The National Center for Education Statistics (NCES) is the primary federal entity for collecting, analyzing, and reporting data related to education in the United States and other nations. It fulfills a congressional mandate to collect, collate, analyze, and report full and complete statistics on the condition of education in the United States; conduct and publish reports and specialized analyses of the meaning and significance of such statistics; assist state and local education agencies in improving their statistical systems; and review and report on education activities in foreign countries.

NCES activities are designed to address high-priority education data needs; provide consistent, reliable, complete, and accurate indicators of education status and trends; and report timely, useful, and high-quality data to the U.S. Department of Education, the Congress, the states, other education policymakers, practitioners, data users, and the general public. Unless specifically noted, all information contained herein is in the public domain.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of audiences. You, as our customer, are the best judge of our success in communicating information effectively. If you have any comments or suggestions about this or any other NCES product or report, we would like to hear from you. Please direct your comments to

## Highlights

In 2006, NCES released a new classification system to make the reporting of locale data consistent across its various surveys and to be more precise in its classification of rural areas. This report brings together data from NCES and Census surveys and applies the new classification system to create a series of indicators on the status of education in rural America. The data used in these indicators are drawn from the most recent versions of NCES's Common Core of Data (CCD), Schools and Staffing Survey (SASS), National Assessment of Educational Progress (NAEP), National Household Education Surveys Program (NHES), the Fast Response Survey System (FRSS), and Census Bureau's American Community Survey (ACS). Additional information on the methodology and the datasets used in this report can be found in appendix B. More detailed information on the new NCES urban-centric locale classification system can be found in the preceding section, "Measuring Rural Education."

The main findings of this report are summarized below, by chapter:

## Demographics

- In 2003-04, over half of all operating school districts and one-third of all public schools were in rural areas; yet only one-fifth of all
public school students were enrolled in rural schools. (Indicator 1.1)
- In 2003-04, a larger percentage of public school students in rural areas ( 10 percent) attended very small schools (schools with fewer than 200 students) than public school students in towns (3 percent), suburbs ( 1 percent), or cities ( 1 percent). (Indicator 1.2)
- The percentage of White public school students in rural areas was larger than that in any other locale. The same was true for American Indian/Alaska Native public school students. However, the percentages of public school students in rural areas who were Black, Hispanic, and Asian/Pacific Islander were smaller than those in any other locale. (Indicator 1.3)
- A larger percentage of public school students in the South and the Midwest were enrolled in rural schools ( 28 and 25 percent, respectively) than in the Northeast and the West (16 and 13 percent, respectively) in 2003-04. (Indicator 1.4)
- In 2005, about 50 percent of children in rural areas between the ages of 3 and 5 at-
tended a center-based preprimary program, such as a daycare center, Head Start program, preschool, nursery school, or prekindergarten. This was less than the national rate ( 57 percent). (Indicator 1.5)
- In 2003-04, about 6 percent of rural students were enrolled in private schools, which was less than the national rate (11 percent). (Indicator 1.6)
- In 2004, the percentage of children living in poverty or below 185 percent of the poverty threshold in rural areas ( 35 percent) was smaller than that in towns ( 46 percent) or cities ( 47 percent), but larger than that in suburban areas (28 percent). (Indicator 1.7)
- Rural public schools overall had a smaller percentage of students eligible for free or re-duced-price lunch in 2003-04 ( 38 percent) than public schools in cities and towns ( 53 and 43 percent, respectively). The percentage of public school students in rural remote areas attending a moderate-to-high poverty school ( 45 percent) was higher than the percentages in all other locales except large and midsize cities ( 66 and 49 percent). (Indicator 1.8)
- In 2003-04, larger percentages of Black and American Indian/Alaska Native public school students in remote rural areas attended moderate-to-high poverty schools ( 87 and 79 percent, respectively) than in large cities ( 78 and 62 percent, respectively). (Indicator 1.9)
- A smaller percentage of public school students in rural areas were identified as limited English proficient (LEP) than in any other locale in 2003-04 (2 vs. 5-14 percent). (Indicator 1.10)
- There was little variation between the percentage of public school students with an Individual Education Program (IEP) in rural areas (13 percent) and the percentages in other locales (12-14 percent) in 2003-04. (Indicator 1.11)
- In 2003, greater percentages of students in rural areas than students in cities had parents who attended a school event ( 74 vs . 65 percent) or served as a volunteer or on
a committee ( 42 vs. 38 percent). In addition, a larger percentage of students in rural areas had parents who reported taking their children to an athletic event outside of school than students in cities and suburbs ( 42 vs. 34 and 38 percent, respectively). (Indicators 1.12 and 1.13)
- In 2004, the percentages of school-age children in rural areas with a mother or father whose highest educational attainment was a high school diploma ( 33 and 36 percent, respectively) were higher than the comparable percentages for children in cities ( 26 and 24 percent, respectively) and suburbs ( 25 and 24 percent respectively). (Indicator 1.14)
- In all locales a larger percentage of high school students in 2003 had parents who expected their child's highest educational attainment to be a bachelor's degree than any other level of attainment. The percentage of rural students whose parents expected their highest educational attainment to be less than a bachelor's degree ( 42 percent) was larger than the percentages of students in cities and suburban areas ( 30 and 25 percent, respectively). (Indicator 1.15)

## Outcomes

- A larger percentage of rural public school students in the 4th- and 8th-grades in 2005 scored at or above the Proficient level on the National Assessment of Educational Progress (NAEP) reading, mathematics, and science assessments than did public school students in cities at these grade levels. However, smaller percentages of rural public school students than suburban public school students scored at or above the Proficient level in reading and mathematics. (Indicators 2.1-2.3)
- In 2004, the high school status dropout rate among 16 - to 24 -year-olds in rural areas ( 11 percent) was higher than in suburban areas ( 9 percent), but lower than in cities ( 13 percent). (Indicator 2.4)
- The averaged freshman graduation rate for public high school students was higher during the 2002-03 school year in rural areas ( 75 percent) than in cities ( 65 percent), but lower than in towns and suburban areas (76 and 79 percent, respectively). (Indicator 2.5)
- A larger percentage of teenagers in rural areas than in suburban areas were neither enrolled in school nor employed in 2004 (6 vs. 4 percent). (Indicator 2.6)
- College enrollment rates for both 18 - to 24 -year olds and 25 - to 29 -year olds were generally lower in rural areas than in all other locales in 2004. (Indicator 2.7)
- A smaller percentage of rural adults than suburban adults in 2005 took work-related courses ( 24 vs. 30 percent) or courses for personal interest ( 18 vs. 23 percent), and a smaller percentage of rural adults than adults in cities and suburban areas participated in part-time college or university credential programs ( 3 vs. 6 percent each). (Indicator 2.8)
- The percentage of adults with a bachelor's degree as their highest level of educational attainment in 2004 was lower in rural areas (13 percent) than the national percentage (17 percent). (Indicator 2.9)
- Regardless of educational attainment, persons in rural areas generally had higher median earnings in 2004 than those in cities and towns (when adjusted to reflect regional cost differences), but lower median earnings than those in suburban areas. (Indicator 2.10)
- The unemployment rate for adults ages 25 to 34 was lower in rural areas ( 6.7 percent) than in cities ( 8.0 percent) and towns ( 8.3 percent), and the unemployment rate for adults ages 35 to 64 was lower in rural areas ( 4.5 percent) than in all other locales (4.8-6.4 percent). (Indicator 2.11)

## Resources for public schools

- Rural public schools tended to receive a smaller percentage of their revenues in 2003-04 from federal sources (9 percent) than city public schools (11 percent), but a larger percentage than suburban public schools (6 percent). (Indicator 3.1)
- Adjusted current public school expenditures per student were higher in rural areas in 2003-04 ( $\$ 8,400$ ) than in cities $(\$ 8,100)$, suburbs ( $\$ 7,900$ each), and towns ( $\$ 8,400$ ). (Indicator 3.2)
- In rural areas, as well as nationally, a larger percentage of public schools reported being underenrolled ( 69 percent of rural schools) than overenrolled (13 percent of rural schools) in fall 2005. The percentage of public schools reporting severe underenrollment in rural areas ( 33 percent) was greater than in all other locales (12-18 percent). (Indicator 3.3)
- In 2002-03, the percentage of public high school students attending schools offering dual credit courses was similar in rural areas ( 76 percent) to the percentages in cities and suburbs, while the percentage of public high school students attending schools offering Advanced Placement and International Baccalaureate courses or programs was lower in rural areas ( 69 and 1 percent, respectively) than in cities ( 93 and 8 percent) and suburbs (96 and 7 percent). (Indicator 3.4)
- The number of public school students per instructional computer with Internet access in school was lower in rural areas ( 3.0 to 1 ) in 2005 than in suburban ( 4.3 to 1) and city (4.2 to 1) schools. (Indicator 3.5)
- Rural public schools generally had fewer pupils per teacher (15.3) than public schools in other locales (15.9-16.9) in 2003-04. (Indicator 3.6 )
- Racial/ethnic minorities account for a smaller percentage of public school teachers in rural schools ( 8 percent) than in schools in all other locales (12-29 percent) in 2003-04. (Indicator 3.7)
- In 2003-04, teachers in rural public schools averaged more years of experience ( 14.5 years) than teachers in city public schools (13.6 years). (Indicator 3.8)
- In general, smaller percentages of public school teachers in rural areas than across the nation as a whole reported problems as "serious" and behavioral problems as frequent (occurring at least once a week) in their schools in 2003-04. (Indicator 3.9)
- Generally, a larger percentage of public school teachers in rural areas than in other locales reported being satisfied with the teaching conditions in their school in 2003-04, though a smaller percentage of
rural public school teachers than suburban public school teachers reported being satisfied with their salary. (Indicator 3.9)
- Public school teachers in rural areas earned less ( $\$ 43,000$ ), on average, in 2003-04 than their peers in towns ( $\$ 45,900$ ), suburbs ( $\$ 45,700$ ), and cities ( $\$ 44,000$ ), even after adjusting for geographic cost differences. (Indicator 3.10)
- In 2003-04, public schools in rural areas experienced the greatest difficulty filling teacher vacancies in the fields of English as a
second language (ESL) and foreign languages. Apart from these fields, the percentage of public schools in rural areas that reportedly could not fill teacher vacancies was not measurably different from the percentages in other locales. (Indicator 3.11)
- In public schools, the average number of students per counselor, social worker, school psychologist, and special education instructional aide was lower in rural areas in 2003-04 than in cities at both the elementary and secondary levels. (Indicator 3.12)

## Acknowledgements

A number of people contributed to the development and production of Status of Education in Rural America. John Ralph, of the National Center for Education Statistics (NCES), provided guidance in the development of the report, which was prepared under the general direction of Thomas Snyder and Val Plisko (NCES). Andrew White (NCES) reviewed the entire document.

Several staff members at the Education Statistics Services Institute (ESSI) contributed to this report. ESSI is funded by NCES and composed of staff from the American Institutes for Research (AIR) and a number of partner organizations. Mary Ann Fox of ESSI-AIR provided overall guidance, research support, and statistical analysis. Elizabeth Jacinto (ESSI-AIR) and William Sonnenberg (NCES) gave programming and data support. Nancy Collins, in
her role as an independent contractor for ESSI-AIR, provided programming assistance. Lauren Drake (ESSI-MacroSys) provided research and formatting support. Tom Nachazel (ESSI-AIR) copyedited the report. Michael Stock, Kalle Culotta, and Katie Ferguson (ESSI-MacroSys) worked on the cover design and report layout and did the desktop publishing of the report.

Status of Education in Rural America has received extensive reviews by several people, both within and outside of the Department of Education. We would like to thank them for their time and expert advice: Kristin Flanagan, Sandy Eyster, Zeyu Xu, Aparna Sundaram, Alison Slade, and Stephen Mistler of ESSI-AIR, Alexandra Henning of ESSI-QIP, and Siri Warkentien of ESSI-Child Trends; and Duc-Le To of IES.

