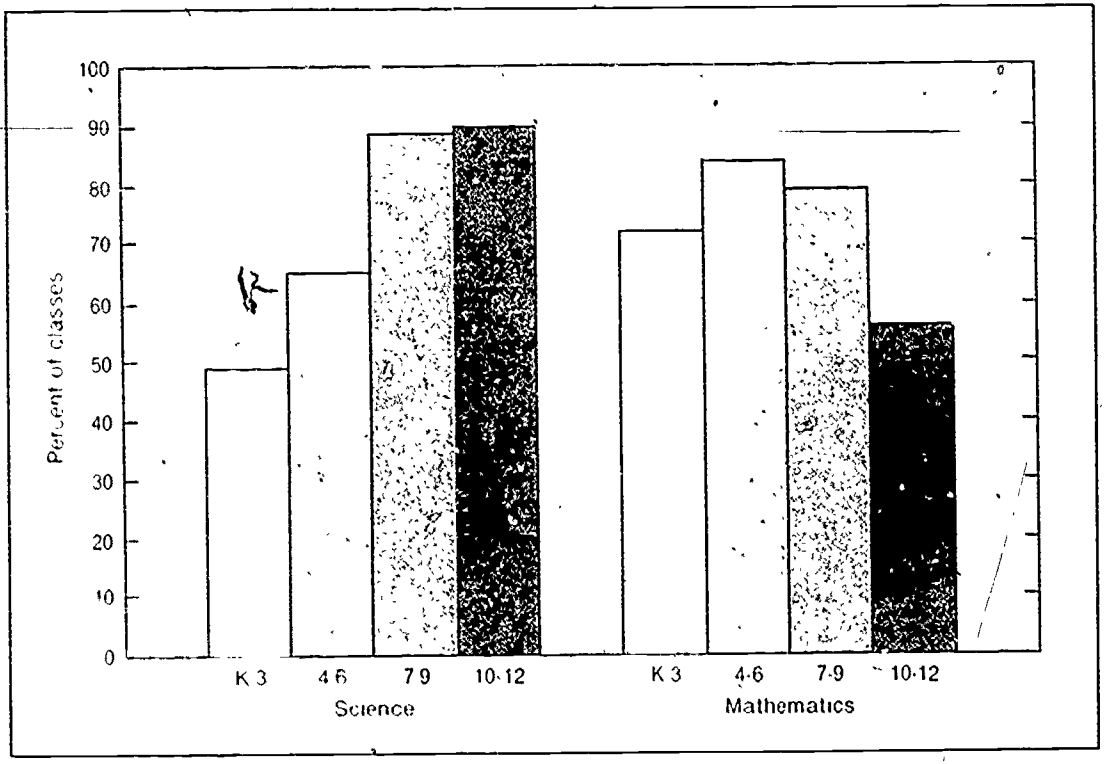

Table I-9: Percent of mathematics and science classes that treat metric concepts in each of a number of ways, by subject and grade range

	Mathematics					Science				
Use of Metric Concepts	K-3	4-6	7-9	10-12	Total	K-3	4-6	7-9	10-12	Total

Chart I-10: Percent of schools with specific budgets for science equipment and science supplies, and average amounts of these budgets per pupil, by grade range

Relatively few schools have specific budgets for science equipment and supplies. In general, schools are somewhat more likely to have specific budgets for supplies than for equipment, and secondary schools are much more likely than elementary schools to have specific budgets for both. The per pupil amounts of science budgets for secondary schools are considerably larger than those for elementary schools, but to the extent the middle schools have such budgets at all, they are not much smaller than those in grades 10-12.

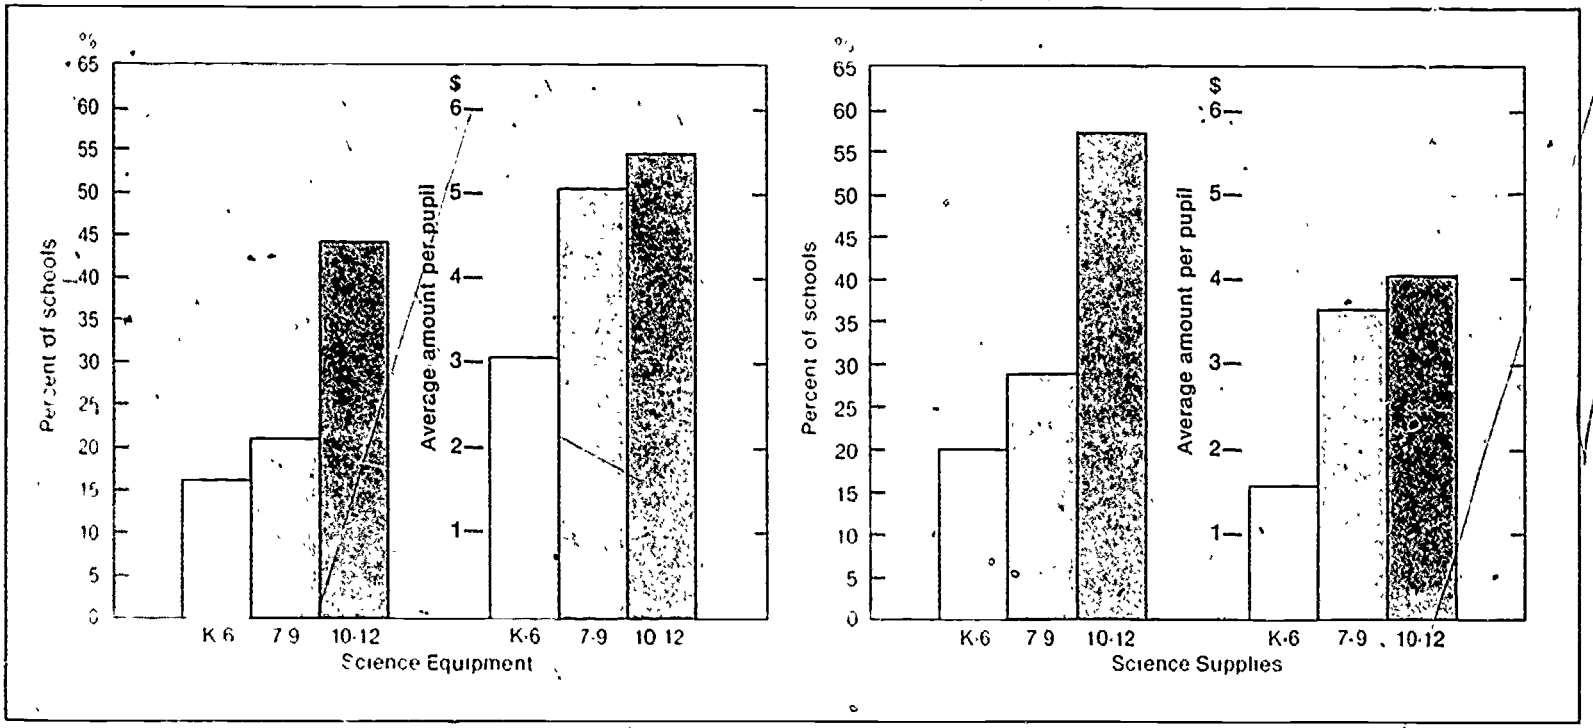

Table I-10: Percent of schools with specific budgets for science equipment and science supplies, and average amounts of these budgets per pupil by sample grade range[1]

	Science Equipment				Science Supplies			
Sample Grade Range	Sample N	Percent of Schools	Average Budget Amount	Standard Error	Sample N	Percent of Schools	Average Budget Amount	Standard Error
K-6	107	16	$3.05	$ .31	155	20	$1.56	$ .15
7-9	119	21	$5.03	$2.09	176	29	$3.62	$1.25
10-12	117	44	$5.46	$ .84	180	57	$4.02	$ .65

Schools that reported there was a specific budget but did not indicate the amount, and schools that did not indicate total enrollment were not included in the calculations of average amounts per pupil.

Source: Weiss, Iris R., *Report of the 1977 National Survey of Science, Mathematics, and Social Studies Education*, p. 126.

Chart I-11: Percent of elementary science classes conducted in various types of rooms

Slightly more than half of all elementary school classes receive science instruction in classrooms with portable science materials. Only 4% of the elementary science classes (and virtually all of these are grades 4-6) are conducted in laboratories or special science rooms. More than a third of the classes are conducted in classrooms with no science facilities at all.

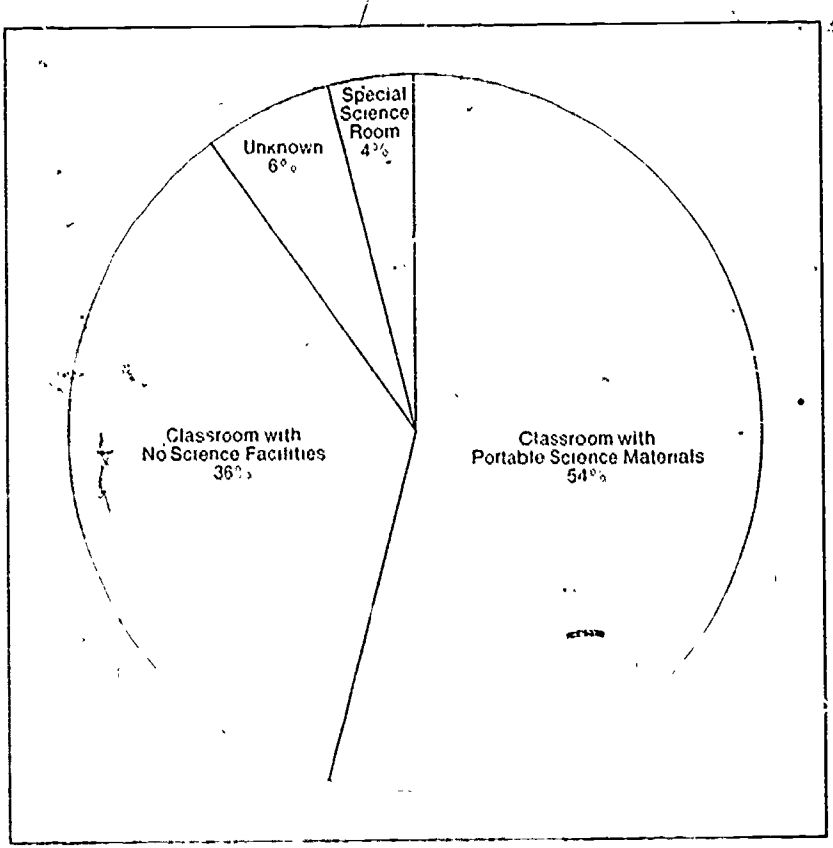

Table I-11: Percent of elementary science classes conducted in various types of rooms, by grade range

Type of Room	Grade Range K-3	4-6	Total
Laboratory or special science room	0	9	4
Classroom with portable science materials	54	54	54
Classroom with no science facilities	38	34	36
Unknown	8	3	6

Table I-12 B: Public school districts providing students access to at least one computer for educational purposes: United States, 1980

(Table entries are school districts providing access.)

Type of access	Total (at least one level) (1)	Type of School, by Grade Level: Elementary Level (2)	Secondary Level (3)	Combined Elem/ Sec Schools and Special Schools (4)	More Than One Level (5)
At least one microcomputer or one terminal	7,606	2,196	6,616	678	1,884
			(In percents of column 1)		
At least one microcomputer or one terminal	7,606	29	87	9	25
At least one microcomputer	6,631	29	84	9	22
At least one terminal	2,973	21	99	5	25
At least one microcomputer *and* one terminal	1,998	17	95	3	15

Column 1 represents the unduplicated number of districts providing access to computers at any level. Since some districts make computers available at more than one type of school, the percents in columns 2-4 include duplicated counts of districts. The difference between the total duplicated counts (col. 2-4) and the unduplicated count (col. 1) represents the percent of districts providing computer access at more than one level (col. 5).

Table I-13: Teaching methods used in courses taken by high school seniors, by control of school: 1972 and 1980

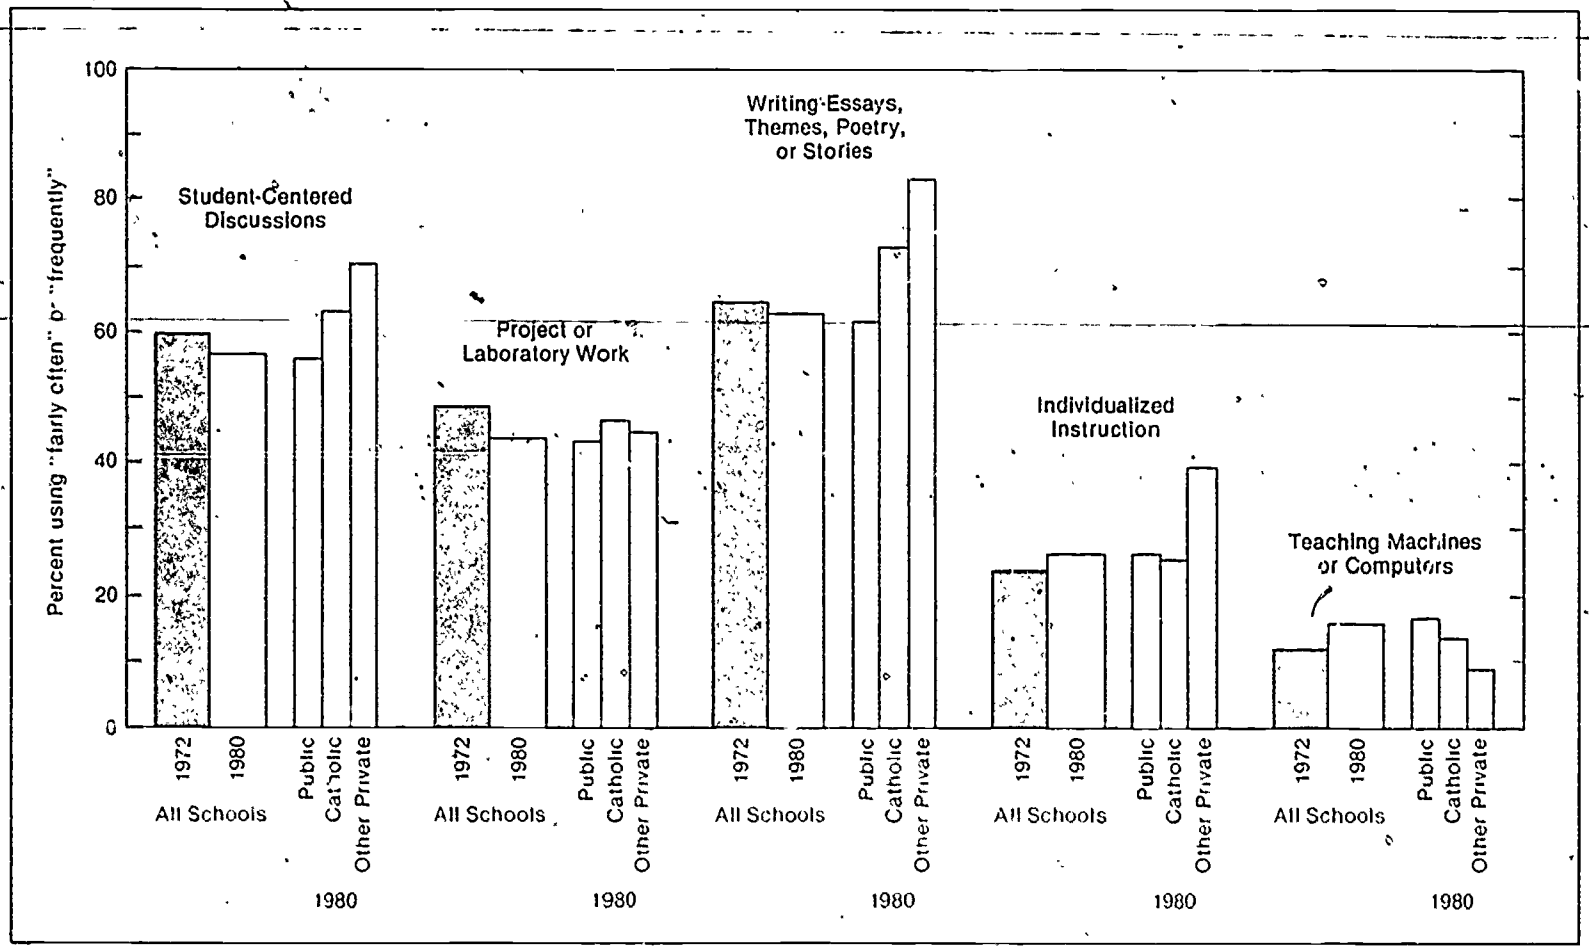
Teaching Method	All Schools	Public Schools	Catholic Schools	Other Private Schools[1]
	Percent of Seniors Responding "Fairly Often" or "Frequently" Used in Courses			
1972 Seniors				
Student-centered Discussions	59.8	59.3	72.0	65.2
Project or Laboratory Work	48.4	48.0	52.5	42.3
Writing Essays, Themes, Poetry or Stories	64.5	63.9	68.9	88.5
Individualized Instruction	23.9	23.3	31.0	16.8
Teaching Machines or Computer-assisted Instruction	12.1	12.0	13.0	5.0
1980 Seniors				
Student-centered Discussions	56.7	55.8	63.0	70.2
Project or Laboratory Work	43.6	43.4	46.7	45.0
Writing Essays, Themes, Poetry or Stories	62.9	61.3	73.0	83.7
Individualized Instruction	26.6	26.2	25.4	39.7
Teaching Machines or Computer-assisted Instruction	16.0	16.4	13.8	8.9

[1]Because of the small school sample size, the heterogeneity of the schools, and the high non-response rate for schools in this sector, the estimates for other private schools are not nearly as accurate or as interpretable as those for public or Catholic schools.

Source: U.S. Department of Education, National Center for Education Statistics, National Longitudinal Study and High School and Beyond Survey, unpublished tabulations.

Chart I-13: Teaching methods used in courses taken by high school seniors

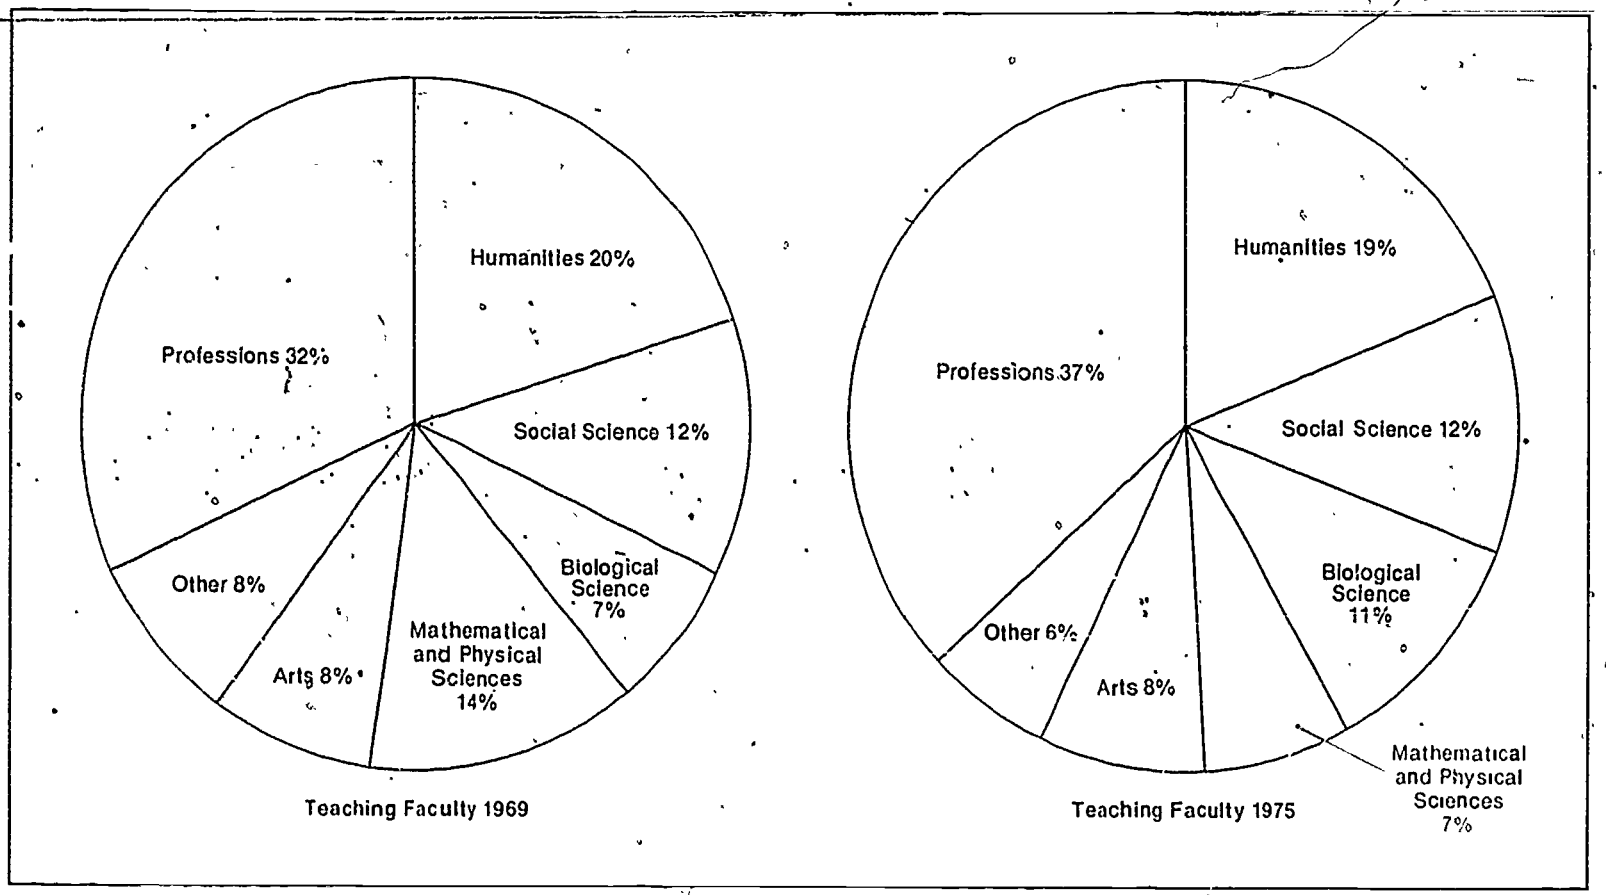
Between 1972 and 1980, there was an increase in the proportion of students participating in classes where individualized instruction and teaching machines or computer assisted instruction were likely to be used.



Source: The Condition of Education, NCES, 1982, p. 83

Chart I-14: Percentages of teaching faculty in higher education in subject fields 1969 and 1975

The biological, mathematical and physical sciences underwent major faculty shifts during the first half of the 1970s. As a percentage of total faculty, the mathematical and physical sciences' share decreased by 50% while the biological sciences' share increased by a like amount. The professions showed a 16% gain while the remaining subjects held steady. These shifts are consistent with shifts in undergraduate enrollments during this time period.



Source. Carnegie Foundation for the Advancement of Teaching, *Missions of the College Curriculum*, p. 103 (revised with permission of author.)

Table I-14 A: Faculty in all higher education, 1965-1980

Since 1965, the full-time faculty in higher education has increased by 89% and the part-time faculty by 76%. However, the student-faculty ratio has also increased in the same time period. The growth in two-year college faculty has been at a much greater rate than in four-year institutions.

Faculty in Thousands

	1965	1970	1975	1980*
Four-year Institutions

Part-Time Faculty	92	104	142	162
FTE Students/Fte Faculty	16.8	16.6	17 4	18.2

*Projected
**FTE equals full-time plus one third of part-time
Source: *Projections of Education Statistics to 1985-86.*

Table I-14 B: Faculty in mathematics, statistics, and computer science, 1980

From 1975 to 1980 the largest faculty increase occurred in private college mathematics departments (+832 FTE). Faculty in departments of computer science also increased to a number about 9% of all FTE mathematical science faculty. These two types of departments also experienced the greatest course enrollment increases.

Type of Department	1970 Full	1970 Part	1975 Full	1975 Part	1980 Full	1980 Part
Universities						
Mathematics	5,235	615	5,405	699	5,605	1,038

Table I-14 C: Mathematical science teaching assistants in universities and four-year colleges

The number of teaching assistants doubled from 1975 to 1980 in computer science and private college mathematics departments, while use of TA's declined in statistics and public college mathematics departments. Over 20% of all TA's are not graduate students, up from only 6% in 1975. In university mathematics departments an even greater fraction are not mathematics graduate students.

Type of Institution	1970	1975	1980

Source: Undergraduate Mathematical Sciences in Universities, Four-Year Colleges, and Two-Year Colleges, 1980-1981. James T. Fey and Wendell H. Fleming. Conference Board on Mathematical Sciences, 1981.

Table I-14 D: Age distribution of full-time mathematics faculty by sex and by educational level, 1980

From 1975 to 1980 the women on full-time mathematics faculties of two-year colleges increased from 21% to 25% of the total. As might be expected, women are more heavily represented in younger age ranges, with nearly one-third less than 35 years of age.

Faculty in the 35-44 year range are more likely to hold doctorates than the other age groups, with 52% of all doctorates held by faculty in that age group.

Age Range	Sex		Highest Degree	
	Male	Female	Doctorate	Master's
< 35	16%	31%	17%	18%
35-44	45%	35%	52%	43%

Table I-16: Unfilled engineering faculty positions, September 1980

10% of all engineering faculty positions were unfilled as of September 1980, a total of nearly 1600 positions. Most of the individual engineering disciplines are close to this percentage except for aeronautical engineering which had only 4% unfilled positions, and computer engineering with a high of 16% unfilled and industrial engineering which had 13.4% unfilled. Generally, the top 50 schools have relatively fewer vacancies than the others, averaging about 2% less in all disciplines.

Table I-18: Full-time junior engineering faculty who did not receive their Baccalaureates in the United States

Nearly a quarter of all junior faculty teaching engineering in the United States received their baccalaureate outside of the U.S., and in public four-year colleges it is nearly a third.

Institutional Category	Total Junior Faculty	Percentage with Baccalaureate Outside the U.S.
Total	3,397	23.7
Top 50 Institutions*	1,400	22.1
Public Institutions	2,416	25.0
Private Institutions	981	20.5
Public Universities	1,768	22.3
Private Universities	683	19.2
Public Four-Year Colleges	648	32.4
Private Four-Year Colleges	298	23.5

*In level of engineering R&D expenditures, FY 79.

Table I-19: Engineering Faculty Salaries

Faculty salaries, show a mean salary range of $34,500 for full professors at high-paying institutions down to $20,000 for assistant professors at low-paying institutions. They have increased in the past year by 8.8% for full professors and 11.4% for assistant professors, and average from $1,000 to $3,000 higher than professional academics' salaries in other undergraduate disciplines. Assistant professors' salaries are roughly comparable to offers being made to bachelor-degree engineering students when adjusted to a 12-month basis.

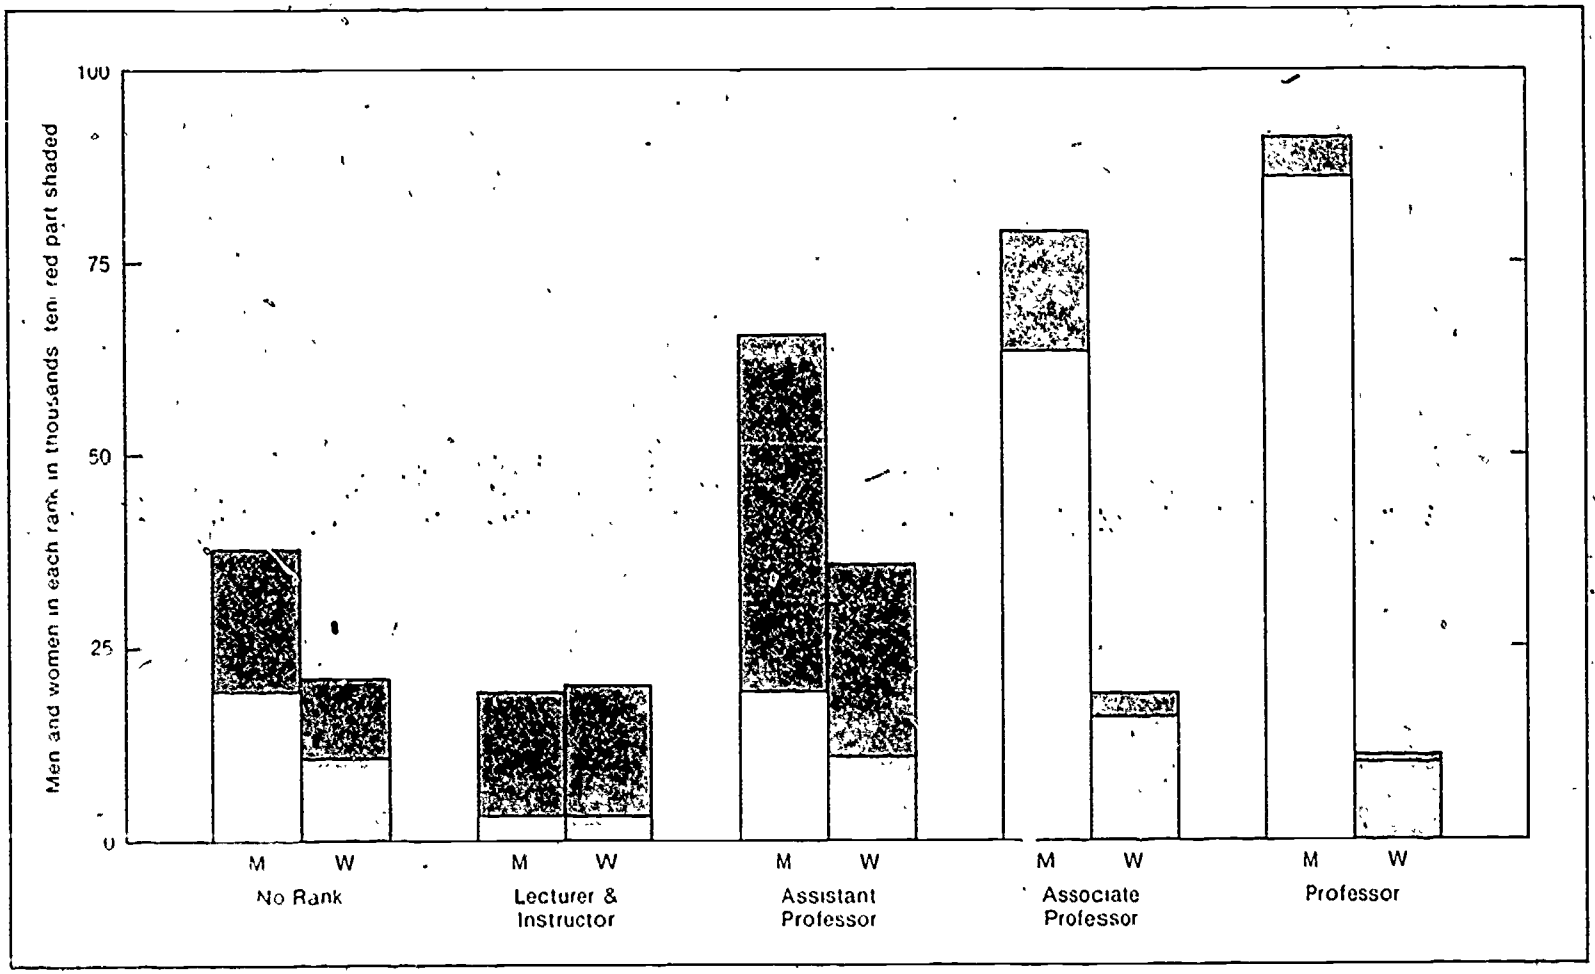
Chart I-15: Distribution of Full-Time Faculty by Rank, Tenure Status, and Sex in 1979-1980

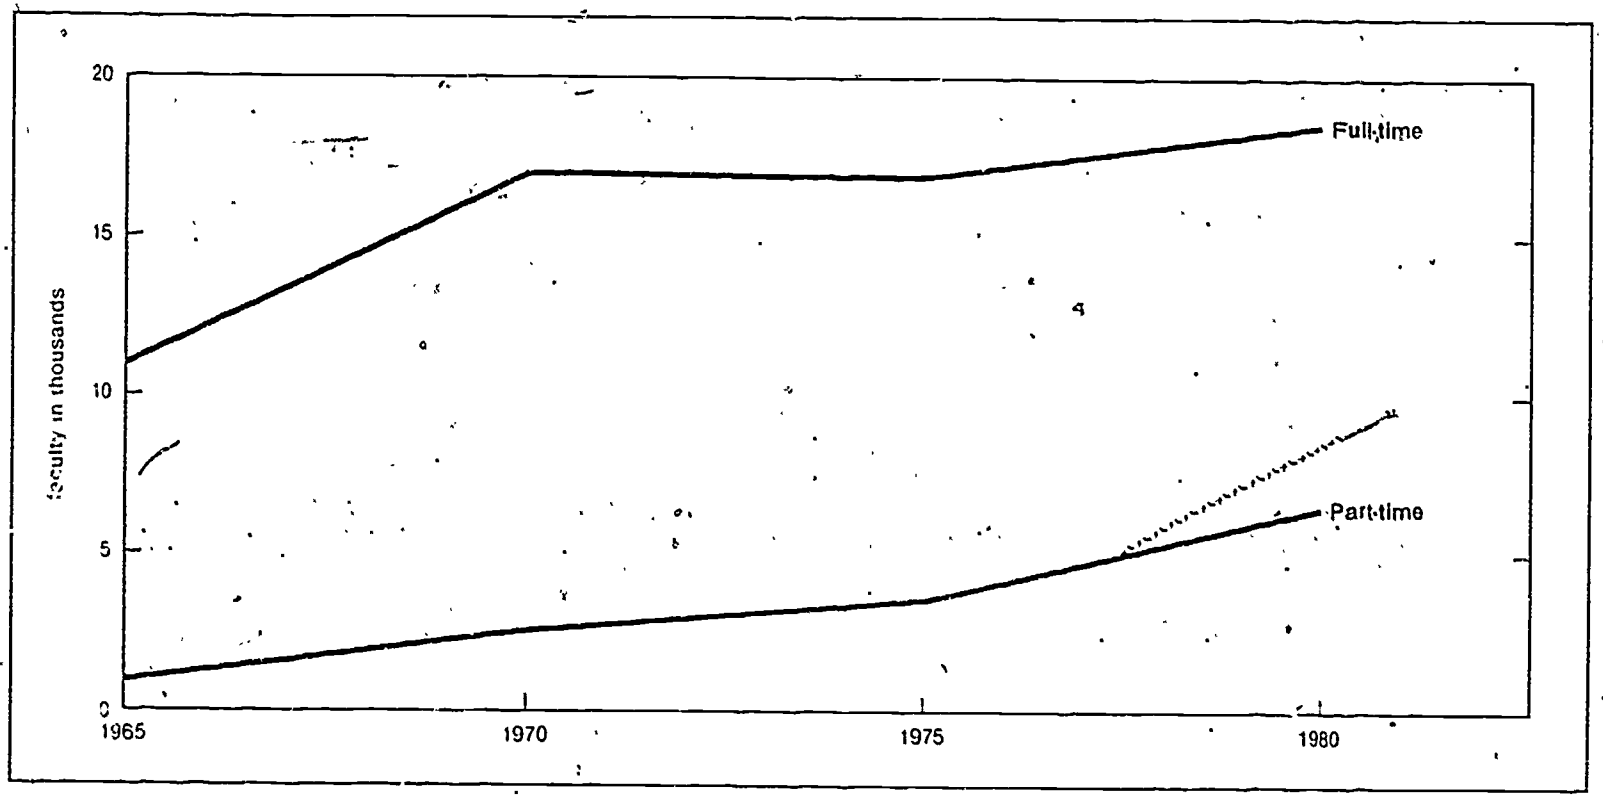
In all higher education men comprise 74% of the full-time faculty. Over 64% of these men hold tenure, compared to 43% of women faculty; men represent 90% of the full professors and 80% of the associate professors.



Source. Smith, C.R., *Faculty Salaries, Tenure, and Benefits 1979-80.*

Chart I-16: University and four-year college mathematical science faculty, 1965-1980

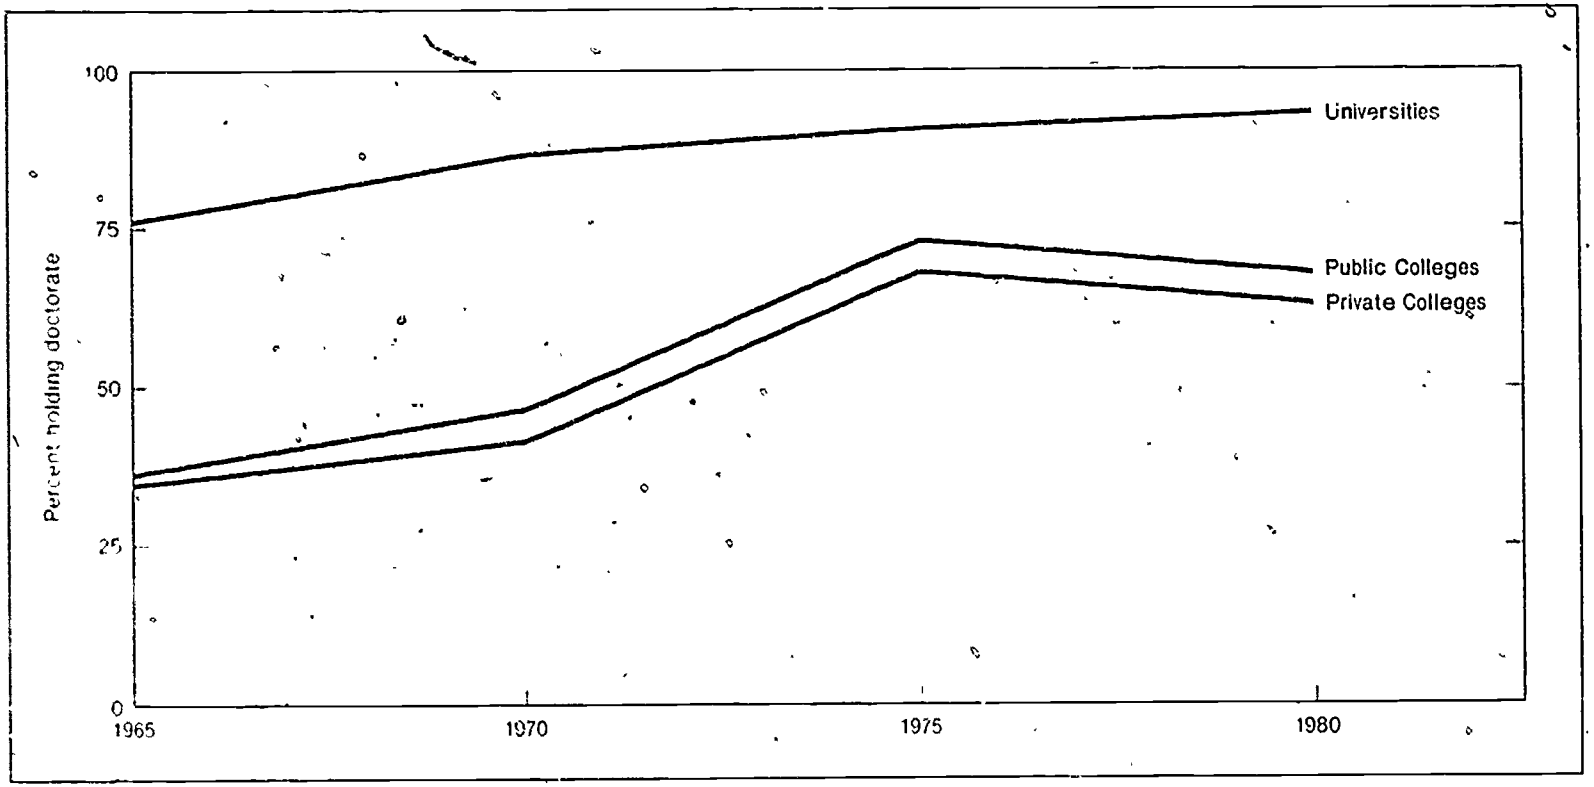
From 1975 to 1980 full-time mathematical science faculty increased by 8% and part-time faculty increased by 75%. The FTE faculty thus increased by 13% compared to an increase of 33% in mathematical science enrollments. The total FTE faculty in universities and four-year colleges increased by only 3% in the same time period.



Source: Undergraduate Mathematical Sciences in Universities, Four Year Colleges, and Two-Year Colleges, 1980-1981. James T. Fey and Wendell H. Fleming. Conference Board on Mathematical Sciences, 1981.

