# Some Fused/Isolated Heterocyclic of Pyrimidine, $\boldsymbol{\beta}$-Lactam, Thiazolidine and Triazine Derivatives 

H.A. Soleiman ${ }^{*}$

Chemistry Department, Aswan Faculty of Science, South Valley University, Aswan, Egypt

#### Abstract

Fused/isolated heterocyclic of pyrimidine $\beta$-lactam, thiazolidine and triazine derivatives incorporating benzpyrimidine derivatives have been synthesized by different method reactions (cycloaddition reaction, condensation reaction and cyclocondensation elimination reaction) of cinnamonitrile, aromatic aldehydes, chloroacetyl chloride, thioglycolic acid and nitroso compounds, respectively.

Keywords: Benzpyrimidine, pyrimidine, $\beta$-lactam, thiazolidine, triazine.

## INTRODUCTION

Fused pyrrole, triazole and isolated $\beta$-lactams, thiazolidinones incorporating benzpyrimidines show a wide spectrum of biological activities and have been exhaustively reviewed, the synthesis of various types of benzpyrimidine which shows a wide range of biological activities. A rapid progress in the work on fused and isolated benzpyrimidines has given rise to a number of compounds exhibiting potent pharmacological actions like adenosine kinase inhibitory activity [1-3] and antibacterial [4]. In our pervious work we reported the synthesis 3-hydroxy-2-methyl quinazoline-4one and benzpyrid-4-one-2-oxime [5, 6], however a different approach was undertaken in the present one. This basically consists in the reaction of hydrazine hydrate with 2methylbenzoxazinone in order to obtain 3-amino-2-methyl benzpyrimidine-4-one (1). Examples of natural nitrogen heterocyclic are Rutaecararpine which possesses intrinsic diuretic, uterotonic and hypertensive [7] and Luotonine A3 which exhibits antitumor activity [8]. These natural compounds contain benzpyrimidine nuclei [9].

## RESULTS AND DISCUSSION

A fusion of equimolar amounts of hydrazine hydrate and 2-methyl benzpyrimidin-4-one were refluxed for half an hour. After the reaction mixture was cooled precipitates was formed, wash by water and crystallized from water to give 3-amino-2-methyl benzpyrimidin-4-one (1). The structure of compound 1 was confirmed by elemental analysis (c.f. Table 1) and the IR spectrum $(\gamma \mathrm{KBr})$ showed general absorption bands at $3370-3300 \mathrm{~cm}^{-1}\left(\gamma \mathrm{C}-\mathrm{NH}_{2}\right)$ and at $1686 \mathrm{~cm}^{-1}$ $(\gamma \mathrm{C}=\mathrm{O})$ ) ${ }^{1} \mathrm{H}$ NMR spectrum (DMSO) [10] of compound 1 showed signals at $\delta 11.05 \mathrm{ppm}\left(\mathrm{br}, 2 \mathrm{H}, \mathrm{NH}_{2}\right), 8.4-6.8 \mathrm{ppm}$ ( $\mathrm{m}, 4 \mathrm{H}, \mathrm{ArH}^{+}$), $1.9 \mathrm{ppm}\left(\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$, (c.f. Table 2). The mass spectrum [11] of compound 1 confirmed a molecular formula $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{~N}_{3} \mathrm{O}$ agree with a molecular ion peaks at $\mathrm{m} / \mathrm{z}=$ 175 and base peak at $\mathrm{m} / \mathrm{z}=117$, (Equation 1).

[^0]3-Amino2-methyl benzpyrimidin-4-one (1) was added to double bond in cinnamonitrile in refluxing ethanol as solvent and few drops of piperidine to yield corresponding pyrido benzpyrimidine derivatives (2a-d), (Equation 2).

The first step in the previous mechanism involves formation of carbanion (a) using piperidine as catalyst which abstract a proton from active methyl group, accordingly it was added itself on the cinnamonitrile compound forming intermediate compound (b) uptake a proton from the piperidinium ion and lose a mole of hydrogen and hydrogen cyanide to produce the compound 2 a -d.