Chapter 2. Outcomes
2.1. Percentage distribution of public school students across NAEP reading achievement levels, by grade level and locale: 2005 ..... 49
2.2. Percentage distribution of public school students across NAEP mathematics achievement levels, by grade level and locale: 2005 ..... 53
2.3. Percentage distribution of public school students across NAEP science achievement levels, by grade level and locale: 2005 ..... 57
2.4. Percentage of 16- to 24-year-olds who were high school status dropouts, by poverty level and locale: 2004 ..... 59
2.6. Percentage of persons ages 16-19 who were neither enrolled in school nor working, by sex and locale: 2004 ..... 62
2.7. Percentage of persons ages 18-29 enrolled in colleges or universities, by age group, locale, and sex: 2004 ..... 64
2.8. Percentage of adults age 16 or older who participated in adult educational activities, by type of activity and locale: 2005 ..... 66
2.9a. Percentage distribution of adults age 25 and over, by highest level of educational attainment, age group, and locale: 2004 ..... 69
2.9b. Percentage distribution of adults age 25 and over, by highest level of educational attainment, locale, and poverty status: 2004 ..... 70
2.10a. Median earnings of full-time, full-year workers age 25 and over adjusted for geographic cost differences, by locale and educational attainment: 2004 ..... 72
2.10b. Median earnings of full-time, full-year workers age 25 and over adjusted for geographic cost differences, by locale, sex, and educational attainment: 2004 ..... 74
2.11. Percentage of civilian persons ages $25-64$ in the labor force and unemployed, by sex, age group, and locale: 2004 ..... 76
Chapter 3. Resources for Public Schools
3.1. Revenues for public elementary and secondary schools and percentage distribution of revenues, by source of funds, locale, and district poverty level: 2003-04 ..... 82
3.2. Expenditures per public elementary and secondary student, by type, locale, and district poverty level: 2003-04 ..... 86
3.3. Percentage distribution of public schools reporting being underenrolled, at capacity, or overenrolled, by school locale: Fall 2005 ..... 88
3.4. Number and percentage of public high schools that offered dual credit, Advanced Placement (AP), or International Baccalaureate (IB) courses during the 12-month school year, and percentage of all public high school students who were enrolled in these schools during this school year, by locale: 2002-03 ..... 90
3.5a. Percentage of public schools with internet access, by type of access available and locale: 2005 ..... 92
3.5b. Number of public school students per instructional computer with internet access and percentage of public schools providing hand-held or laptop computers, by locale: 2005 ..... 92
3.6. Pupil-teacher ratios in public schools, by school level, school size, and locale: 2003-04 ..... 95
3.7. Number and percentage distribution of public elementary and secondary school teachers, by locale and selected characteristics: 2003-04 ..... 98
Table Page
3.8. Average number of years of teaching experience for public school teachers and percentage distribution of such teachers, by years of teaching experience, locale, and grade level taught: 2003-04 ..... 100
3.9a. Percentage of public school teachers who reported potential problems as "serious problems" in their schools, by type of problem, locale, and grade level taught: 2003-04 ..... 103
3.9b. Percentage of public school teachers who reported behavioral problems occurring in their schools at least weekly, by type of problem, locale, and grade level taught: 2003-04 ..... 105
3.9c. Percentage of public school teachers who reported agreement with various statements about teaching conditions, by condition, locale, and grade level taught: 2003-04 ..... 107
3.10. Average base salary for full-time teachers in public elementary and secondary schools adjusted for geographic cost differences, by highest degree earned and locale: 2003-04 ..... 108
3.11. Percentage of public elementary and secondary schools with a teaching vacancy in selected teaching fields, by the school's reported level of difficulty in filling the vacancy, teaching field, and locale: 2003-04 ..... 112
3.12. Total number of teachers and student support staff in regular public schools, average number of staff per school, and average number of students per staff in schools with such staff, by locale, school level, and type of school staff: 2003-04 ..... 117
Appendix A. Supplemental Tables
A-1.1. Number and percentage distribution of public elementary and secondary districts, schools, and students, by detailed locale: 2003-04 ..... 123
A-1.2. Number and percentage distribution of public elementary and secondary schools, by school size and detailed locale: 2003-04 ..... 124
A-1.4. Percentage distribution of public elementary and secondary students, by detailed locale, region, and state and District of Columbia: 2003-04 ..... 125
A-1.7. Percentage distribution of families with children under 18, by poverty level, locale, and family type: 2004 ..... 126
A-1.8. Number and percentage distribution of public elementary and secondary students, by percentage of students in school eligible for free or reduced-price lunch and detailed locale: 2003-04 ..... 127
A-1.9. Percentage distribution of public elementary and secondary students, by percentage of students in school eligible for free or reduced-price lunch, detailed locale, and race/ethnicity: 2003-04 ..... 128
A-1.10. Percentage of children ages $5-17$ who spoke a language other than English at home and who spoke English with difficulty, by age, locale, and race/ethnicity: 2004 ..... 130
A-2.4. Percentage of 16 - to 24 -year-olds who were high school status dropouts, by race/ethnicity and locale: 2004 ..... 131
A-3.7. Number and percentage distribution of public elementary and secondary school teachers, by detailed locale and selected characteristics: 2003-04 ..... 132
A-3.8. Average number of years of teaching experience for public school teachers and percentage distribution of such teachers, by detailed locale, years of teaching experience, and grade level taught: 2003-04 ..... 134

# Measuring Rural Education 

The National Center for Education Statistics (NCES) in its authorizing legislation is charged with the task of reporting information on issues surrounding education by "urban, rural, suburban districts, and other population characteristics, when such disaggregated information will facilitate educational and policy decisionmaking." ${ }^{1}$ To further this aim, NCES has developed a new classification system to make the reporting of locale consistent across its various surveys, as well as improve upon previous systems. This report marks the first use of the new classification system across NCES surveys to describe elementary and secondary education in rural settings and other locales.

Rural education has been the focus of a sizable volume of recent research, which has examined rural schools' student achievement, finances, cultural diversity, responses to special needs students, distance education programs, crime rates, and staff recruitment and retention (Imazeki and Reschovsky 2003; McClure and Reeves 2004; Nelson 2004; RosenKoetter, Irwin, and Saceda 2004; Smith, Hill, Evans, and Bandera 2000; Wenger and Dinsmore 2005; Williams 2005). However, the ability to compare findings across this research, and as a result, the potential usefulness of this research, is hampered by the lack of a single, uniform definition of "rural."

To help address this problem and improve rural education reporting, NCES worked with the Census Bureau to create new measures of locale based on improved geocoding technology and the 2000 Office of Management and Budget (OMB) definitions of metro areas that rely less on population size and county boundaries than proximity of an address to an urbanized area. Released in 2006, the new measures or locale codes are assigned to each school according to the school's physical longitude and latitude. Thus, these new locale codes make school data more consistent, accurate, and useful to policymakers, researchers, and educators concerned with rural education issues.

This report presents various education indicators, using the 2006 locale codes, to provide a more comprehensive description of the current condition of rural education. The report's focus is on elementary and secondary schools, although a few indicators look at postsecondary enrollment and adult education and attainment to provide a context for student expectations and opportunities. This report does not examine trends. Rather, most indicators report data from the school year 2003-04 or calendar year 2004, the first year of data that include the new locale codes. Data from prior years were not recoded in order to

[^0]examine trends. The data apply to the 50 states and the District of Columbia.

## The New Classification System

The new urban-centric classification system has four major locale categories-city, suburban, town, and rural-each of which is subdivided into three subcategories. Cities and suburbs are subdivided into the categories small, midsize, or large; towns and rural areas are subdivided by their proximity to an urbanized area into the categories fringe, distant, or remote (see exhibit A). These twelve categories are based on several key concepts that Census uses to define an
area's urbanicity: principal city, urbanized area, and urban cluster. A principal city is a city that contains the primary population and economic center of a metropolitan statistical area, which, in turn, is defined as one or more contiguous counties that have a "core" area with a large population nucleus and adjacent communities that are highly integrated economically or socially with the core. Urbanized areas and urban clusters are densely settled "cores" of Census-defined blocks with adjacent densely settled surrounding areas. Core areas with populations of 50,000 or more are designated as urbanized areas; those with populations between 25,000 and 50,000 are designated as urban clusters. For more information on

Exhibit A. NCES's urban-centric locale categories, released in 2006

| Locale | Definition |
| :---: | :---: |
| City |  |
| Large | Territory inside an urbanized area and inside a principal city with population of 250,000 or more |
| Midsize | Territory inside an urbanized area and inside a principal city with population less than 250,000 and greater than or equal to 100,000 |
| Small | Territory inside an urbanized area and inside a principal city with population less than 100,000 |
| Suburban |  |
| Large | Territory outside a principal city and inside an urbanized area with population of 250,000 or more |
| Midsize | Territory outside a principal city and inside an urbanized area with population less than 250,000 and greater than or equal to 100,000 |
| Small | Territory outside a principal city and inside an urbanized area with population less than 100,000 |
| Town |  |
| Fringe | Territory inside an urban cluster that is less than or equal to 10 miles from an urbanized area |
| Distant | Territory inside an urban cluster that is more than 10 miles and less than or equal to 35 miles from an urbanized area |
| Remote | Territory inside an urban cluster that is more than 35 miles from an urbanized area |
| Rural |  |
| Fringe | Census-defined rural territory that is less than or equal to 5 miles from an urbanized area, as well as rural territory that is less than or equal to 2.5 miles from an urban cluster |
| Distant | Census-defined rural territory that is more than 5 miles but less than or equal to 25 miles from an urbanized area, as well as rural territory that is more than 2.5 miles but less than or equal to 10 miles from an urban cluster |
| Remote | Census-defined rural territory that is more than 25 miles from an urbanized area and is also more than 10 miles from an urban cluster |

SOURCE: Office of Management and Budget (2000). Standards for Defining Metropolitan and Micropolitan Statistical Areas; Notice. Federal Register (65) No. 249.
urbanized areas and urban clusters, see http://www. census.gov/geo/www/ua/ua_2k.html. Rural areas are designated by Census as those areas that do not lie inside an urbanized area or urban cluster.

NCES has classified all schools into one of these twelve categories based on schools' actual addresses and their corresponding coordinates of latitude and longitude. Not only does this mean that the location of any school can be identified precisely, but also that distance measures can be used to identify town and rural subtypes. Unlike the previous classification system that differentiated towns on the basis of population size, the new system differentiates towns and rural areas on the basis of their proximity to larger urban centers. This key feature allows NCES to identify and differentiate rural schools and school districts in relatively remote areas from those that may be located just outside an urban center.

The choropleth map (see exhibit C) shows the proportion and location of the Census-defined locales in the United States. Differences in locale type are indicated by color. Cities are red, suburban areas are orange, and towns are yellow. Rural areas are represented by varying shades of green: the lightest green indicates fringe rural areas, medium-green indicates distant rural areas, and the darkest green indicates remote rural areas. For the purposes of this map, locales are presented at the level of Census blocks
(not by schools or school districts), giving an overall view of the relative concentrations and arrangement of the various locales across the country.

## Impact of New Classification System

Expanding the school locale codes to twelve categories allows for a greater degree of precision in identifying schools according to their distance from an urban area and the population density of the location, yet it does not cause an enormous shift in the number or percentage of public elementary and secondary schools that are classified as rural. Overall, about 6 percent of these schools were affected by the reclassification: 2,878 schools were newly designated as rural, and 2,418 formerly rural schools were placed in a nonrural category (see exhibit B). The net change was a 0.5 percentage point increase in the total number of public schools classified as rural in the United States; however, there were larger shifts within the rural category, as 8 percent of public schools formerly classified as rural were no longer considered rural in the new system. Also, the number of students enrolled in public schools classified as rural increased 1 percent, by 337,000 . Aside from providing the benefit of a more accurate classification for these schools, the distinguishing benefit of this classification system lies in its ability to distinguish between schools in fringe, distant, and remote rural areas.