Chart I-17: Doctorates among full-time mathematical science faculty

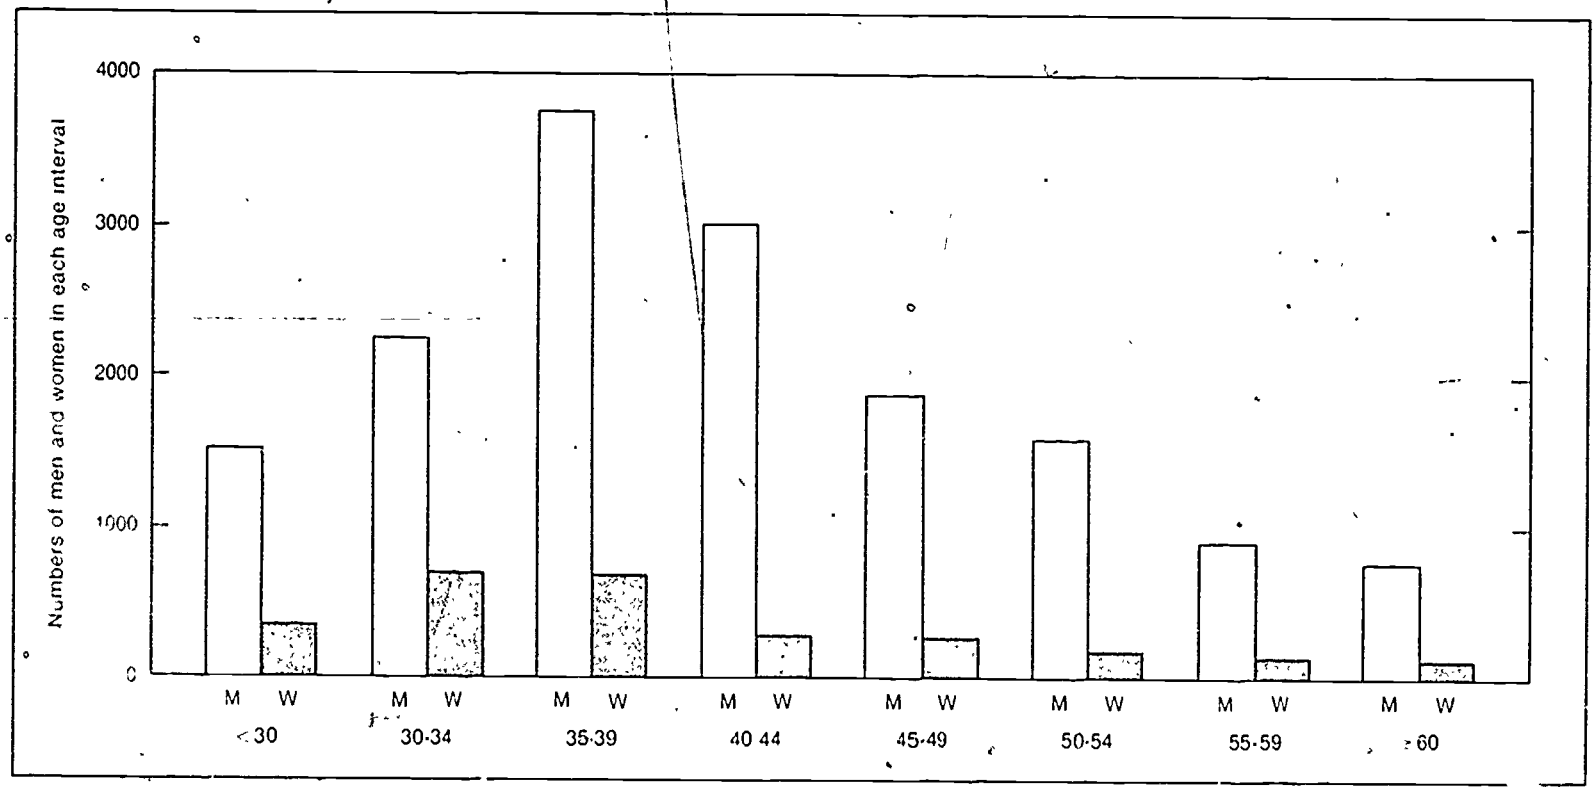
From 1975 to 1980 the fraction of public and private four year college faculty with earned doctorates decreased, reversing the trend of 1965 to 1975.



Source: Undergraduate Mathematical Sciences in Universities, Four-Year Colleges, and Two Year Colleges 1980 1981 James T. Fey and Wendell H. Fleming, Conference Board on Mathematical Sciences 1981

Chart I-18: Distribution of full-time mathematical science faculty by age and by sex, 1980

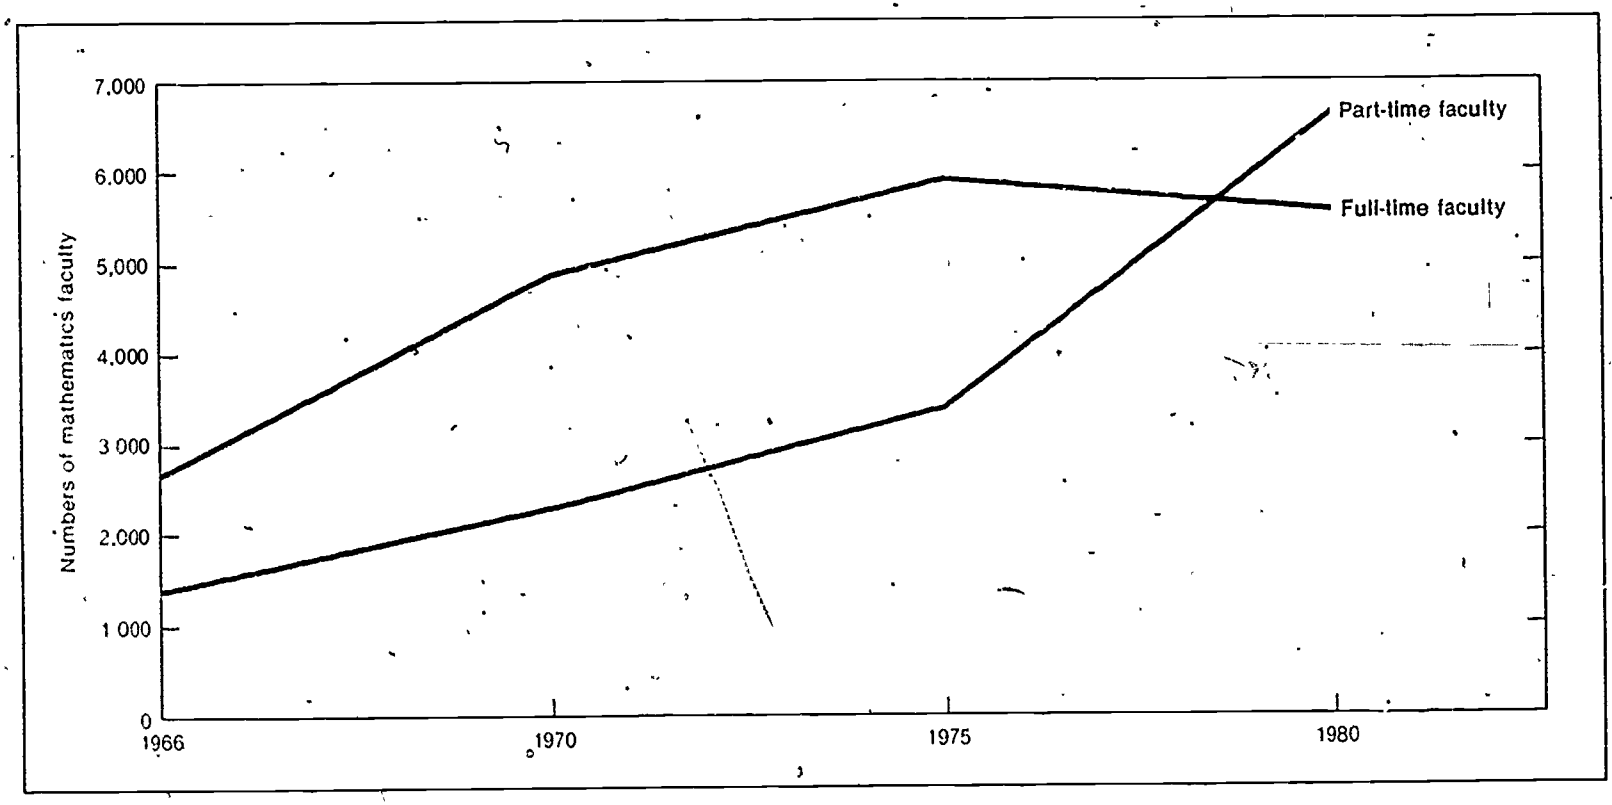
Women comprise 14% of mathematical science faculty, the greatest number in public colleges (18%) and least in universities (9%). All three figures are up substantially from 1975 when only 10% of the mathematical science faculty were women. The median age for women is about five years less than than for men.



*Source Undergraduate Mathematical Sciences in Universities, Four Year Colleges, and Two-Year Colleges, 1980 1981. James T Fey and Wendell H Fleming Conference Board on Mathematical Sciences, 1981

Chart I-19: Trends in numbers of full- and part-time mathematics faculty

For mathematics in two-year colleges, part-time faculty now outnumber full-time faculty, making up 54% of the total. The part-time component of the mathematics faculty increased by 95% over the period 1970-1975. Equally striking is the *decrease* in the size of the full-time faculty. For *all* fields in TYC's, part-timers constitute 56% of the faculty.



Source: Undergraduate Mathematical Sciences in Universities, Four Year Colleges, and Two-Year Colleges, 1980-1981 James T. Fey and Wendell H. Fleming, Conference Board on Mathematical Sciences, 1981

	1966	1970	1975	1980
Full Time	2677	4879	5944	5623
Part-Time	1318	2213	3411	6661
FTE	3116	5617	7081	7843

Chart I-20: Educational qualifications of part-time mathematics faculty in two year colleges

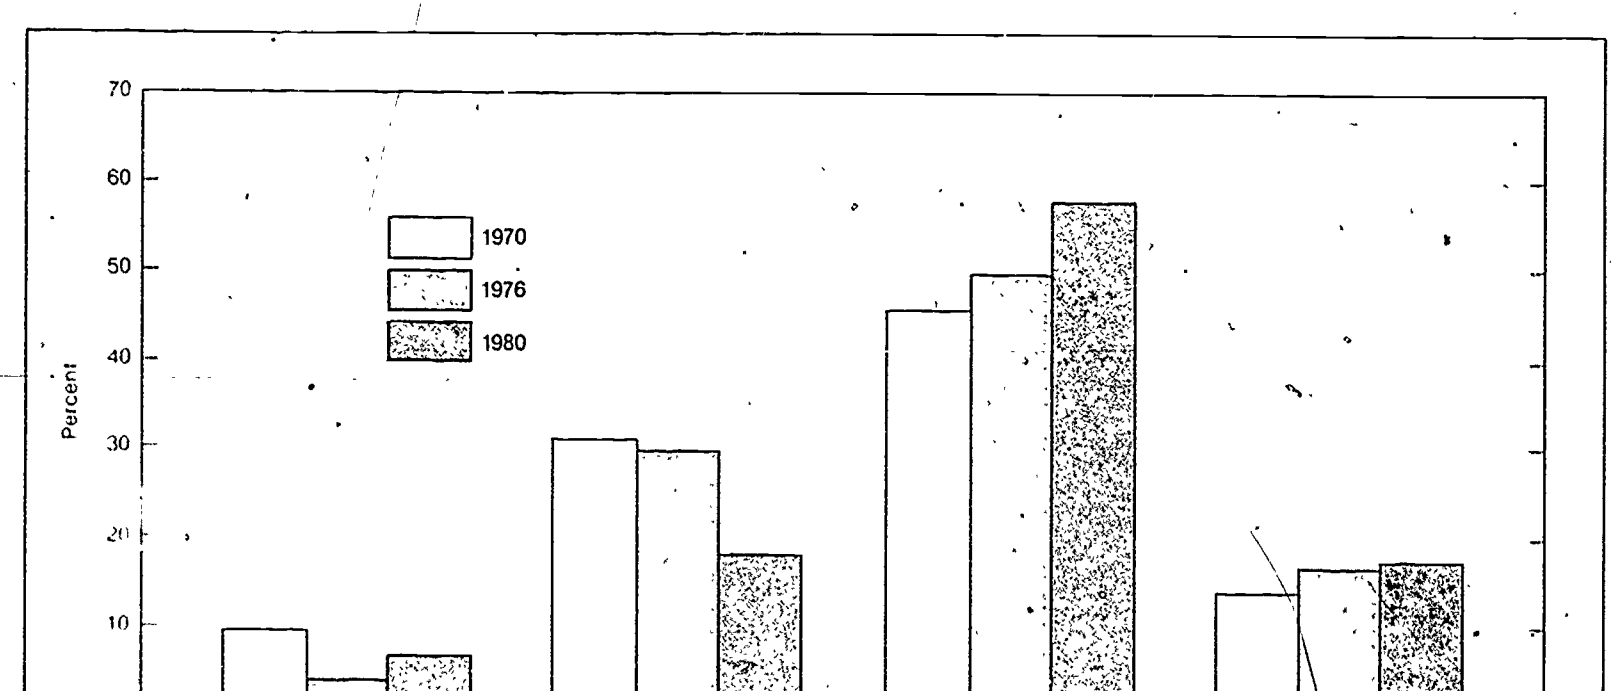


Table I-20: Educational qualifications of part-time mathematics faculty

Highest Degree	1970	1975	1980
Doctorate	9.5%	3.9%	6.7%
Master's + 1 Year	31.0%	29.9%	18.1%
Master's	45.5%	49.6%	57.6%
Bachelor's	14.0%	16.6%	17.4%

As compared with the 1970 figures, the percentages of part-time mathematics faculty in the doctorate or "master's + 1" highest degree categories have declined. Given an increase in the number of industrial opportunities for mathematicians, it is not likely that the educational qualifications of part-timers will increase in the near future.

Source: Undergraduate Mathematical Sciences in Universities, Four-Year Colleges, and Two-Year Colleges, 1980-1981 James T. Fey and Wendell H. Fleming, Conference Board on Mathematical Sciences, 1981

Chart I-21: Percent of higher education institutions with access to computers, 1965-77

The percent of institutions with access to computers has more than doubled since 1965.

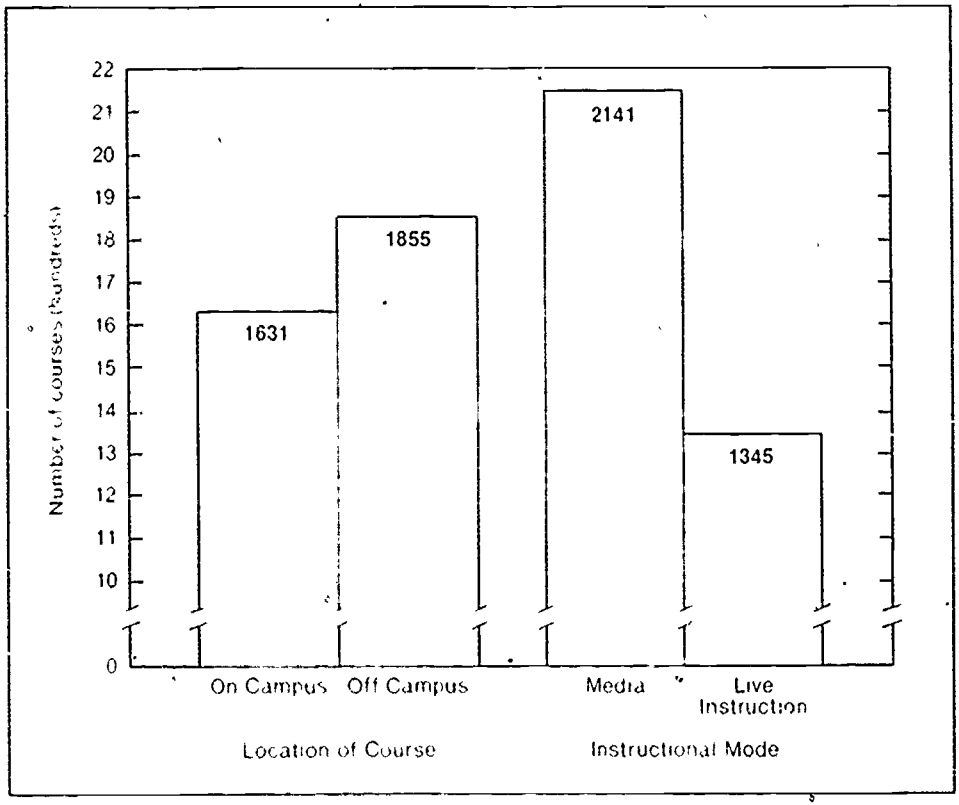
Chart I-25: Number of continuing education degree credit courses for scientists and engineers

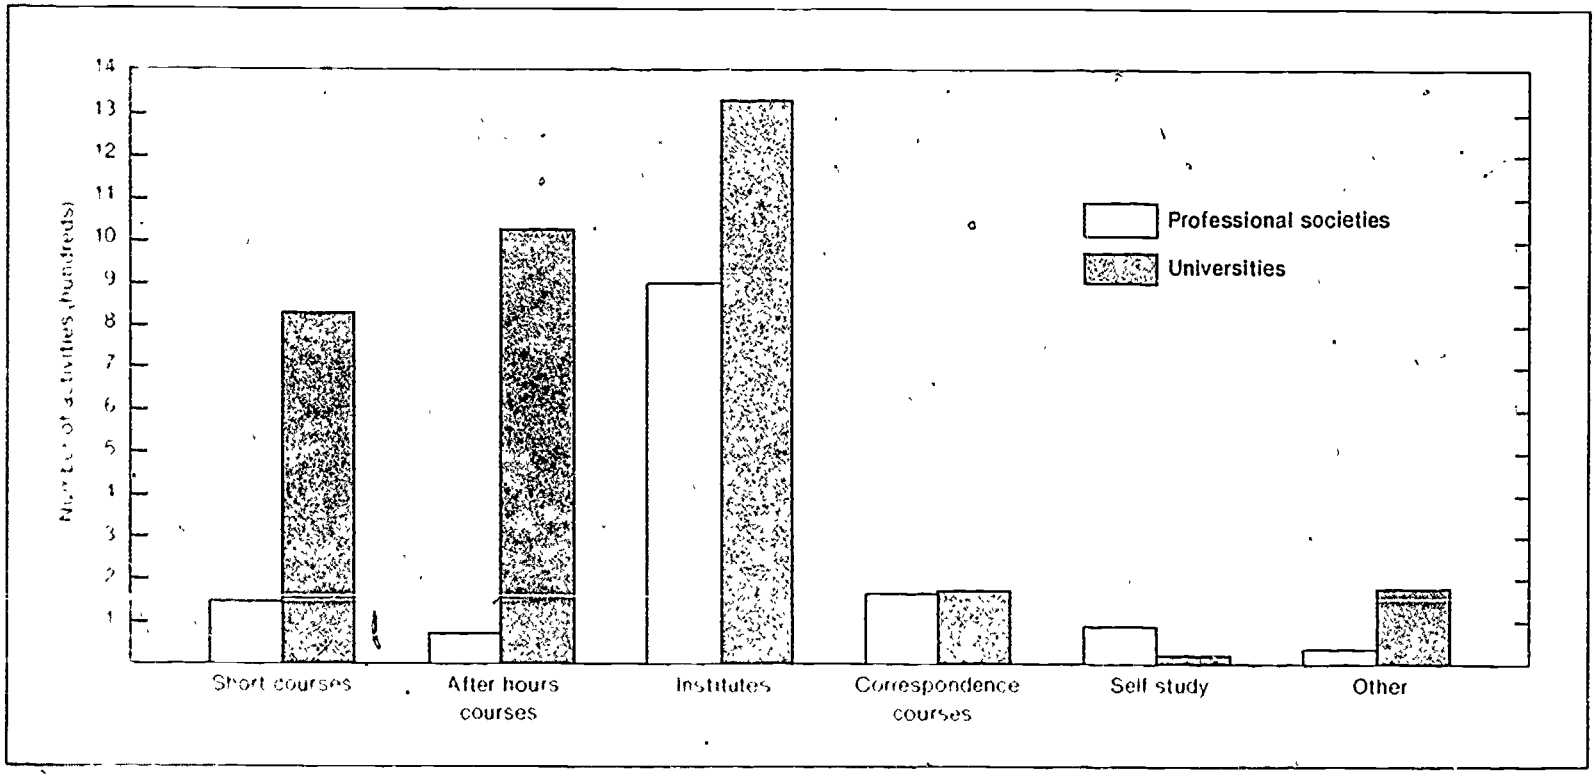
A continuing education degree credit course is defined to be a course directed primarily towards engineers and scientists with at least a bachelor's degree, but excluding courses directed primarily toward full-time students. Fifty-six universities offered 3486 such courses in 1975-76.



Source: Klus, John P. and Jones, Judy A. *Survey of Continuing Education Activities for Engineers and Scientists*, pp. 15-17.

Chart I-26: Number of continuing education non-credit activities for scientists & engineers, offered by universities and professional/technical organizations, 1975-76

During 1975-1976, there were 4909 separate activities for scientists and engineers. Of that total, 3519, or 72%, were given by universities and 1390, or 28%, by professional societies. Institutes and other brief programs (i.e., activity of less than 30 accumulated hours) were the most popular form of activity. There were 2223 institutes, 45% of the total.



75

76

Table I-25: Number of continuing education non-credit activities for scientists and engineers offered by universities and professional/technical organizations, 1975-76

Institution	Number with one or more	Number of activities	Type of Activity*					
			Short courses	After hours courses	Institutes	Correspondence courses	Self-study	Other
Universities	92	3519	821	1015	1323	167	19	174
Professional/Technical Organizations	55	1390	145	67	900	162	83	33
Total	147	4909	966	1082	2223	329	102	207

*The activities are defined as follows. *Short course* — organized instructional program on a specific subject that meets in all day sessions for a minimum of 5 days amounting to at least 30 clock hours. *After-hours course* — organized instructional program on a specific subject presented in short segments over a pre determined number of weeks. *Institute* — also called seminar, clinic, workshop, organized instructional program meeting for 5 hours or more in continuous sessions except for meals and recesses, lasting for less than 30 clock hours. *Correspondence course* — course of instruction involving a continuing exchange between instructor and student conducted primarily by written communication. *Self study* — program of instruction in which student is provided with all materials and left to proceed on his/her own with no direct aid from an instructor.

Table I-26: Percentages of total cash operating income from foundations, corporations, and other non-governmental sources

In 1979, museums received less than one-fourth of their total operating income from private sources, such as foundations, corporations, individual contributions, and other sources. Art museums received the greatest relative percentage of their total operating income from private sources (25 percent) and parks and visitor centers the least (6 percent). On the whole, museums received approximately the same financial support (4 percent of total operating income) from each of foundations, individuals, and other sources. Financial support from corporations made up only an estimated 2 percent of total operating income.

	All Museums	Art	Children's	General	History	Parks and Visitor Centers	Science	Specialized
Total Operating Income	$1,088,086,733	$294,443,182	$8,449,854	$88,315,153	$260,712,507	$29,732,898	$379,817,942	$26,615,197

Table I-27: Trends in educational roles, by size of total operating expenditure: United States, fiscal year 1979

Museums with higher operating income were more likely to have increasing educational roles. Conversely, those institutions with the lowest operating incomes were more likely to indicate that their educational roles were staying the same.

Trends in Educational Role	Total	Total Operating Expenditure								
		None	$1 $25,000	$25,001 $50,000	$50,001 $75,000	$75,001 $100,000	$100,001 $200,000	$200,001 $300,000	$300,001 $400,000	More Than $400,000

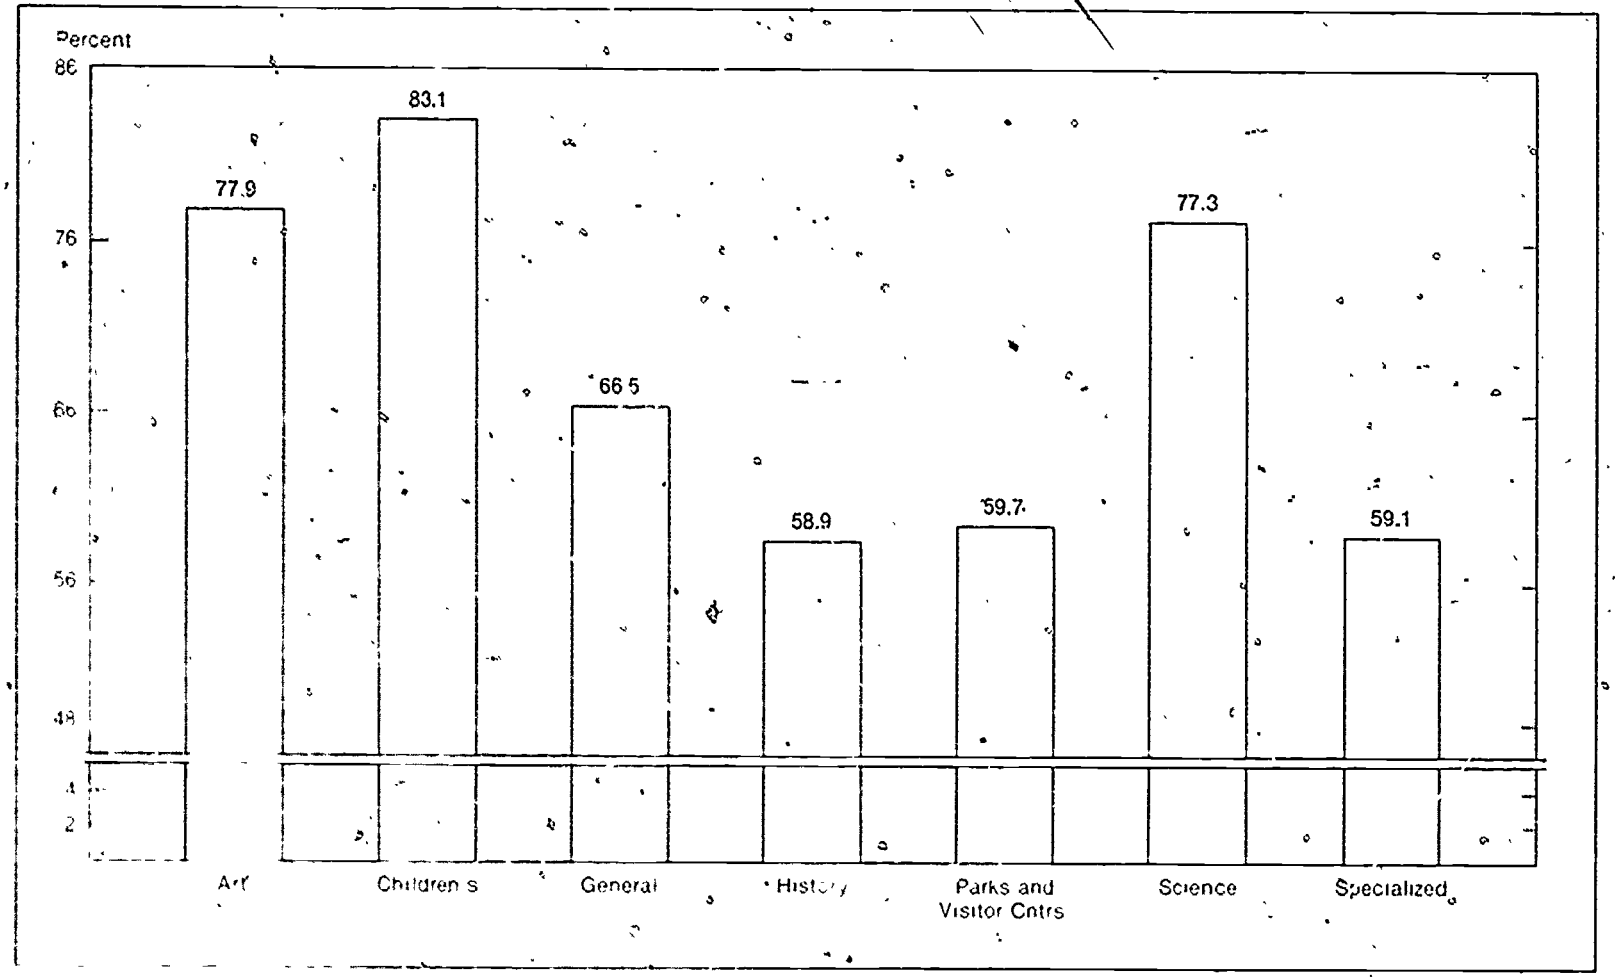
Chart I-27: Distribution of institutions offering specific programs, by type of museum

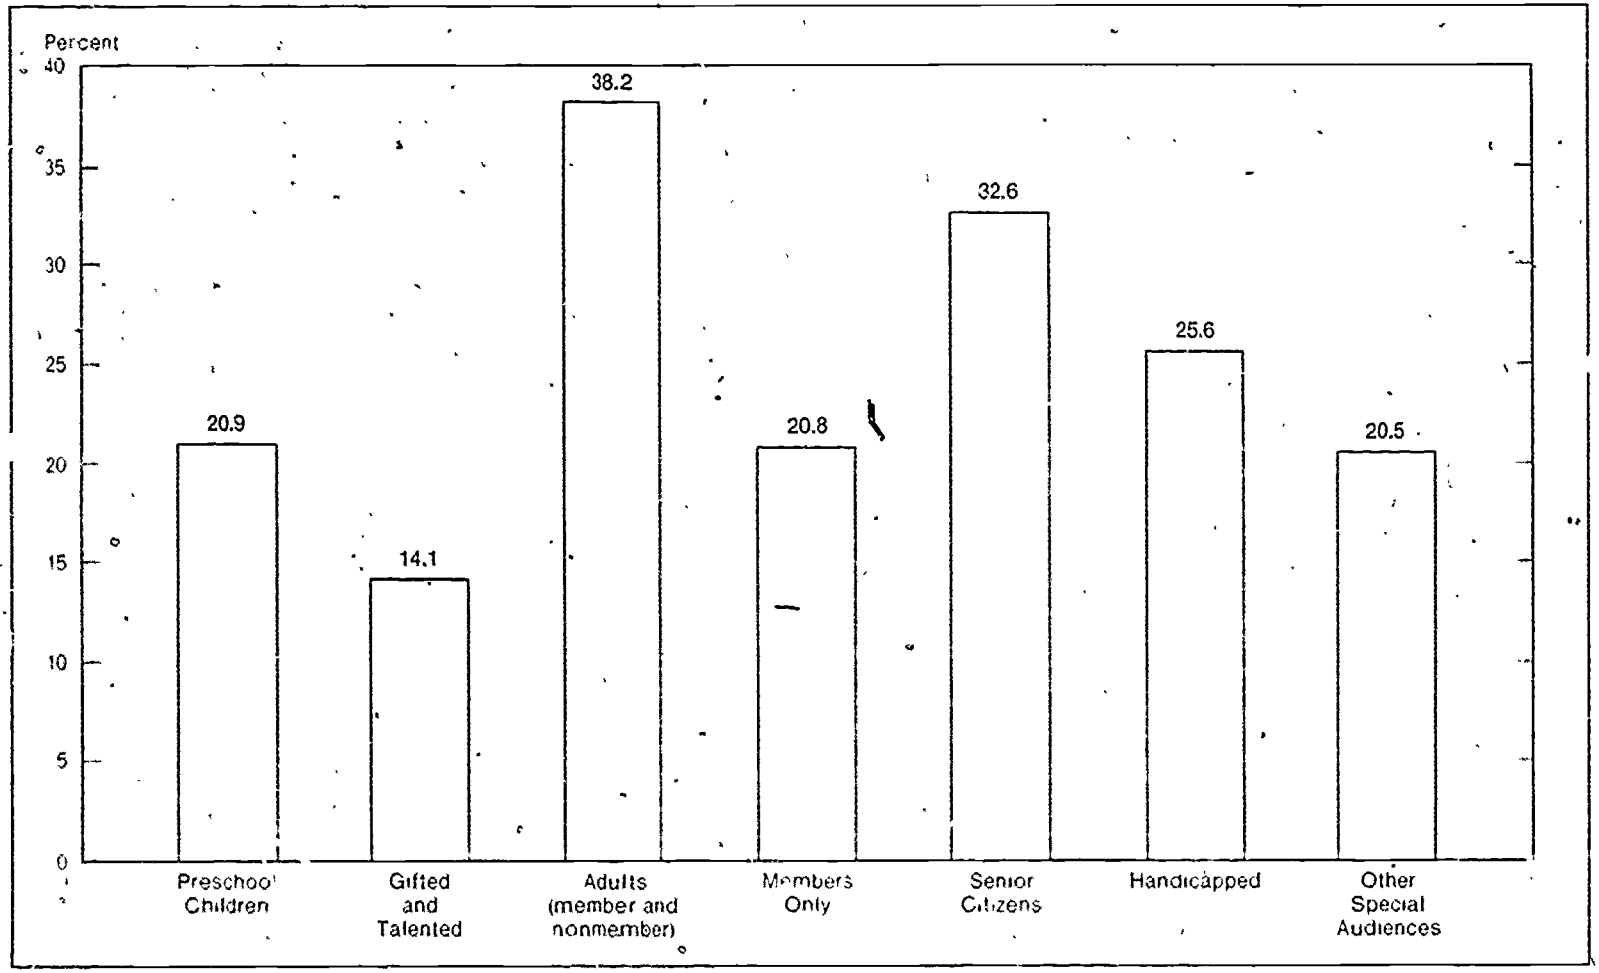
An estimated 66 percent of all museums offered some type of specific program in fiscal year 1979. Children's museums (83 percent) and art and science museums (78 percent) were more likely to have specific programs than other types of museums.



Source: Contractor Report, Museum Program Survey, 1979, National Center for Education Statistics, p. 75.

Chart I-28: Museums offering special programs* for specific groups: United States, 1979

Chart I-26 depicts the percentage of all museums offering programs for pre school children, gifted and talented, adults (member and nonmember), members only, senior citizens, handicapped persons, and other special audiences.

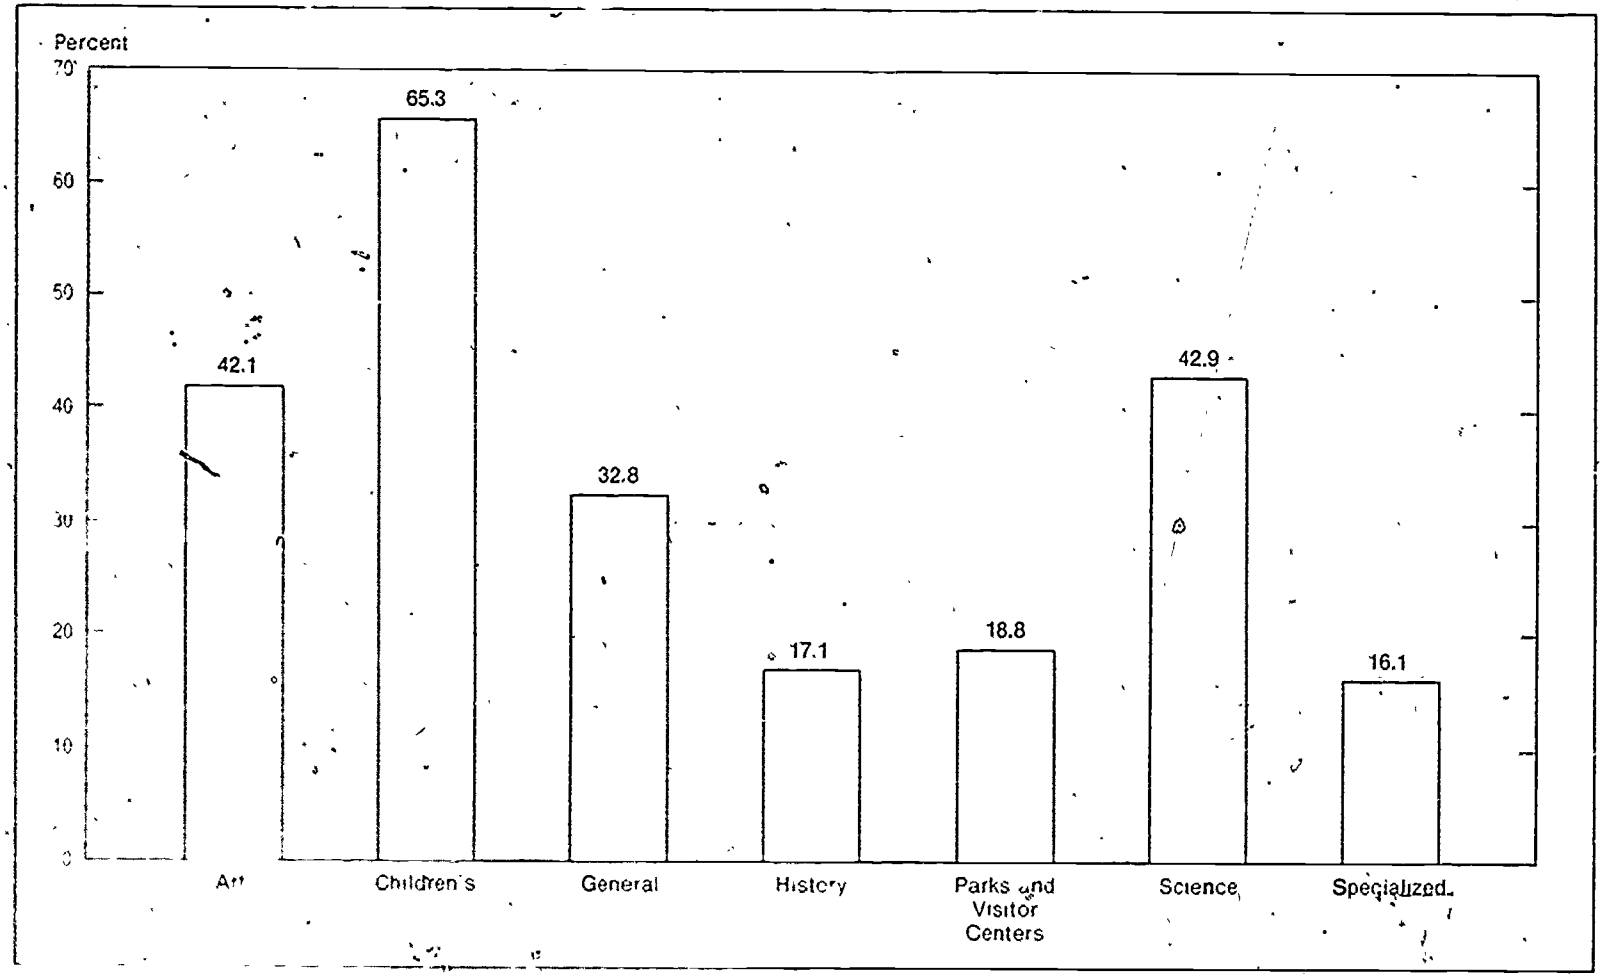


*Museums offering one or more special programs during the fiscal year as reported. 65.8 % of all museums

Source: Contractor Report, Museum Program Survey, 1979. National Center for Education Statistics. p. 76

Chart I-29: Museums offering teacher training, by type of museum

Approximately one-fourth of the museums offered teacher training periodically or on a regular basis on how to use museum resources. An estimated 65 percent of the children's museums offered teacher training. Around 40 percent of science museums and art museums offered such training; only 16 percent of the specialized museums offered some type of teacher training.



Source: Contractor Report, Museum Program Survey 1979, National Center for Education Statistics, p. 45, p. 80

Chart I-30: Federal funding of science-technology centers and museums[1]

These data estimate federal support to science-technology centers and museums. Between 1972 and 1978, the Federal government made grants of slightly over $30 million. National History museums received about $12.2 million, general museums $9.2 million, science-technology centers $6.9 million, and aquariums and zoos $2.6 million.