The structure of compound $2 \mathrm{a}-\mathrm{d}$ was confirmed by elemental analysis (c.f. Table 1) and the IR spectrum ( $\gamma \mathrm{KBr}$ ) showed general absorption bands at $3400-3200 \mathrm{~cm}^{-1}(\gamma \mathrm{C}-$ $\left.\mathrm{NH}_{2}\right), 2220 \mathrm{~cm}^{-1}(\gamma \mathrm{C} \equiv \mathrm{N})$ and at $1660 \mathrm{~cm}-1(\gamma \mathrm{C}=\mathrm{O}) .{ }^{1} \mathrm{H}$ NMR spectrum (DMSO) [10] of compound $2 \mathrm{a}-\mathrm{d}$ showed signals at $\delta 9\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{NH}_{2}\right), 8.5-7\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ar}-\mathrm{H}^{+}+\mathrm{CH}\right.$ olefin), $5(\mathrm{~s}, 2 \mathrm{H}$, $\left.\mathrm{NH}_{2}\right) ; 9\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{NH}_{2}\right), 8.5-7\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ar}-\mathrm{H}^{+}\right), 2.6\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$, $1.3\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ; 9\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{NH}_{2}\right), 8.5-7\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ar}-\mathrm{H}^{+}\right), 5(\mathrm{~s}$, $\left.2 \mathrm{H}, \mathrm{NH}_{2}\right), 1.7\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ; 9\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{NH}_{2}\right), 8.5-7(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ar}-$ $\left.\mathrm{H}^{+}\right), 2.5\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.2\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.5\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$, (c.f. Table 2).

The mass spectrum [11] of compound $2 \mathrm{a}-\mathrm{d}$ confirmed a molecular formula agrees with a molecular ion peaks (c.f. Table 2). The high resolutions of mass spectrum of compound 2 b as example confirmed a molecular formula $\mathrm{C}_{21} \mathrm{H}_{18} \mathrm{~N}_{4} \mathrm{O}_{2}$ agrees with a molecular ion peaks at $\mathrm{m} / \mathrm{z}=358$ $(M=2)$ and base peak at $m / z=303$.

The amino benzpyrimidine derivatives 1 were condensed with different aromatic aldehydes in ethanol under piperidine as catalyst to yield the corresponding Schiff base derivatives 3a-e [12], (Equation 3).

The first step in the previous mechanism involves formation of carbanion (a) using piperidine as catalyst, which abstract a proton from the active hydrogen center, accordingly it was added itself on the polarized aromatic aldehyde compounds forming the intermediate compound (b) uptake a proton from the piperidium ion forming compound (c). The latter compound (c) loses a mole of water to produce

(b)

(c)
equation 3

The mass spectrum [11] of compound 3a-e confirmed a molecular formula agrees with a molecular ion peaks (c.f. Table 2). The mass spectrum of compound $2 b$ as example confirmed a molecular formula $\mathrm{C}_{16} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{2}$ agrees with a molecular ion peaks at $\mathrm{m} / \mathrm{z}=279$ and base peak at $\mathrm{m} / \mathrm{z}=$ 160. The structure (b) was preferred over possible (a) base on the mass fragmentation with revealed base peak at $\mathrm{m} / \mathrm{z}=$ 160, (Equation 4).

The reaction of Schiff base derivatives 3a-c with equimolar ratios of chloroacetyl chloride afforded isolated $\beta$ -
lactam derivatives 4a-e [13] (general scheme). The cycloaddition proceeded smoothly of dioxane in the presence of triethylamine catalyst. The reaction of compound 2 with chloroacetyl chloride proceeded through $[2+2]$ cycloaddition, the reactions are presented as follows, (Equation 5).

Structure (b) was preferred over possible (a) based on ${ }^{1} \mathrm{H}$ NMR which revealed proton b-lactam nuclei appeared at $\delta=$ 4 ppm . The more stable product formed according to the following mechanism, (c.f. Equation 6).

equation 4

$\mathrm{ClCOCH}_{2} \mathrm{Cl}$

Or

(b)