Exhibit B. Comparison of number and percentage of public elementary and secondary schools and students classified as rural under the former metro-centric classification system and under the new urban-centric classification system: 2003-04

| Characteristic | All locales | Rural under former system | Rural under new system | Unchanged (rural in both systems) | No longer classified as rural | Newly classified as rural | $\begin{array}{r} \text { Net } \\ \text { increase } \end{array}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Number of schools | 95,726 | 29,517 | 29,977 | 27,099 | 2,418 | 2,878 | 460 |
| Percentage of |  |  |  |  |  |  |  |
| All schools | 100.0 | 30.8 | 31.3 | 28.3 | 2.5 | 3.0 | 0.5 |
| Former rural schools | $\dagger$ | 100.0 | $101.6^{1}$ | 91.8 | 8.2 | $\dagger$ | $\dagger$ |
| Number of students (in thousands) | 48,354 | 9,971 | 10,308 | 8,851 | 1,120 | 1,457 | 337 |
| Percentage of All students | 100.0 | 20.6 | 21.3 | 18.3 | 2.3 | 3.0 | 0.7 |
| Students formerly classified as rural | $\dagger$ | 100.0 | $103.4^{1}$ | 88.8 | 11.2 | $\dagger$ | $\dagger$ |

[^1]The new classification system allows for the collection and reporting of high-quality data across the range of rural locales (and other locales) with greater consistency and integrity. At present, all NCES national surveys are able to report findings for the major locale designations (i.e., city, suburb, town, and rural). Larger surveys, such as the Schools and Staffing Survey (SASS), and universe datasets, such as the Common Core of Data (CCD), are also able to report breakouts for the various subcategories-including fringe, distant, and remote rural areas. Where possible, those data are included in this report.

## Organization of the Report

This report is the first national effort to report on a variety of educational variables using the new locale codes. It is organized into three chapters: demographics, outcomes, and resources for public schools. The demographic information that is presented in the first chapter describes the number of schools and students in rural areas and examines some of the characteristics of those students and schools, including race/ethnicity, poverty status, the use of a language other than English as a primary language, and the degree of parental involvement in education.

The outcomes chapter of this report highlights student achievement data in reading, mathematics, and science. It also provides dropout rates, high school completion rates, and college enrollment rates, as well as employment rates and earnings of adults. The final chapter focuses on public school resources, including federal and state revenues, computer access, pupil/teacher ratios, and indicators of teacher characteristics from the most recent Schools and Staffing Survey (SASS).

Using the most recent data from the surveys already mentioned and other national surveys-including the CCD, National Assessment of Educational Progress (NAEP), National Household Education Surveys Program (NHES), the Fast Response Survey System (FRSS), and the Census Bureau's American Community Survey (ACS)—this report sets new standards in the breadth of information provided and in the consistency of the metrics used to highlight the condition of rural education. It is meant to serve as a foundation for further discussion and future research on the educational characteristics and developments unique to rural schools as well as those shared with other locales in America.

OTE: Different Iocale types are represented by area shading. These shaded areas connect U.S. Census block and block groups of the same locale type; tey are not intended to represent population density or land contours. The National Center for Education Statistics (NCES) works with the U.S. Census data and dnalytic products, and they are widely used by researchers and program administrators to investigate how conditions of education vary across ographic areas.
te locale typology relies on three core concepts: urbanized areas, urban clusters, and principal cities. Urbanized areas and urban clusters are defined by locks and block groups. . rrban areas with a populataion of 50,000 or more are designated as us urbanized areas, and those with a poppulation less than 50,000 but greater than 2,500 are desiggated as urban clusters. Principipal cities are a component of Core Based Statistical Areas ( CBSA) defined by the

http://www.census. $\mathrm{gov} / \mathrm{g}$ goo/www/ua/ua 2 k. htm. Rural areas are designated by Census as those areas that do not lie inside an urbanized area or urban ster. The NCES locale typology includes four basic classifications. Each classification includes three subtype
City: Teritory inside an urbanized area and inside a principal city.

Rura: : Teritiory defined as rural by the Census Bureau. Rural teritiory that is within 5 miles of an urbanized area, as well as rural teritory within 2.5 miles fi town is classified as Fringe. Rural teritiory yhat is betwen s and 25 miles from an urbanized area, as well as rural teritiory that is between 2.5 and 10 miles from a town is identified as Distant. Rural terititory that is more than 25 miles from an urbanized area and is also more than 10 miles from a town susified as Remote.

## Demographics

The indicators in this chapter profile rural school systems, rural students in poverty or with disabilities, and parental support and school involvement in rural areas. The indicators highlight the fact that rural public school systems in the United States constitute over half of all school districts and one-third of all public schools, yet enroll only one-fifth of all public school students (indicator 1.1). Rural public school systems predominate in the South and Midwest (indicator 1.4).

Rural public school systems differ from those in other locales in terms of the population they serve. Greater proportions of rural public students are White and are enrolled in small schools than public school students in cities or suburban areas (indicators 1.2 and 1.3). A smaller proportion of students in rural areas than in cities or towns live near or below the poverty threshold (indicator 1.7). However, poverty is concentrated in remote rural areas, where American Indian/Alaska Native and Black public school students disproportionately attend moderate-to-high poverty schools (indicators 1.8 and 1.9). A smaller percentage of rural public school students are limited English proficient than public school students in other locales (indicator 1.10).

The percentage of rural public school students identified as having disabilities is similar to other locales (indicator 1.11).

Rural students' parents do not differ markedly from those in other locales on several indicators. For example, parents in rural areas enroll their children in preprimary programs at similar rates to parents in towns, but at lower rates than parents in suburbs and cities (indicator 1.5). The percentages of rural students whose parents attend school events and volunteer are similar to those of students in suburban areas and towns, but higher than those of students in cities (indicator 1.12). However, a smaller percentage of students in rural areas than in cities have parents who are high school dropouts, and a smaller percentage of students in rural areas than in suburban areas have a parent with a bachelor's degree (indicator 1.14). Also, while a larger percentage of students in all locales have parents who expect them to attain a bachelor's degree than any other level of educational attainment, a greater proportion of rural students than students in cities and suburbs have parents who expect them to attain less than a bachelor's degree (indicator 1.15).

### 1.1. Public elementary and secondary students, schools, and districts

#### Abstract

In 2003-04, over half of all operating school districts and one-third of all public schools were in rural areas, more than in any other locale. However, fewer students were enrolled in public schools in rural areas than in suburbs or cities.

In 2003-04, some 96,000 public elementary and secondary schools, located in 14,000 school districts, served over 48 million students in the United States (table 1.1). The distribution of districts, schools, and students across locales highlights some key differences in the size and nature of education in rural America, compared to education in towns, suburbs, and cities.

In 2003-04, more than half of all operating school districts were located in rural areas ( 56 percent), while 20 percent of districts were located in suburban areas, 18 percent in towns, and 6 percent in cities (figure 1.1). About one-third of all U.S. public schools were located in rural areas $(30,000)$, more than in suburbs $(27,000)$, cities $(25,000)$, or towns $(15,000)$. Fewer students, however, were enrolled in public schools in rural areas than in suburbs and cities. Public schools in rural areas en-
rolled 10 million students compared to 17 million in suburban areas and 15 million in cities.

Rural areas located close to or on the fringe of urbanized areas, referred to as "fringe rural," differed from rural areas located further from urbanized areas, referred to as "distant rural" and "remote rural," in their proportions of districts, schools, and students (see the introductory section "Measuring Rural Education" for detailed descriptions of these locale types). Public schools in fringe rural areas enrolled a larger percentage of all students (11 percent) than public schools in distant rural (7 percent) and remote rural (3 percent) areas. However, the percentage of all school districts located in fringe rural areas ( 11 percent) was smaller than that in distant rural ( 22 percent) and remote rural (23 percent) areas (see table A-1.1 for a comparison of all locale types).

Table 1.1. Number and percentage distribution of public elementary and secondary districts, schools, and students, by locale: 2003-04

| Town | 18.3 | 15.2 | 12.9 |  |
| Rural | 55.9 | 31.3 | 21.3 |  |
| Fringe | 11.1 | 10.6 | 11.0 |  |
| Distant | 21.8 | 11.5 | 7.1 |  |
| Remote | 23.0 | 9.2 | 3.2 |  |

NOTE: Schools with no reported enrollment are included in school totals but excluded from student totals. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua $2 k . h t m$. Detail may not sum to totals because of rounding. SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Public Elementary/Secondary School Universe Survey" and "Local Education Agency Universe Survey," 2003-04.

Figure 1.1. Percentage distribution of public elementary and secondary districts, schools, and students, by locale: 2003-04

NOTE: Schools with no reported enrollment are included in school totals but excluded from student totals. Detail may not sum to totals because of rounding. ## Indicator 1,2-Public elementary and secondary schools and students, by school level and size

### 1.2. Public elementary and secondary schools and students, by school level and size

## In 2003-04, a larger percentage of rural students attended small or very small public schools than students in other locales.

Across the United States in the 2003-04 school year, 31.2 million students were enrolled in 65,800 public elementary schools, 15.8 million students were enrolled in 22,800 public secondary schools, and 1.3 million students were enrolled in 5,400 public combined schools (data not shown). In rural areas, 6.4 million students were enrolled in 18,700 public elementary schools, 3.4 million students in 8,800 public secondary schools, and 0.5 million students in 2,000 public combined-level schools (tables 1.2a and A-1.2). At both the elementary and secondary level, the number of students attending rural public schools ( 6.4 million and 3.4 million, respectively) was larger than the number attending public schools in towns
( 3.9 million and 2.1 million), but smaller than the numbers attending public schools in suburbs (11.2 million and 5.6 million) and in cities ( 9.7 million and 4.5 million).

In 2003-04, about two-thirds of public schools in rural areas enrolled less than 400 students, and less than one-half of a percent enrolled 2,000 or more students (table 1.2b). In contrast, in cities and suburbs, roughly two-thirds of public schools enrolled more than 400 students and 3 percent of public schools enrolled 2,000 or more students. In towns, about half of public schools enrolled more than 400 students.

Table 1.2a. Number of public schools and students, by locale, school level, and size of school: 2003-04

| School type and size | City |  | Suburban |  | Town |  | Rural |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Schools ${ }^{1}$ | Students | Schools ${ }^{1}$ | Students | Schools ${ }^{1}$ | Students | Schools ${ }^{1}$ | Students |
| Total | 24,597 | 14,685,209 | 26,589 | 17,137,511 | 14,563 | 6,222,788 | 29,977 | 10,308,015 |
| Less than 200 | 3,379 | 307,082 | 2,546 | 227,312 | 2,537 | 215,016 | 10,741 | 1,054,676 |

[^2]Figure 1.2a. Percentage distribution of public elementary and secondary schools, by level, locale, and size of school: 2003-04

\# Rounds to zero
NOTE: Excludes schools with no reported enrollment and 1,749 schools with no reported grade level are not separately shown. Detail may not sum to totals because of rounding.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Public Elementary/Secondary School Universe Survey," 2003-04.

Generally, a larger percentage of rural students than students in other locales were enrolled in very small public schools. At the elementary level, the percentage of students in rural areas attending public schools with an enrollment below 200 (10.4 percent) was about three times as large as the percentage in towns ( 3.4 percent), about 7 times as large as the percentages in cities ( 1.5 percent), and about 10 times as large as the percentage in suburbs ( 1.0 percent).

At the secondary level, similar differences were found, with the percentage of students in rural areas attending public schools with enrollments of less than 200 ( 9 percent) being more than three times larger than the percentages in cities, suburbs, and towns (ranging from 1 to 2 percent). Conversely, the percentage of students in rural
areas attending public schools with enrollments of 2,000 or more ( 7 percent) was less than in cities ( 36 percent) and suburbs ( 32 percent), though greater than in towns ( 3 percent).