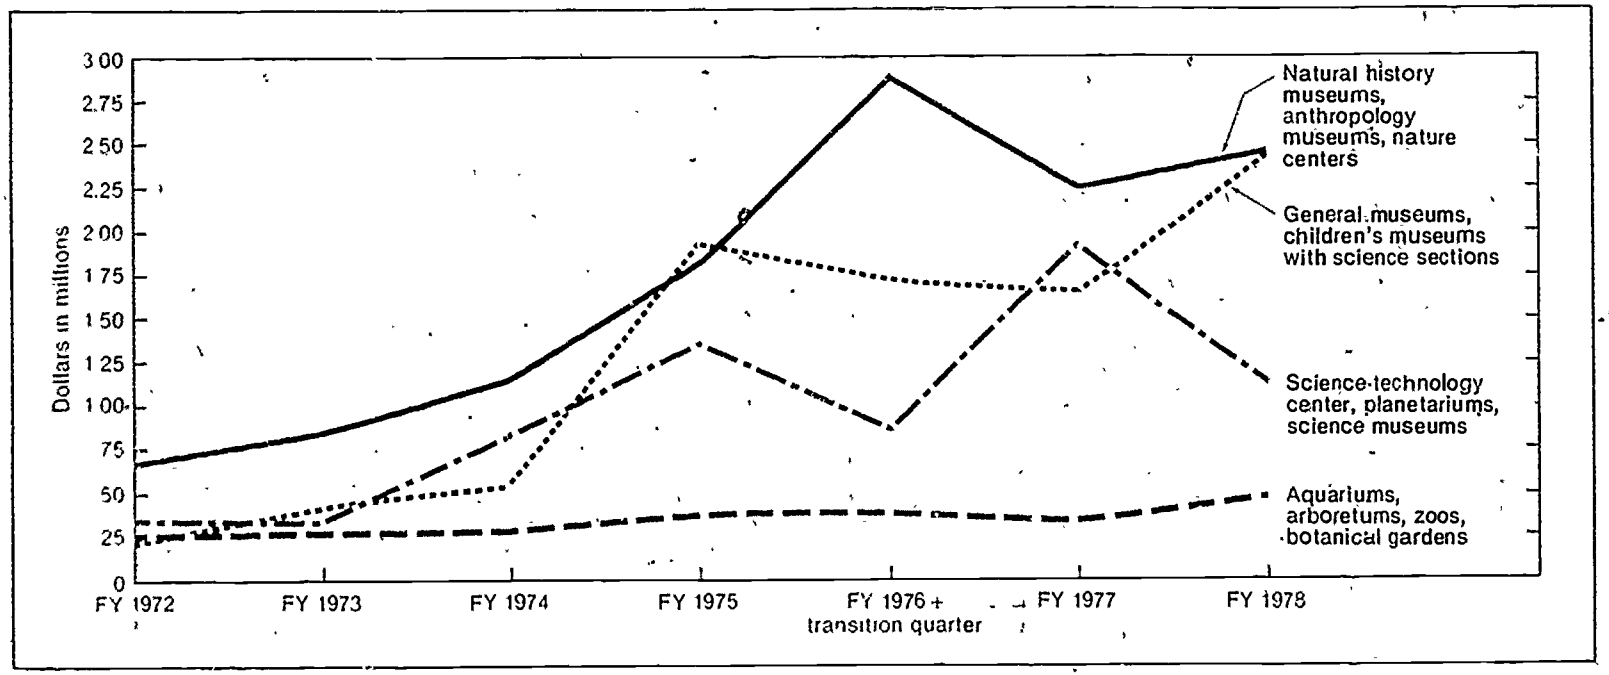


Table I-30: Federal funding of science-technology centers and museums

Museum Type	FY 1972	FY 1973	FY 1974	FY 1975	FY 1976	FY 1977	FY 1978
Science-Technology Centers, Planetariums, Science Museums	$ 360,117	$ 344,317	$ 839,727	$1,375,396	$ 861,191	$1,958,492	$1,126,745
Natural History Museums, Anthropology Museums, Nature Centers	$ 693,096	$ 860,602	$1,172,517	$1,825,954	$2,951,405	$2,264,400	$2,444,954
Aquariums, Aboretums, Zoos, Botanical Gardens	$ 254,900	$ 272,850	$ 289,060	$ 443,457	$ 415,100	$ 360,115	$ 584,624
General Museums, Children's Museums with science sections	$ 230,250	$ 420,865	$ 535,105	$1,957,518	$1,765,742	$1,739,542	$2,581,727
TOTALS	$1,538,363	$1,898,634	$2,836,409	$5,602,325	$5,993,438	$6,322,549	$6,738,050

[1]Challenge grants are excluded from these totals. Funding is from the National Endowment for the Arts, National Endowment for the Humanities, National Museum Act, and National Science Foundation

Chapter II
PARTICIPATION

INTRODUCTION

This chapter presents data on how many and what kinds of people participate in science, mathematics, and technology education and what form that participation takes. The data are grouped into two categories. K-12 and higher education.

HIGHLIGHTS

K-12

1. More than one-third of all high school mathematics teachers and almost half of all high school science teachers have participated in at least one NSF-sponsored activity. (Chart II-1)
2. On the average, a higher percent of 13-year-olds than 17-year-olds report participating in science-related activities outside of school. (Chart II-2)
3. There has been an increase in the total number of people attending museums belonging to the Association of Science/Technology Centers (ASTC) between 1975 and 1977 (Charts II-3, A&B)
4. TV is the most frequently reported source of information about energy issues, but the print media is the most frequently reported source of information about new developments in energy science and technology (Chart II-6)
5. Most college bound high school students continue to take the standard course preparation including 3+ years of mathematics and 2+ years of science (Chart II-7)
6. Honors courses in mathematics and English enrolled higher percents (both 14.5) of students than other honors courses. (Chart II-8)
7. In high school nearly equal proportions of males and females take mathematics courses. (Chart II-9)
8. A substantially larger percent of Asian or Pacific Islander seniors take algebra I, algebra II, and geometry. (Chart II-10)

Higher Education

1. Black, Hispanic, and American Indian seniors were significantly more likely than whites to have taken remedial mathematics courses, while Asian/Pacific Islanders were less likely to have taken such courses. (Chart II-11)
2. Since 1965, full-time-equivalent (FTE) enrollments in higher education have grown by 100%. The two-year college share of this enrollment has increased from 17% to 34%, but more than half of the TYC enrollment is in non degree credit occupational/technical programs. (Chart II-12)
3. Among those declaring a major in the sciences at two-year institutions, engineering accounts for as many students as all the other sciences combined. (Chart II-13)
4. Between 1969 and 1976, undergraduate enrollments in the social sciences declined by more than 50% (Chart II-14)
5. As a percentage of total engineering degrees, women have increased their share. (Chart II-15)
6. While more undergraduates enroll in engineering than any other science, women and minorities find their greatest representation in the biological sciences. (Chart II-16)
7. At the graduate level in 1978, women accounted for approximately one-third of the enrollments in the biological sciences, but for only 7% of those in engineering. (Chart II-17)
8. Undergraduate engineering enrollments are rising significantly. (Chart II-18)
9. From a relative minimum in 1973, undergraduate engineering enrollments have grown steadily to an all-time high of 365,000 in 1980. Since the number of freshman engineering students was also an all-time high in that year, the influence of engineering enrollments on mathematics course demand is likely to continue strong over the next several years. (Chart II-19)
10. Between 1975 and 1980 all mathematical science enrollments increased by 33%, compared to 7% for FTE enrollments in all fields. The 30% increase in calculus and the 196% increase in computing courses led the way. (Chart II-22)
11. Since 1960, enrollment in remedial arithmetic, general mathematics, and algebra has increased by 165%. Those courses now constitute 16% of all mathematics enrollments, compared to 13% in 1960. The biggest increase occurred between 1975 and 1980, matching a period of widespread reports that high school preparation in mathematics has declined sharply. (Chart II-23)
12. Computer science courses now generate over 16% of all mathematical science enrollments and they are increasingly given by separate departments of computer science. As in mathematics and statistics, the largest share of computer science enrollment is in lower level courses. (Chart II-24)
13. There has been strong enrollment growth in nearly every computer science course offering. However, the bulk of the increase from 1975 to 1980 occurred in beginning programming courses. (Table II-12C)
14. Approximately 30,000 scientists and engineers enrolled in continuing education credit-granting courses in 1975-76. (Chart II-25)
15. Almost 187,000 scientists and engineers enrolled in continuing education non-credit activities during 1975-76. (Chart II-26)

Chart II-1: Percent of teachers as of 1977 who attended an NSF-sponsored institute, workshop, or conference

Participation by teachers in NSF sponsored activities increases with grade level. More than one-third of all high school mathematics teachers and almost half of all high school science teachers have participated in at least one such activity. Mathematics and science teachers, especially at the higher grade levels, are much more likely to have participated than social studies teachers.

Chart II-2: Percentages of 13- and 17-year-olds participating in various science-related activities outside of science classes

On the average, a higher percent of 13-year-olds than 17-year-olds report participating in science-related activities outside of school. The activities that 17-year-olds report more frequently than 13-year-olds, however, are reading science articles and watching science shows on TV.

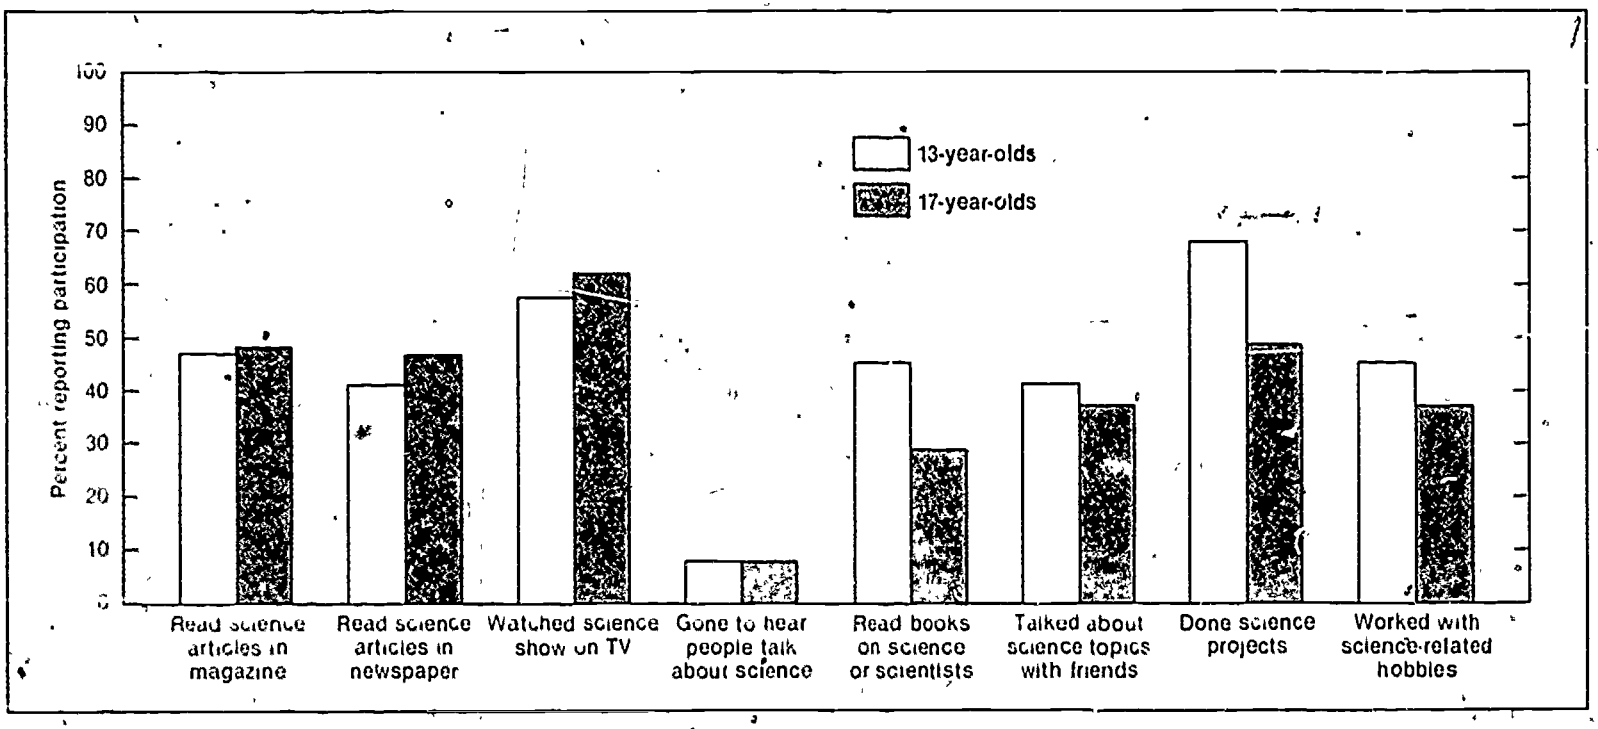

Table II-2: Percentages of 13- and 17-year-olds participating in various science-related activities outside of science classes

How often have you done each of the following activities when *not required* for science class?

	Percent Saying They Often or Sometimes Participate	
	Age 13	Age 17
Read science articles in magazines	47	48
Read science articles in newspapers	41	47
Watched science shows on TV	58	62
Gone to hear people give talks on science	8	8
Read books about science or scientists	45	29
Talked about science topics with your friends	41	37
Done science projects	68	49
Worked with science-related hobbies	45	37
Average percentage reporting participation	44	39

Charts II-3, A&B: Attendance at science museums, Association of Science-Technology Centers (ASTC), 1975-77

The Association of Science-Technology Centers (ASTC) reports a general increase in attendance at its members — science museums, and science and technology centers. Forty-nine of its members showed a 13% increase in their combined attendance figures over a three-year period.

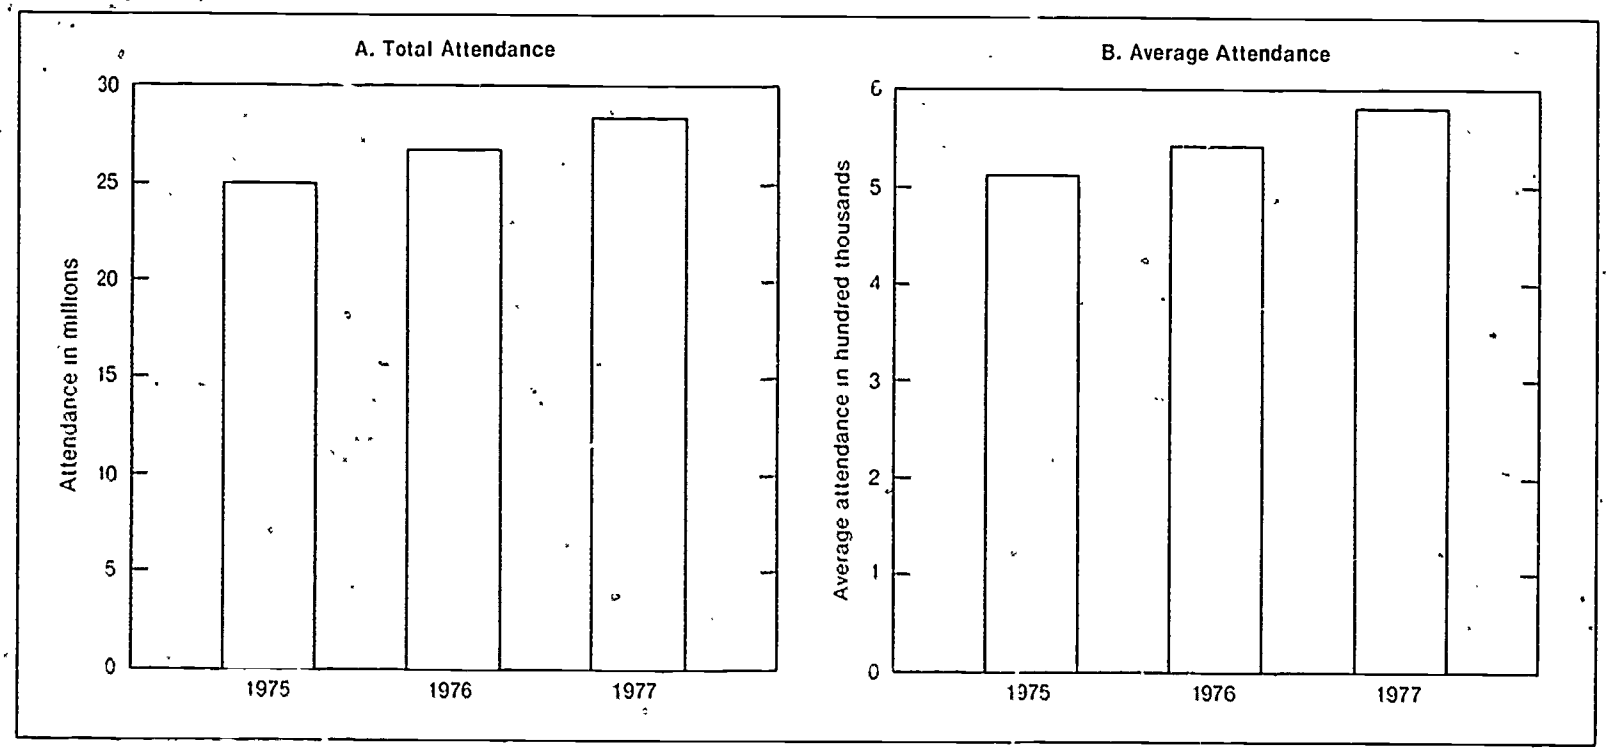

Table II-3: Attendance at science museums, Association of Science-Technology Centers (ASTC), 1975-77

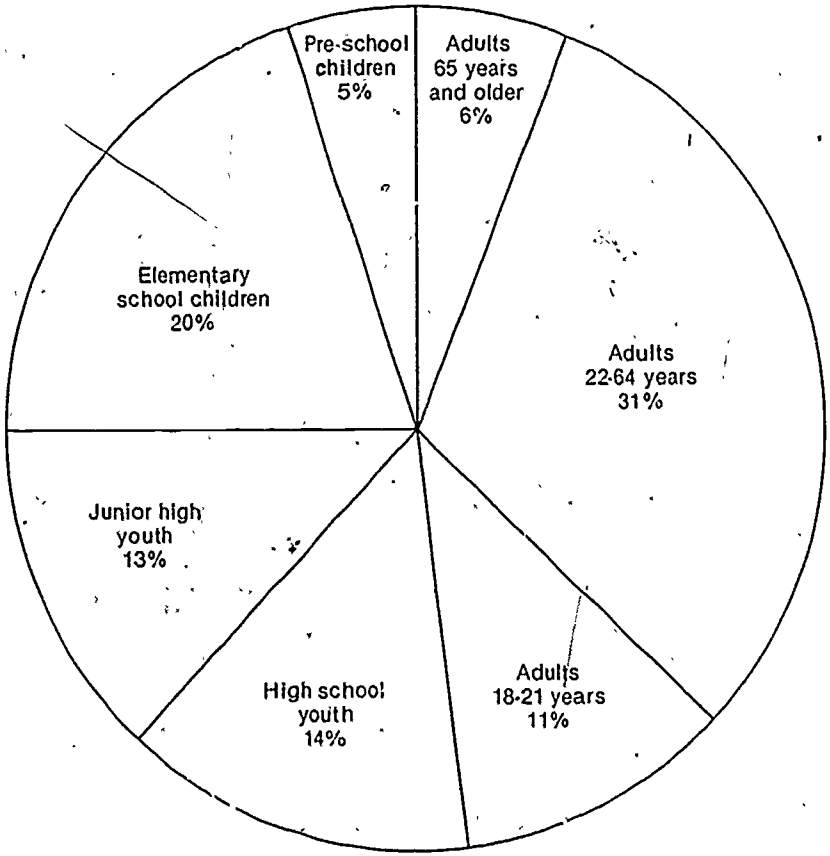
Year	Combined Attendance	Average Attendance
1975	25 010 114	510,410
1976	26,556,428	541,967
1977	28 292 03	577,404
N = 49		

Source: Association of Science-Technology Centers, unpublished data.

Chart II-4: Science museum attendance by age, as percent of total

Science museum attendance is about equally divided between adults and children



Source: Association of Science-Technology Centers, 1977-78 member survey, unpublished data.

Chart II-5: Circulations of popular science magazines

Although there have be n slight fluctuations, circulation for all five science magazines has increased in the past decade.

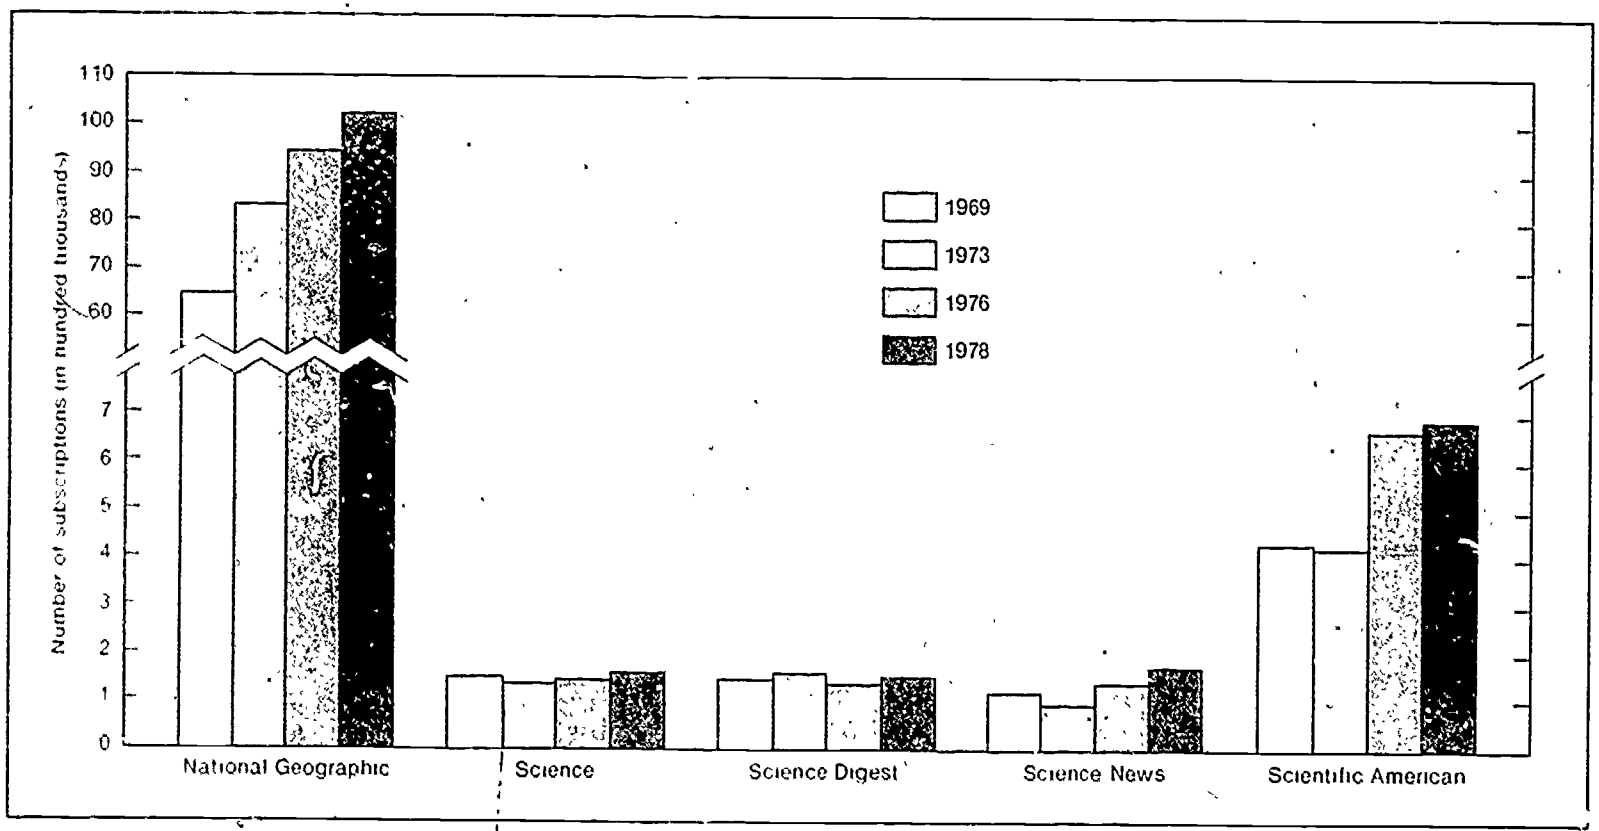


Table II-5: Circulations of popular science magazines

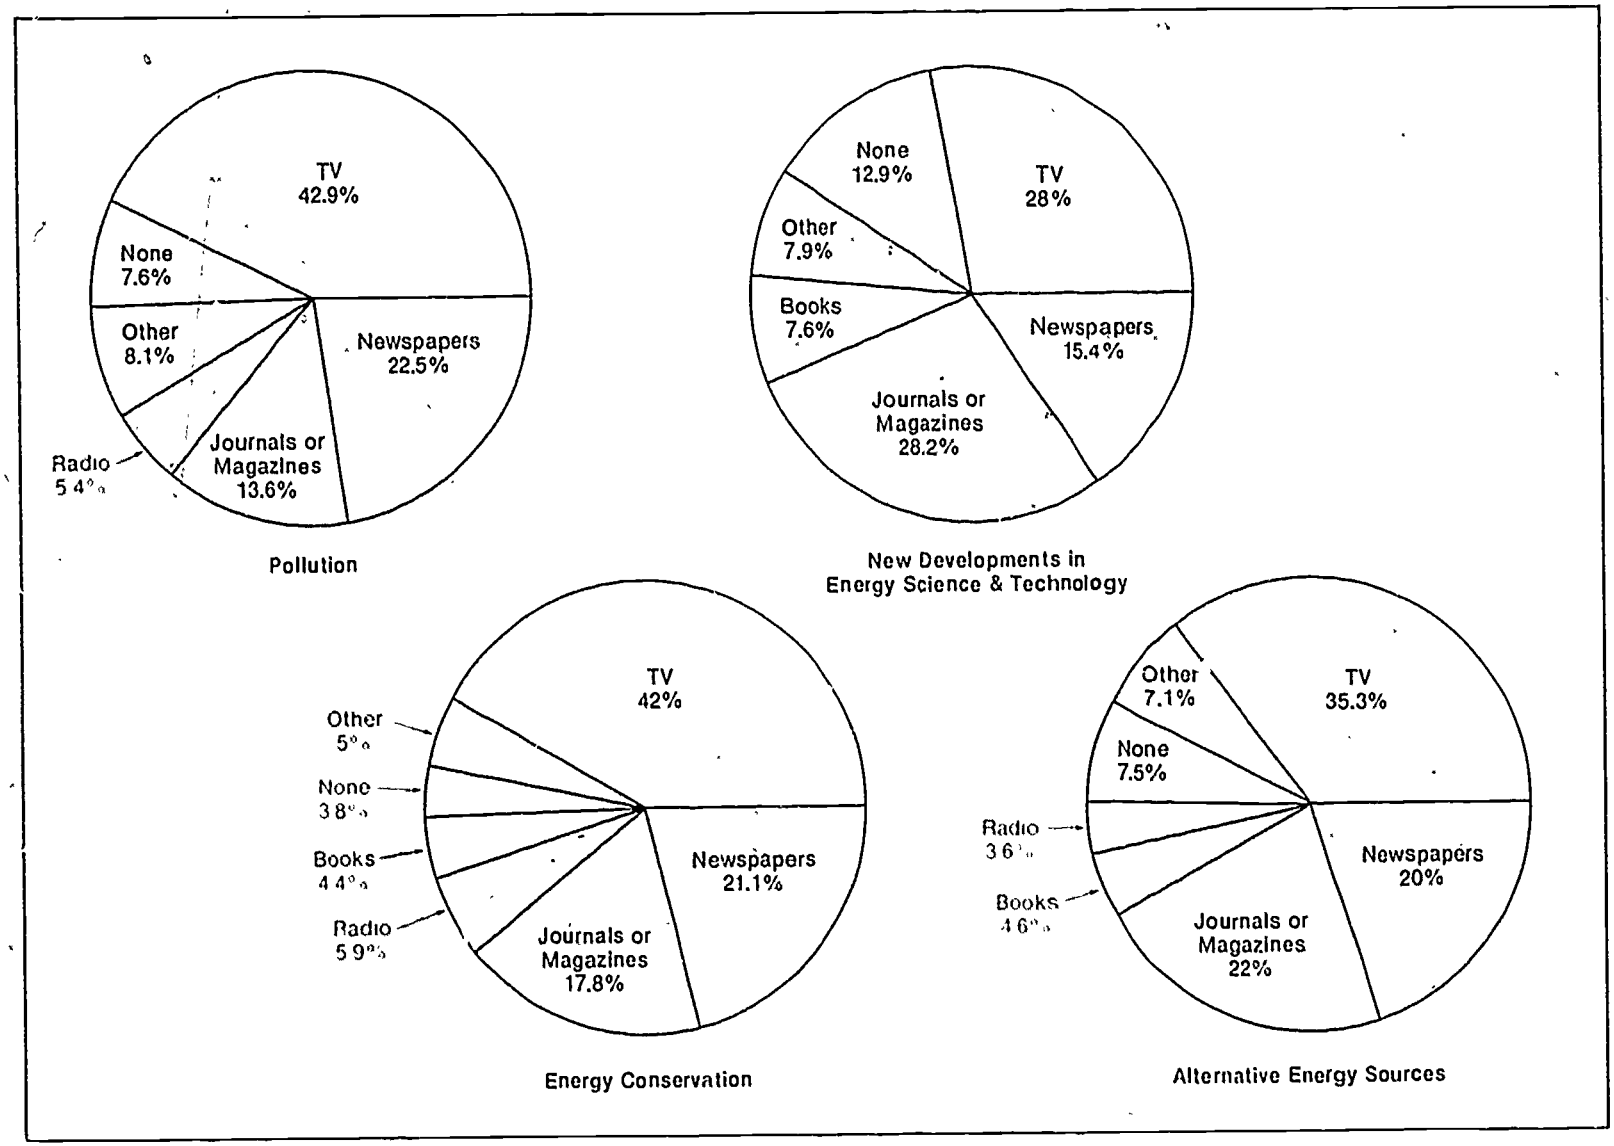
Magazine	1969	1973	1976	1979 (June)
National Geographic	6,402,674	8,276,668	9,350,123	10,249,748
Science	146,898	139,785	142,635	151,488
Science Digest	147,000	156,000	144,000	153,000
Science News	113,927	94,923	134,283	168,248
Scientific American	427,653	425,000	665,395	691,922

Sources: Circulation departments of each magazine

Chart II-6: Sources used by young adults[1] to obtain information about selected energy issues

TV is the most frequently reported source of information about energy issues. For information about pollution, conservation, and alternative energy sources, TV provides information to nearly as many young adults as all the print media combined. For new developments in energy science and technology, however, young adults tend to use the print media.



[1]Defined as 26-35 years old.

Source: National Assessment of Educational Progress, *Energy Knowledge and Attitudes. A National Assessment of Energy Awareness Among Young Adults* p. 38

Chart II-7: Mean number of years of study, by subject of college-bound seniors, by sex, 1980-81

College-bound seniors continue to show the standard course preparation: 4 years of English, 3+ of mathematics, 2 of a foreign language, 1+ of biology, 1-2 of a physical sciences, and 3+ of social studies. The greatest inter-sex differences appear in the physical sciences and mathematics where the males take more course work.

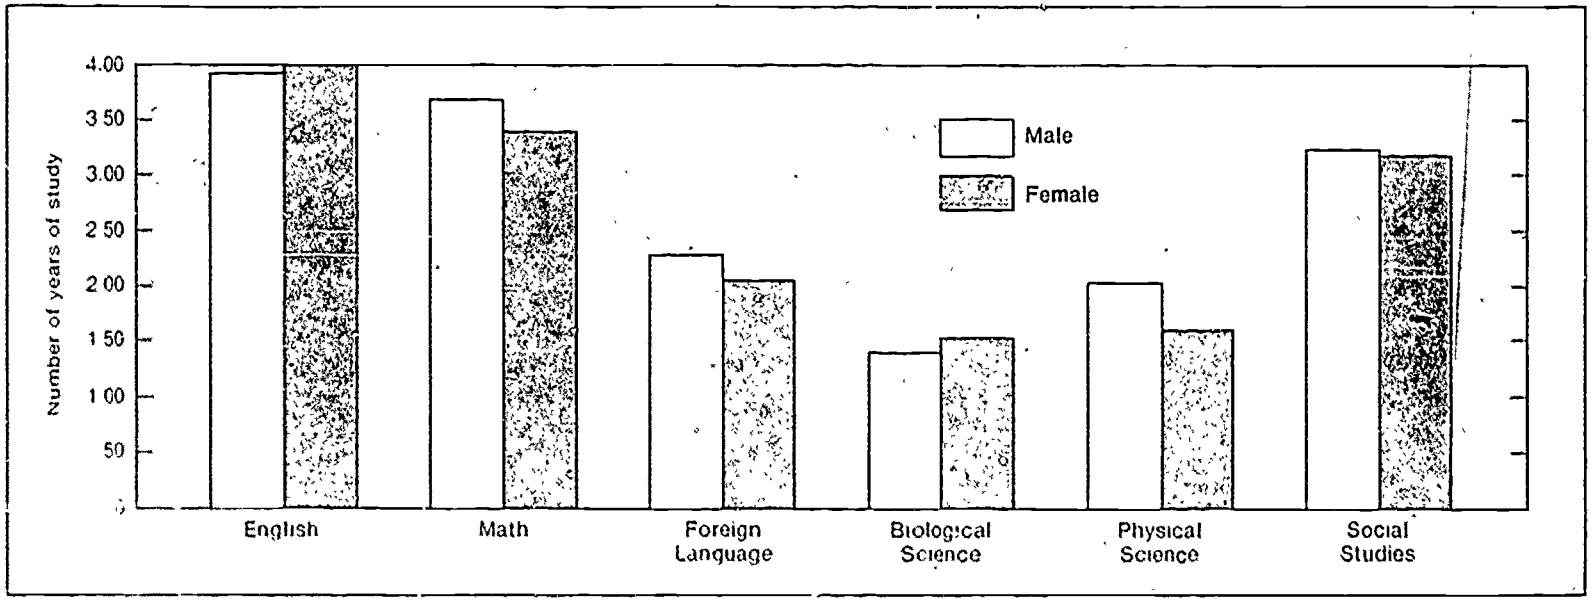


Table II-7: Number of years of study by subject of college-bound seniors, by sex, 1980-81

Students were given examples of science and social studies courses as follows: biological sciences — biology, botany, and zoology; physical sciences — chemistry, physics, and earth sciences; social studies — history, government, and geography. It is not clear, where, if at all, students would note course taking in physical or general science, anthropology, economics, sociology, or psychology.

Source: Admissions Testing Program of the College Board, *National Report, College Bound Seniors, 1981*, p. 14.

Chart II-8: Percent of college-bound seniors who took an honors course, by subject, 1980-81

The percentage of students taking honors courses from among those who reported subject courses on the Student Descriptive Questionnaire of the Admissions Testing Program included 9.0% for social studies, 14.0% for mathematics and over 9.0% for physical and biological sciences.

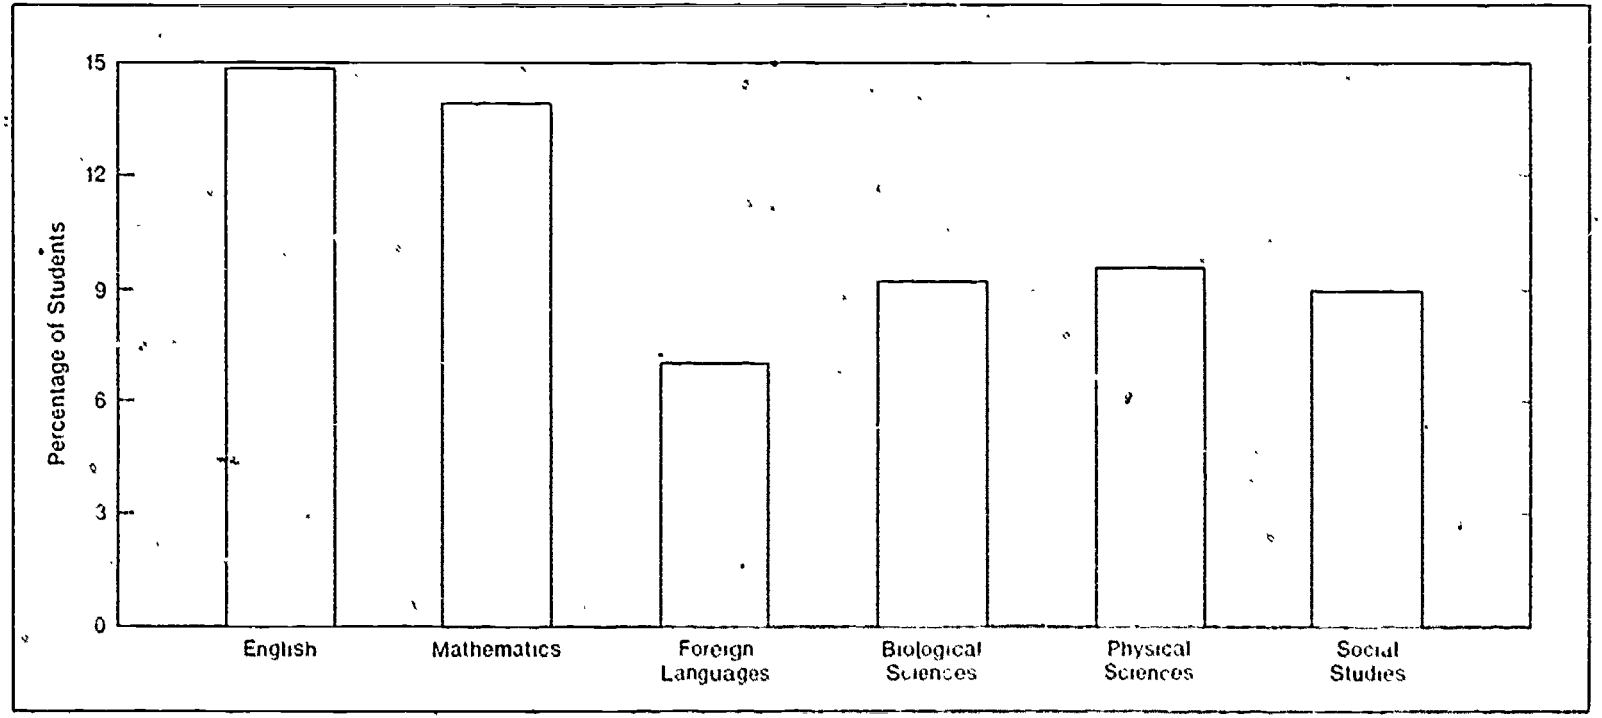

Table II-8: Number and percent of college-bound seniors who took an honors course, by subject, 1980-81

Honors Courses	English	Mathematics	Foreign Languages	Biological Sciences	Physical Sciences	Social Studies
Number Who Took an Honors Course, by Subject	130,706	129,565	56,930	81,747	80,476	82,598

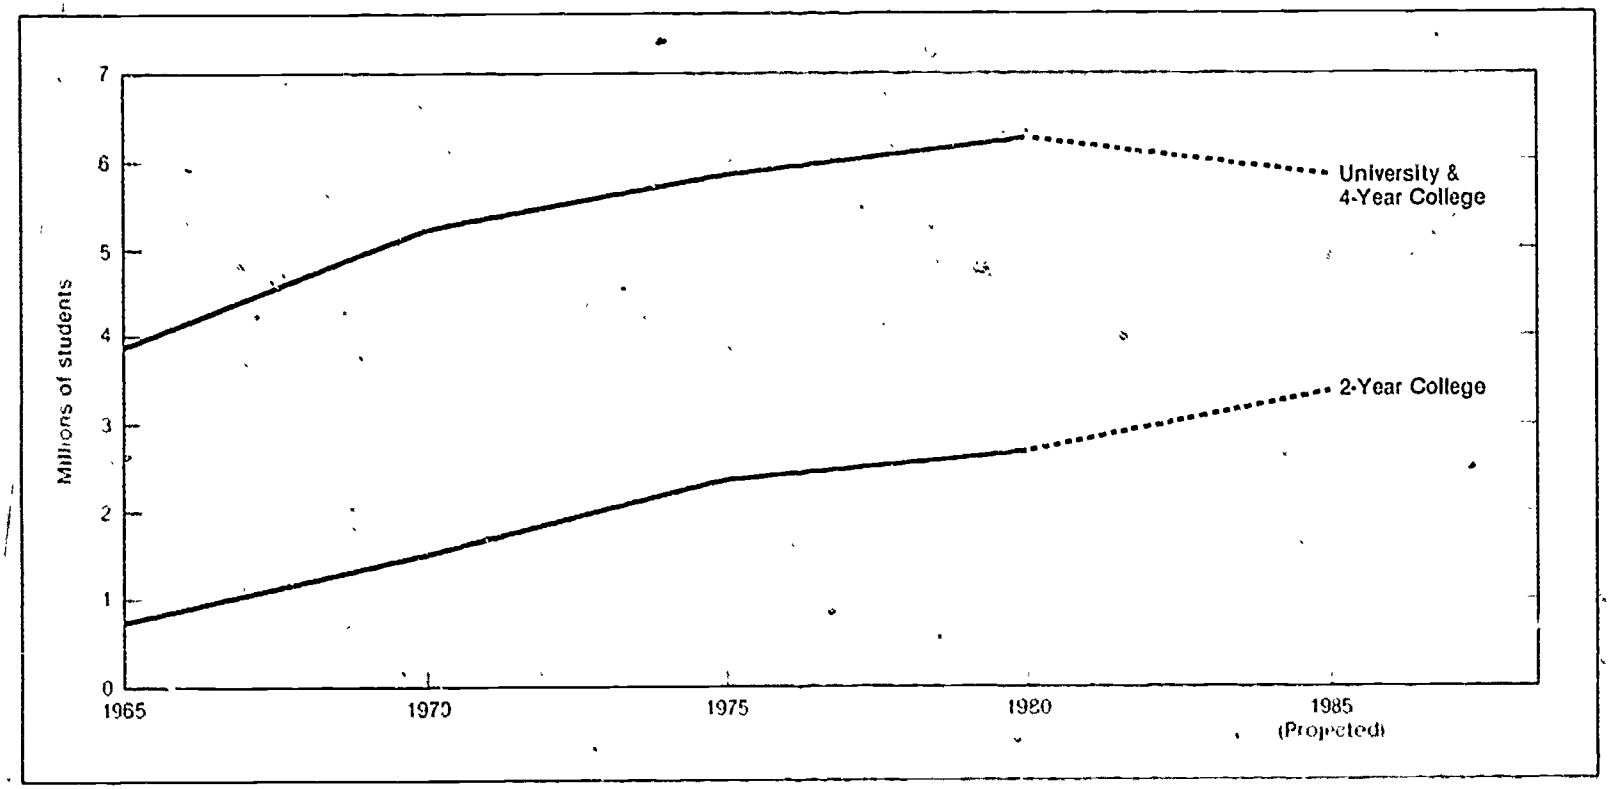
Chart II-12: Full-time equivalent enrollments in all higher education

Since 1965, full-time-equivalent (FTE) enrollments in higher education have grown by 100% The two-year college share of this enrollment has increased from 17% to 34%, but more than half of the TYC enrollment is in nondegree-credit occupational/technical programs. Current projections suggest levelling off and modest decline in total enrollments for higher education during the next decade.



