SOME COMPLETELY MONOTONIC FUNCTIONS INVOLVING THE GAMMA AND POLYGAMMA FUNCTIONS

FENG QI, BAI-NI GUO, AND CHAO-PING CHEN

ABSTRACT. The function $\frac{[\Gamma(x+1)]^{1/x}}{x} (1 + \frac{1}{x})^x$ is strictly logarithmically completely monotonic in $(0, \infty)$. The function $\psi''(x+2) + \frac{1+x^2}{x^2(1+x)^2}$ is strictly completely monotonic in $(0, \infty)$.

1. INTRODUCTION

It is well known that the gamma function $\Gamma(z)$ is defined for $\operatorname{Re} z > 0$ as

$$\Gamma(z) = \int_0^{\infty} t^{z-1} e^{-t} dt. \quad (1)$$

The psi or digamma function $\psi(x) = \frac{\Gamma'(x)}{\Gamma(x)}$, the logarithmic derivative of the gamma function, and the polygamma functions can be expressed for $x > 0$ and $k \in \mathbb{N}$ as

$$\psi(x) = -\gamma + \sum_{n=0}^{\infty} \left(\frac{1}{1+n} - \frac{1}{x+n} \right), \quad (2)$$

$$\psi^{(k)}(x) = (-1)^{k+1} k! \sum_{i=0}^{\infty} \frac{1}{(x+i)^{k+1}}, \quad (3)$$

$$\psi(x) = -\gamma + \int_0^{\infty} \frac{e^{-t} - e^{-xt}}{1 - e^{-t}} dt, \quad (4)$$

$$\psi^{(k)}(x) = (-1)^{k+1} \int_0^{\infty} \frac{t^k e^{-xt}}{1 - e^{-t}} dt, \quad (5)$$

where $\gamma = 0.57721566490153286 \dots$ is the Euler-Mascheroni constant.

This paper was typeset using $\mathcal{A}\mathcal{M}\mathcal{S}\text{-}\mathcal{L}\mathcal{A}\mathcal{T}\mathcal{E}\mathcal{X}$.

A function f is said to be completely monotonic on an interval I if f has derivatives of all orders on I which alternate successively in sign, that is

$$(-1)^n f^{(n)}(x) \geq 0 \quad (6)$$

for $x \in I$ and $n \geq 0$. If inequality (6) is strict for all $x \in I$ and for all $n \geq 0$, then f is said to be strictly completely monotonic.

For $x > 0$ and $s \geq 0$, we have

$$\frac{1}{(x+s)^n} = \frac{1}{(n-1)!} \int_0^\infty t^{n-1} e^{-(x+s)t} dt, \quad n \in \mathbb{N}. \quad (7)$$

A function f is said to be logarithmically completely monotonic on an interval I if its logarithm $\ln f$ satisfies

$$(-1)^k [\ln f(x)]^{(k)} \geq 0 \quad (8)$$

for $k \in \mathbb{N}$ on I . If inequality (8) is strict for all $x \in I$ and for all $k \in \mathbb{N}$, then f is said to be strictly logarithmically completely monotonic.

In [4] it is proved that a (strictly) logarithmically completely monotonic function is also (strictly) completely monotonic. But not conversely, since a convex function may not be logarithmically convex (see Remark. 1.16 at page 7 in [3]).

Completely monotonic functions have applications in many branches. For example, they play a role in potential theory, probability theory, physics, numerical and asymptotic analysis, and combinatorics. Some related references are listed in [1].

It is well known that the function $(1 + \frac{1}{x})^{-x}$ is strictly completely monotonic in $(0, \infty)$. In [1], it is proved that the function $(1 + \frac{a}{x})^{x+b} - e^a$ is completely monotonic with $x \in (0, \infty)$ if and only if $a \leq 2b$, where $a > 0$ and b are real numbers.