$\mathrm{ClCOCH}_{2} \mathrm{Cl}$

equation 6

The structure of compound $4 a-e$ was confirmed by elemental analysis (c.f. Table 1) and spectral analysis. Thus, the IR spectrum ( $\gamma \mathrm{KBr}$ ) showed general absorption bands at $3350-3300 \mathrm{~cm}^{-1}\left(\gamma \mathrm{NH}_{2}, \mathrm{OH}\right)$, and at $1750 \mathrm{~cm}-1(\gamma \mathrm{C}=\mathrm{O}) .{ }^{1} \mathrm{H}$ NMR spectrum (DMSO) [10] of compound 4a-e showed signals at $\delta 8.2-6.8\left(\mathrm{~m}, 9 \mathrm{H}, \mathrm{Ar}-\mathrm{H}^{+}\right), 3.6(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}), 3.4(\mathrm{~d}$, $1 \mathrm{H}, \mathrm{CH}) 1.5\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ; 9.5(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 8.6-7(\mathrm{~m}, 8 \mathrm{H}, \mathrm{Ar}-$ $\left.\mathrm{H}^{+}\right), 3.6(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}), 3.4(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}) 1.9\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ; 8.5-$ $7\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{Ar}-\mathrm{H}^{+}\right), 3.6(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}), 3.4(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}) 1.6(\mathrm{~s}, 3 \mathrm{H}$, $\left.\mathrm{CH}_{3}\right) ; 8.5-7\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{Ar}-\mathrm{H}^{+}\right), 6.5(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}), 3.3\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$, $2.2\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 1.6\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ; 8-7\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{Ar}-\mathrm{H}^{+}\right)$, 6.5(s, 1H, CH), 3.6(s, 2H, CH2), 3.4(s, 3H, OCH 3 ), $1.9(\mathrm{~s}, 3 \mathrm{H}$, $\mathrm{CH}_{3}$ ), (c.f. Table 2). The mass spectrum [11] of compound 4a-e confirmed a molecular formula agree with a molecular ion peaks (c.f. Table 2).

Cycloaddition reaction of thioglycolic acid to the previously prepared Schiff base compound 3a-e proceeded successfully, afforded thiazolidinone derivatives 5a-e [13] as fellow, (Equation 7).

The cycloaddition reaction was assumed to go through the following suggested mechanism, (Equation 8).

The structure of compound 5a-e was confirmed by elemental analysis (c.f. Table 1) and spectral analysis. Thus, the IR spectrum $(\gamma \mathrm{KBr})$ showed general absorption bands at $3320 \mathrm{~cm}-1 \quad(\gamma \mathrm{OH})$ and at $1720 \mathrm{~cm}-1 \quad(\gamma \mathrm{C}=\mathrm{O}) .{ }^{1} \mathrm{H}$ NMR spectrum (DMSO) [10] of compound $5 \mathrm{a}-\mathrm{c}$ showed signals at $\delta 8-6.7\left(\mathrm{~m}, 9 \mathrm{H}, \mathrm{Ar}-\mathrm{H}^{+}\right), 6.5(\mathrm{~d}, 1 \mathrm{H}, \mathrm{CH}), 3.2\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$ $1.5\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ; 9.7(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 8.5-7\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{Ar}-\mathrm{H}^{+}\right), 6.5(\mathrm{~s}$, $1 \mathrm{H}, \mathrm{CH}), 3.2\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right) 1.9\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ; 8.3-6.8(\mathrm{~m}, 8 \mathrm{H}$, $\left.\mathrm{Ar}-\mathrm{H}^{+}\right), 6.5(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}), 3.4\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right) 1.7\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ; 8.5-$ $7\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{Ar}-\mathrm{H}^{+}\right), 6.5(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}), 3.3\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.2(\mathrm{~s}, 6 \mathrm{H}$, $\left.\mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 1.6\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ; 8-7\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{Ar}-\mathrm{H}^{+}\right), 6.5(\mathrm{~s}, 1 \mathrm{H}$, $\mathrm{CH}), 3.6\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 3.4\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 1.9\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$. (c.f. Table 2). The mass spectrum [11] of compound 5a-e confirmed a molecular formula agree with a molecular ion peaks (c.f. Table 2).