Source *Projections of Education Statistics to 1986-87*

Chart II-13: Enrollments in two-year colleges, by sex and by field, fall 1978

Less than 4% of two year institution students declare a major in agriculture/natural resources, biological sciences, engineering, or physical sciences. Within the 4%, women in two year institutions exhibit the same pattern as those in four-year institutions and graduate school. They are most concentrated in the biological sciences, over 50% of the total, and least represented in engineering, about 11% of the total.

Table II-13A: Probable majors of entering freshmen in higher education (percent of all freshmen)

From 1975 to 1980 student choices of academic major shifted toward business, engineering, and computer sciences and away from the physical sciences, arts and humanities, and education. Since 1966, the number of entering freshmen planning a major in mathematics has dropped from 4.5% to .6% of the total.

Subject Areas	1966	1970	1975	1980
Biological Sciences	10.9	12.9	17.5	17.8
Business	14.3	16.2	18.9	23.9

Chart II-14: Percentages of undergraduate enrollments by field, 1969 and 1976

Although enrollment in biological sciences increased somewhat, mathematical, physical, and social sciences lost substantial portions of their enrollments. Professional subjects such as journalism gained considerable enrollments. Most of these changes were paralleled by faculty changes.

Chart II-19: Full-time undergraduate engineering enrollments

From a relative minimum in 1973, undergraduate engineering enrollments have grown steadily to an all-time high of 365,000 in 1980. Since the number of freshman engineering students was also an all-time high in that year, the influence of engineering enrollments on mathematics course demand is likely to continue strong over the next several years.

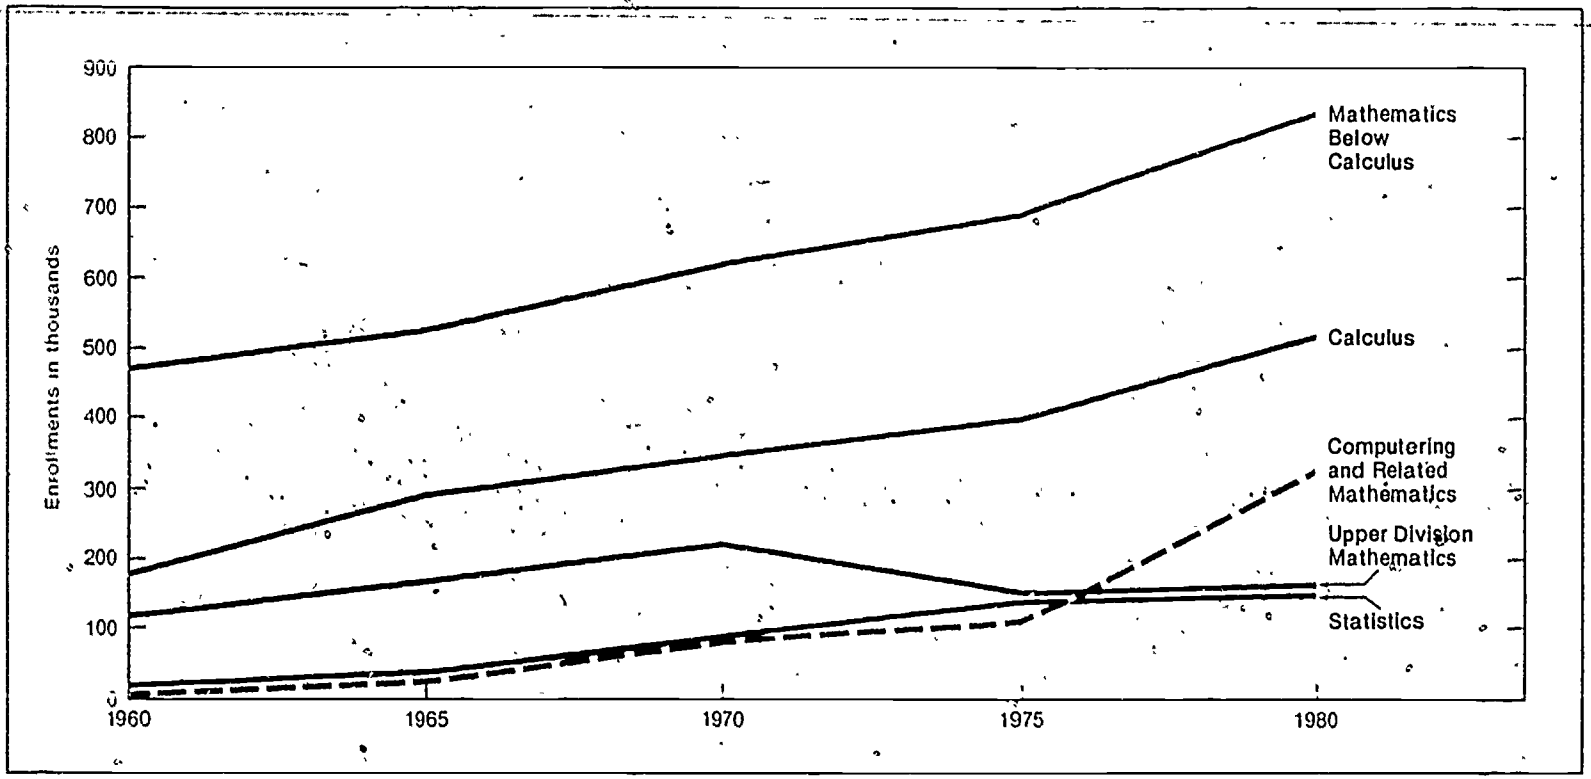
Chart II-22: Mathematical science enrollments in universities and four-year colleges

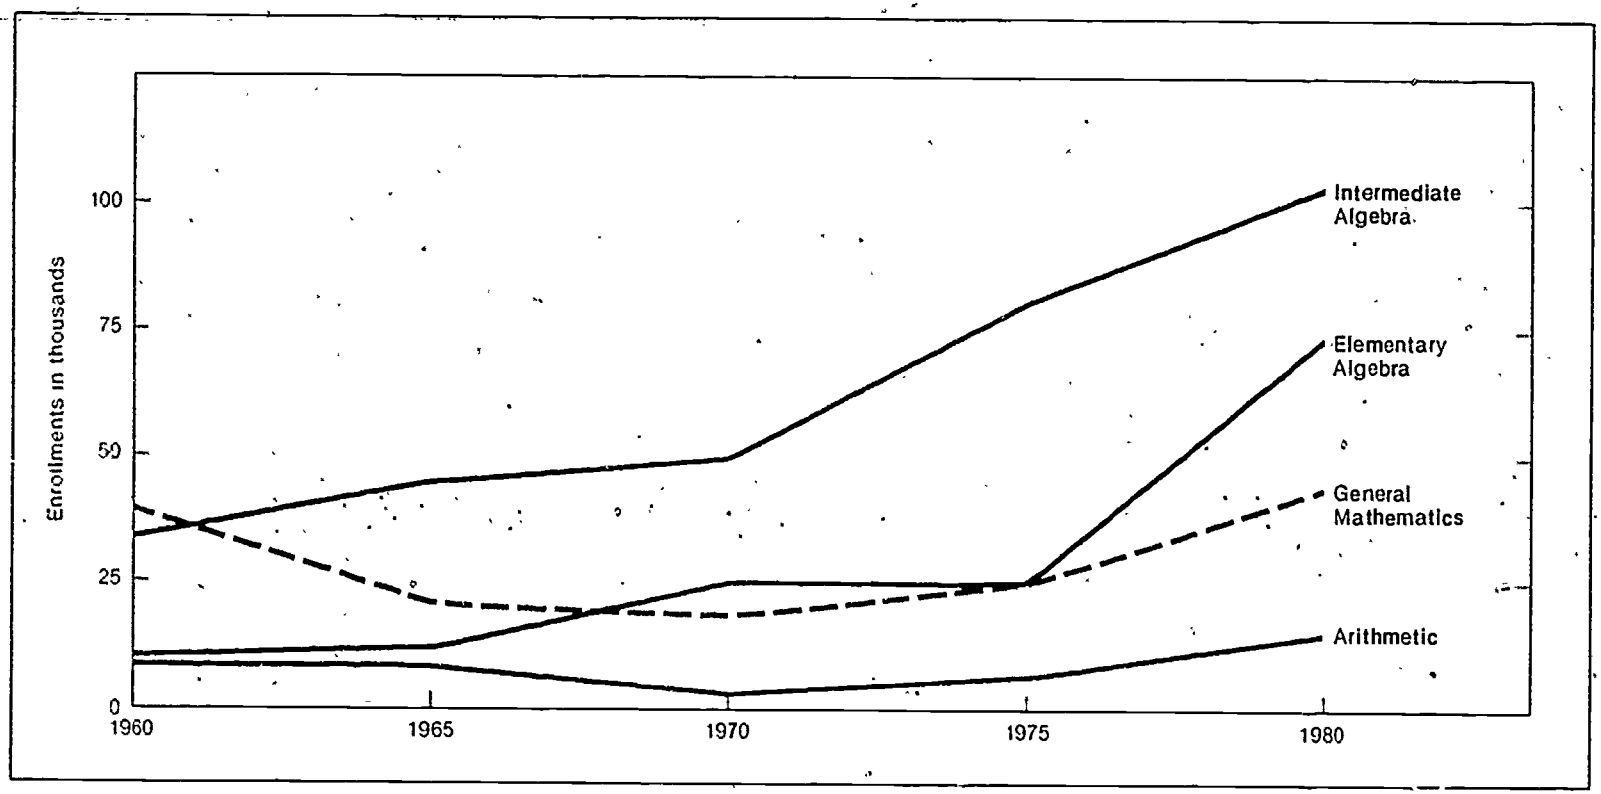
Between 1975 and 1980 all mathematical science enrollments increased by 33%, compared to 7% for FTE enrollments in all fields. The 30% increase in calculus and the 196% increase incomputing courses led the way.



Source: Undergraduate Mathematical Sciences in Universities, Four Year Colleges, and Two-Year Colleges, 1980 1981 James T. Fey and Wendell H. Fleming, Conference Board on Mathematical Sciences, 1981.

Chart II-23: Remedial mathematics in universities and four-year colleges

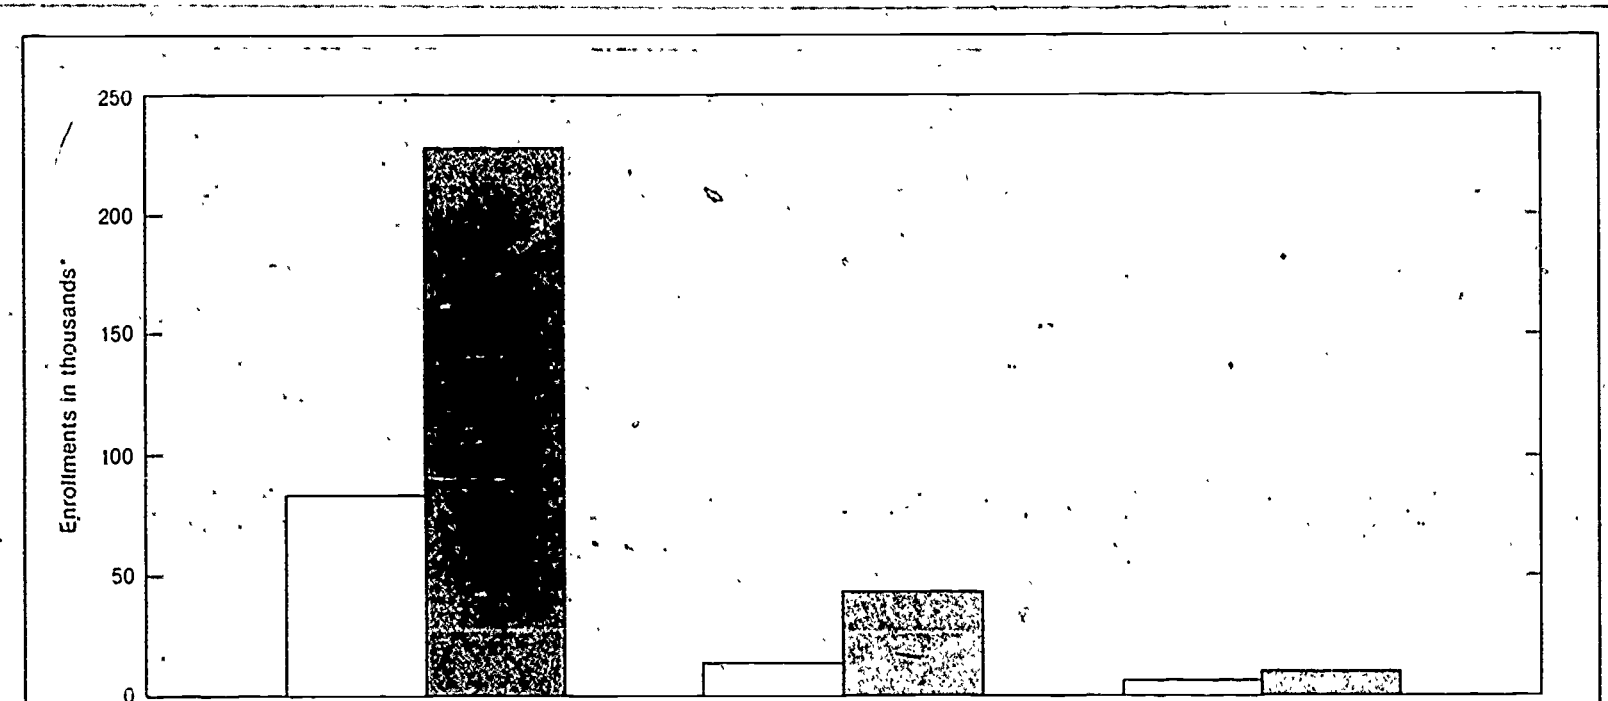
Since 1960, enrollment in remedial arithmetic, general mathematics, and algebra has increased by 165%. Those courses now constitute 16% of all mathematics enrollments, compared to 13% in 1960. The biggest increase occurred between 1975 and 1980, matching a period of widespread reports that high school preparation in mathematics has declined sharply.



Source. Undergraduate Mathematical Sciences in Universities, Four Year Colleges, and Two Year Colleges, 1980-1981 James T Fey and Wendell H Fleming. Conference Board on Mathematical Sciences, 1981.

Chart II-24: Computer science enrollments in universities and four-year colleges

Computer science courses now generate over 16% of all mathematical science enrollments and they are increasingly given by separate departments of computer science. As in mathematics and statistics, the largest share of computer science enrollment is in lower level courses.



*Includes only enrollments in mathematical science departments (including computer science departments). In the 160 universities there are an estimated 94 separate departments of computer science. There are an estimated 85 computer science departments in the 407 public colleges, and 48 computer science departments in the 830 private colleges. However, computer science courses are often taught by mathematics departments.

Source: Undergraduate Mathematical Sciences in Universities, Four-Year Colleges, and Two-Year Colleges, 1980-1981 James T. Fey and Wendell H. Fleming, Conference Board on Mathematical Sciences, 1981.

Table II-24: Course enrollments in computer science at universities and four-year colleges (enrollments in thousands)

There was strong enrollment growth in nearly every computer science course offering. However, the bulk of the increase from 1975 to 1980 occurred in beginning programming courses. The new course "Computers and Society" established a substantial enrollment.

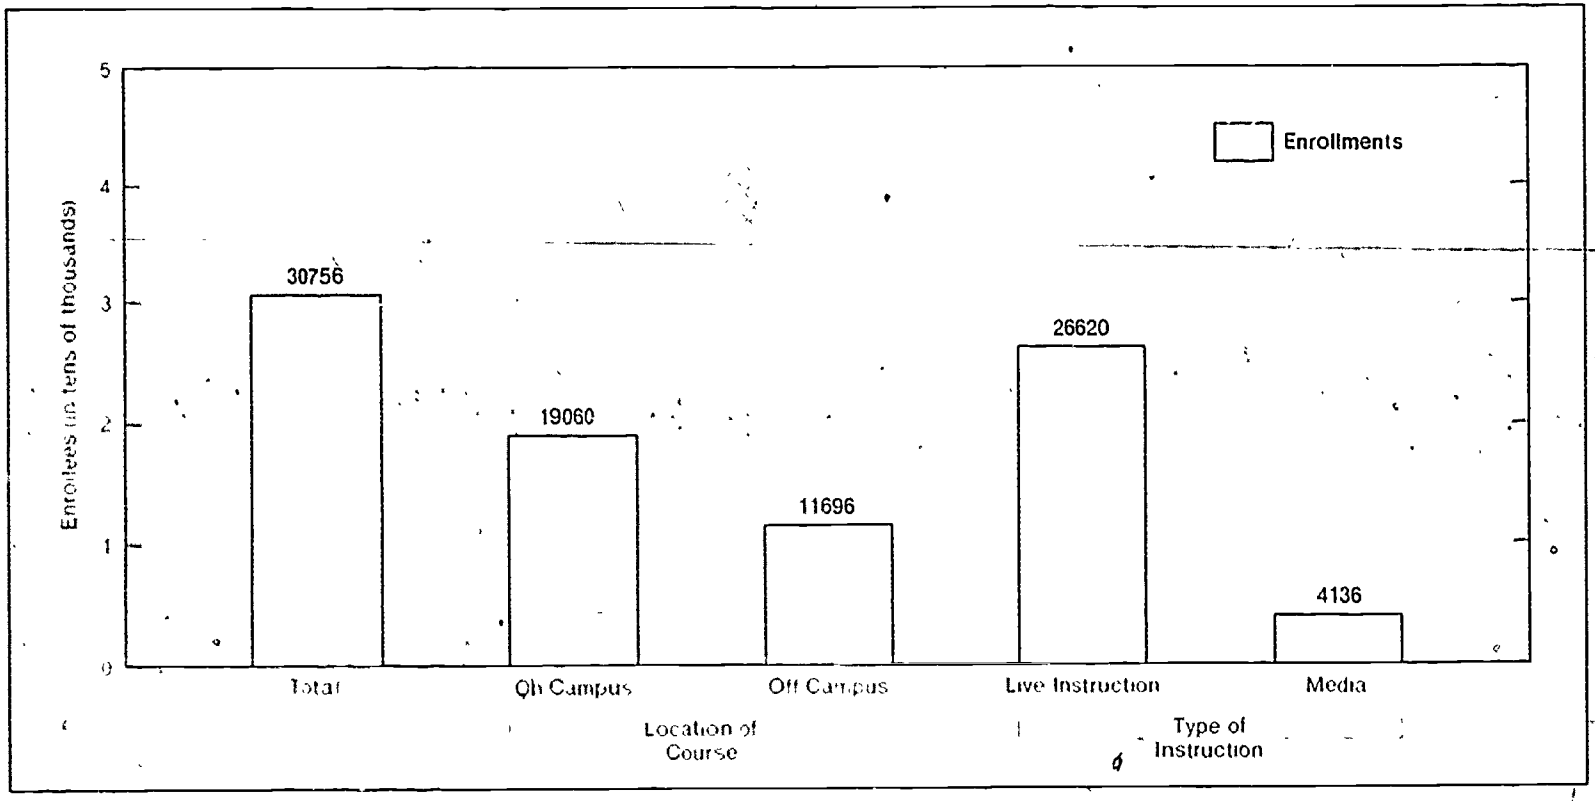
Enrollments are only those reported by mathematical science departments, thus not including computer programming taught by a business or engineering school, for example.

Source: Undergraduate Mathematical Sciences in Universities, Four-Year Colleges, and Two-Year Colleges: 1980-1981, James T. Fey and Wendell H. Fleming, Conference Board on Mathematical Science, 1981.

Chart II-25: Enrollments in continuing education degree credit courses by scientists and engineers, 1975-76

In 1975-76, over 30,000 scientists and engineers enrolled in degree credit courses offering an average of 3 hours credit. About two-thirds of the enrollments occurred in on-campus courses and one-third off-campus. Comparing this chart with chart I-18, we can see that the average course had an enrollment of approximately nine students. Furthermore, while there were more off campus activities, attendance was much greater for the on-campus activities.



Source: Klus, John P. and Jones, Judy A., *Survey of Continuing Education Activities for Engineers and Scientists*, pp. 15-17

Chart II-26: Enrollments in continuing education non-credit activities by scientists and engineers, 1975-76

Almost 187,000 scientists and engineers enrolled in continuing education non-credit activities in 1975-76. About 60% of the enrollments took place in university sponsored activities and 40% with professional societies. Comparing this chart with chart I 19 we can see that while universities offered roughly three times as many activities as the professional associations they attracted only one and one-half times as many enrollees.

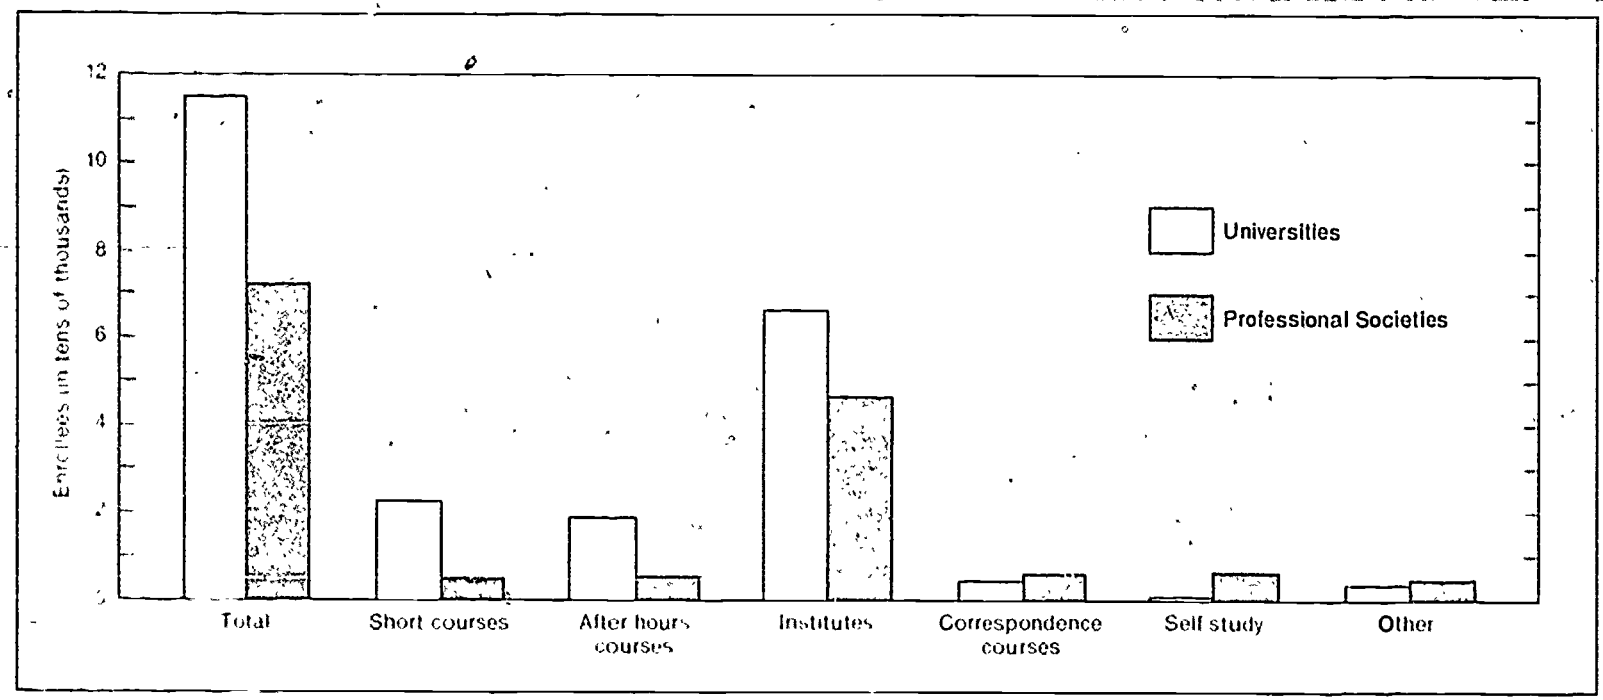


Table II-26: Enrollments in continuing education non-credit activities by scientists and engineers, by type of activity and institution offering activity, 1975-76

Type of institution	Number with One or More Activities	Total Enrollments	Type of Activity* Short Courses	After hours Courses	Institutes	Correspondence Courses	Self study	Other

Chapter III
ATTITUDES, GOALS, AND NEEDS

INTRODUCTION

Resources and participation determine the form and content of American education. But knowing only that gives us an incomplete picture of our educational system, since that alone does not tell us how people feel about the system, what their educational aspirations are, or in what areas they feel the system needs improvement. Such data, generally termed affective, are crucial if we are to understand why our educational system is the way it is and which changes are most likely to occur.

Obtaining affective information regarding science and mathematics education exclusively is very difficult. National polls historically neglect to ask about attitudes towards science and mathematics education. Nevertheless, this chapter assembles a collection of data grouped according to three categories of belief holders (students, faculty, public), which is reasonably representative of people's attitudes, goals, and needs concerning science and mathematics education.

HIGHLIGHTS

Students

1. Students' attitudes toward school decline with increasing grade levels. (Chart III-1)
2. The popularity of science and social studies increases somewhat with students' ages, while the popularity of mathematics decreases. Even so, mathematics is more popular at all ages than either science or social studies. (Chart III-2)
3. About 41% of the college bound seniors intend to study the physical sciences, social sciences, or psychology. (Chart III-3)
4. In the basic skills area, more college-bound seniors say they need help in mathematics than in reading and writing. (Chart III-4)
5. The proportion of teachers who would choose the teaching profession if they had a chance to start all over has declined since 1961. (Chart III-5)
6. Most teachers believe that salary, community attitudes, status and student attitudes have had a negative effect on job satisfaction. (Chart III-6)

Faculty

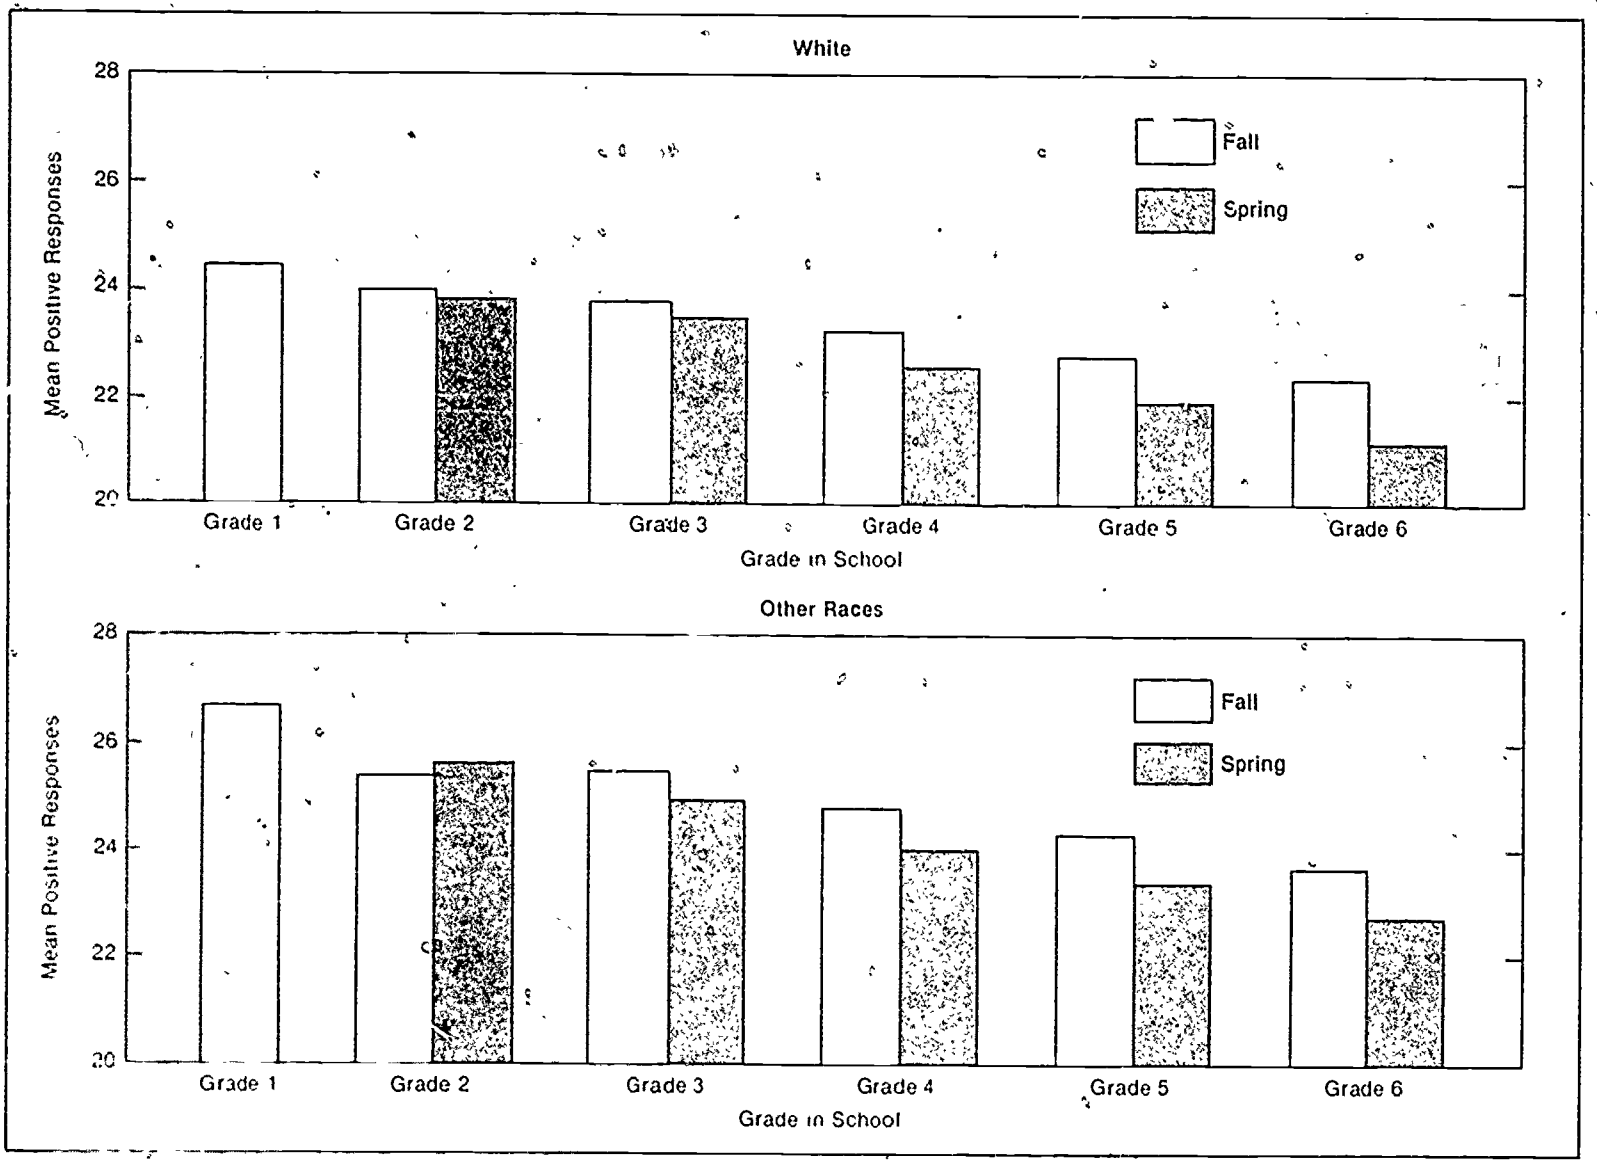
1. A total of 67% of science, mathematics, and social studies teachers reported needing assistance in obtaining information about instructional materials. (Chart III-7)
2. The availability of lab assistants or paraprofessionals and money to buy supplies on a day to day basis were seen as major need areas for mathematics, science, and social studies teachers. (Chart III-8)
3. Issues related to facilities, equipment, and supplies are significantly more troublesome in science classes than in mathematics or social studies classes. (Chart III-8)
4. The largest problem perceived by mathematics teachers is the lack of materials for individualizing instruction. (Chart III-9)
5. Science teachers perceived three serious problems, inadequate facilities, insufficient funds for purchasing equipment and supplies, and lack of materials for individualizing instruction. (Chart III-10)
6. Social studies teachers perceive themselves as having more problems than mathematics and science teachers, but the severity of the problems does not seem as great. Their most troublesome problems are inadequate student reading abilities and need for individualized materials. (Chart III-11)
7. Only 22% of elementary school teachers feel "very well qualified" to teach science and 16% feel "not well qualified" to teach it. Sixty percent feel "adequately qualified." (Chart III-12)
8. A sizable number of secondary school science, mathematics, and social studies teachers feel inadequately qualified to teach one or more of their courses. (Chart III-13)

Public

Ninety-seven percent of the public views mathematics as an essential for high school students. Eighty-three percent regard science as essential (Chart III-14)

Chart III-1: Attitudes of students in Grades 1 to 6 toward school

Attitudes toward school exhibit a steady decline with increasing grade levels.



Source. The Condition of Education, NCES, 1982, p. 201

Table III-1: Attitudes of students in grades 1 to 6 toward mathematics and school, by race: fall and spring 1976

Race and Grade Level	Mathematics		School in General	
	Fall	Spring	Fall	Spring
	Mean Positive Responses[1]			
White:				
Grade 1	—	27 99	—	24.41
Grade 2	26.74	27.28	23.97	23.81
Grade 3	26.28	26.96	23.79	23.47
Grade 4	24.20	25.47	23.20	22 56
Grade 5	24.10	24.48	22 72	21.88
Grade 6	23.56	23.42	22.31	21.12
Other races:				
Grade 1	—	31.72	—	26.65
Grade 2	29.72	31.07	25.35	25 58
Grade 3	29.97	31.09	25.43	24.95
Grade 4	28.18	28.61	24.76	23.98
Grade 5	28.10	29.22	24.27	23.37
Grade 6	28.10	28 13	23.63	22.74

Chart III-2: Percentages of students naming various subjects in school as their most favorite, ages 9, 13, and 17

The popularity of science and social studies, never very high among students, increases somewhat as students age. Mathematics, by contrast, is the favorite of nearly half the 9-year-olds yet becomes less popular as students age. It is, even so, the favorite of more 13- and 17-year-olds than either science or social studies.