Larger numbers of public combined schools (schools having a grade below 7th grade and a grade above 8 th grade) and public combined school students were found in rural areas ( 2,000 schools and 494,000 students) than in each of the other locales (800-1,500 schools and 112,000-441,000 students). While few differences were seen across locales in the distribution of combined school students across school sizes, a smaller percentage of public combined school students in rural areas attended schools with 1,200 or more students than in cities, suburbs, and towns ( 9 percent vs. 33, 29, and 10 percent, respectively).

### 1.3. Public school students, by race/ethnicity

## A greater proportion of public school students in rural areas were White or American Indian/Alaska Native than in towns, suburbs, or cities, and a smaller proportion of public school students in rural areas were Black, Hispanic, or Asian/Pacific Islander than in towns, suburbs, or cities.

In the 2003-04 school year, 58 percent of all public elementary and secondary school students in the nation were White, 17 percent were Black, 19 percent were Hispanic, 4 percent were Asian/Pacific Islander, and 1 percent were American Indian/ Alaska Native (table 1.3). In rural areas, 78 percent of public school students were White, 10 percent were Black, 8 percent were Hispanic, 2 percent were Asian/Pacific Islander, and 3 percent were American Indian/Alaska Native.

The percentage of these students who were White was higher in rural areas ( 78 percent) than in cities ( 35 percent), suburban areas ( 62 percent), and towns (72 percent) (figure 1.3). Conversely, the percentages of these students in rural schools who were Black, Hispanic, and Asian/Pacific Islander
were lower than the corresponding percentages in cities, suburban areas, and towns. A higher percentage of these students in rural areas were American Indian/Alaska Native than in cities, suburbs, and towns (1 to 2 percent).

Within rural areas, a lower percentage of these students in rural fringe areas were White ( 74 percent) than in remote rural ( 79 percent) and distant rural ( 83 percent) areas. A greater proportion of students attending public schools in fringe rural areas were Black ( 12 percent), Hispanic (10 percent), and Asian/Pacific Islander (2 percent) than in distant rural and remote rural areas. However, 7 percent of these students attending schools in remote rural areas were American Indian/Alaska Native, compared with 1 percent in fringe rural areas and 2 percent in distant rural areas.

Table 1.3. Number and percentage distribution of public elementary and secondary students, by race/ethnicity and locale: 2003-04

### 1.4. Elementary and secondary public school students, by region and state

## A greater proportion of public school students in the South and the Midwest were enrolled in rural schools in 2003-04 than in the Northeast and the West.

In 2003-04, among all regions the South had the largest percentage of public school students enrolled in rural schools ( 28 percent), followed by the Midwest ( 25 percent), Northeast ( 16 percent), and West (13 percent) (table 1.4). Looking at individual states, Maine and Vermont had more than 50 percent of
their public school students enrolled in rural schools ( 53 percent each), while Alabama, Arkansas, Kentucky, Mississippi, North Carolina, North Dakota, South Dakota, and West Virginia each had over 40 percent of their public school students enrolled in rural schools (41-47 percent).

Figure 1.4a. Percentage of public elementary and secondary students enrolled in schools in rural areas, by state and District of Columbia: 2003-04

NOTE: Numbers in parentheses in the legend represent the number of states in each category.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Public Elementary/Secondary School Universe Survey," 2003-04.

The percentage of public school students enrolled in remote rural areas differed across the regions of the country (table A-1.4). The Midwest had the largest percentage of students enrolled in remote rural areas ( 5 percent), followed by the South (3 percent), West ( 3 percent), and the Northeast (1 percent). In the states, North Dakota
and South Dakota had more than 30 percent of their public school students enrolled in remote rural schools ( 35 and 32 percent, respectively), while Alaska, Montana, Nebraska, Vermont, and Wyoming each had 15 percent or more of their public school students enrolled in remote rural schools (15-24 percent).

Figure 1.4b. Percentage of public elementary and secondary students enrolled in schools in remote rural areas, by state and District of Columbia: 2003-04

NOTE: Numbers in parentheses in the legend represent the number of states in each category. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. ### 1.5. 3- to 5 -year-olds in preprimary programs

In 2005, about half of children in rural areas between the ages of 3 and 5 attended a center-based preprimary
program such as a daycare center, Head Start program, preschool, or prekindergarten.

Nationwide, 57 percent of 3- to 5 -year-olds were enrolled in center-based preprimary programs ${ }^{2}$ in 2005 (table 1.5). In rural areas, the percentage of 3to 5 -year-olds enrolled in such programs ( 50 percent) was lower than the national rate ( 57 percent) and lower than the rates for children in suburban areas ( 63 percent) and cities ( 58 percent). There was no measurable difference between the enrollment rates for children in rural areas and towns.

Across the United States in 2005, a greater percentage of children in families with incomes at or above the poverty threshold than children in families with incomes below the poverty threshold were enrolled
in preprimary programs ( 60 vs. 47 percent). Among rural children, the apparent difference in enrollment rates between children living at or above the poverty threshold ( 52 percent) and children living below the poverty threshold ( 39 percent) was not statistically significant due to large standard errors.

The number of hours children attended center-based preprimary programs varied. Nationally, a greater percentage of 3 - to 5 -year-olds attended preprimary programs less than 30 hours a week than attended preprimary programs 30 hours or more a week ( 35 vs . 21 percent). The same relationship held true for children in rural areas ( 33 vs. 16 percent) (figure 1.5).

Table 1.5. Percentage of 3- to 5 -year-olds enrolled in center-based preprimary programs, by poverty status, hours of attendance, and locale: 2005

### 1.6. Private schools

In 2003-04, about 6 percent of rural students were enrolled in private schools, over half of them in nonCatholic, religious schools. In contrast, 11 percent of students nationally were enrolled in private schools, the largest percentage of whom (41 percent) were enrolled in Catholic schools.

In 2003-04, some 34,700 private schools across the United States enrolled 6.1 million elementary and secondary students (or 11 percent of all students) (tables 1.6a and 1.6b). In rural areas, 6,700 private schools enrolled 622,000 prekindergarten through 12th-grade students (or 6 percent of all rural students). For the purposes of this analysis, private schools are categorized as Catholic; nonCatholic religious; and nonsectarian schools.

In cities, suburban areas, and towns, the largest percentage of private school students were enrolled
in Catholic schools (42-48 percent), followed by non-Catholic religious schools (33-39 percent), and then nonsectarian schools (13-23 percent) (figure 1.6). In rural areas, however, 55 percent of private school students attended non-Catholic religious schools, compared with 27 percent attending nonsectarian schools and 18 percent attending Catholic schools. Rural areas were the only locale where Catholic schools did not enroll the largest proportion of private school students.

### 1.7. Children in poverty

## The proportion of children living near or below the poverty threshold in rural areas was smaller than in towns or cities, but larger than in suburban areas in 2004.

Using annual household incomes collected by the American Community Survey (ACS), households in poverty are defined as those having an annual income below the poverty threshold (for a comparison of poverty definitions see appendix B). In 2004, 18 percent of children under the age of 18 were living in families below the poverty threshold, while 19 percent were living in families between the poverty threshold and 185 percent of the poverty threshold (table 1.7).

The percentage of children under the age of 18 in rural areas who were living in families in poverty ( 15 percent) was smaller than in cities and towns ( 25 percent each) (figure 1.7). However, a larger percentage of rural children lived in poverty than suburban children ( 15 vs. 13 percent). These same patterns
were found for children under the age of 5 and for children ages 5 to 17 (table 1.7), as well as for families headed by a married couple, a single mother, and a single father (table A-1.7).

Widening the focus to include children living in families below 185 percent of the poverty threshold, including those living in poverty, reveals similar patterns. The percentage of children under the age of 18 in rural areas who were living in families at or below 185 percent of the poverty threshold ( 35 percent) was smaller than in cities ( 47 percent) or towns ( 46 percent), but larger than in suburban areas ( 28 percent) (figure 1.7). These same patterns were detected among children under the age of 5 and children between ages 5 and 17 .

### 1.8. Students eligible for free or reduced-price school lunch in public schools

#### Abstract

In 2003-04, rural public schools had a larger proportion of students eligible for free or reduced-price lunch than suburban public schools, but had a smaller proportion of students eligible for free or reduced-price lunch than public schools in cities or towns. The percentage of public school students in rural remote areas attending a moderate-to-high poverty public school was higher than the percentages in all other locales except large and midsize cities.

During the 2003-04 school year, 41 percent of public elementary and secondary school students nationwide were eligible for free or reduced-price lunch (table 1.8). In rural areas, the percentage of students eligible for free or reduced-price lunch (38 percent) was lower than the national percentage. It was also lower than the percentage in both cities ( 53 percent) and towns ( 43 percent), but was higher than in suburban areas ( 31 percent).

Using the percentage of students eligible for free or reduced-price lunch as a proxy for the poverty level within a school (for a comparison of poverty defini-
tions see appendix B), moderate-to-high poverty schools are defined, for the purposes of this analysis, as schools with more than 50 percent of students eligible. Using this definition-combining the last two columns of table 1.8 to include " 51 to 75 percent" and "more than 75 percent" eligible schools- 35 percent of students nationwide attended moderate-to-high poverty public schools. The percentage of students in rural areas attending moderate-to-high poverty public schools ( 30 percent) was less than the national percentage. The percentage of rural students attending these schools was lower than the percentage in both

| Suburban | 31.4 | 25.4 | 25.9 | 25.0 | 14.5 | 9.2 |
| Town | 42.9 | 6.0 | 19.2 | 39.1 | 25.2 | 10.5 |
| Rural | 37.9 | 11.7 | 22.6 | 36.2 | 21.4 | 8.1 |
| Fringe | 32.5 | 19.0 | 26.6 | 31.5 | 16.9 | 6.1 |
| Distant | 41.1 | 5.0 | 22.5 | 40.2 | 23.5 | 8.9 |
| Remote | 49.6 | 1.6 | 9.3 | 43.8 | 32.0 | 13.3 |

NOTE: The National School Lunch Program is a federally assisted meal program. To be eligible, a student must be from a household with an income at or below 130 percent of the poverty threshold for free lunch or between 130 percent and 185 percent of the poverty threshold for reduced-price lunch. Approximately 13,704 schools did not report information on the number of students eligible for a free or reduced-price school lunch. Therefore, this information is missing for $5,227,075$ students. For a comparison of poverty definitions, see appendix B. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua_2k.html. Detail may not sum to totals because of rounding.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Public Elementary/Secondary School Universe Survey," 2003-04.
cities ( 54 percent) and towns ( 36 percent), but was higher than the percentage of students in suburban areas (24 percent) (figure 1.8).

Within rural areas, however, the percentage of students attending moderate-to-high poverty public schools varied markedly. Specifically, 45 percent of students in remote rural areas attended moderate-to-high poverty public schools, compared with 32 percent in distant rural areas and 23 percent in fringe rural areas.

Comparing the percentages of students attending moderate-to-high poverty public schools in rural fringe
and rural remote areas to other, nonrural, locales further highlights the differences occurring within rural areas. The percentage of students attending moder-ate-to-high poverty public schools in rural fringe areas ( 23 percent) was lower than the percentage of students attending such schools in suburban areas ( 24 percent). On the other hand, only large cities and midsize cities had larger percentages of students attending moderate-to-high poverty public schools than remote rural areas ( 66 and 49 percent vs. 45 percent) (table A-1.8).

Figure 1.8. Percentage distribution of public elementary and secondary students, by percentage of students in school eligible for free or reduced-price lunch and locale: 2003-04

NOTE: The National School Lunch Program is a federally assisted meal program. To be eligible, a student must be from a household with an income at or below 130 percent of the poverty threshold for free lunch or between 130 percent and 185 percent of the poverty threshold for reduced-price lunch. Approximately 13,704 schools did not report information on the number of students eligible for a free or reduced-price school lunch. Therefore, this information is missing for $5,227,075$ public school students. For a comparison of poverty definitions, see appendix B. Detail may not sum to totals because of rounding. SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Public Elementary/Secondary School Universe Survey," 2003-04.

