**Spin-enhanced Magnetocaloric Effect in Molecular Nanomagnets**

MARCO EVANGELISTI, ANDREA CANDINI, ALBERTO GHIRRI, MARCO AFFRONTI, INFN-S3 National Research Center, Italy, EUAN K. BRECHIN, University of Edinburgh, United Kingdom, ERIC J.L. MCINNES, University of Manchester, United Kingdom — Unprecedentedly large magnetocaloric effect for the temperature region below 10 K is found for the  $\text{Fe}_{14}$  molecular nanomagnet [Angew. Chem. Int. Ed. **42**, 3781 (2003)]. We show that this comes out from a combination of several features, such as the spin ground-state that amounting to  $S = 25$  is amongst the highest ever reported, and the highly symmetric cluster core that results in small cluster magnetic anisotropy. The latter enables the occurrence of long-range magnetic order below  $T_N = 1.87$  K, probably of antiferromagnetic nature. We also show that low-lying excited  $S$  states additionally enhance the MCE of  $\text{Fe}_{14}$ . For these reasons,  $\text{Fe}_{14}$  has therefore high potentiality to work as low-temperature magnetic refrigerant.