Among other things, the following completely monotonic properties are obtained in [4]: For $\alpha \leq 0$, the function $\frac{x^\alpha}{[\Gamma(x+1)]^{1/x}}$ is strictly completely monotonic in $(0, \infty)$. For $\alpha \geq 1$, the function $\frac{[\Gamma(x+1)]^{1/x}}{x^\alpha}$ is strictly completely monotonic in $(0, \infty)$.

In [2] the following two inequalities are presented: For $x \in (0, 1)$, we have

$$\frac{x}{[\Gamma(x+1)]^{1/x}} < \left(1 + \frac{1}{x}\right)^x < \frac{x+1}{[\Gamma(x+1)]^{1/x}}. \quad (9)$$

For $x \geq 1$,

$$\left(1 + \frac{1}{x}\right)^x \geq \frac{x+1}{[\Gamma(x+1)]^{1/x}}. \quad (10)$$

Equality in (10) occurs for $x = 1$.

It is easy to see that

$$\lim_{x \rightarrow \infty} \frac{[\Gamma(x+1)]^{1/x}}{x} \left(1 + \frac{1}{x}\right)^x = 1. \quad (11)$$

The main purpose of this paper is to give a strictly logarithmically completely monotonic property of the function $\frac{[\Gamma(x+1)]^{1/x}}{x} \left(1 + \frac{1}{x}\right)^x$ in $(0, \infty)$ as follows.

Theorem 1. *The function $\frac{[\Gamma(x+1)]^{1/x}}{x} \left(1 + \frac{1}{x}\right)^x$ is strictly logarithmically completely monotonic in $(0, \infty)$.*

As a direct consequence of the proof of Theorem 1, we have the following

Corollary 1. *The function*

$$\psi''(x) + \frac{x^4 + 5x^3 + 7x^2 + 7x + 2}{x^3(x+1)^3} = \psi''(x+2) + \frac{1+x^2}{x^2(1+x)^2} \quad (12)$$

is strictly completely monotonic in $(0, \infty)$.

2. PROOF OF THEOREM 1

Define

$$F(x) = \frac{[\Gamma(x+1)]^{1/x}}{x^c} \left(1 + \frac{a}{x}\right)^{x+b} \quad (13)$$

for $x > 0$ and some fixed real numbers a , b and c .

Taking the logarithm of $F(x)$ defined by (13) and differentiating yields

$$\ln F(x) = (x+b) \ln\left(1 + \frac{a}{x}\right) + \frac{\ln \Gamma(x+1)}{x} - c \ln x, \quad (14)$$

$$[\ln F(x)]' = \ln\left(1 + \frac{a}{x}\right) - \frac{a(x+b)}{x(x+a)} + \frac{x\psi(x+1) - \ln \Gamma(x+1)}{x^2} - \frac{c}{x}, \quad (15)$$

and

$$\begin{aligned} [\ln F(x)]^{(n)} &= (-1)^{n-1} (n-1)! (x+b) \left[\frac{1}{(x+a)^n} - \frac{1}{x^n} \right] \\ &\quad + (-1)^n (n-2)! n \left[\frac{1}{(x+a)^{n-1}} - \frac{1}{x^{n-1}} \right] \\ &\quad + \frac{h_n(x)}{x^{n+1}} + (-1)^n (n-1)! \frac{c}{x^n} \end{aligned}$$

$$= (-1)^n (n-2)! \left[\frac{(n-1)(b+c) - x}{x^n} + \frac{x + na - (n-1)b}{(x+a)^n} \right] + \frac{h_n(x)}{x^{n+1}}, \quad (16)$$

where $n \geq 2$, $\psi^{(-1)}(x+1) = \ln \Gamma(x+1)$, $\psi^{(0)}(x+1) = \psi(x+1)$, and

$$h_n(x) = \sum_{k=0}^n \frac{(-1)^{n-k} n! x^k \psi^{(k-1)}(x+1)}{k!}, \quad (17)$$

$$h'_n(x) = x^n \psi^{(n)}(x+1) \begin{cases} > 0, & \text{if } n \text{ is odd,} \\ < 0, & \text{if } n \text{ is even.} \end{cases} \quad (18)$$