### 1.9. Concentrations of poverty in public schools, by race/ethnicity

In rural areas, greater percentages of Hispanic, Black, and American Indian/Alaska Native public school students than White or Asian/Pacific Islander public school students attended a moderate-to-high poverty school in 2003-04. This was particularly true for remote rural areas; for instance, larger proportions of Black and American Indian/Alaska Native public school students attended such schools in remote rural areas than in large cities.

Using the percentage of students eligible for free or reduced-price lunch as a proxy for the concentration of low-income students within a school (for a comparison of poverty definitions see appendix B), moderate-to-high poverty schools are defined, for the purposes of this analysis, as schools with more than 50 percent of students eligible for free or reduced-price lunch. Approximately 15.3 million public school students nationwide (or 35 percent of all public school students) attended moderate-to-high poverty schools in 2003-04 (tables 1.9a and 1.9b).

Nationally, 63 percent of Hispanics, 62 percent of Blacks, 55 percent of American Indians/Alaska Natives, 29 percent of Asians/Pacific Islanders, and 19 percent of Whites attended moderate-to-high poverty public schools (table 1.9b). A similar pattern was detected in rural areas, where more than half of American Indian/Alaska Native ( 69 percent), Black ( 60 percent), and Hispanic (54 percent) students were enrolled in
moderate-to-high poverty public schools, compared with less than a quarter of White ( 21 percent) and Asian/Pacific Islander students ( 20 percent).

When comparing the detailed rural locales (fringe, distant, and remote) with other detailed locales (such as large, midsize, and small cities), higher percentages of Black and American Indian/Alaska Native public school students in remote rural areas were enrolled in moderate-to-high poverty schools ( 87 and 79 percent, respectively) than their peers in large cities ( 78 and 62 percent) (table A-1.9). Furthermore, approximately half of all Black public school students and nearly half of all American Indian/Alaska Native public school students ( 45 percent) in remote rural areas were enrolled in high-poverty schools (schools with more than 75 percent of students eligible for free or reduced-price lunch), compared with the 5 percent of White public school students in remote rural areas who attended high-poverty schools.

Figure 1.9. Percentage of public school students in moderate-to-high poverty schools, by race/ethnicity and locale: 2003-04

Percent

NOTE: Figures are percentages of students in schools where over 50 percent of students were eligible for free or reduced-price lunch. The National School Lunch Program is a federally assisted meal program. To be eligible, a student must be from a household with an income at or below 130 percent of the poverty threshold for free lunch or between 130 percent and 185 percent of the poverty threshold for reduced-price lunch. Approximately 13,704 public schools did not report information on the number of students eligible for a free or reduced-price school lunch. Therefore, this information is missing for $5,227,075$ public school students. Race/ethnicity categories exclude persons of Hispanic origin unless otherwise specified. For a comparison of poverty definitions, see appendix B. SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Public Elementary/Secondary School Universe Survey," 2003-04.

${ }^{1}$ Includes other racial/ethnic groups not separately shown.
NOTE: The National School Lunch Program is a federally assisted meal program. To be eligible, a student must be from a household with an income at or below 130 percent of the poverty threshold for free lunch or between 130 percent and 185 percent of the poverty threshold for reduced-price lunch. Approximately 13,704 public schools did not report information on the number of students eligible for a free or reduced-price school lunch. Therefore, this information is missing for $5,227,075$ public school students. For a comparison of poverty definitions, see appendix B. Race/ethnicity categories exclude persons of Hispanic origin unless otherwise specified. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999. Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua 2k.html. Detail may not sum to totals because of rounding.

### 1.10. Public school students with limited English proficiency

## A smaller proportion of public school students in rural areas were identified as limited English proficient (LEP) than in any other locale in 2003-04.

During the 2003-04 school year, 3.8 million public school students in the United States were identified as limited English proficient (LEP), meaning they did not use English as their primary language or had limited ability to read, speak, write, or understand English (table 1.10). Those students made up 8 percent of the total student population, but among rural students, LEP students made up 2 percent of the student popula-tion-the lowest percentage of all locales.

LEP students constituted a larger percentage of the public school student population in cities (14 percent) than in suburban areas ( 7 percent), towns ( 5 percent), or rural areas ( 2 percent). Of all LEP students in the United States, 52 percent attended public schools in cities, while 34 percent attended public schools in suburban areas, 9 percent in towns, and 6 percent in rural areas.

|  | Percentage of public <br> school students who <br> were identified as LEP |
| :--- | ---: |
| Locale | 14 |
| City | 7 |
| Suburban | 5 |
| Town | 2 |
| Rural |  |

Of the four major U.S. regions, the West had the largest percentage of LEP students ( 18 percent), followed by the South ( 6 percent), the Northeast ( 5 percent), and the Midwest ( 4 percent). In each region besides the Midwest, rural public schools enrolled a lower percentage of LEP students than public schools in any other locale. In the Midwest, however, there was no measurable difference between the percentages of LEP students in town and rural public schools. In the Midwest, South, and West, the proportions of LEP students in town and rural public schools were higher than in the Northeast.

LEP students often do not speak English at home. In 2004, some 19 percent of children ages 5-17 spoke a language other than English at home and 5 percent of children these ages had difficulty speaking English (table $\mathrm{A}-1.10$ ). The percentages of children in rural areas who spoke a language other than English at home (7 percent) and who had difficulty speaking English ( 2 percent) were lower than those for children in cities ( 29 and 9 percent, respectively), suburban areas ( 19 and 5 percent, respectively), and towns ( 12 and 3 percent, respectively).

Within each racial/ethnic group (except within the American Indian/Alaska Native group, where no measurable difference was observed), smaller percentages of children ages 5-17 in rural areas than in cities spoke a language other than English at home or spoke English with difficulty.

Table 1.10. Number and percentage of public school students who were identified as limited English proficient (LEP), by locale and region: 2003-04

| Rural | 108,000 | 9.7 | 5.4 |

! Interpret with caution.
NOTE: Does not include prekindergarten, postsecondary, or adult education students. Limited English proficient (LEP) refers to students whose native or dominant language is a language other than English and whose difficulty speaking, reading, writing, or understanding the English language is sufficient enough as to deny them the opportunity to learn successfully in an English-only classroom. Detail may not sum to totals because of rounding. SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, "Public School Questionnaire," 2003-04.

### 1.11. Public school students with disabilities

Across locales, there was little variation in 2003-04 in the percentage of public school students identified
with disabilities that were addressed through an Individual Education Program (IEP).

In 2003-04, approximately 6.1 million public school students across the United States were identified with disabilities that were addressed through an Individual Education Program (IEP) (table 1.11). This number represented about 13 percent of the total number of public school students. An IEP is required for all public school students with an identified disability

| Locale | Percentage of public <br> school students with IEPs |
| :--- | ---: |
| City | 13 |
| Suburban | 12 |
| Town | 14 |
| Rural | 13 |

under the Individuals with Disabilities Education Act of 2004 (IDEA). IDEA is intended to "support states and localities in protecting the rights of, meeting the individual needs of, and improving the educational outcomes of infants, toddlers, children, and youth with disabilities and their families" (U.S. Department of Education 2006).

Generally, there was little variation among the percentages of public school students with an IEP in the different locales (the percentages ranged from 12 to 14 percent). The percentages of such students in towns and rural areas who had an IEP (14 and 13 percent, respectively) were higher than in suburban areas (12 percent).

Table 1.11. Number and percentage of public school students with Individual Education Programs (IEPs), by locale: 2003-04

### 1.12. Parental participation in school-related activities

In 2003, greater percentages of rural students had parents who attended a school event or served as a volunteer or on a committee than did students in cities, while a smaller percentage of rural students than suburban students had parents who attended a general school meeting.

In 2003, the National Household Education Survey (NHES) asked parents of elementary and secondary public and private school students about their participation in four school-related activities since the beginning of the school year: attending a general school meeting, attending a scheduled meeting with their child's teacher, attending a school event, and serving as a volunteer or on a committee. In all locales, over 80 percent of students had parents who reported that they attended a general meeting, and most students (between 65 and 78 percent in all locales) had parents who reported that they attended a scheduled meeting with a teacher and attended a school event (table 1.12 and figure 1.12). The least commonly reported activity (under 50 percent in all locales) was serving as a volunteer or on a committee.

In all locales, higher percentages of students in kindergarten through 5th grade had parents who reported participating in each type of school-related activity than did students in 6th through 12th grades, with one exception. No significant difference was found between the percentage of students in kindergarten
through 5th grade and the percentage of students in 6th through 12th grades in towns whose parents reported attending a school event.

A higher percentage of students in rural areas had parents who reported serving as a volunteer or on a committee ( 42 percent) than did students in cities (38 percent) (table 1.12 and figure 1.12). A higher percentage of rural students also had parents who reported attending a school event ( 74 percent) than did students in cities ( 65 percent). No measurable differences were detected between rural areas and suburbs and towns in the percentages of students whose parents participated in these two activities. The percentage of rural students with parents who reported attending a general school meeting ( 86 percent) was less than the percentage of suburban students with parents who reported doing so ( 90 percent), but was not measurably different than the percentage of students in towns and cities with parents who reported doing so. No measurable differences were found between the percentages of students in each locale with parents who reported attending a scheduled meeting with a teacher.

Table 1.12. Percentage of public and private elementary and secondary students whose parents reported participation in school-related activities, by selected school activity, grade level, and locale: 2003

| Grade and locale | Attended general meeting | Attended scheduled meeting with teacher | Attended school event | Acted as a volunteer or served on a committee | Indicated involvement in any of the four activities |

### 1.13. Family outings

In 2003, a greater proportion of students in rural areas had parents who reported taking their children to an athletic event outside of school than students in cities and suburbs. A smaller percentage of students in rural areas and towns than students in cities and suburbs had parents who reported taking their children to a library or visiting a zoo or aquarium.

In 2003, the National Household Education Survey (NHES) asked parents of elementary and secondary public and private school students about their participation in certain activities outside of school and home. Nationally, 44 percent of elementary and secondary school students had parents who reported visiting a library with their children in the past month; 38 percent had parents who reported attending an athletic or sporting event; 35 percent had parents who reported going to a play, concert, or live show; 20 percent had parents who reported visiting an art gallery, museum, or historical site; and 12 percent had parents who reported visiting a zoo or aquarium (table 1.13). In rural areas, 42 percent of students had parents who reported attending an athletic event with their children; 38 percent had parents who reported visiting a library; 34 percent had parents who reported going to a play, concert, or live show; 15 percent had parents who reported visiting an art gallery, museum, or historical site; and 8 percent had parents who reported visiting a zoo or aquarium (figure 1.13).

A larger percentage of rural students ( 42 percent) than suburban students ( 38 percent) and city students ( 34 percent) had parents who reported attending athletic
events with their children. There were no measurable differences between the percentage of students in rural areas ( 34 percent) with parents who reported taking their children to a play, concert, or live show and the percentages of students in cities ( 35 percent), suburbs ( 36 percent), and towns ( 34 percent) with parents who reported attending these events. No measurable differences existed between the percentages of students in rural areas and students in towns whose parents reported participating in any of the selected activities.

A smaller percentage of students in rural areas and towns had parents who reported visiting a library with their children ( 38 percent in both areas) than students in cities ( 48 percent) and suburban areas ( 47 percent). A lower percentage of students in rural areas (15 percent) also had parents who reported having visited an art gallery, museum, or historical site with their children than students in suburbs ( 21 percent) or cities ( 22 percent). Similarly, a lower percentage of students in rural areas ( 8 percent) had parents who reported having visited a zoo or aquarium with their children, compared with students in suburbs (14 percent) and cities ( 15 percent).

Table 1.13. Percentage of public and private elementary and secondary students whose parents reported outings with their children in the past month, by selected activity and locale: 2003

| Locale | Attended an athletic/sporting event(outsideof school) inwhich child |  | Went to a play, concert, or live show | Visited an art gallery, museum, or historical site | Visited a zoo or aquarium |

### 1.14. Parents' educational attainment

In 2004, a larger percentage of school-age children in rural areas had a mother or father who completed high school as their highest level of educational attainment than their peers in cities and suburbs. The percentage of school-age children with a mother or father with a bachelor's degree as their highest attainment was lower in rural areas than in suburban areas.