On the other hand, the condensed amino benzpyrimidine (1) with different nitroso compounds such a $\alpha$-nitroso- $\beta$ naphthol and $\beta$-nitroso- $\alpha$-naphthol gave triazino benzpyrimidine derivatives $6 \mathrm{a}, \mathrm{b}$, the structure of triazino compound derivatives ( $6 a, b$ ) was confirmed by elemental analysis (c.f. Table 1) and spectral analysis. Thus, the IR spectrum $(\gamma \mathrm{KBr})$ showed general absorption bands at 1700

$\mathrm{cm}-1 \quad(\gamma \mathrm{C}=\mathrm{O})$ and $1600 \mathrm{~cm}-1(\gamma \mathrm{C}=\mathrm{N}) .{ }^{1} \mathrm{H}$ NMR spectrum (DMSO) [10] of compound $6 \mathrm{a}, \mathrm{b}$ showed signals at $\delta 8-7$ (m, 10, $\mathrm{ArH}^{+}$) (c.f. Table 2). The mass spectrum [11] of compound $6 \mathrm{a}, \mathrm{b}$ confirmed a molecular formula agrees with a molecular ion peak at $\mathrm{m} / \mathrm{z}=299$.

## EXPERIMENTAL

All melting points were uncorrected. IR spectra were recorded on a Pye Unicam SP 1100 Spectrophotometer using KBr disc. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Varian EM 390 MHz spectrophotometer using $\mathrm{DMSO}_{6}$ as a solvent and TMS as an internal standard. Chemical shifts are expressed as ppm, units. Mass spectra were recorded on an HP Ms 6988 spectrometer. Analytical data were determined with a CE 440 Elemental Analyzer-Automatic Injector at Cairo University.

Synthesis of 3-Amino-2-Methylbenzpyrimidin-4-One (1)

## General Procedure

A mixture of 2-methyl benzpyrimidin-4-one ( $1.6 \mathrm{~g}, 0.01$ moles) and hydrazine hydrate ( $0.50 \mathrm{ml}, 0.01$ moles) were fused for half an hour. A pale yellow precipitate formed was washed several times with water. It was crystallized from water to give compound 1.

## Synthesis of Pyrido [1, 2-a] Benzpyrimidine Derivatives 2a-d

## General Procedure

Equimolar amounts of compound 1 and ylidene cinnamonitrile ( 0.01 moles) in ethanol $(50 \mathrm{ml})$ were treated with a few drops of piperidine. The reaction mixture was refluxed for 2 hours, then left to cool. The solid product so formed was separated by filtration and crystallized from ethanol to yield compound $2 \mathrm{a}-\mathrm{d}$.

## Synthesis of 3-Azarylbenzpyrimidine Derivatives 3a-e

## General Procedure

Compound $1(0.01 \mathrm{~mole})$ and aromatic aldehydes ( 0.01 mole) in equimolar ratio were dissolved in ethanol and few
drops of piperidine as catalyst were added, the reaction mixture was refluxed about 6-8 hours. The solid product so formed was separated by filtration and crystallized from ethanol to yield compound 3a-e.

## Synthesis of $\boldsymbol{\beta}$-Lactam Benzpyrimidine Derivatives 4a-e

## General Procedure

To a well stirred solution ( 0.01 mole) of base (3a-e) and ( 0.02 mole) of triethylamine in 100 mls of dry dioxane were added ( 0.02 mole) of monochloroacetyl chloride drop wise at room temperature. The mixture is stirred for extra 9 hours, and left at room temperature for 3 days. The formed precipitate (triethylamine hydrochloride) was filtered off, washed thoroughly with the same solvent (dioxane). The combined solvent and filtrate, washed thoroughly with dilute hydrochloric acid three times then water, then dried over anhydrous $\mathrm{MgSO}_{4}$. After filtration the solvent was evaporated under reduce pressure. The residue was collected and purified to yield compound 4a-e.

## Synthesis of Thiazolbenzpyrimidine Derivatives 5a-e

## General Procedure

A mixture of equimolecular amount of Schiff bases 3a-e ( 0.01 moles) and thioglycolic acid in 100 ml dry benzene was refluxed with water, and separated until the theoretical amount of water had been removed. The solid product so formed was collected and crystallized from ethanol to yield 5 a -е.

## Synthesis of Triazinobenzpyrimidine Derivatives 6a, b

## General Procedure

Equimolar amounts of compound 1 and $\alpha$-nitroso- $\beta$ naphthol or $\beta$-nitroso- $\alpha$-naphthol ( 0.01 moles) were dissolved in ethanol as organic solvent under a few drops of piperidine as catalyst. The reaction mixture was refluxed about 5-6 hours. The solid product so formed was separated by filtration and crystallized from ethanol to yield compound $6 \mathrm{a}, \mathrm{b}$.