Therefore, we have

$$\begin{aligned} & (-1)^n x^{n+1} [\ln F(x)]^{(n)} \\ &= (n-2)! \left\{ (n-1)(b+c) - x + \frac{x^n [x + na - (n-1)b]}{(x+a)^n} \right\} x + (-1)^n h_n(x) \end{aligned} \quad (19)$$

and

$$\begin{aligned} & \frac{d\{(-1)^n x^{n+1} [\ln F(x)]^{(n)}\}}{dx} \\ &= (-1)^n x^n \psi^{(n)}(x+1) + (n-2)! \left\{ (n-1)(b+c) - 2x \right. \\ & \quad \left. + \frac{x^n [a(b+an+an^2 - bn^2) + (2a+b+2an-bn)x + 2x^2]}{(x+a)^{n+1}} \right\} \\ &= x^n \left\{ (-1)^n \psi^{(n)}(x+1) + (n-2)! \left[\frac{(n-1)(b+c) - 2x}{x^n} \right. \right. \\ & \quad \left. \left. + \frac{a(b+an+an^2 - bn^2) + (2a+b+2an-bn)x + 2x^2}{(x+a)^{n+1}} \right] \right\} \\ &= x^n \left\{ (-1)^n \psi^{(n)}(x) + \frac{n!}{x^{n+1}} + (n-2)! \left[\frac{(n-1)(b+c) - 2x}{x^n} \right. \right. \\ & \quad \left. \left. + \frac{a(b+an+an^2 - bn^2) + (2a+b+2an-bn)x + 2x^2}{(x+a)^{n+1}} \right] \right\}. \end{aligned}$$

By letting $a = c = 1$ and $b = 0$, we have

$$\begin{aligned} & \frac{d\{(-1)^n x^{n+1} [\ln F(x)]^{(n)}\}}{dx} = x^n \left\{ (-1)^n \psi^{(n)}(x) + \frac{n!}{x^{n+1}} \right. \\ & \quad \left. + (n-2)! \left[\frac{n-1-2x}{x^n} + \frac{n(n+1) + 2(n+1)x + 2x^2}{(x+1)^{n+1}} \right] \right\} \\ &= x^n \left\{ (-1)^n \psi^{(n)}(x) + (n-2)! \left[\frac{n(n-1) + (n-1)x - 2x^2}{x^{n+1}} \right. \right. \\ & \quad \left. \left. + \frac{n(n+1) + 2(n+1)x + 2x^2}{(x+1)^{n+1}} \right] \right\} \end{aligned}$$

$$\triangleq x^n \{(-1)^n \psi^{(n)}(x) + (n-2)!g_n(x) + (n-2)!h_n(x)\}.$$

By induction, it follows that

$$g'_n(x) = -(n-1)g_{n+1}(x) \quad \text{and} \quad h'_n(x) = -(n-1)h_{n+1}(x), \quad (20)$$

this implies

$$g_2^{(n-2)}(x) = (-1)^n (n-2)!g_n(x) \quad \text{and} \quad h_2^{(n-2)}(x) = (-1)^n (n-2)!h_n(x), \quad (21)$$

therefore

$$\frac{d\{(-1)^n x^{n+1} [\ln F(x)]^{(n)}\}}{dx} = (-1)^n x^n [\psi''(x) + g_2(x) + h_2(x)]^{(n-2)}. \quad (22)$$