In 2004, some 11 percent of school-age children (ages $6-18$ ) in rural areas had mothers who did not have a high school diploma (or its equivalent), 33 percent had mothers whose highest educational attainment was a high school diploma (or its equivalent), 35 percent had mothers whose highest attainment was some college or an associate's degree, and 21 percent had mothers who had completed a bachelor's degree or higher (table 1.14 and figure 1.14).

The percentage of school-age children whose mothers did not complete high school was smaller in rural areas (11 percent) than in cities ( 21 percent) or towns ( 16 percent). The percentage of these children whose mothers had a bachelor's degree as their highest educational attainment was smaller in rural areas ( 15 percent) than in suburban areas ( 22 percent), higher in rural areas than in towns ( 14 percent), and similar in rural areas and cities.

In contrast, the percentage of school-age children whose mothers' highest educational attainment was high school completion was larger in rural areas ( 33 percent) than in suburban areas ( 25 percent) and cities ( 26 percent). This same pattern was observed for children whose mothers' highest attainment was some college or an associate's degree.

Across locales, the percentage of school-age children whose fathers did not complete high school was lower in rural areas ( 13 percent) than in cities ( 20 percent) and towns ( 15 percent), while the percentage in rural areas was higher than in suburban areas ( 11 percent). A higher percentage of rural children had fathers who completed a high school diploma (or equivalent) as their highest level of attainment ( 36 percent) than children in suburban areas ( 24 percent), cities ( 24 percent), and towns ( 31 percent).

The percentage of school-age children whose fathers had completed some college or an associate's degree as their highest attainment was greater in rural areas ( 29 percent) than in cities ( 25 percent) and suburban areas ( 27 percent). In contrast, a lower percentage of rural children had fathers who completed a bachelor's degree ( 14 percent) than suburban children ( 23 percent) and children in cities (18 percent). No differences were detected between children in rural areas and towns in the percentages of children whose fathers had completed these levels of educational attainment as their highest attainment.

Table 1.14. Percentage distribution of children ages $\mathbf{6}$ to 18, by parents' highest level of education and locale: 2004

| Parent and locale | Total | Less than high school diploma or equivalent ${ }^{1}$ | High school diploma or equivalent or higher |  |  |  |  |  |

Parent
and locale

[^6]
### 1.15. Parental expectations of educational attainment

While a larger percentage of high school students in all locales in 2003 had parents who expected their child's highest educational attainment to be a bachelor's degree than any other level of attainment, a greater proportion of rural students than students in cities and suburbs had parents who expected their child's highest attainment to be less than a bachelor's degree.

In 2003, the National Household Education Survey (NHES) asked parents of elementary and secondary public and private school students about their educational expectations for their children. Nationally, a larger percentage of students had parents who reported that they expected their child's highest level of educational attainment to be a bachelor's degree (39 percent) than the percentage of students whose parents reported that they expected their child's highest level of educational attainment to be a graduate or professional degree ( 30 percent), completion of 2 or more years of college ( 16 percent), a high school diploma (8 percent), and attendance at a vocational or technical school after high school ( 7 percent) (table 1.15). Less than one percent of students in all locales had parents who expected their child to receive less than a high school diploma. In rural areas, the ranking of parental expectations mirrored the national rates: the largest percentage of students had parents who expected their child to complete a bachelor's degree ( 37 percent), followed by a graduate or professional degree (21 percent), 2 years or more of college ( 20 percent), a high school diploma ( 11 percent), and attendance at a vocational or technical school (10 percent).

There were no measurable differences between the percentage of rural students with parents expecting
their child's highest attainment to be a bachelor's degree ( 37 percent) and the percentages of students with parents having similar expectations in cities ( 36 percent) and towns ( 39 percent); however, the percentage of rural students having parents with such expectations was lower than the percentage of suburban students ( 37 vs .41 percent) (figure 1.15). A smaller percentage of rural students also had parents who reported expecting their child to earn a graduate or professional degree as their highest level of attainment ( 21 percent) than students in cities or suburban areas (both 34 percent). As with all other levels of parental educational expectations, no measurable differences were found in the percentages of students in rural areas and towns with parents who expected their child to attain a graduate or professional degree.

A greater percentage of students in rural areas had parents who reported expecting their child to complete high school as their highest level of educational attainment ( 11 percent) than students in cities ( 8 percent) or suburban areas ( 5 percent). This pattern was also true among students with parents who reported expecting their child's highest attainment to be 2 or more years of college ( 20 percent for rural vs. 15 and 13 percent for cities and suburban areas, respectively) or attendance at a vocational or technical school (10 percent vs. 7 and 6 percent, respectively).

## 2 <br> Outcomes

The indicators in this chapter focus on a range of learner outcomes, including assessment scores from the 2005 National Assessment of Educational Progress (NAEP); dropout and graduation rates for high school students; and college enrollment, labor force participation, and unemployment rates. These indicators show that, on average, public school students in rural areas perform better than their peers in cities, but generally not as well as their peers in suburban areas, as measured by 4th- and 8 th-grade reading, mathematics, and science assessment scores and high school graduation rates (indicators 2.1-2.3 and 2.5). Generally, a smaller percentage of high school graduates in rural areas enroll in college than graduates in
any other locale, and a smaller percentage of rural adults have a bachelor's degree than their peers in cities and suburbs (indicators 2.7 and 2.9).

The unemployment rate for older adults is lower in rural areas than in all other locales, and the unemployment rate for younger adults is lower in rural areas than in cities and towns (indicator 2.11). In addition, regardless of educational attainment, median earnings (when adjusted for geographic cost differences) for adults who worked full-time, all year, are generally higher in rural areas than in cities and towns, but lower in rural areas than in suburban areas (indicator 2.10).

### 2.1. National Assessment of Educational Progress (NAEP) reading achievement

The proportion of public school students in rural areas in the 4th and 8th grades that read at or above the
Proficient level in 2005 was larger than in cities and towns, but smaller than in suburban areas.

Nationwide, some 30 percent of 4th-grade public school students scored at or above the Proficient level on the 2005 NAEP reading assessment (table 2.1). The percentage of such 4th-graders in rural areas scoring at this achievement level ( 31 percent) was larger than in towns ( 28 percent) and cities ( 24 percent), but
smaller than in suburban areas ( 34 percent). Within rural locales, a higher percentage of such 4th-graders in fringe rural areas scored at or above the Proficient level (34 percent) than in distant rural areas ( 30 percent) or remote rural areas ( 27 percent).

Figure 2.1a. Percentage distribution of 4th-grade public school students across NAEP reading achievement levels, by locale: 2005

NOTE: For information on NAEP, including technical aspects of scoring and assessment validity and more specific information on achievement levels, see http://nces.ed.gov/nationsreportcard. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua_2k.html. SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2005 Reading Assessment.

The pattern for 8th-grade public school students who scored at or above Proficient in reading was similar to that for 4 th-graders, with 29 percent of such 8th-graders in the United States scoring at this level overall. The percentage of 8 th-graders in rural areas scoring at or above the Proficient level (30 percent)
was larger than in towns ( 27 percent) and cities (23 percent), but smaller than in suburban areas ( 34 percent). Additionally, a higher percentage of public school 8th-graders in fringe rural areas scored at or above the Proficient level (31 percent) than in remote rural areas (29 percent).

Figure 2.1b. Percentage distribution of 8th-grade public school students across NAEP reading achievement levels, by locale: 2005

[^7]Across the nation, 34 percent of 12 th-grade public school students scored at or above Proficient in reading. A lower percentage of such 12 th-graders scored at this level in rural areas ( 33 percent) than in suburbs ( 37 percent). There were no measurable differences between the percentages of public school 12th-grad-
ers achieving at this level in rural areas and in towns and cities, or between the percentages of such 12thgraders scoring at this level in each of the three rural locales. Many of the apparent differences between these groups were not statistically significant due to large standard errors.

### 2.2. National Assessment of Educational Progress (NAEP) mathematics achievement

#### Abstract

A larger proportion of public school students in rural areas in the 4th, 8th, and 12th grades in 2005 scored at or above the Proficient level in mathematics than their peers in cities. However, at all three grade levels, smaller percentages of rural public school students scored at this achievement level than did their suburban peers.

Nationwide, some 35 percent of 4th-grade public school students scored at or above the Proficient level on the 2005 NAEP mathematics assessment (table 2.2). The percentage of such 4th-graders scoring at this achievement level in rural areas ( 36 percent) was larger than in cities ( 29 percent), but was smaller than in suburban areas ( 41 percent). No measurable
difference was detected between the percentages of 4th-graders in rural areas and towns achieving at this level. Within rural locales, higher percentages of public school 4th-graders in fringe rural areas scored at or above the Proficient level (38 percent) than in distant rural areas ( 35 percent) or remote rural areas (32 percent).

Figure 2.2a. Percentage distribution of 4th-grade public school students across NAEP mathematics achievement levels, by locale: 2005

NOTE: For information on NAEP, including technical aspects of scoring and assessment validity and more specific information on achievement levels, see http://nces.ed.gov/nationsreportcard. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua 2 k .html. SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2005 Mathematics Assessment.

The percentages of 8th-grade public school students scoring at or above the Proficient level in mathematics followed a similar pattern. Nationally, 29 percent of such 8th-graders scored at this level. The percentage of 8th-graders reaching the Proficient level or above in rural areas ( 29 percent) was larger than in both towns
(26 percent) and cities ( 23 percent), but was smaller than in suburban areas ( 33 percent). Within rural locales, a higher percentage of public school 8th-graders in fringe rural areas scored at this achievement level ( 31 percent) than in distant rural areas ( 27 percent) or remote rural areas ( 26 percent).

Figure 2.2b. Percentage distribution of 8th-grade public school students across NAEP mathematics achievement levels, by locale: 2005

[^8] http://nces.ed.gov/nationsreportcard. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua 2k.html SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2005 Mathematics Assessment.

The proportion of 12 th-grade public school students in rural areas scoring at or above the Proficient level in mathematics ( 21 percent) was greater than in cities (18 percent), but smaller than in suburban areas ( 25 percent). No difference was detected between the
percentages of such 12 th-graders in rural areas and towns achieving this level or among the percentages of 12th-graders scoring at this level in the three different rural locales.

### 2.3. National Assessment of Educational Progress (NAEP) science achievement

#### Abstract

A larger proportion of public school students in rural areas in the 4th, 8th, and 12th grades in 2005 scored at or above the Proficient level in science than did their peers in cities. There were no measurable differences between the percentages of rural and suburban public school students scoring at the Proficient level in any of the three grade levels.

Nationwide, 27 percent of 4th-grade public school students scored at or above the Proficient level on the 2005 NAEP science assessment (table 2.3). The percentage of such 4th-graders scoring at this level in rural areas ( 32 percent) was larger than in towns (27 percent) or cities (19 percent). There was no measurable difference between the percentages of

4th-graders in rural and suburban areas achieving at or above the Proficient level. Within rural areas, a larger percentage of public school 4th-graders in fringe rural areas scored at this level (34 percent) than their peers in distant rural ( 30 percent) and remote rural (28 percent) areas.

Figure 2.3a. Percentage distribution of 4th-grade public school students across NAEP science achievement levels, by locale: 2005

! Interpret data with caution.
NOTE: For information on NAEP, including technical aspects of scoring and assessment validity and more specific information on achievement levels, see http://nces.ed.gov/nationsreportcard. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua_2k.html. SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2005 Science Assessment.

The pattern for 8th-grade public school students scoring at or above Proficient in science was similar to that for 4 th-graders, with 27 percent of such 8th-graders in the United States scoring at or above this level. Again, a larger percentage of 8th-graders in rural areas scored at or above the Proficient level (30 percent)
than in towns (28 percent) and cities (19 percent). There were also no measurable differences between the percentages of public school 8th-graders in rural and suburban areas scoring at this level or between the percentages of such 8th-graders achieving at this level in each of the three rural locales.