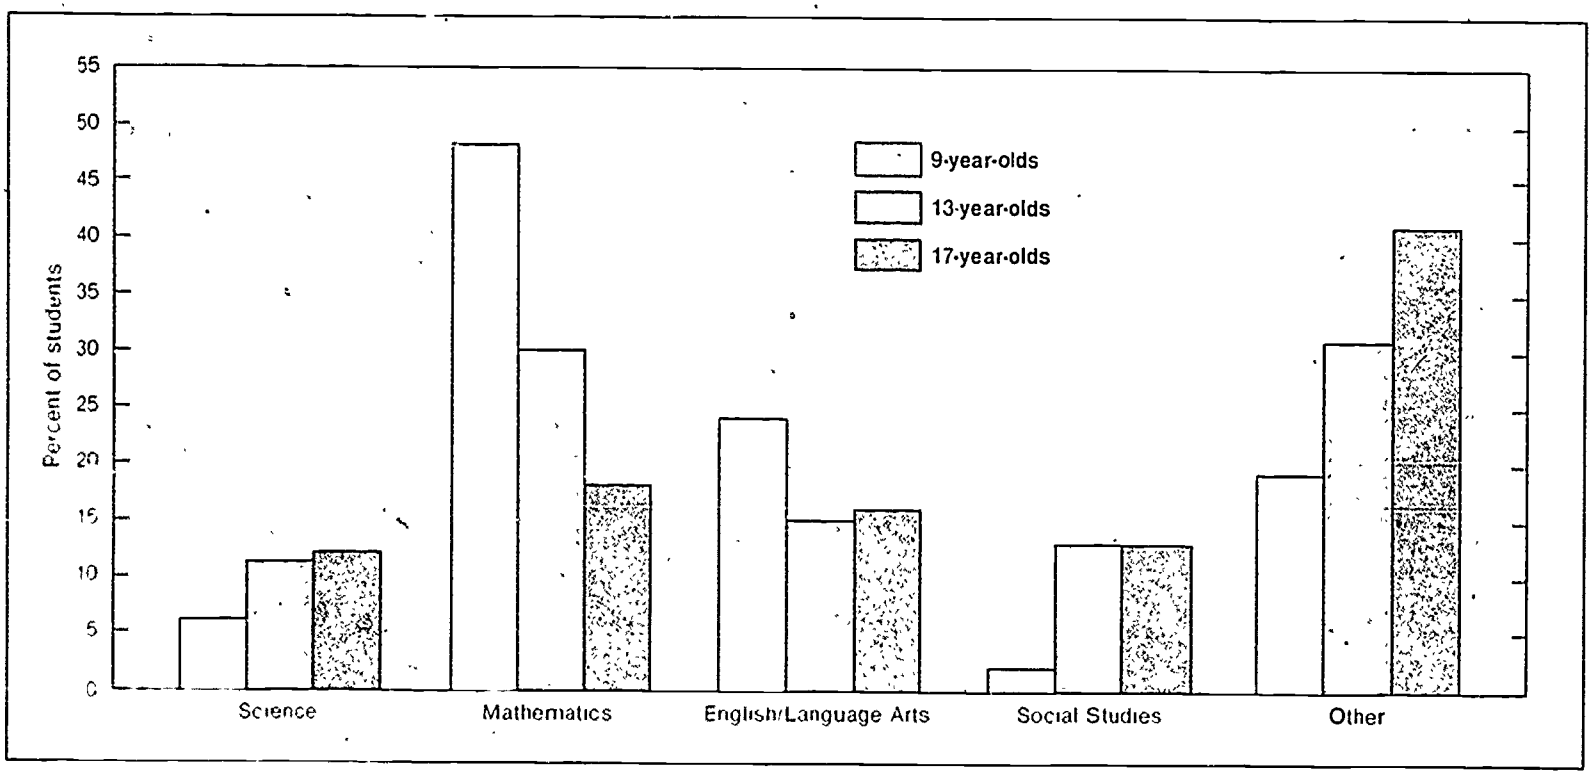

Table III-2: Percentages of students naming various subjects in school as their most favorite, ages 9, 13, and 17

	Percent Naming Favorite Subject		
	Age 9	Age 13	Age 17
Science	6	11	12
Mathematics	48	30	18

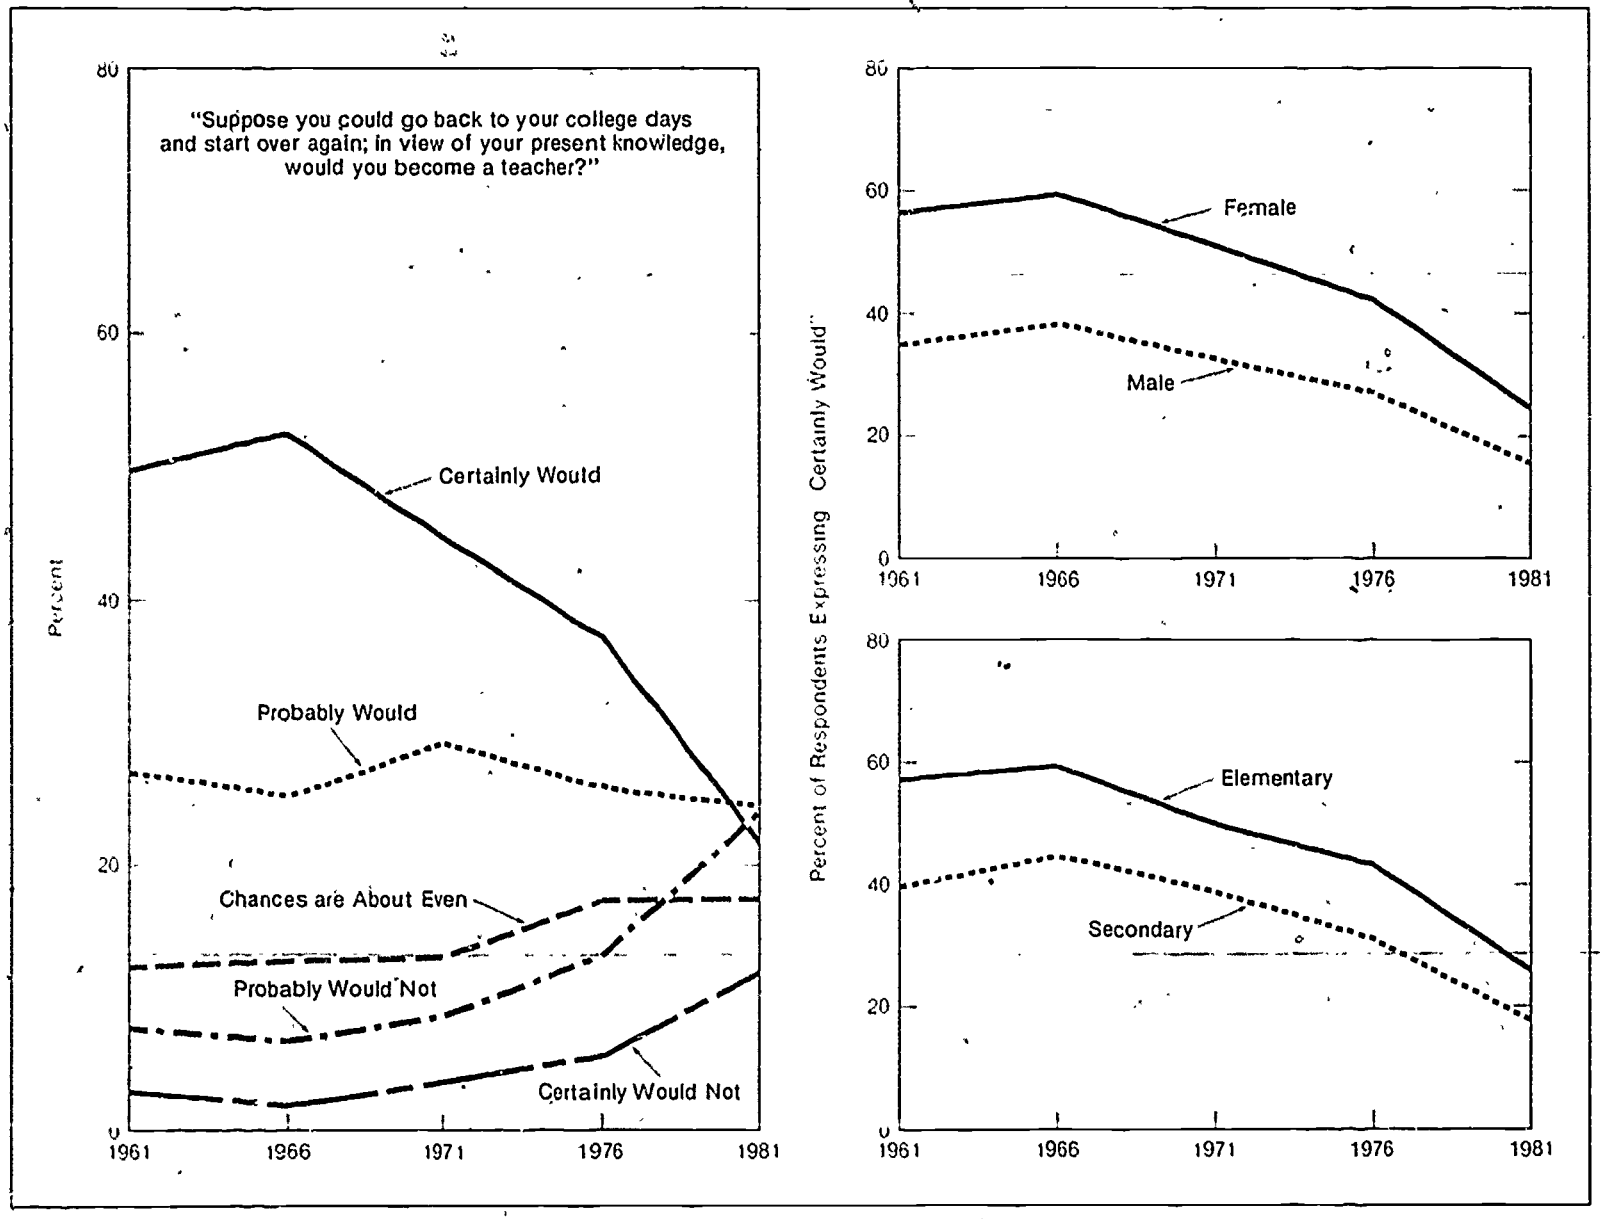
Chart III-5: Attitudes toward the teaching profession: opinions of public school teachers

The proportion of teachers who would choose the teaching profession if they had a chance to start over declined considerably from 1961 to 1981. In every year, men were less likely than women to affirm their original choice, and secondary teachers were less likely than elementary teachers to do so.



Source: The Condition of Education, NCES, 1982, p. 107

Table III-5: Opinions of public school teachers toward their profession: 1961, 1966, 1971, 1976, and 1981

"Suppose you could go back to your college days and start over again; in view of your present knowledge, would you become a teacher?

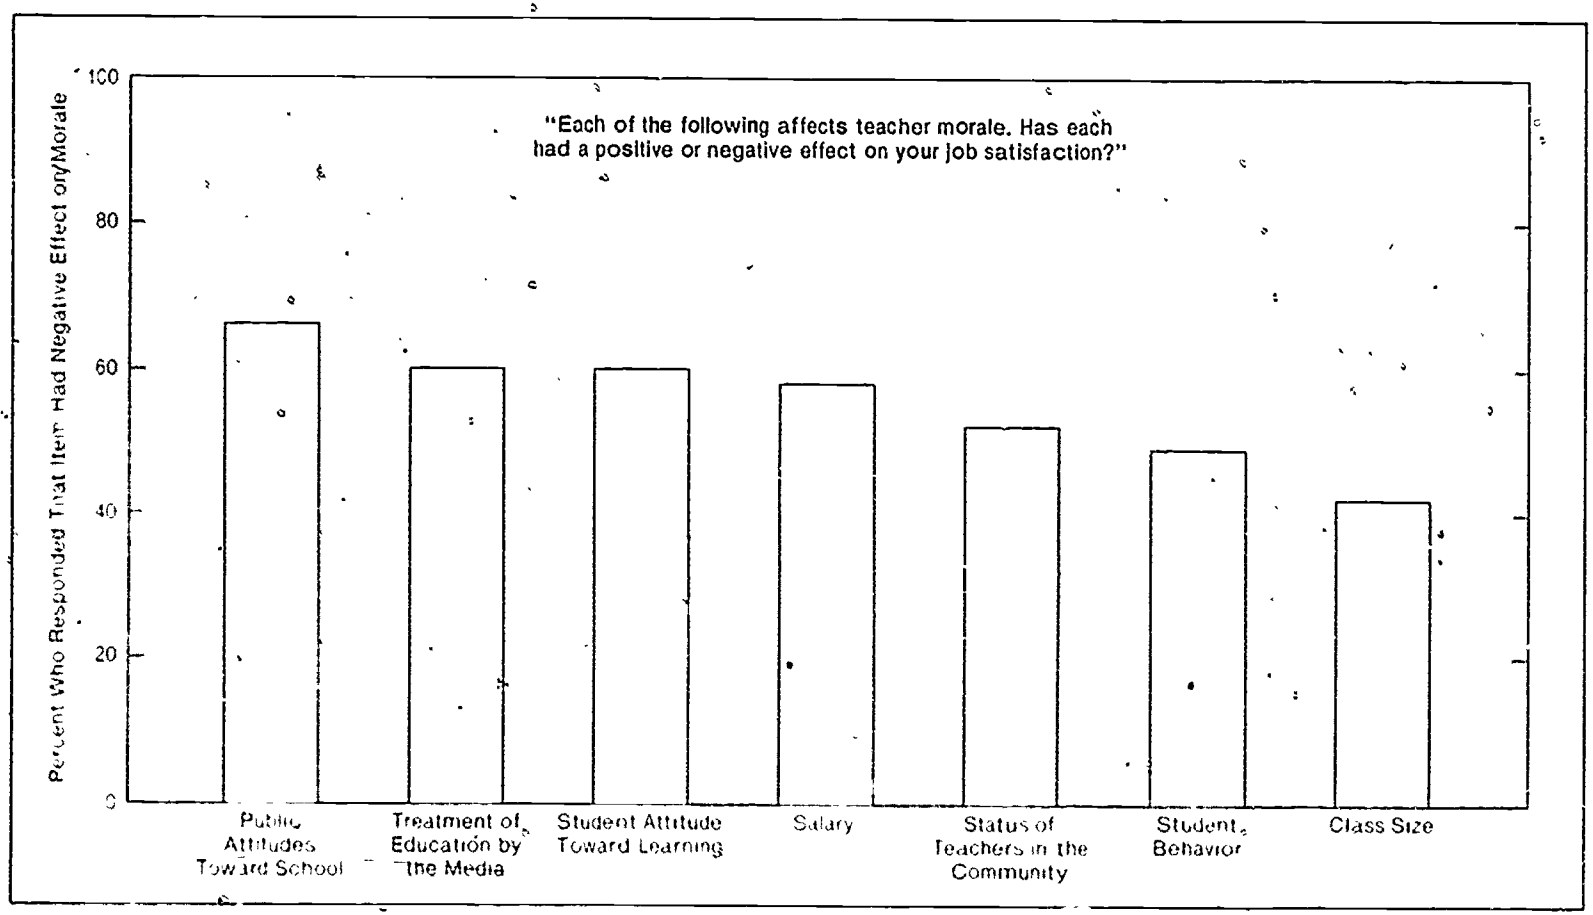
—Not available.

Source: National Education Association, *Status of the American Public School Teacher*, various years.

Chart III-6: Job satisfaction: opinions of public school teachers

More than half of all teachers believed that salary, community and media attitudes, teachers' status, and student attitudes towards learning had a negative effect on their job satisfaction. Salary had a more negative effect in the South than in other regions. In nearly every category, secondary school teachers were more likely than teachers of other levels to respond that any item had a negative effect.



Source: The Condition of Education, NCES, 1982, p. 105

Table III-6: Opinions of public school teachers toward job satisfaction, by region, enrollment, size of school district, and teaching level: 1980

Each of the following affects teacher morale. Has each had a positive or negative effect on your job satisfaction?

Item	Total	Region[1]				Enrollment Size of School District			Teaching Level		
		North east	South east	Middle	West	Under 3,000	3,000-24,999	25,000 and Over	Elementary	Junior high	Senior high

Chart III-8: K-12 science, mathematics and social studies teachers' perceptions of classroom needs

Issues related to facilities, equipment and space for classroom preparation are more troublesome in science classes than in mathematics or social studies classes. However, the availability of lab assistants or paraprofessionals and money to buy supplies on a day-to-day basis were seen as problems for teachers of all three subjects.

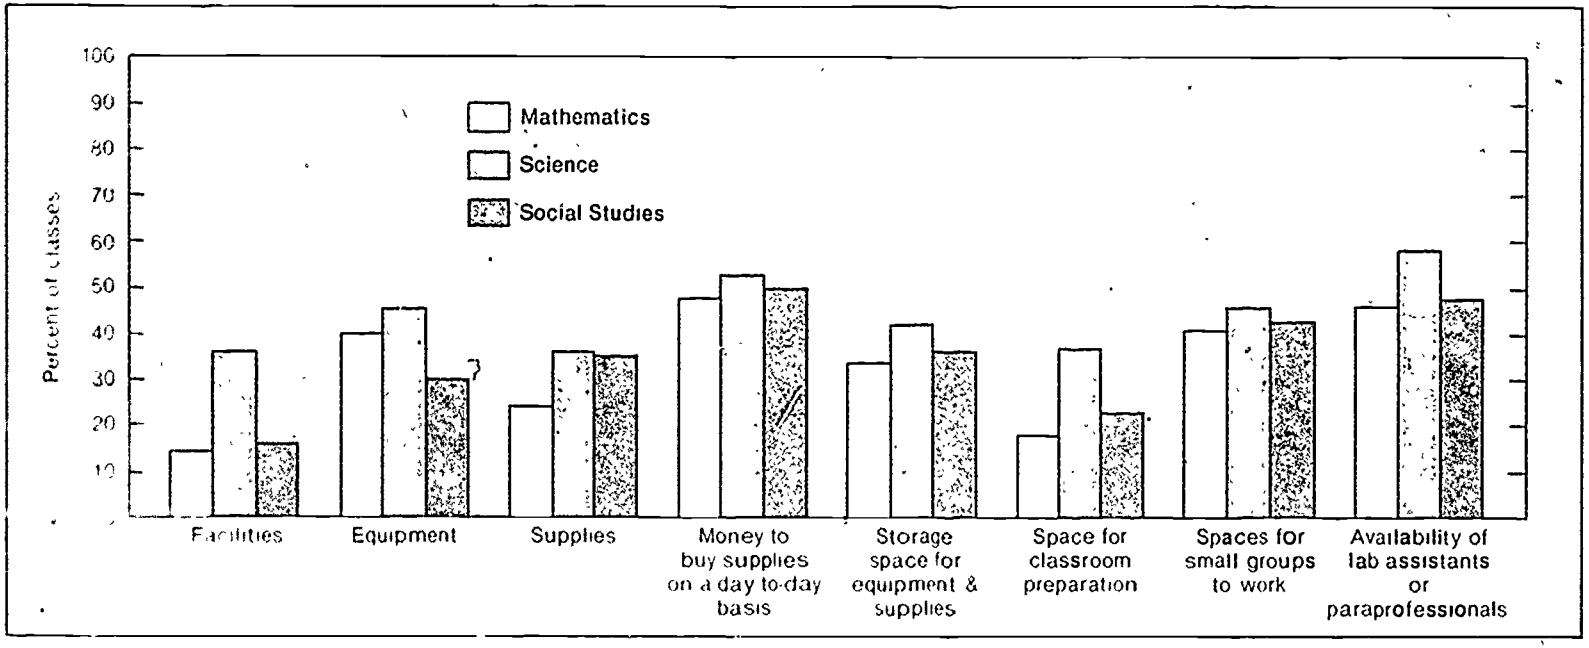

Table III-8: K-12 science, mathematics, and social studies teachers' perceptions of classroom needs (by percent of classes)

Source: Weiss, Ina R. *Report of the 1977 National Survey of Science, Mathematics, and Social Studies Education*, p. 135

Chart III-9: K-12 mathematics teachers' perceptions of problem areas

For the most part, mathematics teachers do not seem beleaguered by problems. In only two categories, insufficient funds for purchasing equipment and supplies, and lack of materials for individualizing instruction, did the combined problem options account for more than 50% of the responses and no category received as much as a 20% response indicating a serious problem.

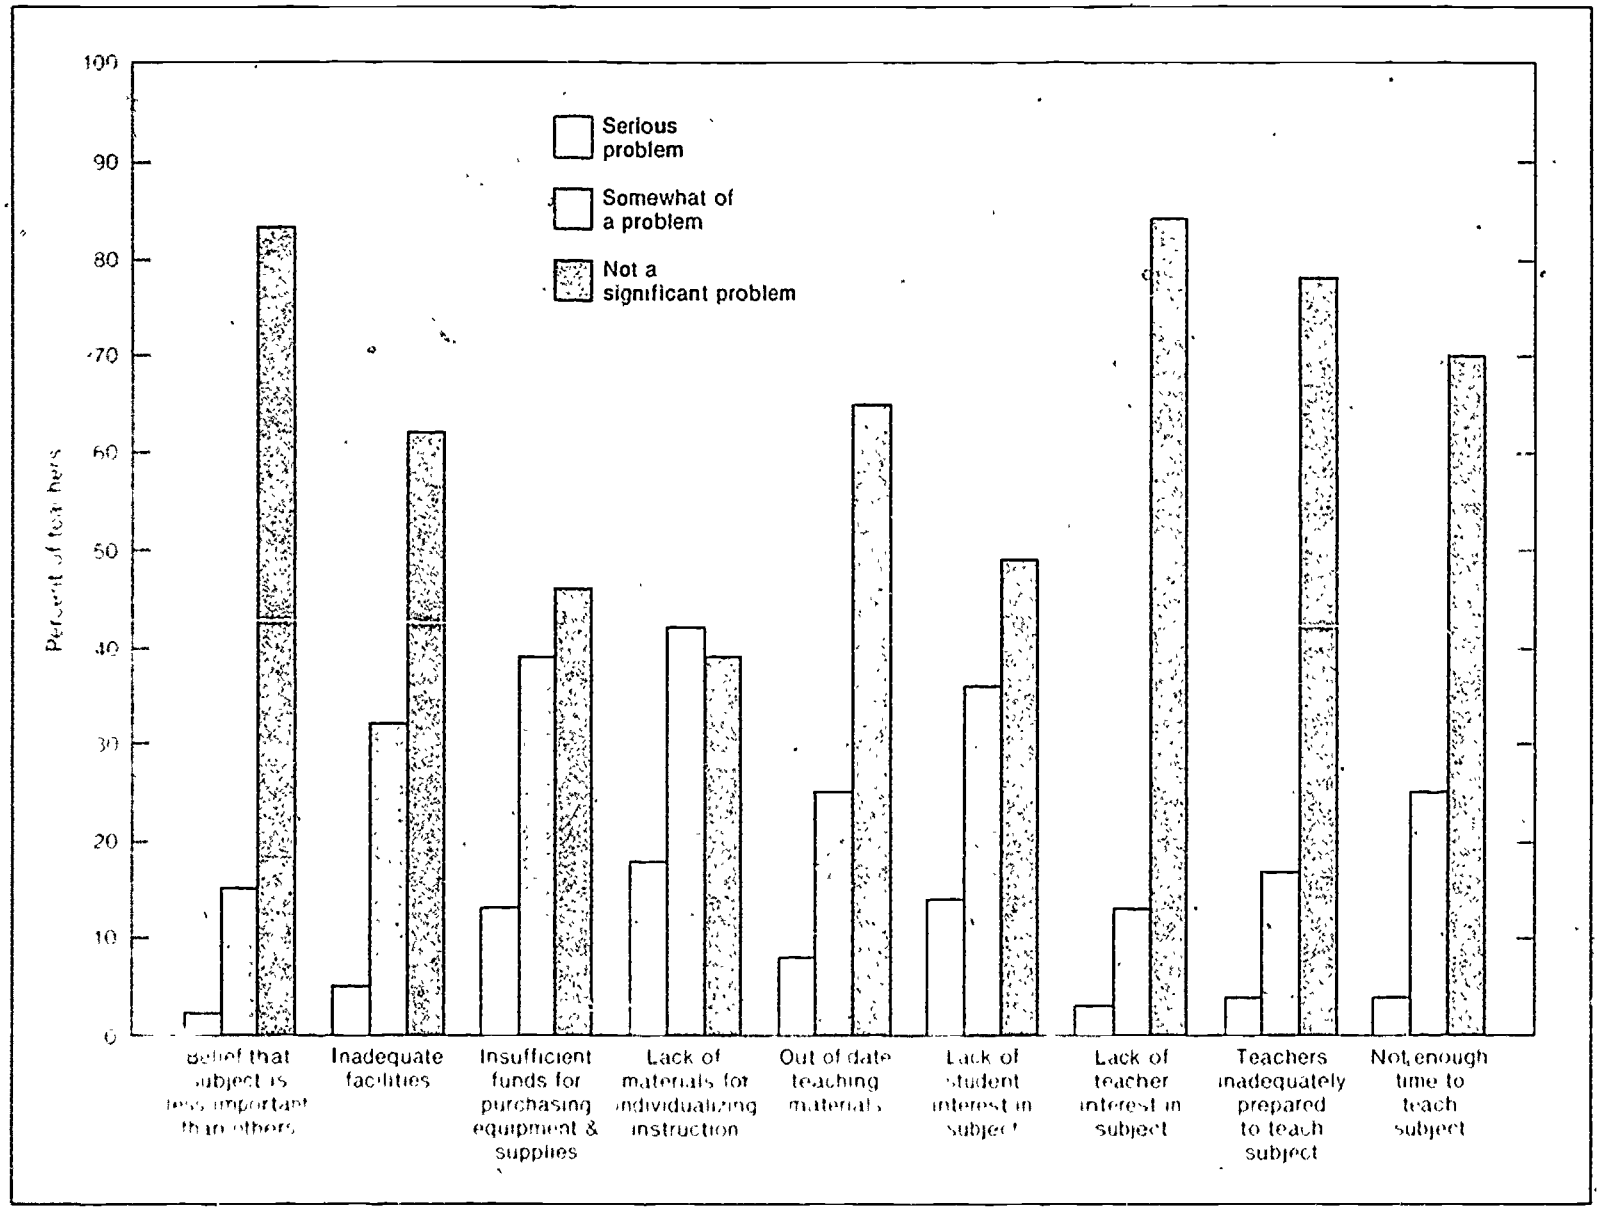

Chart III-10: K-12 science teachers' perceptions of problem areas

Compared to the mathematics teachers, science teachers perceive science instruction as having more problems. In three categories — inadequate facilities, insufficient funds for purchasing equipment and supplies, and lack of materials for individualizing instruction — the two problem options accounted for more than 50% of the responses and the same three categories received more than 25% response as indicating a serious problem.

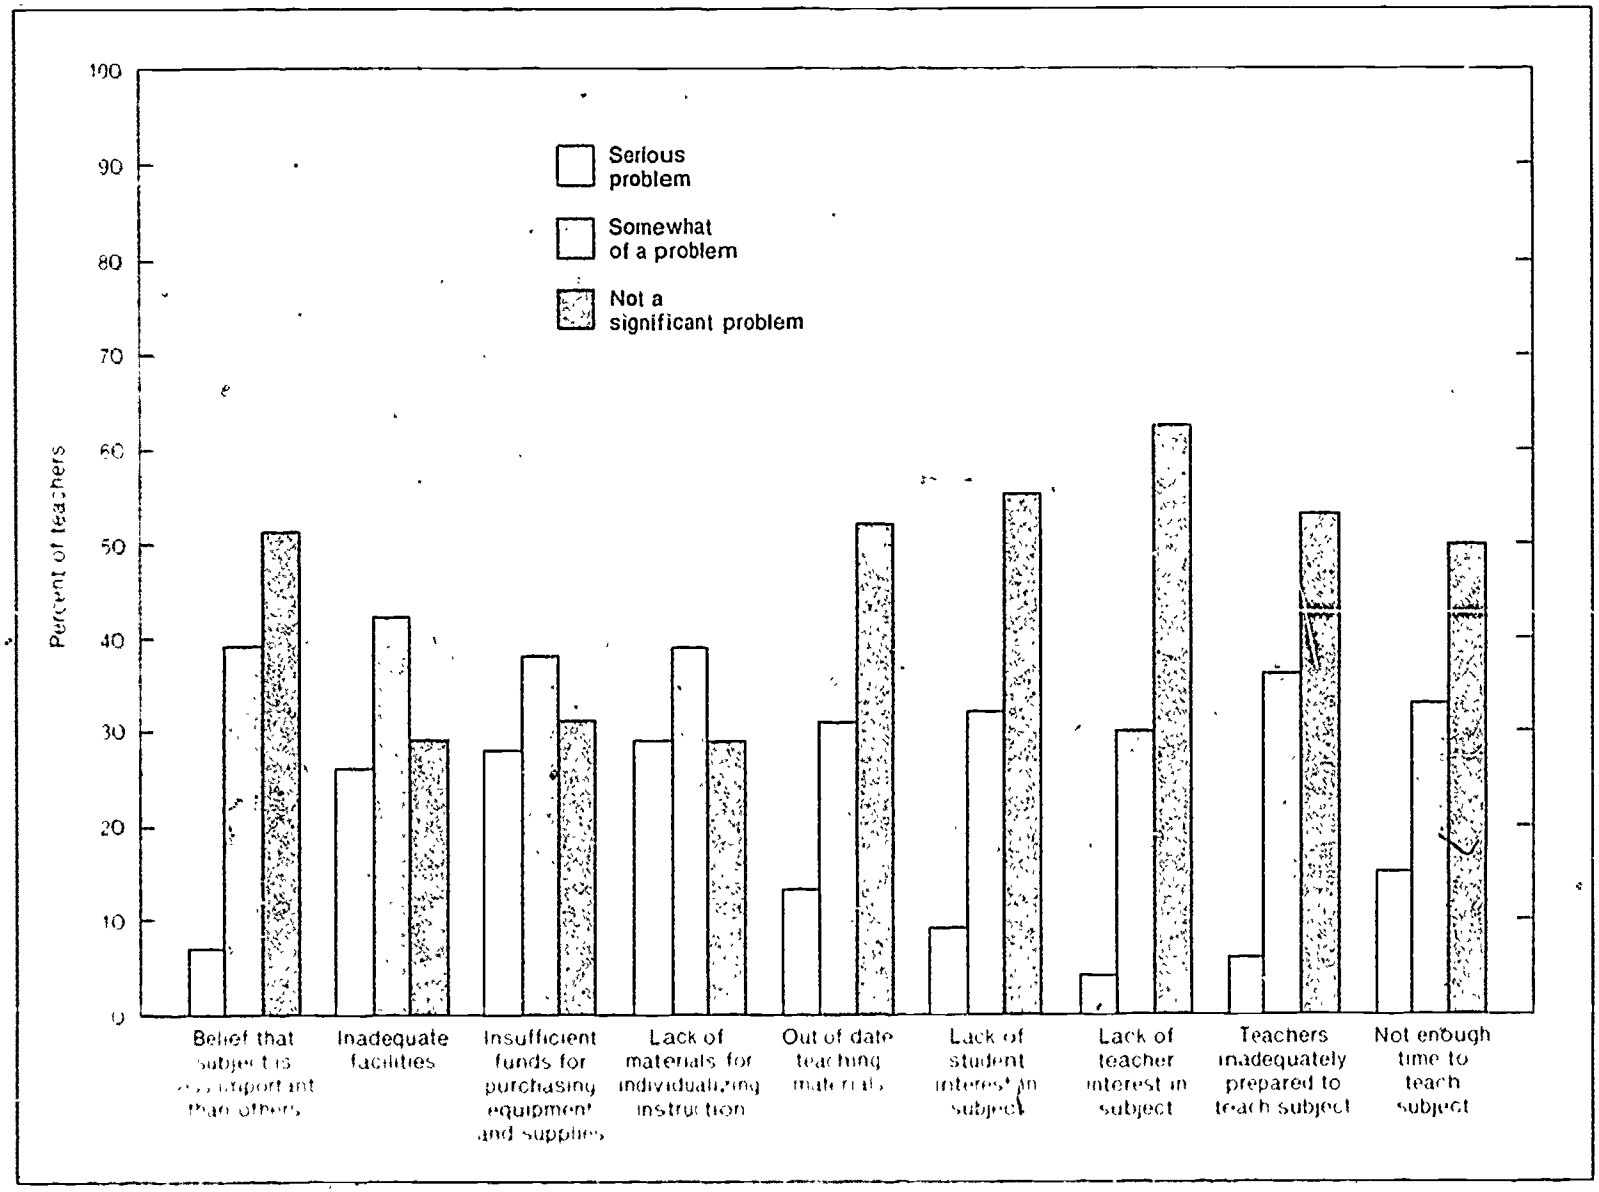

Chart III-11: K-12 social studies teachers' perceptions of problem areas

Compared to the mathematics and science teachers, social studies teachers perceive social studies instruction as having more problems. In six categories, the two problem options accounted for 50% or more of the responses: insufficient funds for purchasing supplies and equipment, lack of materials for individualizing instruction, out-of-date teaching materials, lack of student interest in subject, inadequate student reading abilities, and belief that the subject is less important than other subjects.

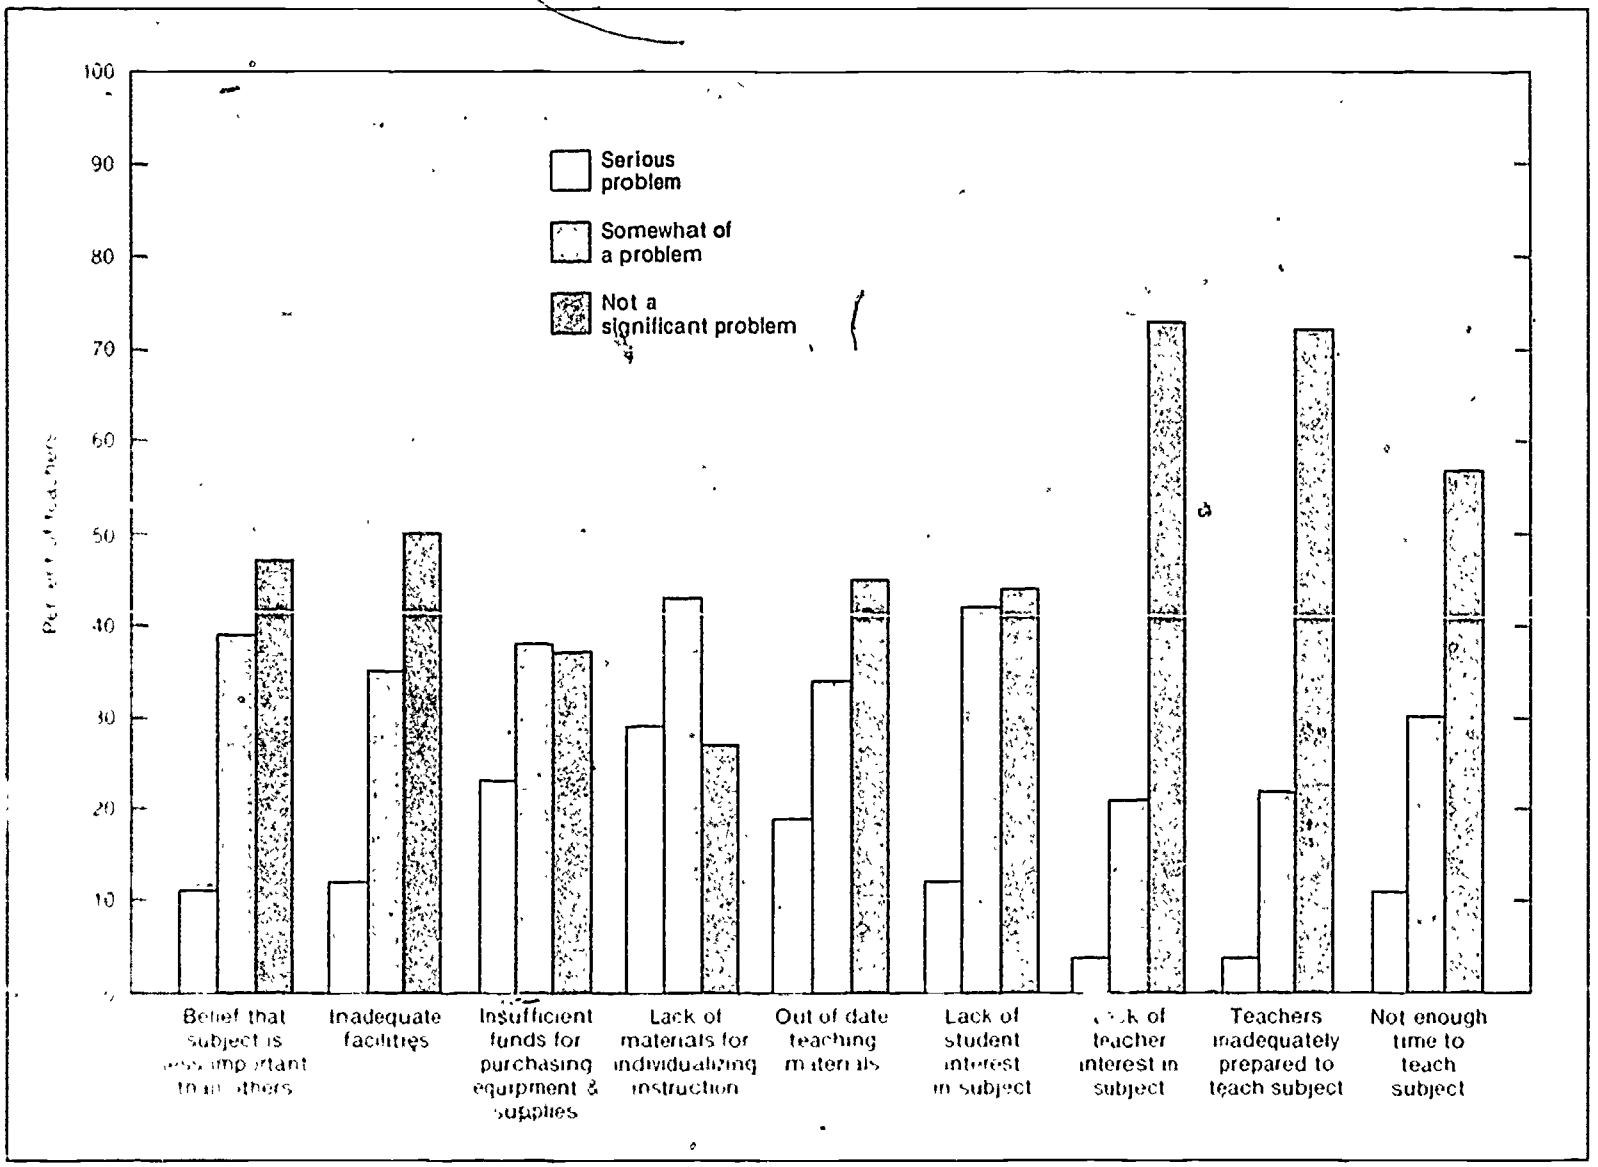

Table III-9, 10, 11: K-12 mathematics, science and social studies teachers' perceptions of problem areas

Factor	Mathematics				Science				Social Studies			
	Serious Problem	Somewhat of a Problem	Not a Significant Problem	Missing	Serious Problem	Somewhat of a Problem	Not a Significant Problem	Missing	Serious Problem	Somewhat of a Problem	Not a Significant Problem	Missing

TEST DATA

INTRODUCTION

No measure of the health of American education receives as much scrutiny as student test data Recent attention has focused on measures of what people know and what intellectual and performance skills they possess Such measures are usually standardized tests (e.g., Scholastic Aptitude Tests, Graduate Record Examinations, National Assessment of Educational Progress instruments).

The test data contained in this chapter are grouped for K 12 students and higher education students

HIGHLIGHTS

K-12

1 Background and instructional grouping factors have been found to influence achievement test scores (Chart IV-1)

2 Time spent in mathematics instruction has a positive effect on mathematics achievement in grade school (Chart IV 2)

3 9-year-old black students showed a significant gain between 1973 and 1978 NAEP mathematics assessments. (Chart IV-3)

4. Nevertheless, overall mathematical knowledge of black students, according to the NAEP results, was lower than white students in 1978 (Chart IV-4)

5 According to National Assessment of Educational Progress (NAEP) data, all age groups experienced statistically significant declines in science achievement during the first test interval (1969-70 to 1972 73) There were no significant changes during the second test interval (1972 73 to 1976-77) (Chart IV 5)

6 When analyzed separately as to type of science, NAEP data showed that all age groups experienced statistically significant declines in physical science achievement during the first test interval Only the decline of the 9-year-olds was significant during the second interval (Chart IV-6)

7 In biological science achievement, NAEP data shows that the only statistically significant change is the decline demonstrated by 17 year-olds during the first test interval (Chart IV-7)

8 According to NAEP data, overall mathematics achievement declined for all ages tested in the test interval 1973 to 1978 The decline was statistically significant for the 13 and 17-year-olds (Chart IV-8)

9 High school students who complete advanced mathematics courses perform better on mathematics achievement tests. (Chart IV-9)

10 Additional years of mathematics course taking is associated with higher mathematics achievement scores (Chart IV-10)

11 Scholastic Aptitude Test (SAT) scores declined from 1969-1980; however, 1981 scores remained at the 1980 low point. (Chart IV-11)

12 Regarding SAT scores, the mathematics scores for men have consistently been well above those for women, and since 1972 verbal scores for men have also exceeded those of women. (Chart IV-12)

13 College-bound students who intended to major in biological sciences, engineering, math and physical sciences had SAT scores that were above the average for all college bound seniors. (Chart IV-12)

14 The college-bound seniors scoring, on the average, highest on their SAT's, tend to plan on studying science, engineering, mathematics, or English literature. (Chart IV-13)

15 In contrast to the SAT scores, the Admissions Testing Program Achievement Tests scores, averaged across all subjects, have held steady over the past six years, within a range of 526 in 1972 to 538 in 1976. (Chart IV-14)

Higher Education

As reflected by Graduate Record Examination (GRE) scores there were no statistically significant changes in either the verbal or quantitative aptitudes of prospective science graduate students. (Charts IV-15, 16)

Chart IV-1: Factors contributing to achievement on spring mathematics scores

Factors Ranked by Order of Importance

Among background factors, fall mathematics scores, parental education, and race contributed to mathematics scores

Background Factors

Fall Mathematics Scores*

Parental Education*

Race*

Compensatory Education

Family Income

Among instructional factors, large group instruction and tutoring contributed to mathematics scores, although time with a tutor was negatively associated

Instructional Grouping Factors

Classroom Teacher, Over 20 Students*

Tutor*

Classroom Teacher, 14 to 20 Students

Independent Work Program Materials

Classroom/Special Teacher, 1 to 6 Students

Classroom Teacher, 7 to 13 Students

*Statistically significant effect on spring mathematics scores based on the results of a multiple regression analysis ($R^2 = .8651$)

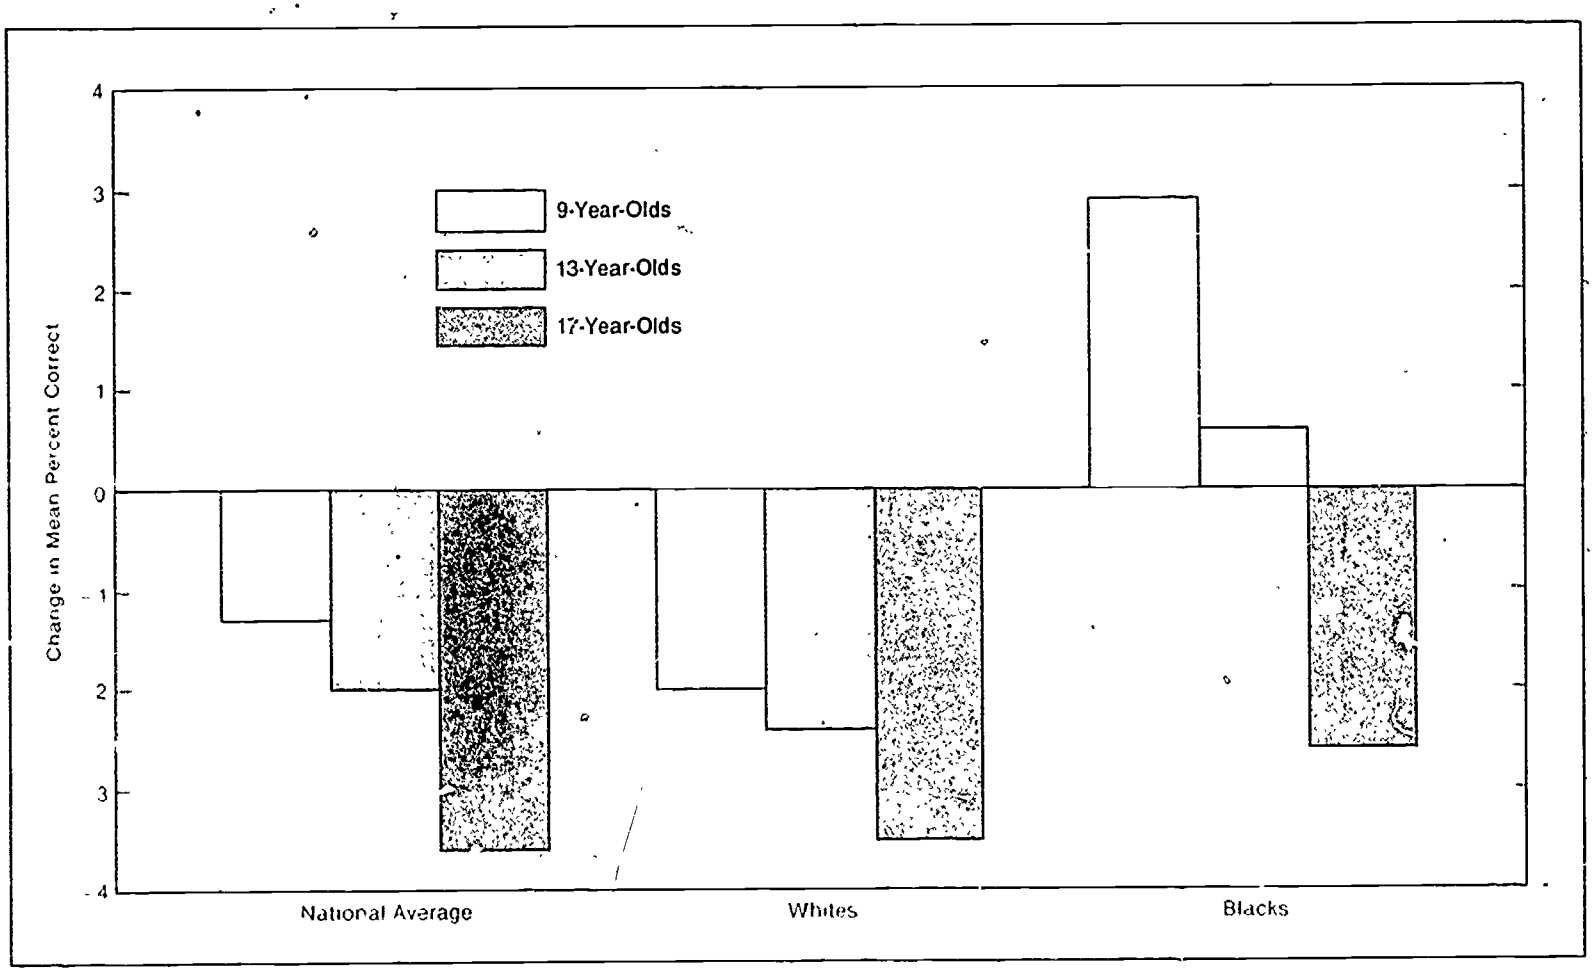
Chart IV-3: Change in mathematics performance of 9-, 13-, and 17-year-olds: 1973 to 1978

While mathematical achievement test scores for 19-, 13-, and 17-year-olds fell nationally between 1973 and 1978, blacks' scores showed significant gains among the 9-year-olds.