From formulas (3), (5) and (7), for $x \in (0, \infty)$ and any nonnegative integer i , we have

$$\begin{aligned} \phi(x) &\triangleq \psi''(x) + g_2(x) + h_2(x) \\ &= \psi''(x) + \frac{2+x-2x^2}{x^3} + \frac{2(3+3x+x^2)}{(x+1)^3} \\ &= \psi''(x) + \frac{x^4+5x^3+7x^2+7x+2}{x^3(x+1)^3} \\ &= \psi''(x) + \frac{2}{x^3} + \frac{1}{x^2} - \frac{2}{x} + \frac{2}{(1+x)^3} + \frac{2}{(1+x)^2} + \frac{2}{1+x} \\ &= \frac{1}{x^2} - \frac{2}{x} + \frac{2}{(1+x)^2} + \frac{2}{1+x} - 2 \sum_{i=2}^{\infty} \frac{1}{(x+i)^3} \\ &= \psi''(x+2) + \frac{1}{x^2} - \frac{2}{x} + \frac{2}{(1+x)^2} + \frac{2}{1+x} \\ &= \psi''(x+2) + \frac{1+x^2}{x^2(1+x)^2} \\ &= \int_0^{\infty} t e^{-xt} dt - 2 \int_0^{\infty} e^{-xt} dt + 2 \int_0^{\infty} t e^{-(x+1)t} dt \\ &\quad + 2 \int_0^{\infty} e^{-(x+1)t} dt - \int_0^{\infty} \frac{t^2 e^{-(x+2)t}}{1-e^{-t}} dt \\ &= \int_0^{\infty} [t-2+(t+4)e^{-t} - (t^2+2t+2)e^{-2t}] e^{-xt} dt \\ &\triangleq \int_0^{\infty} q(t) e^{-xt} dt, \\ \phi^{(i)}(x) &= (-1)^i \int_0^{\infty} q(t) t^i e^{-xt} dt, \end{aligned}$$

and

$$\begin{aligned}
q'(t) &= (2 + 2t + 2t^2 - 3e^t + e^{2t} - te^t)e^{-2t} \\
&\triangleq p(t)e^{-2t}, \\
p'(t) &= 2 + 4t - 4e^t + 2e^{2t} - te^t, \\
p''(t) &= 4 - 5e^t + 4e^{2t} - te^t, \\
p'''(t) &= (8e^t - t - 6)e^t \\
&> 0.
\end{aligned}$$

Hence, $p''(t)$ increases in $(0, \infty)$. Since $p''(0) = 3 > 0$, we have $p''(t) > 0$ and $p'(t)$ is increasing. Because of $p'(0) = 0$, it follows that $p'(t) > 0$ in $(0, \infty)$, and then $p(t)$ is increasing. From $p(0) = 0$, it is deduced that $p(t) > 0$ and $q'(t) > 0$ in $(0, \infty)$, then $q(t)$ increases. As a result of $q(0) = 0$, we obtain $q(t) > 0$ in $(0, \infty)$. Therefore, we have $\phi(x) > 0$ in $(0, \infty)$, and then for all nonnegative integer i , we have $(-1)^i \phi^{(i)}(x) > 0$ in $(0, \infty)$. This means that the function $\psi''(x) + g_2(x) + h_2(x)$ is strictly completely monotonic on $(0, \infty)$.

Thus the function $(-1)^n x^{n+1} [\ln F(x)]^{(n)}$ is increasing in $x \in (0, \infty)$. Since

$$\lim_{x \rightarrow 0} \{(-1)^n x^{n+1} [\ln F(x)]^{(n)}\} = 0,$$

we have $(-1)^n x^{n+1} [\ln F(x)]^{(n)} > 0$, then $(-1)^n [\ln F(x)]^{(n)} > 0$ for $n \geq 2$ in $(0, \infty)$. Since $[\ln F(x)]'' > 0$, the function $[\ln F(x)]'$ is increasing. It is not difficult to obtain $\lim_{x \rightarrow \infty} [\ln F(x)]' = 0$, so $[\ln F(x)]' < 0$ and $\ln F(x)$ is decreasing in $(0, \infty)$. In conclusion, the function $\ln F(x)$ is strictly completely monotonic in $(0, \infty)$. The proof is complete.

3. AN OPEN PROBLEM

Open Problem. *Under what conditions on a , b and c the function $F(x)$ defined by (13) is strictly logarithmically completely monotonic in $(0, \infty)$?*