Figure 2.3b. Percentage distribution of 8th-grade public school students across NAEP science achievement levels, by locale: 2005

! Interpret data with caution.
NOTE: For information on NAEP, including technical aspects of scoring and assessment validity and more specific information on achievement levels, see http://nces.ed.gov/nationsreportcard. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua 2k.html SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2005 Science Assessment.

Among 12th-grade public school students nationally, 17 percent scored at or above the Proficient level in science. A greater proportion of such 12th-graders achieved at this level in rural areas ( 18 percent) than in cities ( 13 percent), but there were no measurable differences in the percentages of 12 th-graders in rural
areas, towns, and suburbs who scored at this level. There were also no measurable differences between the percentages of public school 12th-graders in each of the three rural locales scoring at or above the Proficient level.

### 2.4. High school status dropouts

The high school status dropout rate among 16- to 24-year-olds in rural areas in 2004 was higher than in
suburban areas, but lower than in cities.

This indicator examines the high school status dropout rate of 16 - to 24 -year-olds. The high school status dropout rate is defined as the percentage of individuals who are not enrolled in high school and have not earned a high school credential (either a diploma or an equivalency credential such as a General Educational Development [GED] certificate). ${ }^{3}$ In 2004, some 11 percent of all 16 - to 24 -year-olds nationally were high school status dropouts (table 2.4). The status dropout rate in rural areas ( 11 percent) was higher than in suburban areas ( 9 percent), but lower than in cities ( 13 percent). No measurable difference was detected between the status dropout rate in rural areas and towns.

In each locale, the high school status dropout rate among 16 - to 24 -year-olds living below the poverty threshold ( $16-23$ percent) was greater than among
those living above 185 percent of the poverty threshold ( $6-9$ percent) (figure 2.4a) (for a comparison of poverty definitions see appendix B). In addition, in rural and suburban areas, the high school status dropout rate in this age group was greater among those living in poverty ( 23 and 18 percent, respectively) than among those living between 100 and 185 percent of the poverty threshold (17 and 15 percent, respectively). Among those living in poverty, a larger percentage of 16 - to 24 -year-olds in rural areas were status dropouts ( 23 percent) than in towns ( 16 percent), cities ( 18 percent), and suburban areas ( 18 percent). In contrast, among those living above 185 percent of the poverty threshold, the percentage of 16 - to 24 -year-olds in rural areas who were status dropouts ( 7 percent) was smaller than in cities ( 9 percent) and towns ( 8 percent), but still larger than in suburban areas ( 6 percent).

Figure 2.4a. Percentage of 16- to 24-year-olds who were high school status dropouts, by poverty level and locale: 2004

NOTE: The data presented here represent the status dropout rate, which is the percentage of civilian, noninstitutionalized 16- to 24-year-olds who are not in high school and who have not earned a high school credential (either a diploma or equivalency credential such as a GED). The status dropout rate includes all dropouts regardless of when they last attended school, as well as individuals who may have never attended school in the United States, such as immigrants who did not complete a high school diploma in their home country. For a comparison of poverty definitions and measures of educational attainment, see appendix B. SOURCE: U.S. Department of Commerce, Census Bureau, American Community Survey, 2004, previously unpublished data.

| Town | 12.1 | 16.5 | 15.5 | 8.4 |
| Rural | 11.1 | 23.2 | 17.1 | 6.9 |

NOTE: The data presented here represent the status dropout rate, which is the percentage of civilian, noninstitutionalized 16 - to 24 -year-olds who are not in high school and who have not earned a high school credential (either a diploma or equivalency credential such as a GED). The status dropout rate includes all dropouts regardless of when they last attended school, as well as individuals who may have never attended school in the United States, such as immigrants who did not complete a high school diploma in their home country. For a comparison of poverty definitions and measures of educational attainment, see appendix B.
SOURCE: U.S. Department of Commerce, Census Bureau, American Community Survey, 2004, previously unpublished data.

The status dropout rate for 16 - to 24 -year-olds showed considerable variations across racial/ethnic groups. $\mathrm{Na}-$ tionally, 8 percent of Whites, 12 percent of Blacks, 24 percent of Hispanics, 4 percent of Asians, and 17 percent of American Indian/Alaska Natives were high school status dropouts in 2004 (figure 2.4b and table A-2.4).

A higher percentage of White 16- to 24-year-olds in rural areas were status dropouts ( 10 percent) than in
suburban areas ( 6 percent), cities ( 7 percent), and towns ( 9 percent). For Black 16-to 24 -year-olds, the status dropout rate in rural areas ( 14 percent) was higher than in suburban areas ( 9 percent), but was not measurably different from that in cities and towns. No measurable differences were found between the status dropout rate for Hispanic 16- to 24-year-olds in rural areas and in the other locales.

Figure 2.4b. Percentage of $\mathbf{1 6}$ - to 24 -year-olds who were high school status dropouts, by race/ethnicity and locale: 2004

[^10]
### 2.5. Public high school graduation

The averaged freshman graduation rate for public high schools during the 2002-03 school year was higher in rural areas than in cities, but was lower in rural areas than in towns and suburbs.

Nationally, during the 2002-03 school year, the averaged graduation rate ${ }^{4}$ for the freshman class of 1999-2000 was 73 percent (figure 2.5). The averaged freshman graduation rate was higher in rural areas ( 75 percent) than across the nation as a whole. This rate was higher in rural areas than in cities ( 65 percent), but was lower in rural areas than in towns and suburbs ( 76 and 79 percent, respectively).

Among the three rural locale types, the averaged freshman graduation rate was higher in remote rural areas (79 percent) than in distant rural and rural fringe areas ( 75 and 74 percent, respectively). The averaged freshman graduation rates in distant rural and rural fringe areas were lower than the rates in suburbs and towns. However, the averaged freshman graduation rate in remote rural areas was higher than the rate in towns and was comparable to the rate in suburban areas.

[^11]Figure 2.5. Averaged freshman graduation rate for public high school students, by locale: 2002-03

NOTE: The averaged freshman graduation rate provides an estimate of the percentage of public high school students who graduate on time. The rate is the number of graduates divided by the estimated count of freshmen 4 years earlier. The estimated averaged freshman enrollment count is the sum of the number of 8th-graders 5 years earlier, the number of 9th-graders 4 years earlier (because this is when current year seniors were freshmen), and the number of 10 th-graders 3 years earlier, divided by 3 . (Enrollment counts used for these calculations include a proportional distribution of students not enrolled in a specific grade.) The averaging is intended to account for higher grade retentions in the 9th grade. Graduates include only those who earned regular diplomas or diplomas for advanced academic achievement (e.g., honors diplomas) as defined by the state or district. This measure is sensitive to in and out migration at the school district level. Data in this table reflect totals reported by schools and school districts and may differ slightly from data calculated from state reported summaries. For a comparison of measures of educational attainment, see appendix B. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua 2k.html.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Public Elementary/Secondary School Universe Survey," 2003-04.

### 2.6. Teens neither enrolled in school nor employed

In 2004, the percentage of teenagers in rural areas who were neither enrolled in school nor employed was
higher than in suburban areas, lower than in cities, but not measurably different than in towns.

In 2004, approximately 5.5 percent of persons ages 16 to 19 were neither enrolled in school nor working in the labor market (table 2.6). The percentage of rural teenagers who were neither enrolled nor employed ( 5.8 percent) was greater than the percentage in suburban areas ( 4.3 percent), lower than the percentage in cities ( 6.6 percent), but not measurably different from the percentage in towns ( 5.9 percent).

Nationally, a larger percentage of females ages 16 to 19 were neither enrolled nor employed ( 6.1 percent) than males ( 4.9 percent). While this same difference existed between male and female teenagers in cities and towns, there was no measurable difference between the percentages of male and female teenagers in rural or suburban areas who were neither enrolled
nor employed. The apparent difference between these percentages in rural areas may not be statistically significant due to large standard errors.

A greater percentage of rural males ages 16 to 19 were neither enrolled nor employed ( 5.4 percent) than suburban males ( 4.0 percent), while no difference was detected between these rural males and their peers in cities or towns (figure 2.6). Like males, the percentage of female teenagers in rural areas who were neither enrolled nor employed ( 6.3 percent) was greater than in suburban areas ( 4.6 percent) and not measurably different than in towns ( 6.7 percent). However, unlike males, the percentage of such females in rural areas was smaller than in cities ( 7.6 percent).

Table 2.6. Percentage of persons ages 16-19 who were neither enrolled in school nor working, by sex and locale: 2004

| Locale | Total | Male | Female |
| :--- | ---: | ---: | ---: |

### 2.7. College enrollment rates

College enrollment rates for both 18-to 24-year-olds and 25- to 29-year-olds were generally lower in rural areas than in all other locales in 2004. In rural areas, as in the nation as a whole, females enrolled in postsecondary education at a higher rate than males.

In 2004, approximately 34 percent of all 18 - to 24 -year-olds were enrolled in colleges or universities. The college enrollment rate in rural areas ( 27 percent) was lower than the rate in cities (37 percent), suburban areas ( 37 percent), or towns ( 32 percent) (table 2.7). ${ }^{5}$

A higher percentage of all 18 - to 24 -year-old females enrolled in a college or university ( 38 percent) than did their male peers ( 31 percent). This finding also held true within each locale (figure 2.7). For example, within rural areas, 31 percent of females in this age group were enrolled in postsecondary education, compared with 23 percent of males.

Among 25 - to 29 -year-olds, 10 percent were enrolled in undergraduate programs and another 5 percent were enrolled in graduate programs (including professional
programs) (table 2.7). The undergraduate enrollment rate for this age group was lower in rural areas (8 percent) than in all other locales ( $10-11$ percent). The percentage of 25 - to 29 -year-olds enrolled in graduate programs was also lower in rural areas ( 3 percent) than in cities ( 7 percent) and suburban areas ( 5 percent), but was not measurably different from the percentage in towns.

The enrollment rate for 25 - to 29-year-old females was higher than the enrollment rate for their male peers at both the undergraduate level (11 vs. 9 percent) and the graduate level ( 6 vs. 5 percent). This finding also held true in rural areas, where 9 percent of females and 6 percent of males were enrolled in undergraduate programs, while 3 percent of females and 2 percent of males were enrolled in graduate programs.

Table 2.7. Percentage of persons ages 18-29 enrolled in colleges or universities, by age group, locale, and sex: 2004

| Locale and sex | Ages 18-24 | Ages 25-29 |  |
| :---: | :---: | :---: | :---: |
|  | Enrolled in any program | Enrolled in undergraduate programs | Enrolled in graduate or professional programs |
| Total | 34.2 | 10.1 | 5.2 |
| City | 36.6 | 10.6 | 6.8 |
| Suburban | 36.6 | 10.3 | 5.2 |
| Town | 31.8 | 11.2 | 3.2 |
| Rural | 27.1 | 7.8 | 2.6 |

### 2.8. Adult education

Forty percent of adults in rural areas participated in some type of formal educational activity in 2005. A smaller percentage of rural adults than suburban adults took work-related courses or courses for personal interest and a smaller percentage of rural adults than adults in both cities and suburban areas participated in part-time college or university credential programs.

In 2005, 44 percent of persons nationwide age 16 and over participated in some form of adult educational activities (table 2.8). In rural areas, 40 percent of such persons participated in some form of adult educational activities (figure 2.8). Adult educational activities include all formal educational activities led by an instructor, excluding full-time participation for any part of the year in a postsecondary credential program. They include English as a Second Language (ESL) classes, basic skills or General Educational Development (GED) preparation classes, part-time postsecondary or vocational programs, apprenticeship programs, work-related courses, and personal interest courses. The percentage of adults participating in such educational activities in rural areas was less than the percentage participating in suburban areas ( 47 percent) and cities ( 46 percent), but was not measurably different from the percentage participating in towns (42 percent).