Source: The Condition of Education, NCES, 1982, p. 189

Table IV-3: Mean mathematics performance of 9-, 13-, and 17-year-olds, by race, type of community, and parental education: 1973 and 1978

Characteristic	9-Year-Olds			13-Year-Olds			17-Year-Olds		
	1973	1978	Change	1973	1978	Change	1973	1978	Change
National Average	38 1	36.8	– 1 3	52.6	50 6	– 2 0	51 7	48 1	– 3 6
Race:									
White	41 1	39 1	– 2.0	56.6	54.2	– 2.4	54 5	51 0	– 3.5
Black	23.4	26.3	2.9	31 8	32.4	0.6	33 5	30 9	– 2 6
Type of Community[1]:									
Disadvantaged Urban	25.3	27 7	2 4	34 7	36 7	2 0	40 7	35 1	– 5 7
Advantaged Urban	46.6	46.0	– 0.7	63.6	59 4	– 4.2	59 5	57 3	– 2.2
Extreme Rural	34.0	32 1	– 1.9	50.0	45 2	– 4 8	48 4	46 4	– 2 0
Parental Education [2]:									
Not Graduated from High School	31.1	28.7	– 2.3	42 8	40 3	– 2 5	42 5	37 7	– 4 7
Graduated from High School	39.3	36.9	– 2.4	52.1	49.6	– 2 6	50 0	45.5	– 4.6
Post High School	44.3	42.6	– 1.7	60.8	58.2	– 2.5	57 9	54 1	– 3 8

[1]Communities are defined as one of three types: disadvantaged urban — cities with a population greater than 200,000 where a high proportion of the residents are on welfare or are not regularly employed, advantaged urban — cities with a population greater than 200,000 where a high proportion of the residents are in professional or managerial positions, and extreme rural — areas with a population under 10,000 where most of the residents are farmers or farm workers.

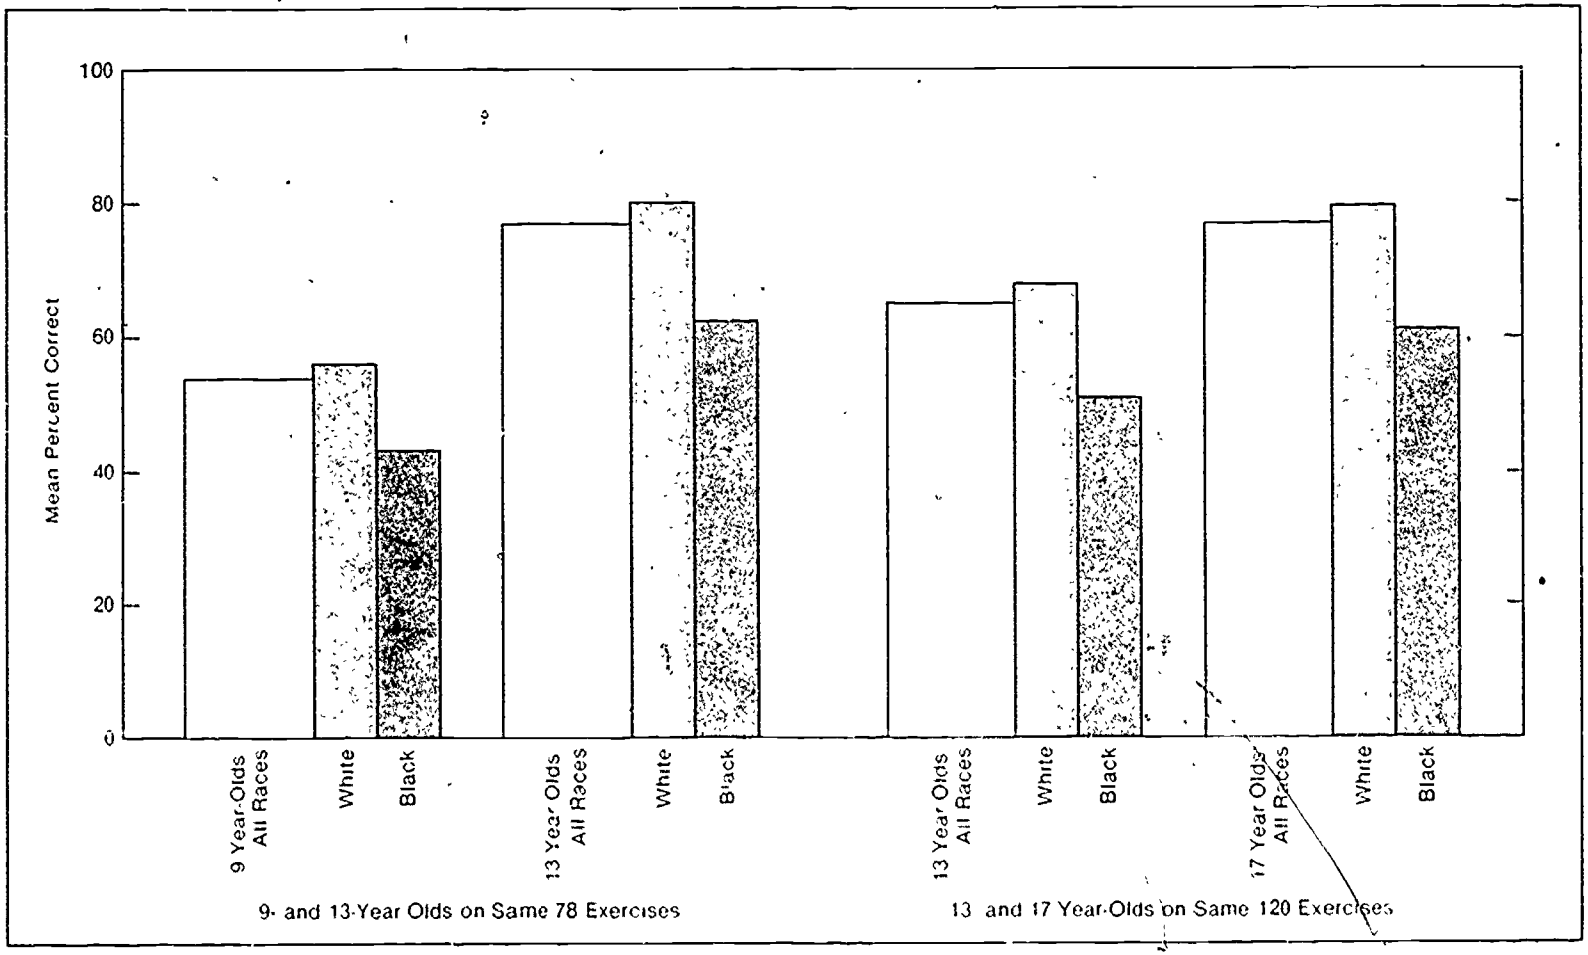
[2]Three levels of parental education are defined. Those whose parents did not graduate from high school, those who have at least one parent who graduated from high school, and those who have at least one parent with some post-high school education.

Note: Percent correct on identical mathematics items for assessments in 1973 and 1978.

Source: U.S. Department of Education, National Institute of Education, National Assessment of Educational Progress, *Mathematical Technical Report. Summary Volume*, April 1980.

Chart IV-4: Mathematical knowledge of 9-, 13-, and 17-year olds: 1978

Although the gap appears to be narrowing between assessments, the mathematical knowledge of black students was substantially lower than that of white students in 1978.



Source: The Condition of Education, NCES, 1982, p 187.

Table IV-4: Mean percent correct responses of 9-, 13-, and 17-year-olds on the same mathematics exercises, by race: 1978

Race	9-Year-Olds	13-Year-Olds	Yearly Progression Rate[2]	13-Year-Olds	17-Year-Olds	Yearly Progression Rate[2]
	Mathematical Applications					
	Same 33 Items			Same 83 Items		
All Races	36 4	64 8	15 5	38 3	55 1	9 5

	Same 78 Items			Same 120 Items		
All Races	53 4	77.0	9 6	64 8	76 9	4 4
White	55 8	80 0	9 4	67 ,	79 6	4 1
Black	42 9	62 2	9.7	50 7	60.9	4.7
	Mathematical Skills[1]					
	Same 98 Items			Same 218 Items		
All Races	41 6	69 6	13 7	48 6	66 1	8 0
White	43 9	73 1	13.6	51 8	69.2	7 5
Black	30 6	51 9	14.1	32 4	47 2	9.9

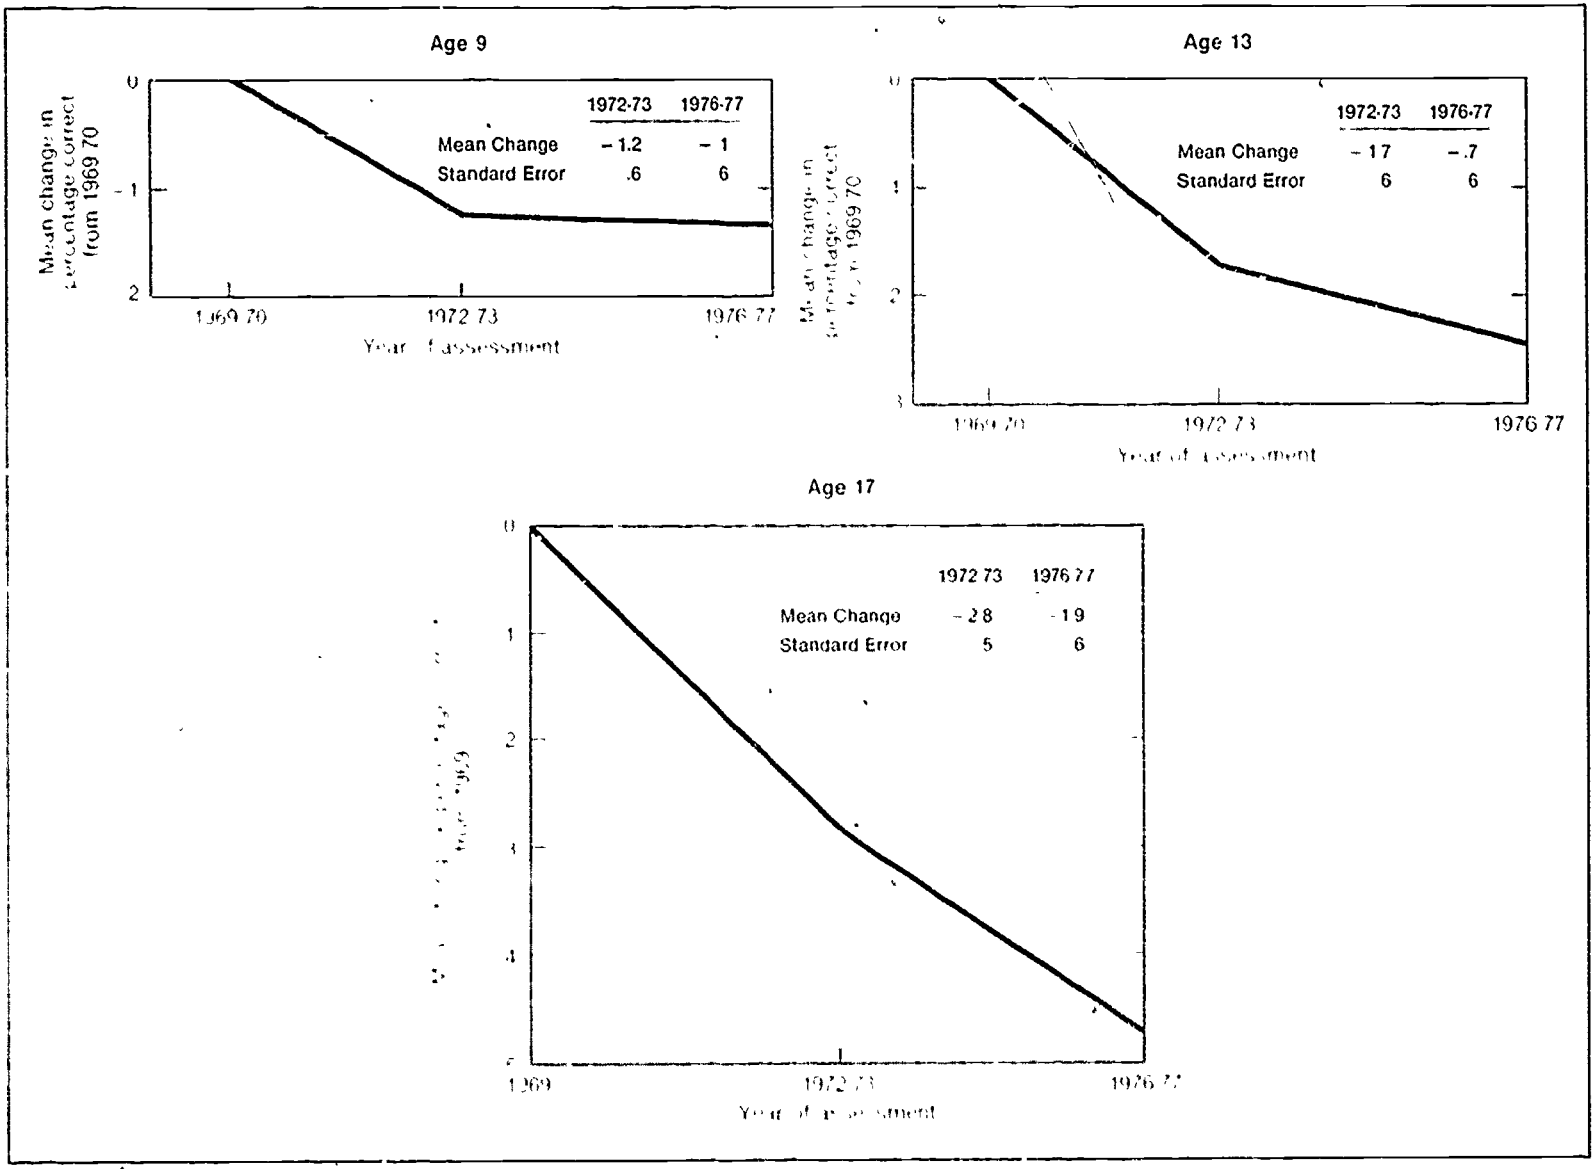
Assessment areas include the following cognitive abilities. Mathematical knowledge — ability to recall and recognize facts, definitions and symbols, mathematical skill — ability to perform mathematical computations, make measurements, read graphs and tables, perform geographic and algebraic manipulations and estimate answers to computations and measurements, mathematical application — ability to solve typical textbook problems, solve nonroutine problems, estimate answers, and use mathematics in reasoning and making judgements.

[2]Yearly progression rate in mean percent correct responses between younger and older age groups is determined by using the annual compound growth rate formula $r = \sqrt[t]{R_o/R_y} - 1$, where t = number of years difference in age (4), R_o = score for older age group, and R_y = score for younger age group.

Source: U.S. Department of Education, National Institute of Education, National Assessment of Educational Progress, *Mathematical Knowledge and Skills. Selected Results from the Second Assessment of Mathematics*, Report No. 09-MA-02, August 1979. *Mathematical Applications. Selected Results from the Second Assessment of Mathematics*, Report No. 29-MA 03, August 1979.

Chart IV-5: Changes in science achievement for 9-, 13- and 17-year olds: 1969-77

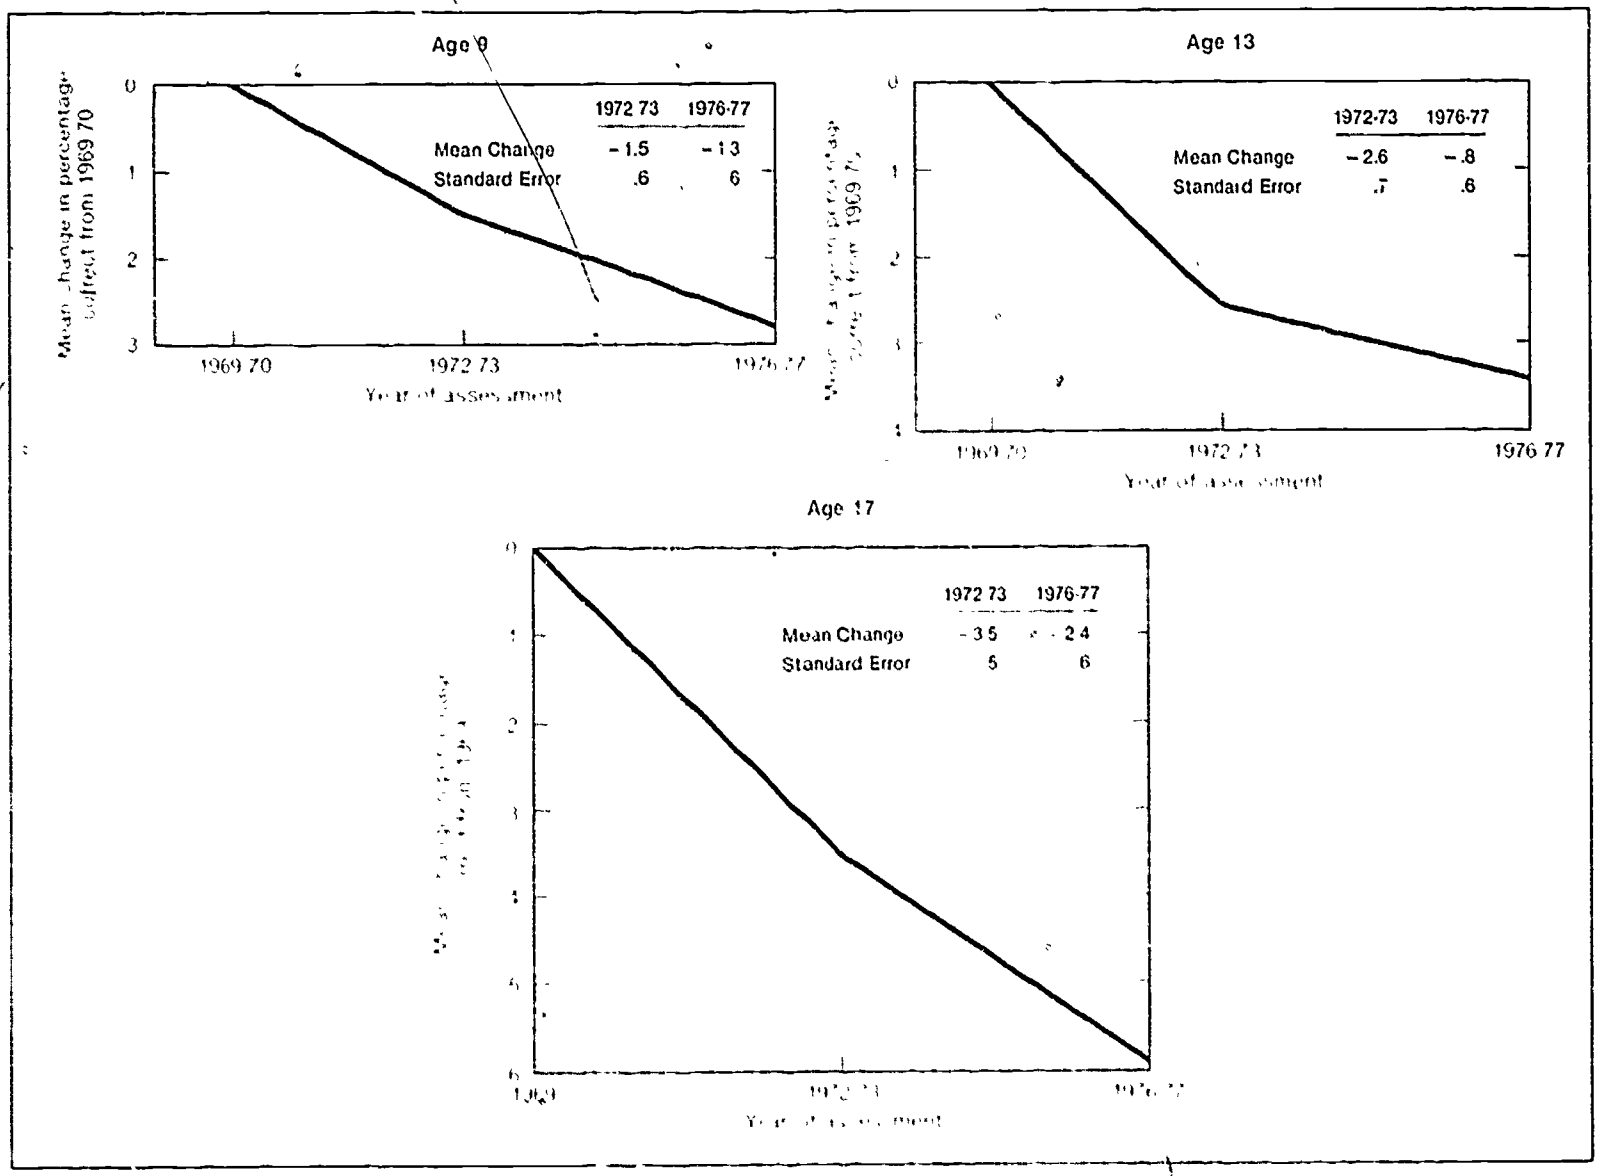
Overall achievement in science declined for all age groups at every test interval. All three declines in the first National Assessment and Educational Progress NAEP Testing interval were statistically significant (at the .05 level) while only that for 17-year-olds was significant in the second interval.



Source: National Assessment of Educational Progress, *Three National Assessments of Science: Changes in Achievement 1969-77*, p. 6

Chart IV-6: Changes in physical science achievement 1969-77 for 9-, 13- and 17-year olds: National Assessment of Educational Progress

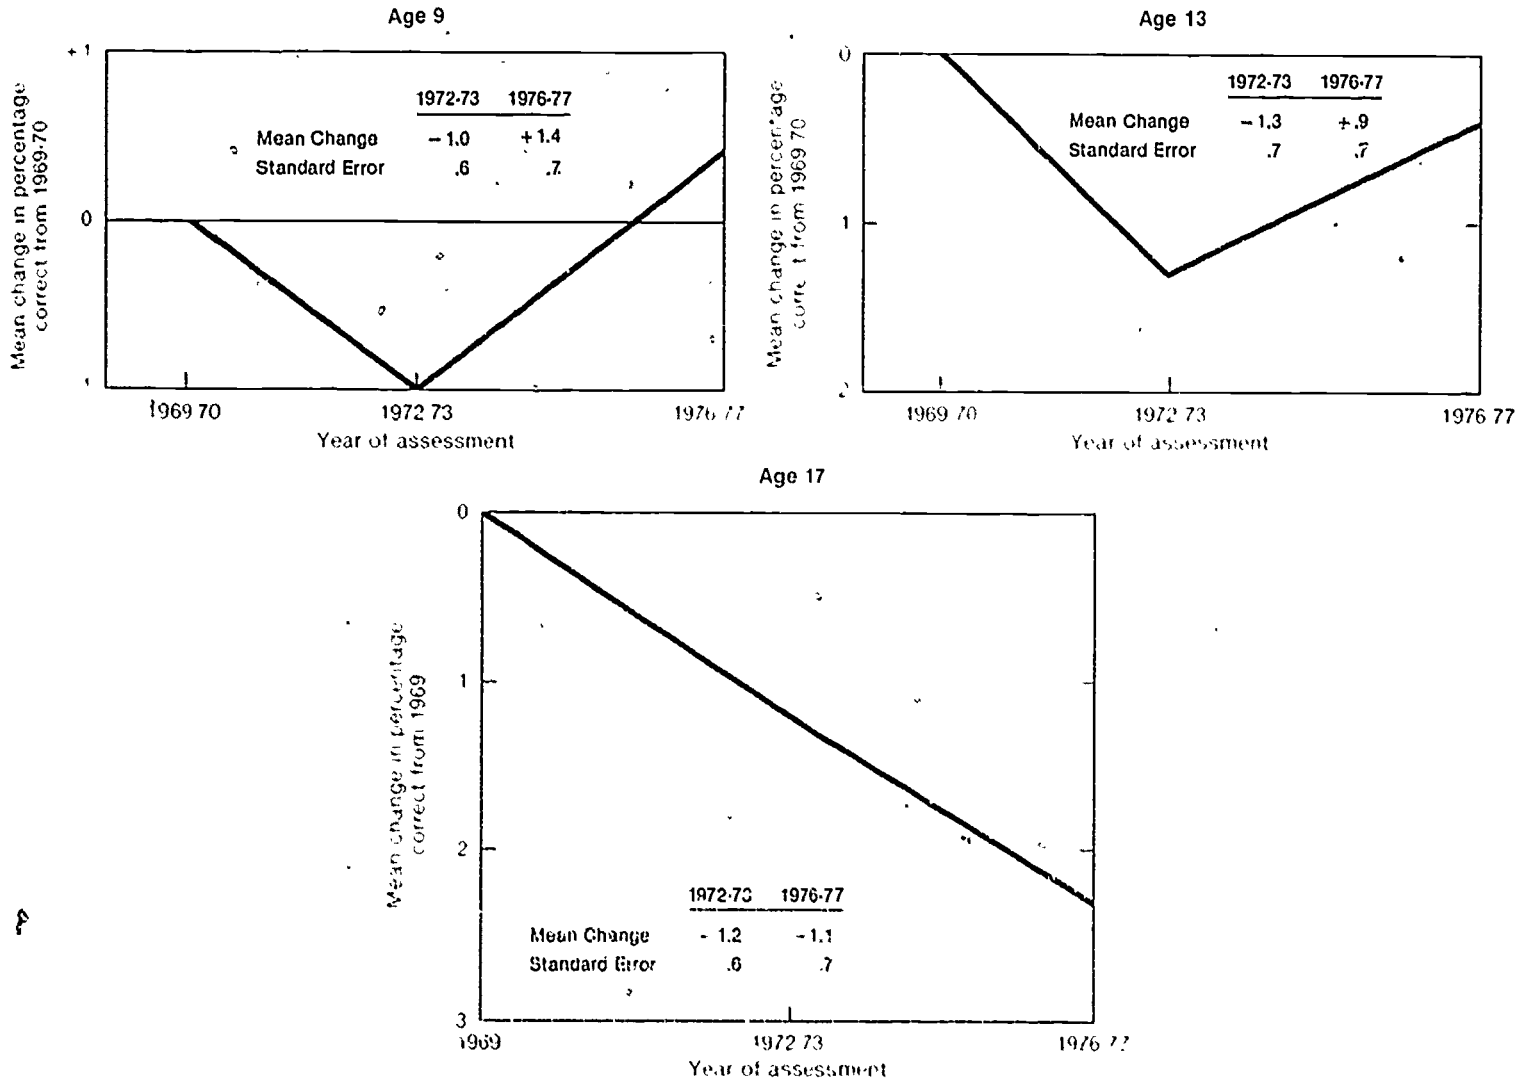
Achievement in the physical sciences declined for all age groups at every test interval. All three declines in the first interval were statistically significant (at the .05 level) while the declines for the nine-year-olds and 17-year-olds were significant in the second interval.



Source: National Assessment of Educational Progress. *Three National Assessments of Science: Changes in Achievement 1969-77*, p. 6.

Chart IV-7: Changes in biology achievement 1969-77 for 9-, 13- and 17-year-olds: National Assessment of Educational Progress

Although it appears that achievement in the biological sciences declined for all three age groups in the first interval and continued to decline for 17 year olds while improving for the younger groups, the only statistically significant change (at the .05 level) occurred for the 17 year-olds between 1969-70 and 1972-73.



Source: National Assessment of Educational Progress, *Three National Assessments of Science Changes in Achievement 1969 77*, p. 7

Table IV-5, 6, 7: Change in science achievement, 1969-77 for 9-, 13-, and 17-year olds: National Assessment of Educational Progress

*Change statistically significant at the 0.05 level.
[1]Year of assessment for 17-year-olds is 1969.
Source: Dearman, Nancy B., and Plisko, Valena White, *The Condition of Education, 1979 Edition*, p. 176.

Chart IV-8: Changes in mathematical achievement, 1973-78, for 9-, 13-, and 17-year-olds: National Assessment of Educational Progress

Overall mathematics achievement declined for all three age groups with the decline for the two older groups being statistically significant at the .05 level, with the exception of the knowledge items. Where there were no statistically significant differences, the older the group the steeper the decline in each of the assessed areas.

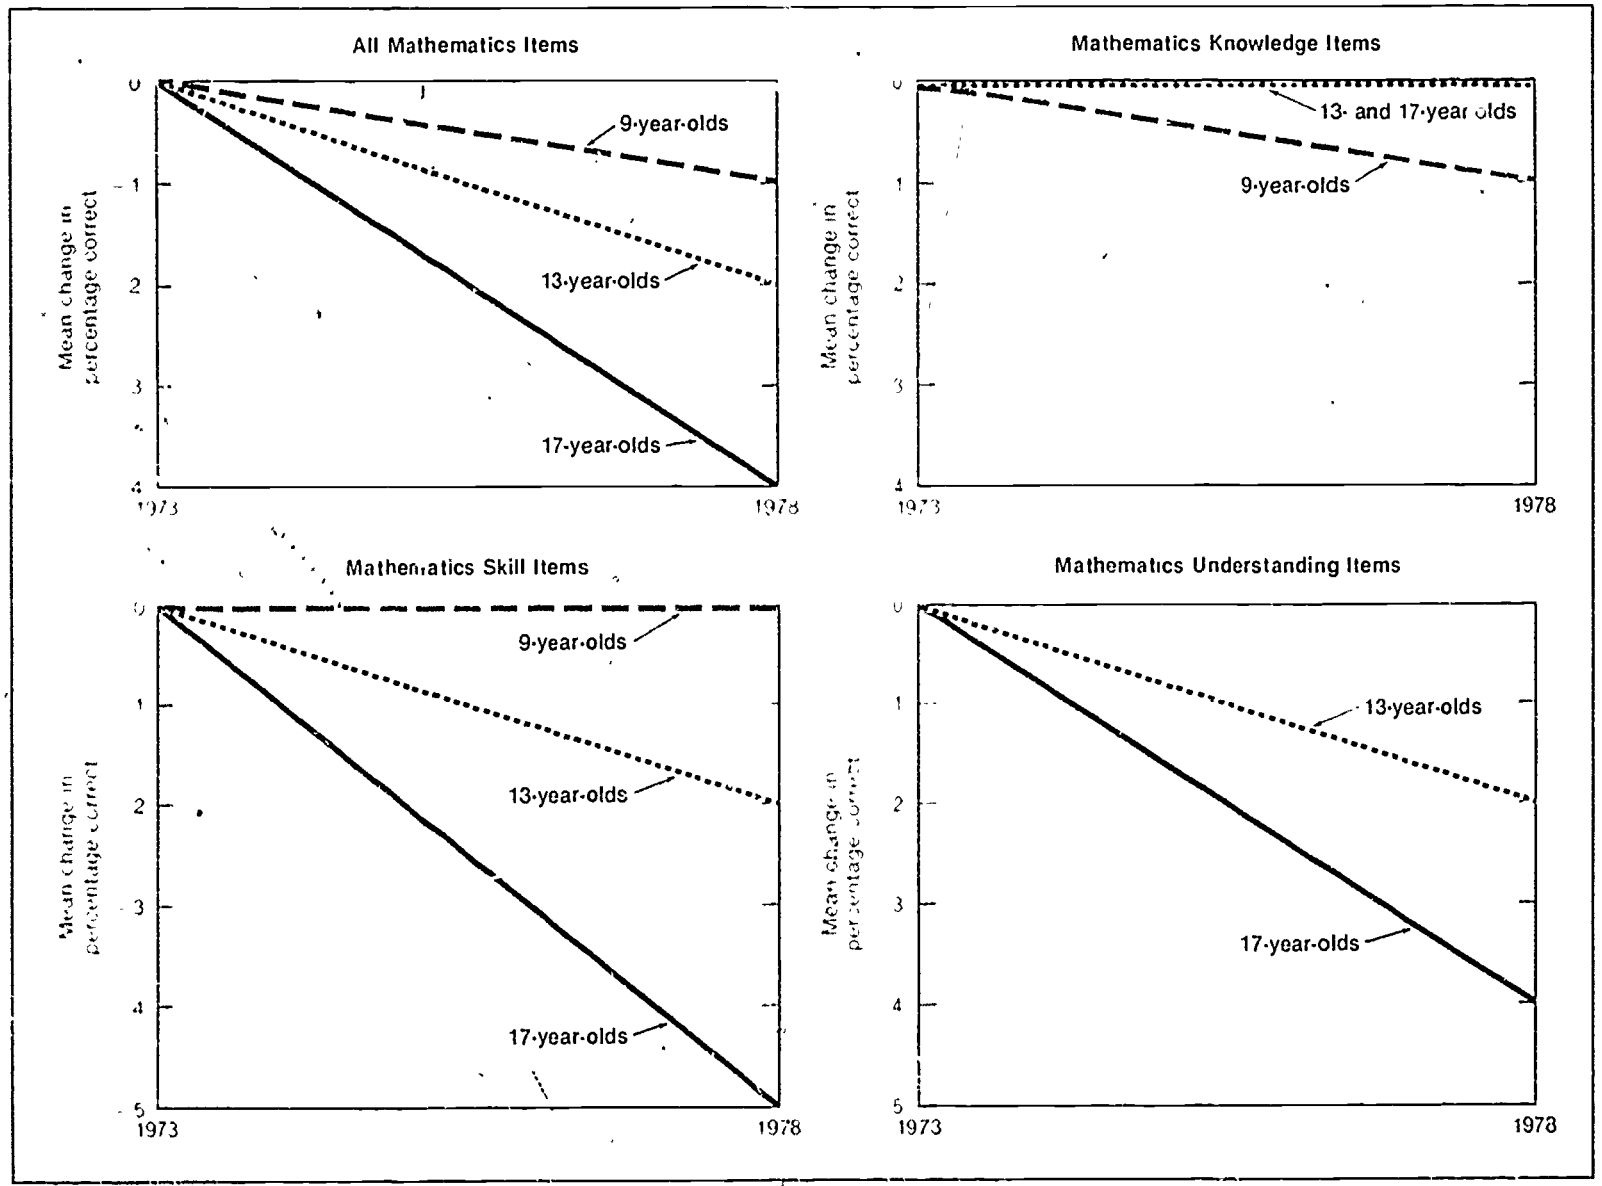

Chart IV-9: Mathematics test scores of high school seniors related to types of courses taken

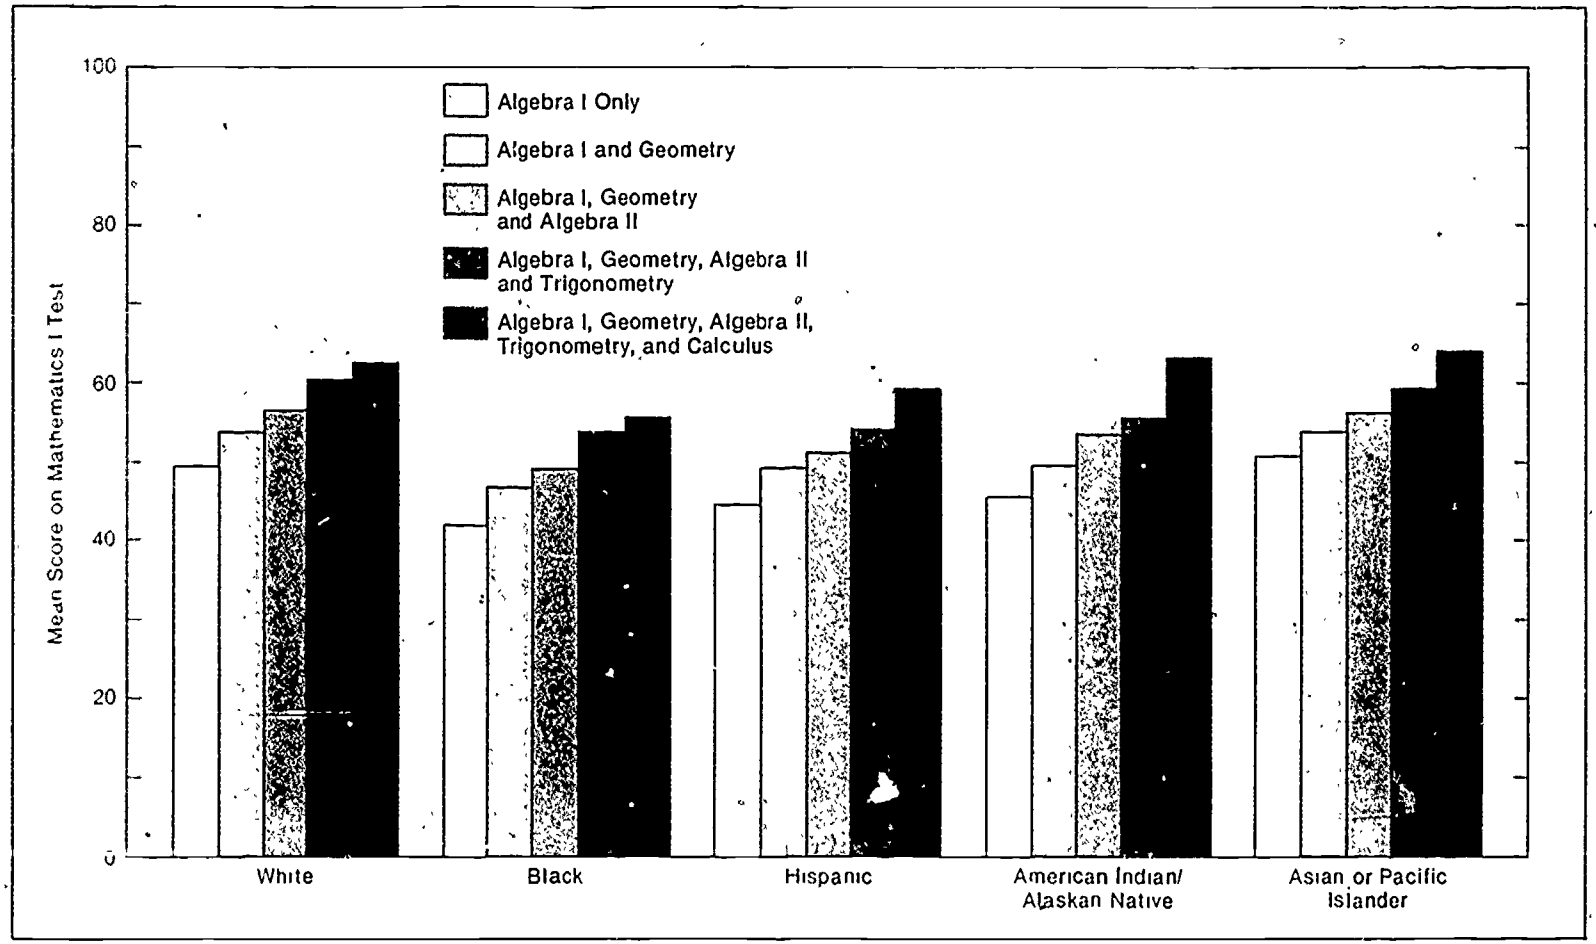
Within each racial/ethnic group, high school seniors who had completed increasingly complex mathematics courses performed significantly better on the mathematics achievement test than students who had completed lower-level courses only.



