SOME NEW ALGORITHMS FOR HIGH-PRECISION COMPUTATION OF EULER'S CONSTANT

RICHARD P. BRENT AND EDWIN M. MCMILLAN

Abstract

We describe several new algorithms for the high-precision computation of Euler's constant $\gamma = 0.577\ldots$. Using one of the algorithms, which is based on an identity involving Bessel functions, γ has been computed to 30,100 decimal places. By computing their regular continued fractions, we show that, if γ or $\exp(\gamma)$ is of the form P/Q for integers P and Q, then $|Q| > 10^{15000}$.

Comments

Only the Abstract is given here. The full paper appeared as [2]. For earlier work, see [1]. An interesting connection with the work of Ramanujan is described in [3].
