

Grégoire Allaire

Shape Optimization by the Homogenization Method

With 54 Illustrations

Springer

Contents

Preface	v
Notation	xi
1 Homogenization	1
1.1 Introduction to Periodic Homogenization	2
1.1.1 A Model Problem in Conductivity	3
1.1.2 Two-scale Asymptotic Expansions	6
1.1.3 Variational Characterizations and Estimates of the Effective Tensor	9
1.1.4 Generalization to the Elasticity System	11
1.2 Definition of H -convergence	15
1.2.1 Some Results on Weak Convergence	15
1.2.2 Problem Statement	19
1.2.3 The One-dimensional Case	22
1.2.4 Main Results	25
1.3 Proofs and Further Results	31
1.3.1 Tartar's Method	31
1.3.2 G -convergence	43
1.3.3 Homogenization of Eigenvalue Problems	50
1.3.4 A Justification of Periodic Homogenization	55
1.3.5 Homogenization of Laminated Structures	63
1.3.6 Corrector Results	71
1.4 Generalization to the Elasticity System	77
1.4.1 Problem Statement	77
1.4.2 H -convergence	79
1.4.3 Lamination Formulas	83

2	The Mathematical Modeling of Composite Materials	91
2.1	Homogenized Properties of Composite Materials	92
2.1.1	Modeling of Composite Materials	92
2.1.2	The G -closure Problem	94
2.2	Conductivity	102
2.2.1	Laminated Composites	102
2.2.2	Hashin-Shtrikman Bounds	107
2.2.3	G -closure of Two Isotropic Phases	120
2.3	Elasticity	126
2.3.1	Laminated Composites	126
2.3.2	Hashin-Shtrikman Energy Bounds	138
2.3.3	Toward G -closure	162
2.3.4	An Explicit Optimal Bound for Shape Optimization	165
3	Optimal Design in Conductivity	189
3.1	Setting of Optimal Shape Design	190
3.1.1	Definition of a Model Problem	191
3.1.2	A first Mathematical Analysis	195
3.1.3	Multiple State Equations	199
3.1.4	Shape Optimization as a Degeneracy Limit	201
3.1.5	Counterexample to the Existence of Optimal Designs	206
3.2	Relaxation by the Homogenization Method	211
3.2.1	Existence of Generalized Designs	211
3.2.2	Optimality Conditions	216
3.2.3	Multiple State Equations	225
3.2.4	Gradient of the Objective Function	231
3.2.5	Self-adjoint Problems	233
3.2.6	Counterexample to the Uniqueness of Optimal Designs	244
4	Optimal Design in Elasticity	259
4.1	Two-phase Optimal Design	261
4.1.1	The Original Problem	261
4.1.2	Counterexample to the Existence of Optimal Designs	267
4.1.3	Relaxed Formulation of the Problem	274
4.1.4	Compliance Optimization	277

4.1.5	Counterexample to the Uniqueness of Optimal Designs	296
4.1.6	Eigenfrequency Optimization	306
4.2	Shape Optimization	316
4.2.1	Compliance Shape Optimization	317
4.2.2	The Relaxation Process	321
4.2.3	Link with the Michell Truss Theory	336
5	Numerical Algorithms	343
5.1	Algorithms for Optimal Design in Conductivity	345
5.1.1	Optimality Criteria Method	346
5.1.2	Gradient Method	349
5.1.3	A Convergence Proof	351
5.1.4	Numerical Examples	356
5.2	Algorithms for Structural Optimization	358
5.2.1	Compliance Optimization	360
5.2.2	Numerical Examples	368
5.2.3	Technical Algorithmic Issues	372
5.2.4	Penalization of Intermediate Densities	381
5.2.5	Quasiconvexification versus Convexification	385
5.2.6	Multiple Loads Optimization	394
5.2.7	Eigenfrequency Optimization	401
5.2.8	Partial Relaxation	413
	Index	453