Source: The Condition of Education, NCES, 1982, p. 197

Table IV-9: Mean mathematics test scores of high school seniors, by types of mathematics courses taken and racial/ethnic group: 1980

Characteristic	Algebra I Only		Algebra I and Geometry		Algebra I, Geometry, and Algebra II		Algebra I, Geometry, Algebra II, and Trigonometry		Algebra I, Geometry Algebra II, Trigonometry, and Calculus	
	Math Test I	Math Test II	Math Test I	Math Test II	Math Test I	Math Test II	Math Test I	Math Test II	Math Test I	Math Test II
	Mean Test Score[1]									
White	49 44	48 30	53 74	52 23	56 55	55 02	60 07	59 21	62 65	62 64
Black	41 85	44 69	46.63	47.36	48 90	49 07	53 46	53.26	55 59	56 22
Hispanic	44 39	45 74	49 08	49.29	51 06	50 63	54 09	53 92	59 59	57 56
American Indian or Alaskan Native	45.54	45 70	49 88	49 95	53 35	51 95	55 59	53.20	63 06	59.36
Asian or Pacific Islander	50.80	51 30	53.90	54.97	56 25	58 10	59 47	60 50	63 95	63.98

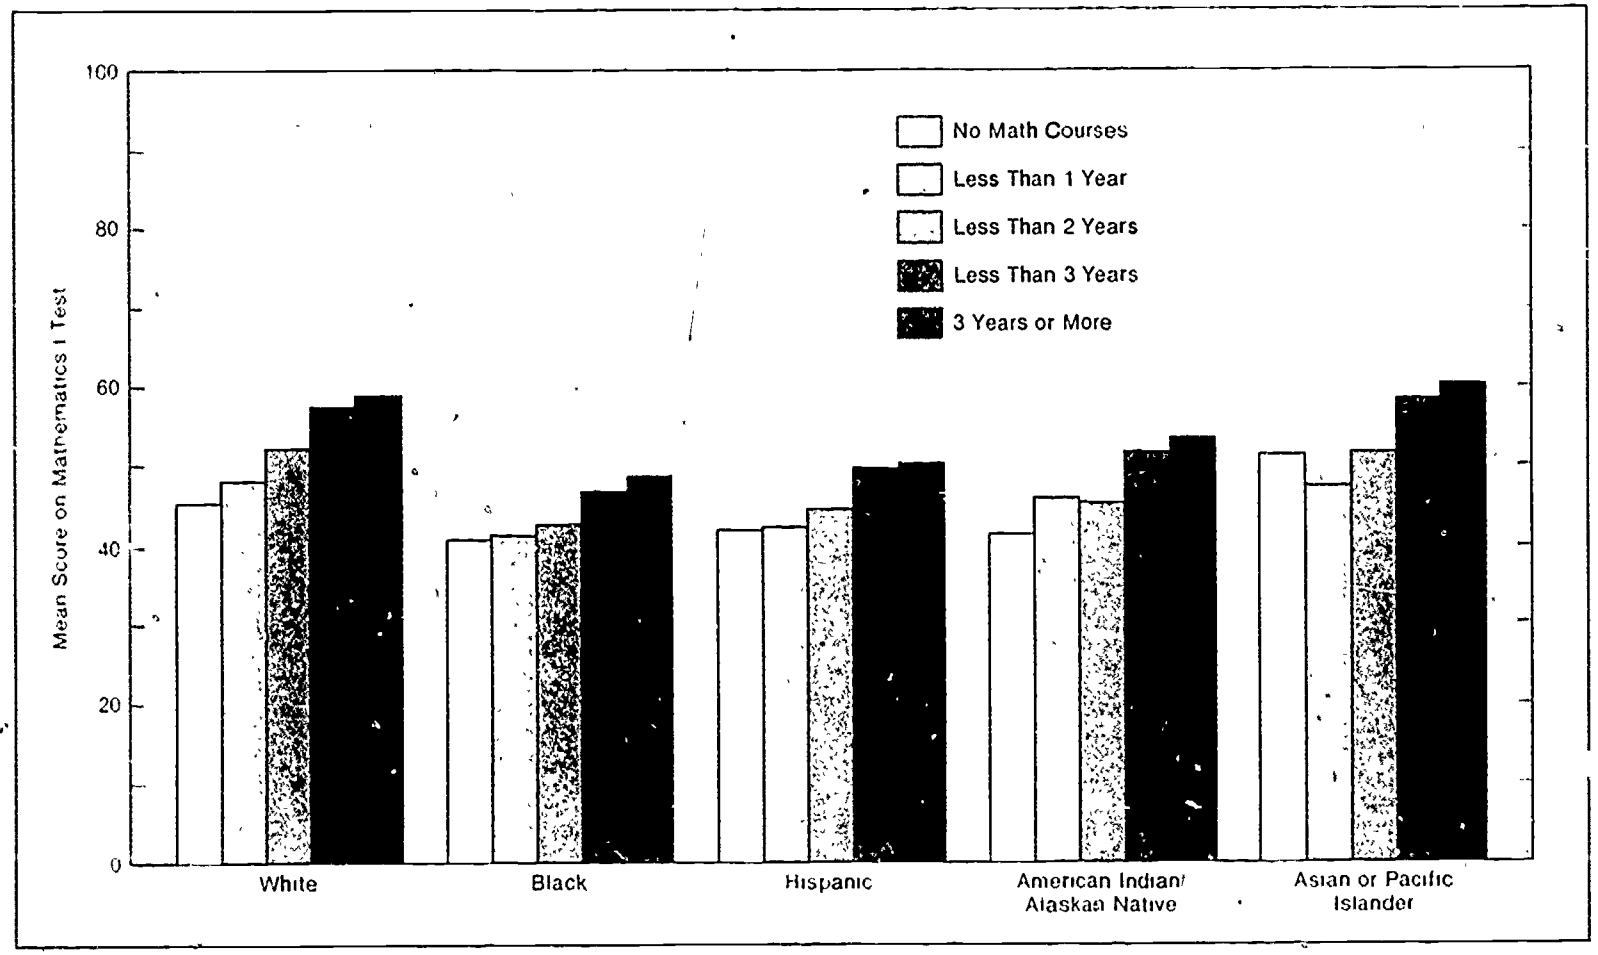
[1]Mathematics test I was designed to measure basic competence in quantitative skills, while mathematics test II measured the skills at a higher level. Because each set of test scores is standardized, comparisons can only be made within each test.

Note: Scores are standardized to a mean of 50 points and a standard deviation of 10 points.

Source: U.S. Department of Education, National Center for Education Statistics, 1980 High School and Beyond Study, unpublished tabulations.

Chart IV-10: Mathematics test scores of high school seniors related to years of coursework

Additional years of mathematics were associated with higher mathematics test scores, although white and Asian students with fewer years of math often performed better than other racial/ethnic groups with more years.



Source: The Condition of Education, NCES; 1982, p. 195

Table IV-10: Mean mathematics test scores of high school seniors, by number of years of mathematics taken, racial/ethnic group, sex, and socioeconomic status: 1980

Characteristic	Mathematics Test I Scores[1]					Mathematics Test II Scores[1]

Source: U.S. Department of Education, National Center for Education Statistics, 1980 High School and Beyond Study, unpublished tabulations

Chart IV-11: Scholastic Aptitude Test (SAT) score averages for college-bound seniors, 1967-81

For 1981, the average verbal and mathematical scores were identical to the averages of 1980 predecessors. For the first time since the score decline began, neither the verbal nor mathematical score averages declined from the previous year. Men outperform women on the verbal test with average scores of 430 versus 418. This difference by sex has widened from 3 points in 1976 to 12 points in 1981. Part of this difference may be due to the larger number of women taking the test. In the mathematical section, average scores for males increased one point from the previous year to 492, and those for females remained the same as in the previous two years (443). Between 1973 and 1981, the difference in male and female averages widened from 42 points to 49 points. This difference is even greater for students with an outstanding high school record, men in the top tenth of their class have a mathematical average that is 63 points higher than that of women in the top tenth of their class.

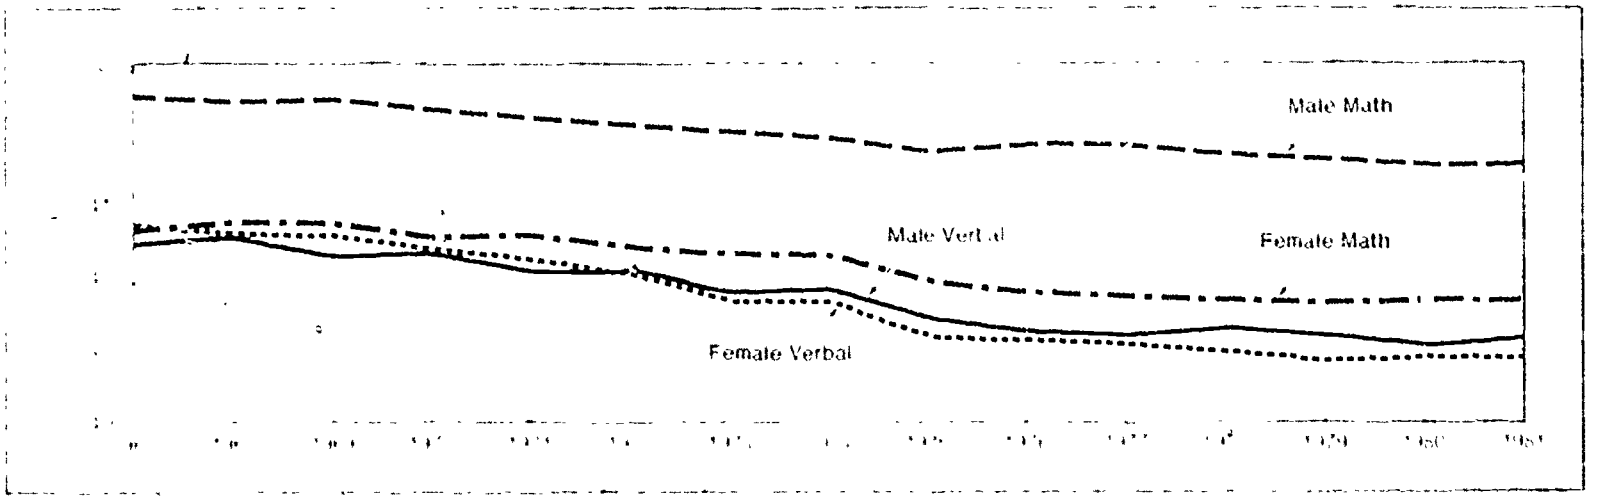

Table IV-11: SAT score averages for college-bound seniors, 1967-81*

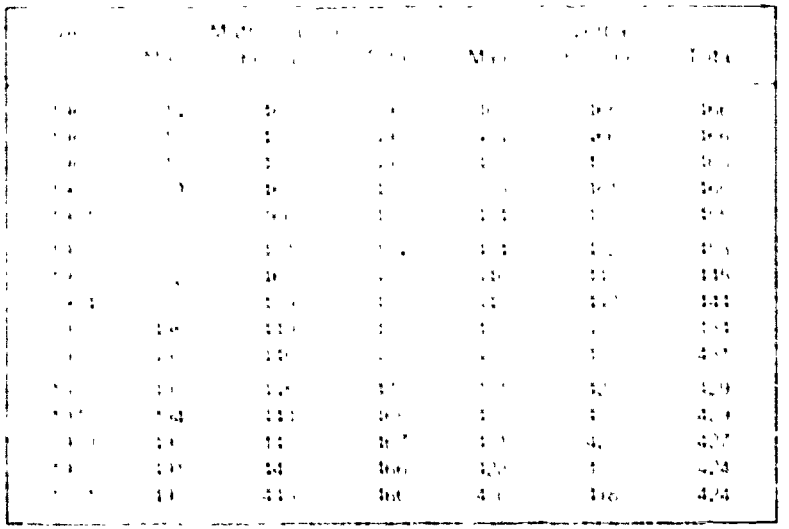

*[illegible] averages [illegible] estimates of the averages that would have been reported [illegible] high school years if such reports had been produced.

Chart IV-12: Scholastic Aptitude Test (SAT) score averages for college-bound seniors

From 1973 to 1981, the national mean SAT verbal and math scores dropped from 445 and 481 to 424 and 466, respectively. During the same time period, among college bound who intended to major in biological science, engineering, math and physical science, SAT verbal and math scores remained above the average for all college-bound seniors.

*Note: V = verbal, Q = quantitative. Standard deviations cannot be computed for all years. For 1976/77, however, standard deviations ranged between 100 and 138.

Sources: Data for the years 1970/71 through 1974/75 are from a one-in-fifteen sample study of examinees of those years. See Robert F. Boldt, *Trends in Aptitude of Graduate Students in Science* (Princeton, N.J.: Educational Testing Service), p. 20. Mean scores for 1975/76 and 1967/77 were calculated from unpublished tabulations furnished by the Educational Testing Service, based on the test results of a high proportion of all examinees of those years. Mean scores for 1977/78 are from *A Summary of Data Collected from Graduate Record Examination Test Takers During 1977/78, Data Summary Report #3* (Princeton, N.J.: Educational Testing Service), February 1978, Tables 13, 14 and 42; pp. 42, 81-84 and 85-88.

See figure 5-5.

Chapter V
DEGREE DATA

INTRODUCTION

A traditional measure of educational achievement is a degree Patterns of degree earning derive from many influences resources (Chap I), individual desires and ability (Chaps III and IV) and economic and social conditions, to list a few In this chapter data are presented showing patterns in science degree earning at all levels

The degrees data contained in this chapter are grouped into three categories. total number of earned degrees by subject and level, percent distribution of earned degrees by subject and level, and degree and distribution data for women and minorities

HIGHLIGHTS

Earned Degrees

1 Between 1970 and 1979, the total number of associate degrees in science/engineering related occupational curricula increased by 183 7% (Chart V-1)

2. The total number of degrees awarded in most science disciplines peaked in the early 1970's and has now declined, however. Bachelor's degrees in engineering continue to climb (Charts V-3 to 10)

3 In 1979 80, Women obatined more degrees in mathematics education at the bachelor's and master's level than men. (Chart V 11)

4 From 1975 to 1980 earned bachelor's degrees in mathematics, statistics, and secondary teaching decreased by 42% Computer science degrees increased by 145% In universities 83% of computer science degrees are from computer science departments, in public colleges the fraction is 56% However, many public colleges have joint mathematics and computer science departments (Table V 14C)

Distribution:

1 As a percent of total associate degrees, scienc engineering related occupational curri a grew from 25% to 37.5% between 1970 and 1979. (Chart V-2)

2 The number of science degrees as a percent of all degrees declined at all degree levels between 1968 69 and 1978-79. (Charts V-12 to 14)

Women and Minorities:

1. With a few exceptions, the number of science degrees at all levels earned by females has steadily increased. (Charts V-15 to 17)

2 Women have increased their share of science degrees in almost every discipline and at every level. (Charts V-18 to 20)

3 Minorities earn a greater percent of bachelor's degrees in the social sciences than in the natural sciences. (Chart V-21)

Chart V-1: Earned associate degrees, science/engineering-related occupational curricula, 1970-71 to 1978-79.

The total number of degrees in science/engineering related occupational curricula has increased by 183.7% since 1970.

[1]Includes degrees in anatomy, bacteriology, biochemistry, biology, botany, entomology, physiology, zoology, and other biological sciences.

NOTE. Although a strenuous effort has been made to provide a consistent series of data, minor changes have occurred over time in the way degrees are classified and reported. Any degrees classified in early surveys as "first-professional" are included above with bachelor's degrees, any degrees classified as "second professional" or "second level" are included with master's degrees. Data for all years are for 50 States and the District of Columbia.

Charts V-4, A&B: Earned degrees in the physical sciences, by level of degree, 1951-52 to 1979-80

The number of bachelor's degrees in the physical sciences declined somewhat in the early 1970's and rose to its highest point by 1979-80. The numbers of both master's and doctor's degrees have decreased since 1970-71.

Chart V-8, A, B&C: Earned degrees in engineering by level of degree, 1951-52 to 1979-80

In 1978-1979 the number of engineering bachelor's degrees awarded surpassed the peak reached in 1972-73 and continued to gain in 1978-1980. The number of master's degrees was highest in 1971-72 but the subsequent decline appears to have stabilized. The number of doctor's degrees has fallen steadily since 1969-70 and also appears to have stabilized.

NOTE: Although a strenuous effort has been made to provide a consistent series of data, minor changes have occurred over time in the way degrees are classified and reported. Any degrees classified in early surveys as "first-professional" are included above with bachelor's degrees, any degrees classified as "second professional" or "second level" are included with master's degrees. Data for all years are for 50 States and the District of Columbia.

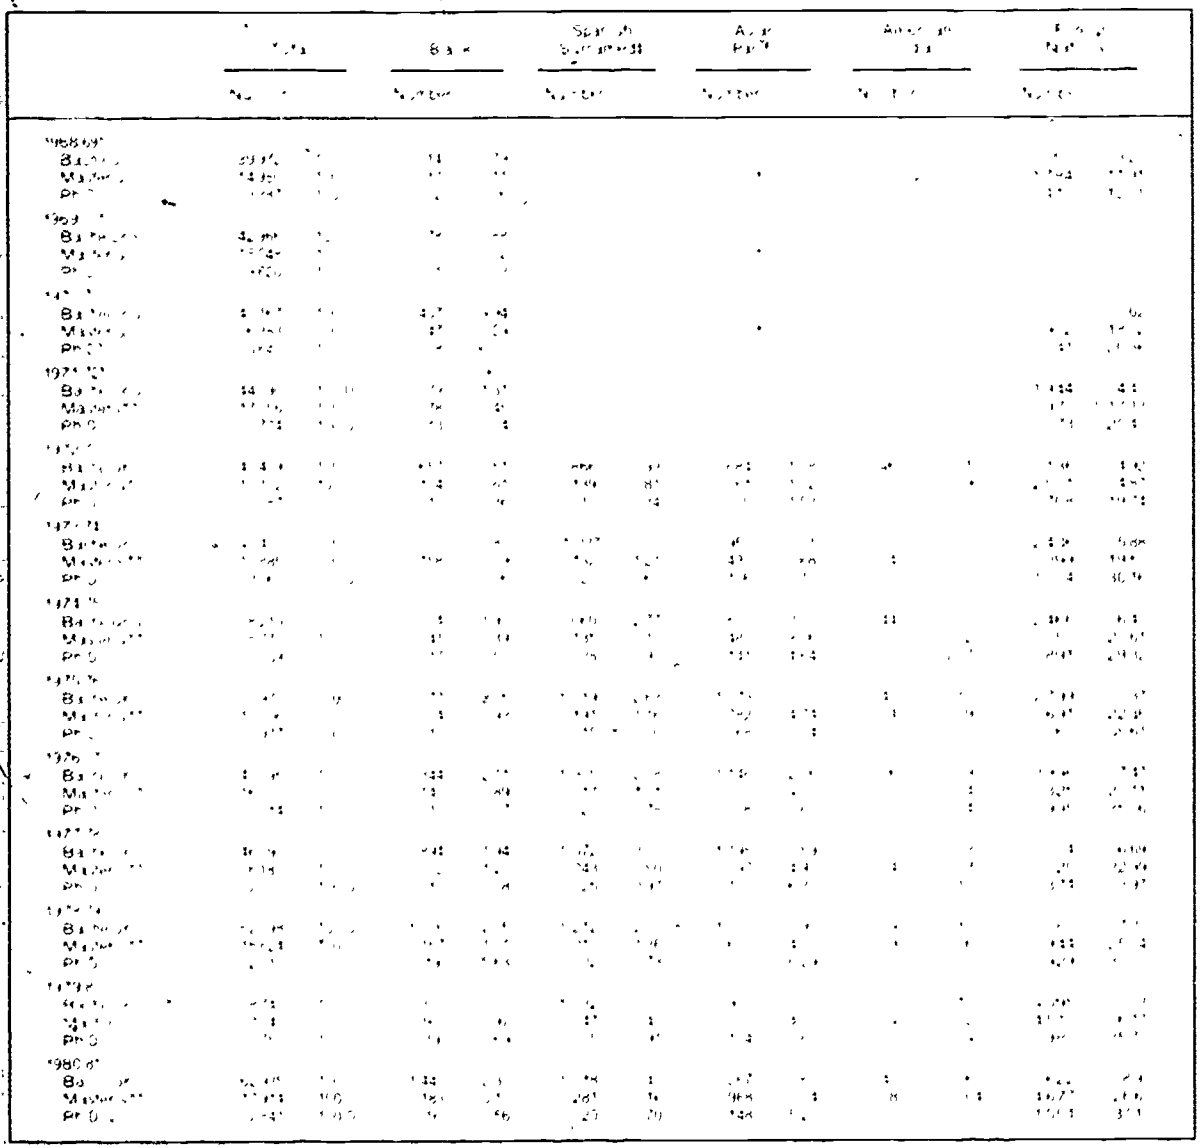
Table V-8 B: Number and percent of engineering degrees granted by level of degree and minority group, 1978-79 – 1980-81



*Totals for minority groups in these years include only numbers actually reported. The number would be higher if all institutions had reported all categories
**Includes engineer degrees.
†Data were not broken by any minority group except blacks, prior to 1972-73, however, some foreign national data was available
‡Includes University of Puerto Rico as follows:
1973-1980 Bachelors: 343, 397, 416, 339, 333, 324, 404, 329.
0 Masters: 13, 6, 2, 7, 6, 9, 15, 7.
ntific Manpower Commission, Betty Vetter.

Table V-8.C: Engineering degrees by curriculum and level, 1981

Electrical Engineering produces the most graduates at all three degree levels followed by mechanical, civil and chemical engineering. Although chemical engineering awarded only half the number of bachelor's degrees as did mechanical, the number of Ph.Ds was approximately the same.

	Bachelor	Master	Engineer	Doctor
Aerospace	1,587	380	10	114

Table V-14 C: Specialization of earned bachelor's degrees in mathematical sciences

From 1975 to 1980 earned bachelor's degrees in mathematics, statistics, and secondary teaching decreased by 42%. Computer science degrees increased by 145%. In universities 83% of computer science degrees are from computer science departments; in public colleges the fraction is 56%. However, many public colleges have joint mathematics and computer science departments.

(Numbers of bachelor's degrees)

[1]Includes degrees in anatomy, bacteriology, biochemistry, biology, botany, entomology, physiology, zoology, and other biological sciences

[2]Includes degrees conferred in statistics.

[3]Includes degrees in astronomy, chemistry, geology, metallurgy, meterology, physics, and other physical sciences

Source: Grant, W. Vance and Lind, C. George, *Digest of Education Statistics, 1979*, pp. 120-22, *1977 78*, pp. 118-19, and U.S. Department of Health, Education and Welfare, National Center for Education Statistics, reports on *Earned Degrees Conferred; IBID.*, 1980 pp. 120-24.

NOTE. Although a strenuous effort has been made to provide a consistent series of data, minor changes have occurred over time in the way degrees are classified and reported. Any degrees classified in early surveys as "first professional" are included above with bachelor's degrees, any degrees classified as "second professional" or "second level" are included with master's degrees. Data for all years are for 50 States and the District of Columbia.

Chart V-16: Master's degrees in science earned by women, 1951-52 to 1979-80

Except in mathematics, chemistry, sociology, and physics, women have steadily increased their number of master's degrees in science.

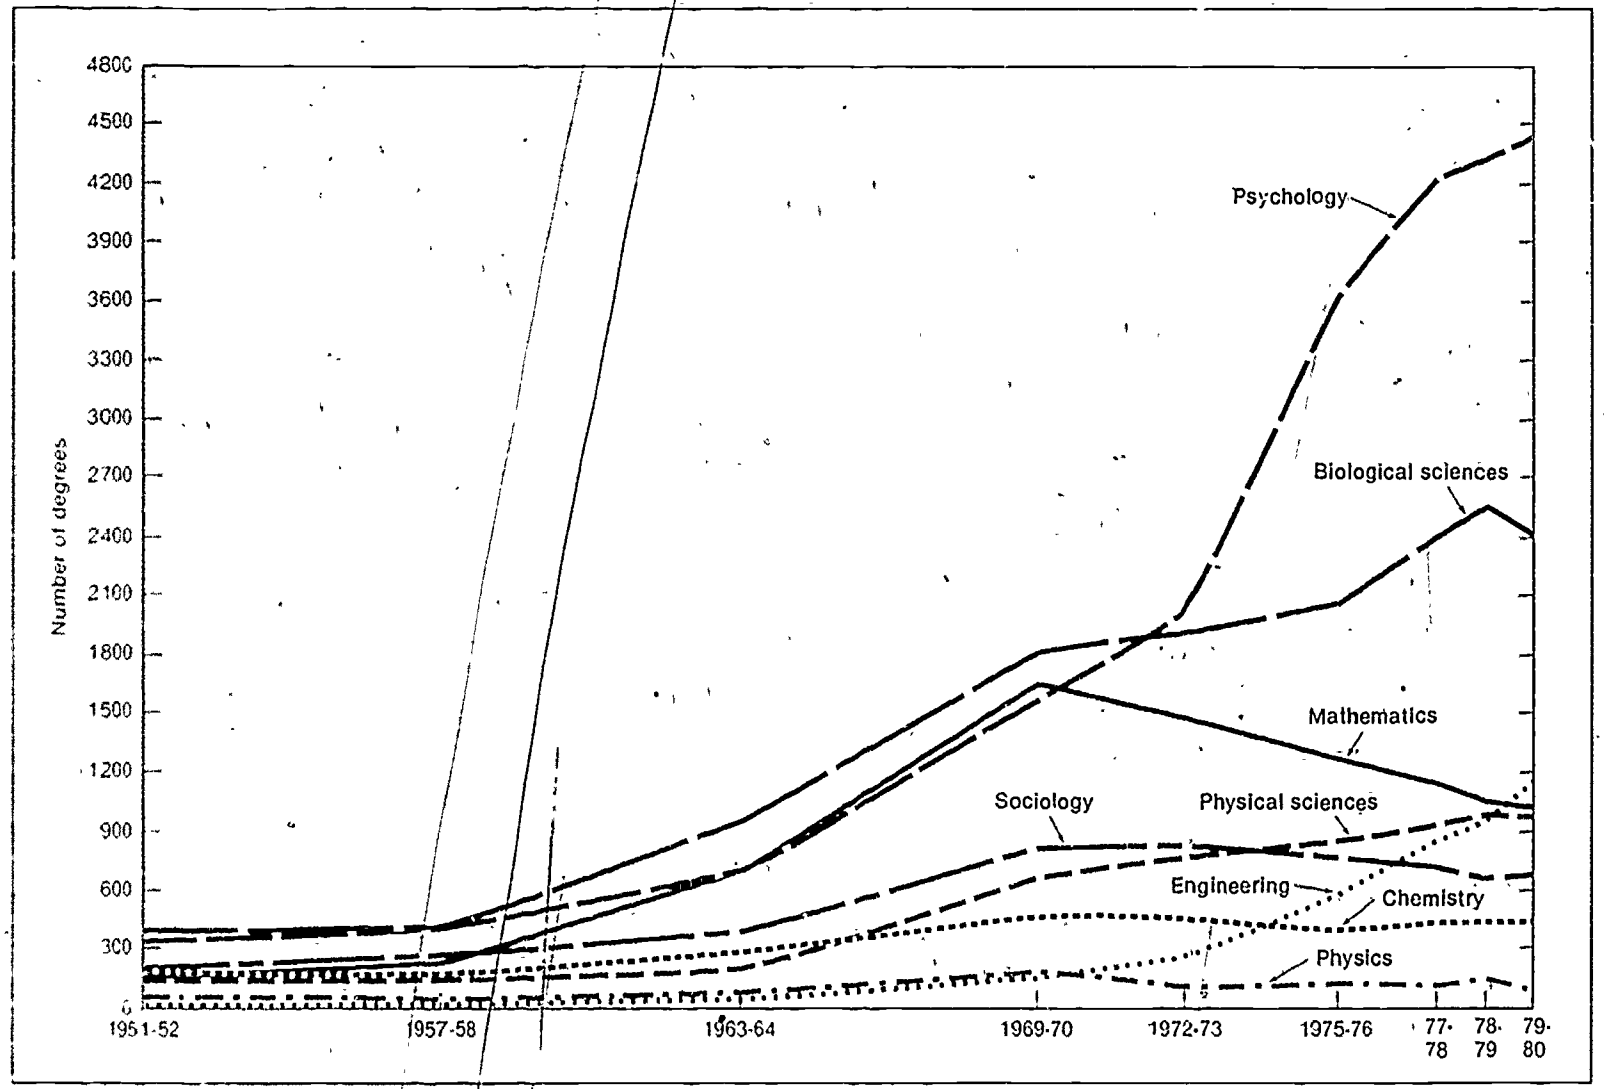

Table V-16: Master's degrees in science earned by women, 1951-52 to 1979-80

Year	Psychology	Biological science[1]	Sociology	Mathematics[2]	Physical sciences[3]	Chemistry	Engineering	Physics

Chart V-18: Percent of bachelor's degrees in science earned by women, 1951-52 to 1979-80

As a percent of total bachelor's degrees, the female share continues to grow in every scientific discipline. The relative position of the fields is stable; however, sociology and psychology have had and continue to have the most degrees, physics and engineering, least.

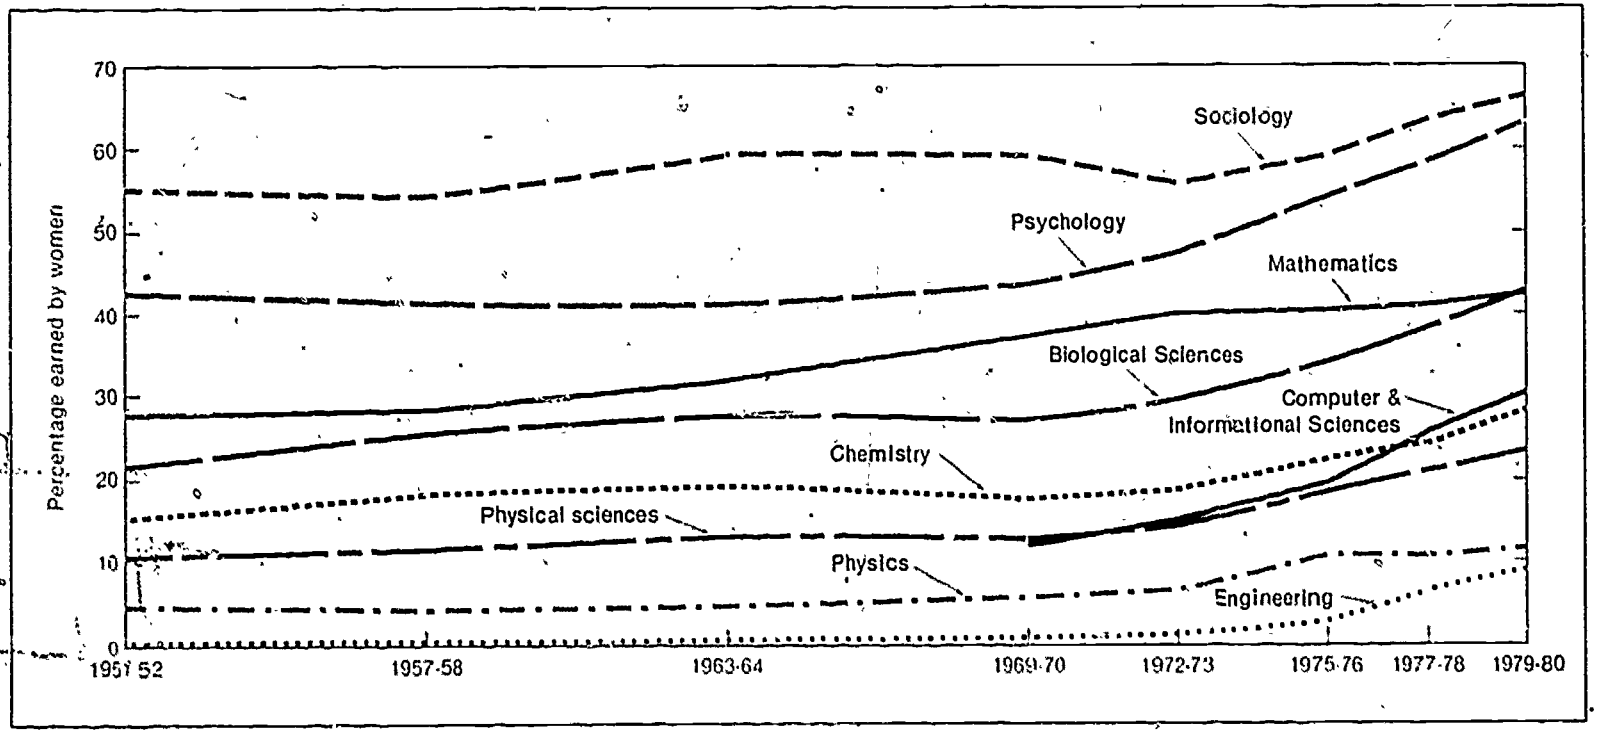

Table V-18: Percent of bachelor's degrees in science earned by women, 1951-52, 1979-80

	1951-52	1957-58	1963-64	1969-70	1972-73	1975-76	1977-78	1979-80

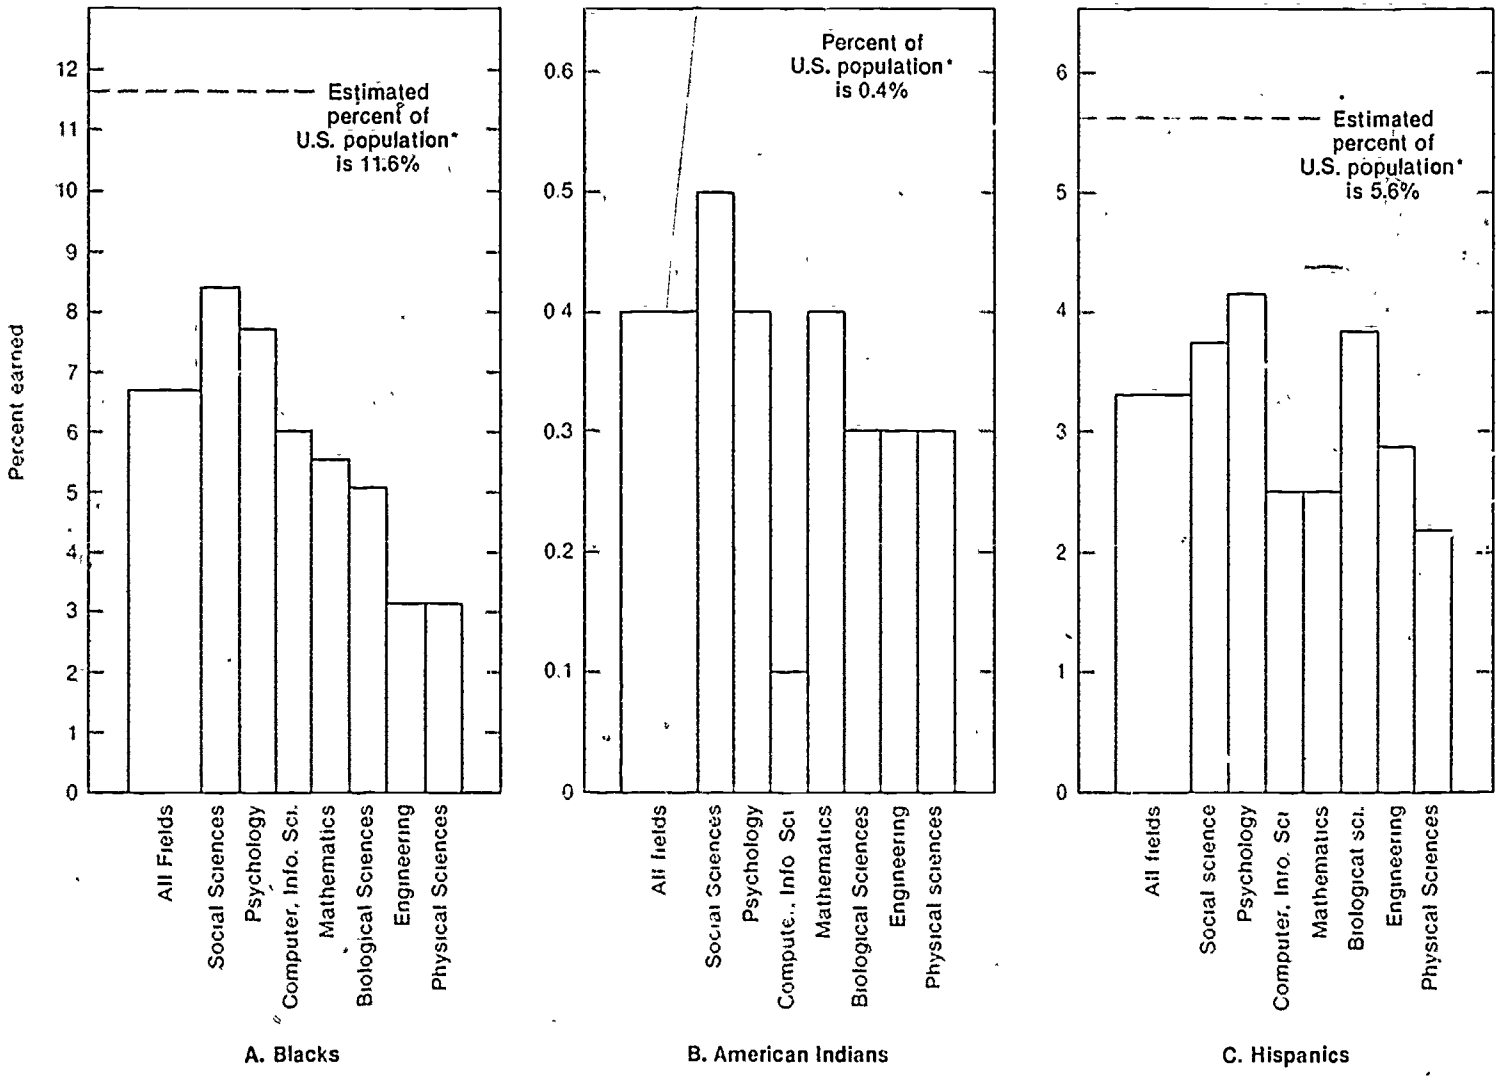
Charts V-21, A, B & C: Percent of bachelor's degrees in science earned by minorities and by field, 1978-79

Minorities earn more degrees in psychology and social sciences than in physical sciences. American Indians earn degrees in an amount more representative of their share of the population than do blacks or Hispanics.



*NOTE. Figures for the Black and Hispanic populations are from the March 1978 Current Population Survey, and therefore are estimates. The population figure for American Indians is from the 1970 Census. Also, persons of Hispanic origin may be of any race.

Table V-21: Percent of bachelor's degrees in science earned by minorities, by field, 1978-79

	All Fields	Science	Psychology	Computer	Mathematics	Biology	Engineering	Physics
Blacks	6 6	8 4	7 6	6 0	5 6	5 1	3 1	3 1
American Indian	0 4	0.5	0.4	0 1	0.4	0 3	0.3	0 3
Hispanic	3.3	3.6	4.1	2.5	2 5	3.7	2.7	2.2

Chapter VI
EMPLOYMENT IN SCIENCE AND ENGINEERING

INTRODUCTION

A full understanding of American science education requires that it be related to the context of American society. To what uses do individuals put their science education? Of what use to society is their science education? Most of the data available helps answer the first question and presented here are what seem relevant and useful of that data.

Data in this chapter are presented in two groups: employment and salaries.

HIGHLIGHTS

1. More than half of all doctoral scientists and engineers are employed by educational institutions. (Chart VI-1)
2. Approximately 32% of doctoral scientists and engineers are engaged in R&D as their primary work activity. (Chart VI-2)
3. In general, female scientists and engineers have a higher unemployment rate than males. (Charts VI-3, 4)
4. Male scientists and engineers claim a greater degree of underemployment than females. (Chart VI-5)
5. From 1965-78, male scientists and engineers outearned women scientists and engineers in most fields at all levels; in 1979 median annual salaries for baccalaureate recipients were less divergent. (Charts VI-7 to 11)
6. Beginning salary offers are highest in engineering. (Chart VI-10)

Chart VI-1: Employers of doctoral scientists and engineers, 1973 and 1979

More than half of all doctoral scientists and engineers are employed by educational institutions. No significant trends developed between 1973 and 1979.

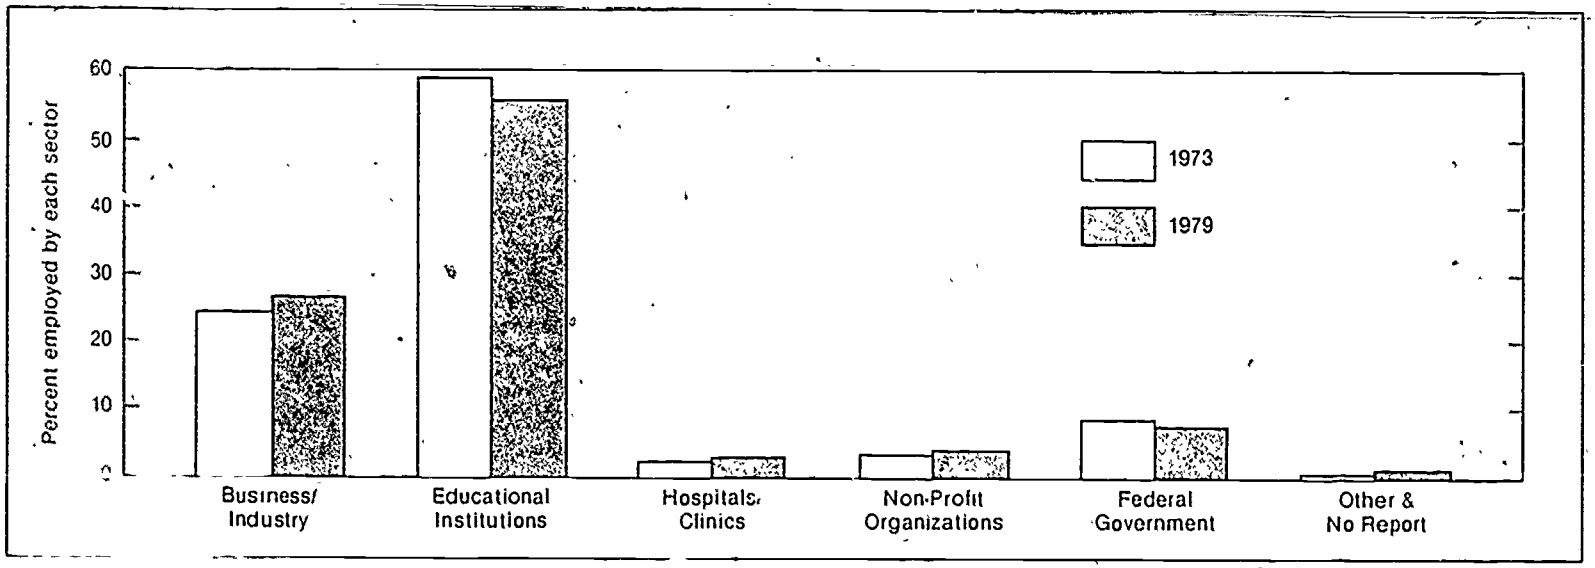

Table VI-1: Employers of doctoral scientists and engineers, 1973, 1975, 1977 and 1979

Chart VI-2: Primary work activity of doctoral scientists and engineers, 1973 and 1979

R&D activities account for approximately 32% of primary work activities among doctoral scientists and engineers. Between 1973 and 1979, there was a 19.3% relative decline in those reporting teaching as their primary work activity.

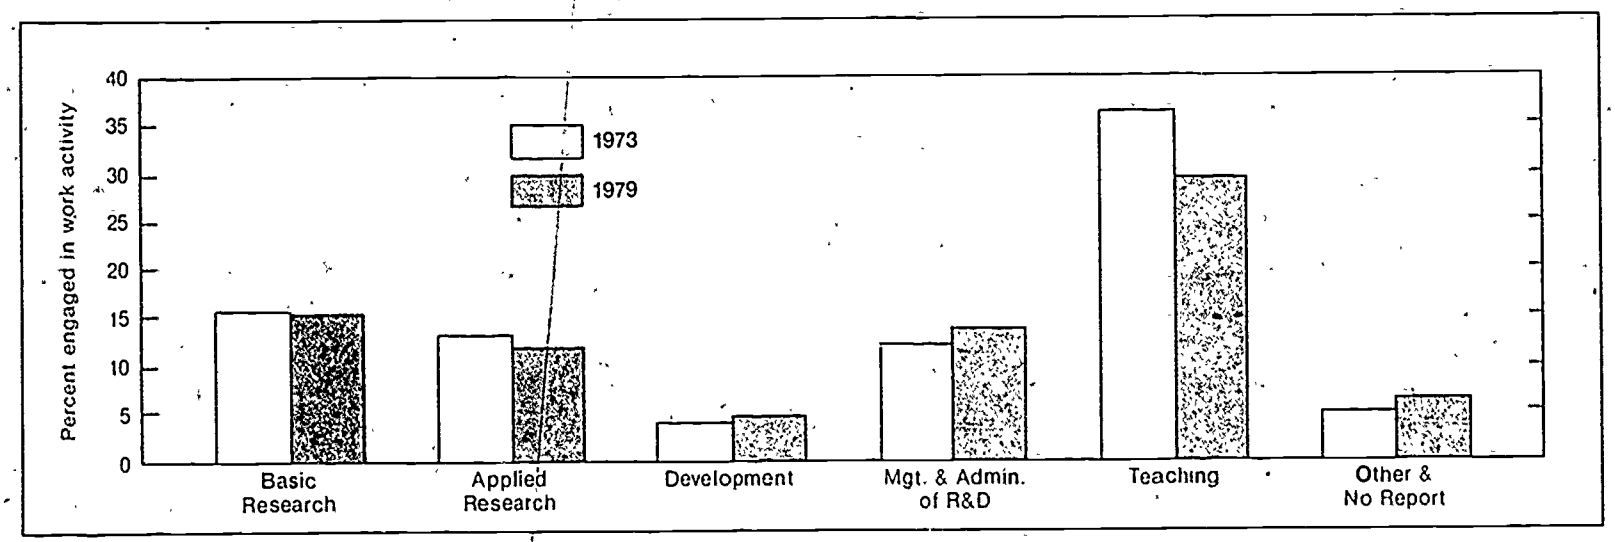

Table VI-2: Primary work of doctoral scientists and engineers, 1973, 1975, 1977 and 1979

Chart VI-5: Average underemployment of 1976-77 bachelor's degree recipients working full-time, by field and sex, February 1978

Except in psychology, men claim a greater degree of underemployment in science and engineering fields.

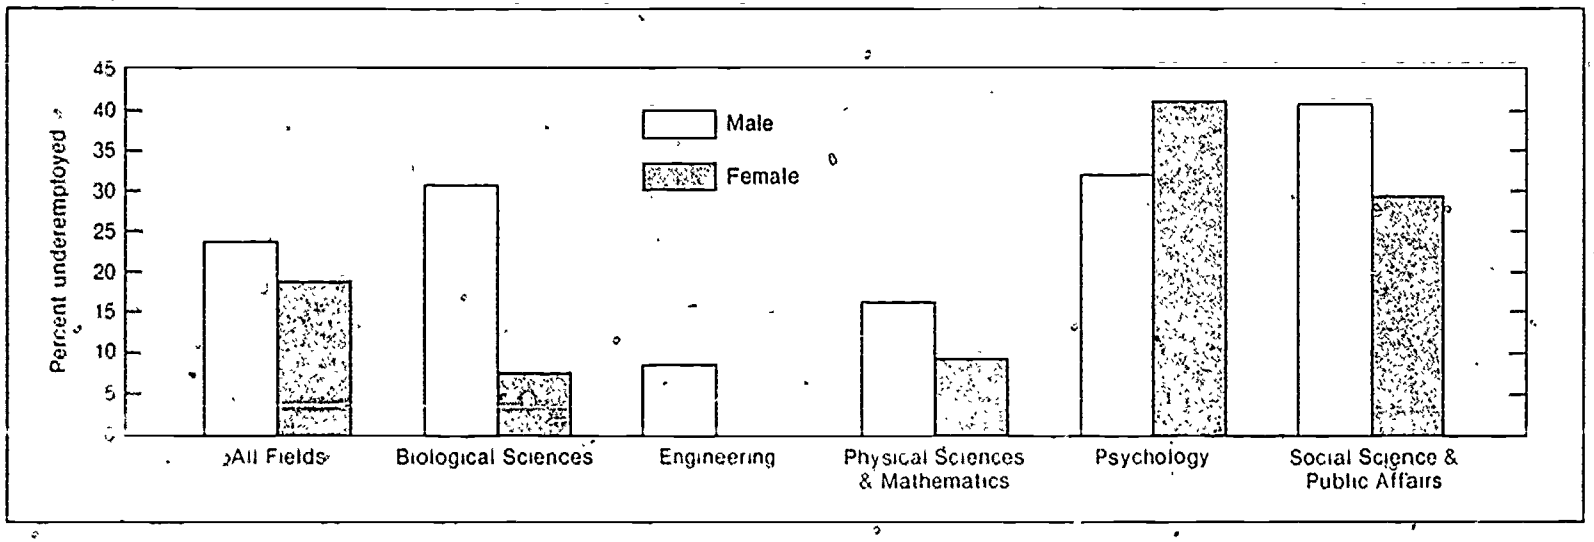

Table VI-5: Average underemployment[1] of 1976-77 bachelor's degree recipients working full-time, by major degree field and sex: February 1978

Major degree field	Percent Underemployed		
	Total	Male	Female
Total	21 6	23 7	19 0
Biological sciences	21 6	30 5	7 8
Engineering	7 9	8 4	0

Psychology	36 8	32 0	41 0
Social sciences & public affairs	36 3	40 4	29 5
Humanities	32 9	32 5	33 2
Business & management	18 6	19 9	14 2
Education	14 0	15 9	13 3
Health professions	2 5	3 4	2 3
Communications	23 0	19 7	26 3
Other	32 7	34 1	31 2

[1] Bachelor's degree recipients working full-time are defined as underemployed if in a job that is not professional, technical, managerial, or administrative and when asked, responded that job did not require a college degree. Definition includes additional stipulation that they are not enrolled in school

Chart VI-6: Percent of science and engineering doctorate recipients still seeking* position at time of Ph.D. by sex, 1965-77

It is becoming increasingly more difficult for new doctorate recipients to secure positions.

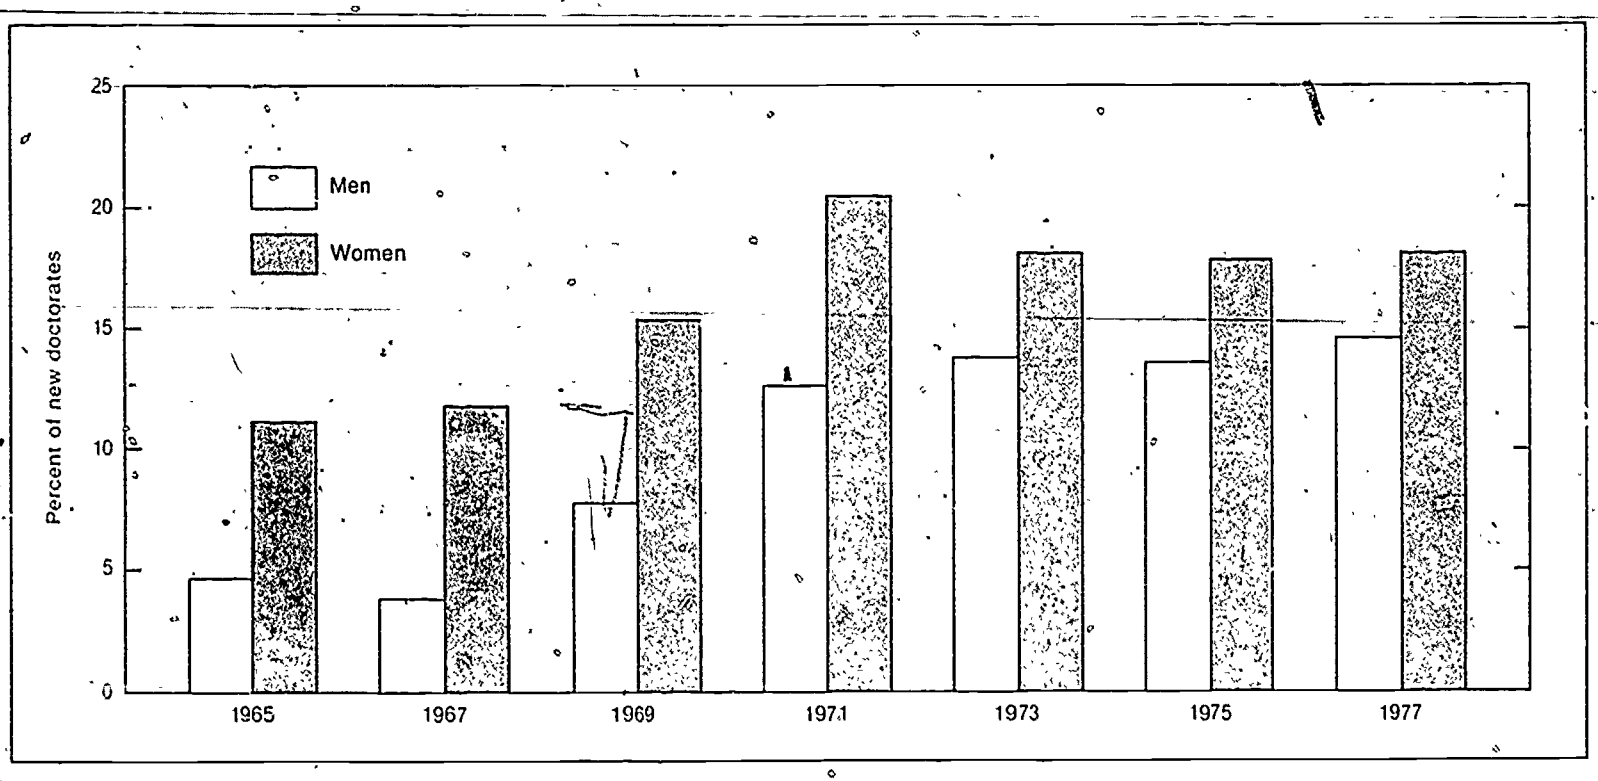

Table VI-6: Percent of science and engineering doctorate recipients still seeking* position at time of Ph.D. by sex, 1965-1977

	Male	Female
1965	4.7	11.1
1967	3 8	11.8
1969	7 8	15.3
1971	12 6	20.4
1973	13 8	18.2
1975	13.6	17.8
1977	14.6	18.2

*Still seeking position is defined as those who checked response 2 to item 5 on the Survey of Earned Doctorates questionnaire.

Chart VI-7: Median annual salaries of bachelor's and doctoral degree recipients: 1980

In all fields but engineering and mathematics, individuals with a doctoral degree and 2 to 5 years experience earned approximately twice as much as bachelor's degree recipients with no experience.

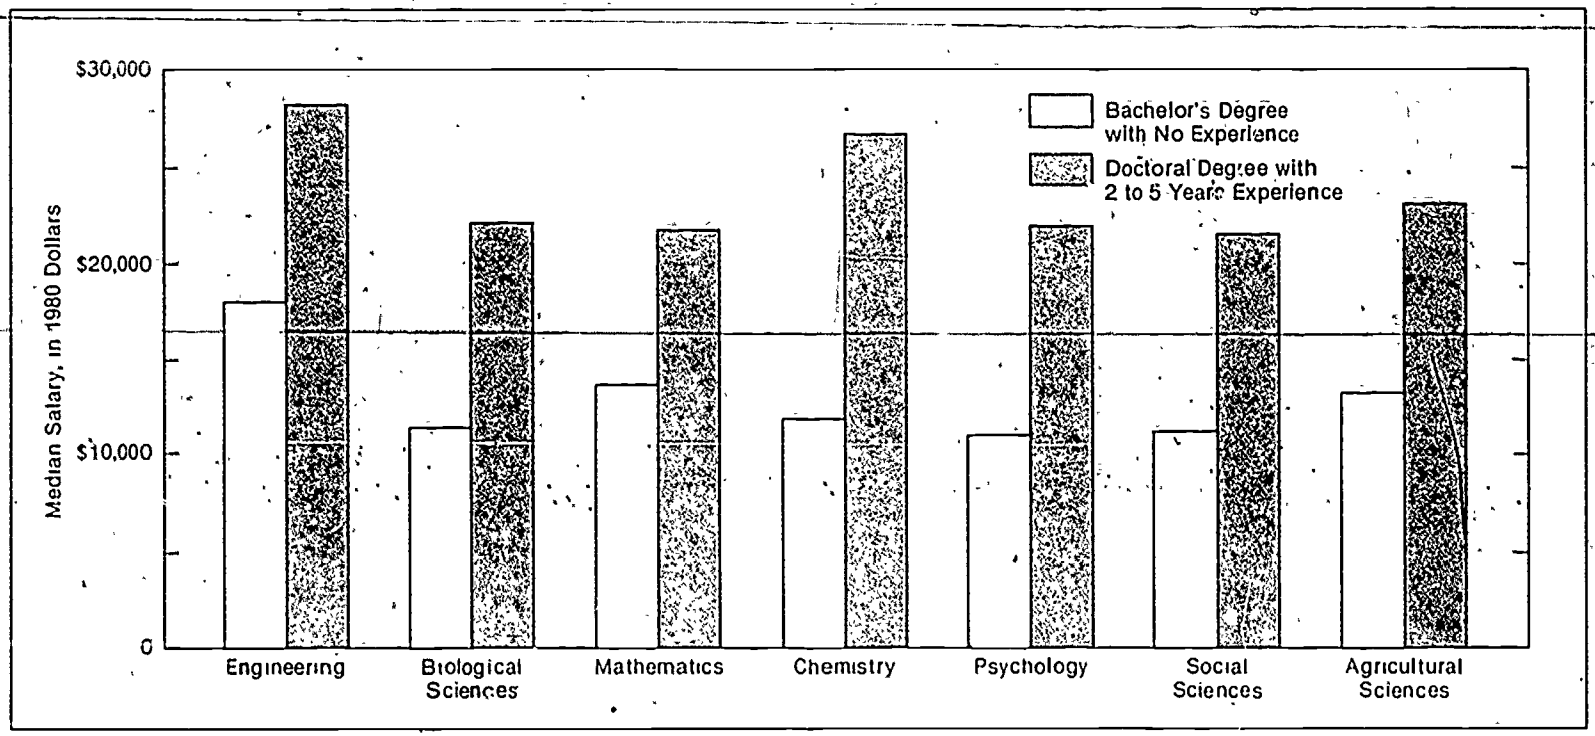

Table VI-7: Median annual salaries of bachelor's degree recipients with no experience and doctoral degree recipients with 2 to 5 years experience, by field of degree: 1980

	Median Salaries[1]	
	Bachelor's Degree No Experience	Doctoral Degree 2 to 5 Years Experience
Engineering	$17 933	$28,295
Biological Sciences	11,258	22,132
Mathematics	13,332	21,803
Chemistry	11,857	26,734
Psychology	11,043	22,023
Social Sciences	11,090	21,694
Agricultural Sciences	13,109	23,118

[1]Median salaries are for full time workers only and have been adjusted to 1980 dollars using median earnings for professional, technical, and kindred workers.

ANNOTATED BIBLIOGRAPHY

Admissions Testing Program of the College Board. *National report, College bound seniors, 1972 73, 1973 74, 1974 75, 1975 76, 1977, 1978, 1979.* Princeton: Educational Testing Service, 1973-79.

National Report, College-Bound Seniors for the years 1973 through 1979 summarizes the College Board ATP records of high school seniors who registered for Scholastic Aptitude Tests (SAT) or Achievement Tests at any time during their high school years. The 1979 report presents data for about one million seniors, about a third of all seniors of 1979 and about two-thirds of all who go directly to college. Included are summaries of scores for the SAT, and the Achievement Tests, and from the Student Descriptive Questionnaire (SDQ) data on high school records of students, their socioeconomic characteristics, and their college plans. Results of the Test of Standard Written English (TSWE) are included from 1974-75 onwards. Copyright 1977, 1978, 1979 by College Entrance Examination Board, New York.

Atelsek, Frank J. and Gomberg, Irene L. *Young doctoral faculty in science and engineering: Trends in composition and research activity.* (Higher Education Panel Report, Number 43) Washington, D.C.. American Council on Education, February 1979.

Young Doctoral Faculty in Science and Engineering: Trends in Composition and Research Activity is the report of a survey funded by the National Science Foundation, the U.S. Office of Education, and the National Institute of Education to ascertain the extent of declines in the proportion of young doctorates in science and engineering faculties. The report discusses expected faculty hiring during 1978-79, comparisons with earlier surveys, trends in faculty composition, and measures of research activities of younger and older faculty members.

Carnegie Foundation for the Advancement of Teaching. *Missions of the college curriculum.* San Francisco: Jossey-Bass, 1977.

Missions of the College Curriculum seeks to describe for persons involved with curriculum, particularly those new to the responsibilities therein, the current state of American curricula in institutions of higher education and ways of change and development. The preface observes that the timing of the study is such because higher education has undergone considerable change in the past decade, that change is continuing, and that the period ahead is one of no growth for higher education but important social changes for society. Fourteen chapters and four appendices comprise the volume.

Association of Science Technology Centers. *ASTC science museum funding study.* Unpublished report, Washington, D.C., January 19, 1979.

ASTC Science Museum Funding Study represents a preliminary, unverified by agencies, draft-form report of the structure of lead agency support for science museums from federal sources. The data were gathered from agency annual reports, program office reports, and individual museum reports of federal funding. Since it provides preliminary estimates, it can only give rough estimates until more precise data are made available.

College Placement Council Inc. *CPC salary survey. A study of 1978 79 beginning offers, final report,* July 1979. Bethlehem, PA: 1979.

The CPC Salary Survey presents data on beginning monthly salary offers made to graduates at all degree levels from a representative group of colleges and universities in the United States. A broad number of job types is surveyed, although teaching is excluded. The College Placement Council issues reports five times annually to members and subscribers. This report contains 2 pages of text analysis and 9 pages of tables and charts covering offers by sex, field, type of employer, and level of degree.

Dearman, Nancy B. and White, Valena Plisko, *The condition of education, 1979 edition,* (National Center for Education Statistics, Statistical Report, Stock No. 017-080-02008-4). Washington, D.C.. U.S. Government Printing Office, 1979.

The Condition of Education, 1979 Edition, is the fifth annual report in a series describing various conditions in education as well as in the larger society affecting education. The first of its two parts provides an overview of education in three sections. the social context of education (the family, work and the community), elementary and secondary education (enrollments, school environment, *etc.*), postsecondary education (enrollments in higher and adult education, faculties, finances, *etc.*). The second part of the volume deals with three selected topics. financing precollege public education, outcomes of education, and the status of women and minorities in higher education. There is an appendix, and a cumulative index. The format of the text is a discussion of the section followed by numerous tables each accompanied by an illustrative chart.

Engineering Manpower Commission of Engineers Joint Council. *Engineering manpower bulletin*, No. 47. New York. Engineers Joint Council. May 1979.

Engineering Manpower Bulletins provide information on trends and developments in manpower for engineering and related technologies. Number 47 summarizes a two part report, *Engineering and Technology Enrollments Fall 1978*, presenting four tables, one figure and interpretive text on current and past engineering enrollments.

Frankel, Martin M. *Projections of education statistics to 1986-87*, (National Center for Education Statistics, Stock No. 017 080-01918 3). Washington, D.C.. U.S. Government Printing Office, 1978.

Projections of Education Statistics to 1986-87 provides projections of statistics for elementary schools, secondary schools, and institutions of higher education. The projections which are revised annually based upon newly collected data by NCES, include statistics on enrollments, graduates, teachers, and expenditures. The latest population projects and estimates from the Bureau of the Census are also incorporated in the volume on a yearly basis.

Golladay, Mary A and Noell, Jay. *The condition of education, 1978 edition*, (National Center for Education Statistics, Statistical Report. Stock No 017 080 01[illegible]25). Washington, D C. U S. Government Printing Office, 1978.

The Condition of Education, 1978 Edition is an annual statistical report describing various conditions in education as well as in the larger society affecting education This volume, which is the fourth report to be published in this series, is organized into two parts The first part is concerned with trends and developments at all levels of education including the societal context for describing education (e g., public opinion, school age population, financial support), elementary and secondary education (e.g., public and professional opinion, enrollments, outcomes), and post secondary education (e g., enrollment in higher education, characteristics of institutions, and adult education) The second part looks at educational personnel, the financing of higher education, and a comparison of education and labor force participation patterns in the United States and other selected nations. The format of the volume is a discussion of a topic followed by numerous tables and charts in which each table is illustrated on the following page by a chart (i.e., a statistical graph)

Gooler, Dennis D. The development and use of educational indicators. *Educational indicators. Monitoring the state of education.* (Proceedings of the 1975 ETS Invitational Conference) Princeton: Educational Testing Service, 1976.

The Development and Use of Educational Indicators suggested the main features of the organizing framework for this Databook. Gooler categorizes educational indicators as follows. access, aspirations, achievement, impact, and resources. He notes that the information base for access and resources is reasonably good, adequate for achievement, and poor for aspirations and impact.

Grant, W. Vance and Lind, C. George. *Digest of education statistics 1977-78* and *1979*, (National Center for Education Statistics). Washington, D.C.: U.S. Governmen Printing Office, 1978, 1979.

Digest of Education Statistics, 1977-78, and 1979 continue a series published annually since 1962. They provide an abstract of statistical information covering American education from kindergarten through graduate school. The Digest includes data on the number of schools and colleges, enrollments, teachers, graduates, attainments, finances, federal funds for education, libraries, international education, and research and development. The 1977 78 edition, also contains a number of innovations from previous editions, such as NAEP data on social and political attitudes of 13 and 17-year-olds, years for computing school attendance in each state, trends on Scholastic Aptitude Test scores, college dropouts for the high school class of 1972, expenditures for school lunch programs, and expenditures for public libraries. The 1979 edition's innovations include data on trends in engineering enrollments and on earned degrees conferred in mathematics, biological sciences and physical sciences.

Hamblen, John W. and Baird, Thomas B., (Eds.). *Fourth inventory of computers in higher education.* Princeton, Edcom, 1979.

Fourth Inventory of Computers in Higher Education reports data from the fourth national survey of computers in higher education. The book consists primarily of tables on computers, numbers of, expenditures, degree programs, instructional and administrative use, student access, and other topics An interpretive report is due to be published in early 1980

Klus, John P. and Jones, Judy A. *Survey of continuing education activities for engineers and scientists.* Washington, D.C.. The American Society for Engineering Education, 1978.

Survey of Continuing Education Activities for Engineers and Scientists summarizes the findings of a poll of 349 universities and professional/technical associations concerning their activities in continuing education. Included in the summary are statistics related to noncredit activities, such as, intensive short courses, non credit after hours courses, institutes, seminars, etc., correspondence courses, and self study activities. Also discussed are degree credit courses and the development and operation of courses with attention to such factors as needs analyses, promotion, evaluations, and funding.

Malitz, Gerald S. *Associate degrees and other formal awards below the baccalaureate· Analysis of 6-year trends* (National Center for Education Statistics, Stock No. 017-080-01848-9). Washington, D.C.: U.S. Government Printing Office, 1978.

Associate Degrees and Other Formal Awards Below the Baccalaureate: Analysis of 6-Year Trends is based upon a survey which is part of the Higher Education General Information Survey (HEGIS) conducted annually by NCES. This report which focuses upon the years 1970 71 through 1975-76 compares data available on curriculum categories and divisions, types of instructional units, and classifications of degrees and awards. Included are associate degrees and all other formal awards which require at least two but less than four years of post secondary work, regardless of whether or not the work was intended to be applicable toward a baccalaureate degree.

National Assessment of Educational Progress. *Changes in social studies performance, 1972 76* (National Center for Education Statistics. Report No. 07 SS-01). Denver, Colorado: 1978

Changes in Social Studies Performance, 1972-76 studies the changes in two surveys conducted by NAEP to measure achievement in social studies during the 1971 72 school year and during the 1975 76 school year These surveys provided data on changes in social studies achievement for young Americans aged 9, 13, and 17. Changes were reported in knowledge, skills, and attitudes, related to economics, geography, history, and politics. The publication includes sample items from the surveys as well as the statistics (charts, graphs, etc) related to the changes.

National Assessment of Educational Progress. *Attitudes toward science. A summary of results from the 1976-77 national assessment of science.* (National Institute of Education, Report No. 08-S-02) Denver, Colorado: 1979.

Attitudes toward Science presents findings from the 1976-77 assessment of science that indicate how students ages 9, 13, and 17, and in some cases young adults (ages 26-35), responded to questions on three major topics. 1) personal experience with science, 2) science and society, and 3) awareness of the philosophy and methodology of science. The data are analyzed by age, racial, geographic, and other categories.

National Assessment of Educational Progress. *Changes in mathematical achievement, 1973-78.* (National Institute of Education, Report No. 09-MA-01) Denver, Colorado: 1979.

Changes in Mathematical Achievement, 1973-78, relates the changes in two surveys conducted by NAEP to measure achievement in mathematics during the school years of 1972-73 and 1977-78. The subjects of the surveys were 9-, 13 and 17 year olds. The 1977 78 assessment dealt with four cognitive process levels (knowledge, skills, understanding, and application) across a variety of traditional mathematics content areas (numbers and numeration, variables and relationships, geometry, measurement, and other topics such as graphs, and probability). The publication includes sample items from the surveys as well as the statistics (tables, charts, etc.) related to the changes.

National Assessment of Educational Progress. *Energy knowledge and attitudes. A national assessment of energy awareness among young adults.* (National Center for Education Statistics, Report No. 08 E 01) Denver, Colorado. 1978.

Energy Knowledge and Attitudes: A National Assessment of Energy Awareness Among Young Adults is a report of a survey administered to a sample of American adults during the summer of 1977. Seventy knowledge questions and 76 attitudinal questions were given in this assessment. The questions measuring knowledge fell into three major categories. (1) basic energy facts, (2) general energy issues, and (3) energy conservation. The attitude questions were categorized into four major classifications. (1) feelings about the seriousness of energy problems, (2) belief in the effectiveness of personal action, (3) feelings toward environmental hazards, and (4) feelings toward energy trade-offs.

National Assessment of Educational Progress. *Mathematical knowledge and skills.* (National Institute of Education, Report No. 09-MA-02) Denver, Colorado. 1979.

Mathematical Knowledge and Skills presents the achievement of 9, 13, and 17 year olds during the school year 1977 78 as shown in the NAEP survey. Results and sample items, are presented for knowledge in numbers and numeration, geometry, and measurement, for computational skills with whole numbers, fractions, decimals, integers, percents and fractional conversions, for skills in measurement, reading graphs and tables, geometric and algebraic manipulations, and estimating. Some groups and age-level comparisons are made and as observations and recommendations.

National Assessment of Educational Progress. *Three national assessments of science: Changes in achievement, 1969-77.* (National Center for Education Statistics, Report No. 08-S-00). Denver, Colorado: 1978.

Three National Assessments of Science: Changes in Achievement, 1969-77 is a study of the changes in the three national science assessments. 1969-70, 1972-73, and 1976-77. In each assessment, students were assessed for achievement in three broad objectives of science education. (1) fundamental aspects of science, (2) applications of fundamentals to a wide range of problem situations, and (3) appreciation of the processes of science, its consequences and limitations, and the personal and social relevance of science to society. The second and third assessments contained questions from the first assessment so that comparisons could be made.

National Science Foundation. *Characteristics of doctoral scientists and engineers in the United States, 1973 Detailed statistical tables, appendix B,* NSF 75-312-A. Washington, D C . National Science Foundation, 1973

Characteristics of Doctoral Scientists and Engineers in the United States, 1973. Detailed Statistical Tables, Appendix B, presents demographic and employment tables of data resulting from the 1973 Survey of Doctoral Scientists and Engineers conducted by the National Academy of Science for the NSF and the National Institutes of Health. Results of the survey are discussed in *Characteristics of Doctoral Scientists and Engineers in the United States, 1973* (NSF 75-312).

National Science Foundation. *Characteristics of doctoral scientists and engineers in the United States. 1977. Technical notes and detailed statistical tables,* NSF 79-306. Washington, D.C.. National Science Foundation, 1977.

Characteristics of Doctoral Scientists and Engineers in the United States: 1977 is a set of tables affording data on the demographic and employment characteristics of doctoral scientists and engineers (individuals holding S/E doctorates or holding non S-E doctorates but employed in S/E positions). Two previous surveys of this population were conducted in 1973 and 1975, some of the results from those surveys are presented here also for time series information. Data include types of employer (education, business/industry, federal government), field, primary work activity, sex, age, race, years of experience, and other.

National Science Foundation. *Reviews of data on science resources.* June, 1978, NSF 78-310. Washington, D.C.: National Science Foundation, 1978.

Reviews of Data on Science Resources presents selected demographic and employment characteristics of recent bachelor's and master's degree recipients in science and engineering. The report presents findings of a 1976 survey of the 1973 74 and 1974 75 graduating classes. Eight pages of charts and text are accompanied by two detailed statistical tables showing by field and sex the total number of graduates, the number in the labor force, the number employed, the number employed in science and engineering, and the number in the field of training.

National Science Foundation. *Science resources studies high lights.* September 26, 1977, NSF 77 318. Washington, D.C.. National Science Foundation, 1977.

Science Resources Studies Highlights presents in this issue a summary of a report by Dr. Robert Boldt of Educational Testing Service on the Graduate Record Exam (GRE) scores over several years. The report, *Trends in Aptitudes of Graduate Students in Science,* is a statistical analysis of scores from 1970 to 1975 with particular emphasis on prospective science and engineering graduate students.

National Science Foundation. *Science resources studies high lights* October 4, 1978, NSF 78-316, Washington, D.C.. National Science Foundation, 1978.

Science Resources Studies Highlights presents in this issue the first analytical results of the 1977 survey of doctoral scientists and engineers (earlier surveys were in 1973 and 1975). Tables, charts and text deal with employment data by type of employer, type of work activity, sex and field of employee, in both 1973 and 1977.

Pepin, Andrew J. *Fall enrollment in higher education 1978,* (to be published by National Center for Education Statistics, DHEW, Washington, D.C.)

Fall Enrollments in Higher Education 1978 was not published at the time the *Science Education Databook* was compiled but two tables from it were used in the *Data Book*. Table 26 — Total Enrollment in Institutions of Higher Education by Major Degree Field and Sex and By Control and Level of Institution, and Table 29 — Total Enrollment in Institutions of Higher Education, by Level of Enrollment, Sex and Attendance Status of Student and By Major Degree Field and Ethnicity. Aggregate United States, Fall 1978.

Pepin, Andrew J. *Fall enrollment in higher education 1976.* (National Center for Education Statistics: Stock Number 017 080-01907 8). Washington, D.C.. U.S. Government Printing Office, 1978.

Fall Enrollment in Higher Education 1976 is the result of a single effort of the National Center for Education Statistics and the Office of Civil Rights of the Department of Health, Education, and Welfare to conduct a single fall enrollment survey that would satisfy the needs of both agencies. Data in this publication are organized under six major categories. (a) enrollment by level of institution, (b) enrollment by state, (c) enrollment by institution, (d) Enrollment by race/ethnicity; (e) enrollment by major degree field; and (f) Enrollment by major degree field and race/ethnicity.

Phi Delta Kappa, Inc., The eleventh annual Gallup poll of the public's attitude toward the public schools. *Phi Delta Kappan,* September 1979.

The Annual Gallup Poll of the Public's Attitude Toward the Public Schools surveys a replicated probability sample of American adults to determine attitudes toward such matters as school quality, problems, strengths, finances, quality compared with previous eras, and other topics The poll is published each September in the *Phi Delta Kappan* It provides information useful to school decision makers and others interested in the forces that shape and support the public school system.

Smith, Stanley V. and Wells, Agnes Q. *Earned degrees conferred, 1975 76.* (National Center for Education Statistics, Stock No. 017-080-01868-3). Washington, D.C.. U.S. Government Printing Office, 1978.

Higher Education, Earned Degrees Conferred, 1975 76, Summary Data is the fifth report in a series begun in 1970 71 to portray all degrees granted by all institutions in the United States identified as degree granting by the *Education Directory, Higher Education.* Detailed tables are provided in which bachelor's, master's, and doctor's degrees are categorized by level of degree, sex of student, control (public or private) of institution, and discipline specialty. All data collected for survey years 1970-71 through 1975-76 are directly comparable and provide excellent data for serial and trend analyses.

U.S. Dept. of Commerce. Bureau of the Census. *Current population reports, Series P-20, No. 336,* Washington, D.C.: 1979.

Current Population Reports, Population Profile of the United States. 1978 reports on a sample survey conducted on 60,000 households. Data are considered supplementary to that of the decennial census and not strictly comparable.

U.S., Dept. of Commerce, Bureau of the Census. *1970 census of population. Vol. I, U.S. Summary,* Washington, D.C., 1975

1970 Census of Population, Vol. I, U.S. Summary provides data on the various racial groups in the U.S., as well as other information.

Vetter, Betty M., Babco, Eleanor L., McIntire, Judith E. *Professional women and minorities. A manpower data resource service, 2nd edition.* Washington, D.C.: Scientific Manpower Commission, November 1978.

Professional Women and Minorities: A Manpower Data Resource Service is designed to provide current and historical statistics about the professional segment of the U.S. population and particularly about the participation and availability of women and minorities in pursuits requiring at least the baccalaureate level. The first five sections of the volume deal with general enrollments, general degrees, general professions, general workforce and academic workforce. The remaining sections are devoted to subject fields (chemistry, mathematical sciences, life sciences, etc.) and provide data on degrees, enrollments, general workforce, and academic workforce.

Vetter, Betty M. *Labor force participation of women trained in science and engineering and factors affecting their participation* Unpublished report submitted to National Science Foundation under Grant No. SRS 77 19575, by Scientific Manpower Commission. Washington, D.C., June, 1979.

Labor Force Participation of Women Trained in Science and Engineering and Factors Affecting Their Participation presents data on science and engineering graduates of the past 15 years regarding employment status, salaries, number and ages of children, fields of training and work, marital status, spouses, occupations, level of degrees, etc. Thirty seven tables are accompanied by six pages of findings and detailed discussion

Weiss, Iris R. *Report of the 1977 national survey of science, mathematics, and social studies education* (National Science Foundation, SE 78 72) Washington, D.C. U.S Government Printing Office, 1978

Report of the 1977 National Survey of Science, Mathematics, and Social Studies Education describes the results of a national survey designed to ascertain what science courses are offered in the schools, what textbooks and materials are being used in the schools by grade level, how much time is being spent on the teaching of science, and what are the roles of science teachers, supervisors, and administrators in working in science education The report provides excellent base line data for comparisons with future investigations Data were gathered from teachers (both elementary and secondary), principals, superintendants district supervisors, and state supervisors

An overview and summaries of three studies* (National Science Foundation, SE 78 71). Washington, D.C.: U.S. Government Printing Office, 1978.

The Status of Pre-College Science, Mathematics, and Social Studies Educational Practices in U.S. Schools: An Overview and Summaries of Three Studies is a summary of the three studies, (a) the 1977 National Survey of Science, Mathematics and Social Studies Education conducted by the Research Triangle Institute of North Carolina; (b) Case Studies in Science Education conducted by the Center for Instructional Research and Curriculum Evaluation of the University of Illinois, and (c) The Status of Pre-College Science, Mathematics, and Social Science Education, 1955-75 (A Literature Review) conducted by the Center for Science and Mathematics Education, The Ohio State University. These studies were designed to assess the current status of pre college-science education in the United States.