The most common adult educational activity was work-related coursework, with 27 percent of all adults participating in these courses (table 2.8). Nationally, adults also enrolled in personal interest courses ( 21 percent), college or university credential programs (5
percent), and other activities (3 percent). This "other activities" category includes activities such as basic skills training, ESL classes, and apprenticeships. Adults in rural areas followed participation patterns similar to those of the nation as a whole: work-related courses were the most common type of educational activity (24 percent), followed by personal interest courses (18 percent), part-time college or university credential programs (3 percent), and other activities ( 2 percent).

A lower percentage of adults in rural areas (3 percent) than in cities and suburban areas (both 6 percent) participated in part-time college or university credential programs (figure 2.8). In addition, a smaller proportion of adults in rural areas than in suburban areas participated in work-related courses ( 24 vs. 30 percent) or participated in courses for personal interest (18 vs. 23 percent). Also, a smaller percentage of adults in rural areas than adults in cities participated in other activities ( 2 vs. 5 percent). There were, however, no measurable differences between adults in rural areas and towns in terms of the percentages participating in any of the selected educational activities.

Table 2.8. Percentage of adults age 16 or older who participated in adult educational activities, by type of activity and locale: 2005

| Locale |  | Type of adult educational activity |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Overall participation | College or university credential programs ${ }^{1}$ | Work-related courses | Personal interest courses | Other activities ${ }^{2}$ |
| Total | 44.4 | 5.0 | 26.9 | 21.4 | 3.3 |
| City | 45.8 | 5.7 | 26.3 | 22.5 | 4.6 |
| Suburban | 46.9 | 5.8 | 29.7 | 23.4 | 2.6 |
| Town | 41.8 | 4.2 ! | 25.6 | 18.5 | 3.6 ! |
| Rural | 39.6 | 3.3 | 24.2 | 18.4 | 2.2 ! |

[^12]Figure 2.8. Percentage of adults age 16 or older who participated in adult educational activities, by type of activity and locale: 2005

! Interpret data with caution.
${ }^{1}$ Full-time participation for all or part of the year in a college or university credential program or a vocational or technical diploma program was not counted as an adult educational activity. However, individuals who were enrolled part-time in a college or university credential program or vocational or technical diploma program were included in the denominator.

### 2.9. Educational attainment

In 2004, the percentage of adults with a bachelor's degree as their highest educational level was lower in rural areas than the national percentage.

In 2004, across the nation some 16 percent of adults age 25 and over lacked a high school credential, 30 percent had completed only high school (with a diploma or its equivalent), 27 percent had completed some college or an associate's degree, 17 percent had earned a bachelor's degree as their highest level of educational attainment, and 10 percent had a graduate or professional degree (table 2.9a).

In rural areas, the percentage of adults age 25 and over who lacked a high school credential (17 percent) was one percentage point higher than the national figure. No measurable differences were detected between the rural and national percentages of adults who had some college or an associate's degree as their highest level
of attainment. Smaller percentages of rural adults (compared with the national percentages) had earned either a bachelor's degree ( 13 percent) or a graduate or professional degree ( 7 percent) as their highest educational attainment level.

Smaller percentages of adults in rural areas had a bachelor's degree or higher than did adults in cities and suburbs at all age groups. For example, 21 percent of adults ages 25-34 in rural areas had a bachelor's degree or higher, compared with 34 percent each in cities and suburbs (figure 2.9a). No substantive differences were found between the percentages of adults with a bachelor's degree or higher in rural and town locales, except among adults ages 45-54 and adults age 65 and over.

Figure 2.9a. Percentage distribution of adults ages 25-34 and 65 and over, by locale and highest level of educational attainment: 2004

[^13]Overall and within each locale, adults age 65 and over had lower educational attainment than younger adults (table 2.9a). For example, among adults in rural areas, 13 percent of adults age 65 and over had a bachelor's degree or higher, compared with 21 percent of adults ages 45-54 years old and 20 percent of adults ages

55-64 years old. Thirty-three percent of rural adults age 65 and over did not have a high school diploma (or equivalent), compared with 13 percent of rural adults ages $25-34$, 12 percent of those ages 45-54, and 17 percent of those ages 55-64.

Within each locale, a larger percentage of adults with incomes above 185 percent of the poverty threshold had a bachelor's degree or higher than did adults below the poverty threshold and adults between 100 and 185 percent of the poverty threshold. For example, in rural areas, 6 percent of adults with incomes below the poverty threshold and 7 percent of adults with incomes between 100 and 185 percent of the poverty threshold had a bachelor's degree or higher, while 23 percent of adults with incomes above 185 percent
of the poverty threshold had a bachelor's degree or higher (table 2.9 b and figure 2.9 b ).

In rural areas, 12 percent of adults with incomes above 185 percent of the poverty threshold lacked a high school credential, compared with 38 percent of adults with incomes below the poverty threshold and 32 percent of those with incomes between 100 and 185 percent of the poverty threshold (for a comparison of poverty definitions see appendix B).

### 2.10. Median earnings

#### Abstract

People with higher levels of educational attainment had higher annual median earnings in 2004, regardless of sex and locale. Persons in rural areas generally had higher median earnings than those in cities and towns, but lower median earnings than those in suburban areas, regardless of educational attainment.

In 2004, the median annual earnings for all fulltime, full-year workers over the age of 25 in the United States was $\$ 38,600$ (table 2.10a). Nationally, among such workers, those with higher educational attainment had higher median earnings than those with lower educational attainment: the median earnings of those with a graduate or professional degree $(\$ 67,200)$ was higher than that of those with a bachelor's degree ( $\$ 51,500$ ), those with some college or an associate's degree ( $\$ 37,300$ ), those with a high school diploma or equivalent ( $\$ 31,100$ ), and those with less than a high school diploma ( $\$ 23,700$ ).

In order to accurately compare earnings among such workers across various locales, the data presented in this analysis have been adjusted to reflect geographic cost differences (such as cost-of-living differences). ${ }^{6}$ The median earnings in rural areas $(\$ 39,000)$ was higher than that in cities $(\$ 35,700)$ and towns ( $\$ 36,500$ ), but was lower than that in suburban areas $(\$ 40,200)$. This pattern held true at each level of educational attainment, with two exceptions. Among workers with less than a high school diploma or
equivalent, the median earnings for those in rural areas $(\$ 28,200)$ was higher than for those in towns ( $\$ 25,100$ ), suburbs ( $\$ 24,400$ ), and cities $(\$ 20,900)$ (figure 2.10a). In addition, the median earnings of those with a high school diploma or its equivalent as their highest level of education was higher in rural areas $(\$ 33,800)$ than in suburban areas $(\$ 31,900)$, towns $(\$ 31,600)$, and cities $(\$ 28,700)$.

In 2004, the median earnings for full-time, full-year employed males over the age of $25(\$ 42,900)$ were higher than the median earnings for such females $(\$ 32,300)$ (table 2.10b and figure 2.10b). This difference was observed in all locales and at all levels of educational attainment. For males, the median earnings in rural areas $(\$ 44,800)$ were higher than the median earnings in cities $(\$ 39,600)$ and towns $(\$ 42,200)$, but lower than the median earnings in suburban areas $(\$ 46,900)$. For females, the median earnings in rural areas $(\$ 31,500)$ were also higher than in towns $(\$ 30,500)$ and lower than in suburban areas ( $\$ 34,400$ ), but were not measurably different from the median earnings in cities $(\$ 31,600)$.

Table 2.10a. Median earnings of full-time, full-year workers age 25 and over adjusted for geographic cost differences, by locale and educational attainment: 2004

| Educational attainment | Total | City | Suburban | Town | Rural |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Total | $\mathbf{\$ 3 8 , 6 0 0}$ | $\mathbf{\$ 3 5 , 7 0 0}$ | $\mathbf{\$ 4 0 , 2 0 0}$ | $\mathbf{\$ 3 6 , 5 0 0}$ | $\mathbf{\$ 3 9 , 0 0 0}$ |
| Less than high school diploma or equivalent | 23,700 | 20,900 | 24,400 | 25,100 | 28,200 |
| High school diploma or equivalent or higher | 40,700 | 38,800 | 42,600 | 38,300 | 40,100 |
| High school diploma or equivalent | 31,100 | 28,700 | 31,900 | 31,600 | 33,800 |
| Some college/associate's degree | 37,300 | 34,600 | 38,700 | 37,100 | 39,700 |
| Bachelor's degree or higher | 56,300 | 52,800 | 58,200 | 52,200 | 56,700 |
| Bachelor's degree | 51,500 | 48,500 | 53,000 | 47,600 | 53,600 |
| Graduate or professional degree | 67,200 | 63,400 | 69,300 | 59,100 | 67,100 |

While males and females as a whole showed relatively similar patterns across locales, different earnings patterns between the sexes, particularly in earnings between rural and suburban areas, are observed when levels of educational attainment are taken into account. Males in rural areas had higher median earnings than males in towns and cities, regardless of their educational attainment. Even though rural males with no more than a high school diploma (or equivalent) had higher median earnings than their suburban peers, no significant difference was detected between the median earnings of rural and suburban males with bachelor's degrees.

Median earnings for females in rural areas were higher than median earnings for females in cities and towns, regardless of their educational attainment, with two exceptions. No significant differences were detected between median earnings for females with a high school diploma (or equivalent) in rural areas and towns or for females with a bachelor's degree or higher in rural areas and cities. Females with less than a high school diploma (or equivalent) had higher median earnings in rural areas than in suburban areas, while females with a high school diploma (or equivalent) or higher (including a bachelor's degree) had lower median earnings in rural areas than in suburban areas.

Table 2.10b. Median earnings of full-time, full-year workers age 25 and over adjusted for geographic cost differences, by locale, sex, and educational attainment: 2004

### 2.11. Employment of adults

In 2004, the unemployment rate for adults ages 25 to 34 was lower in rural areas than in cities and towns, and the unemployment rate for adults ages 35 to 64 was lower in rural areas than in all other locales.

In 2004, some 82 percent of young adults participated in the labor force (table 2.11). For the purposes of this analysis, young adults are defined as all civilian adults from the age of 25 to 34 . The labor force participation rate for young adults in rural areas ( 81 percent) was not measurably different from the national rate or from the rates in all other locales. Nationally, the labor force participation rate among young adults was higher for males ( 91 percent) than for females ( 74 percent). The same was true for young adults in rural areas ( 92 vs. 72 percent, respectively).

Older adults, for the purposes of this analysis, are defined as all civilian adults from the age of 35 to 64 . The overall labor force participation rate for older adults ( 76 percent) was lower than that for young adults ( 82 percent), but across locales and by sex the rates for older adults followed patterns similar to those of the rates for young adults. The labor force participation rate for older adults in rural areas ( 74 percent) was not measurably different from the national rate or the rates in other locales, with the exception of suburban areas ( 78 percent). As among young adults, the labor force participation rate in all locales was higher among older adults who were male ( 81 to 86 percent) than female ( 67 to 71 percent).

The unemployment rate for young adults across the nation in 2004 was 7.2 percent. In rural areas, the unemployment rate for young adults ( 6.7 percent) was lower than in cities ( 8.0 percent) or towns ( 8.3 percent), but not measurably different from the rate in suburban areas (figure 2.11). This same pattern held true among both males and females, although in all locales, female young adults had higher unemployment rates than male young adults.

The national unemployment rate among older adults ( 5.2 percent) was lower than among young adults (7.2 percent) (table 2.11). The unemployment rate for older adults in rural areas ( 4.5 percent) was lower than that in cities ( 6.4 percent), towns ( 5.5 percent), or suburban areas ( 4.8 percent). This same pattern generally held true among both males and females, with one exception: the unemployment rates for male older adults in rural areas ( 4.4 percent) and in suburbs were not measurably different. While the national unemployment rate was higher among female older adults ( 5.4 percent) than male older adults ( 5.1 percent), there was no measurable difference between the unemployment rates of older males and older females in rural areas.

Table 2.11. Percentage of civilian persons ages 25-64 in the labor force and unemployed, by sex, age group, and locale: 2004

| Age group and locale | In labor force |  |  | Unemployed |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 3 <br> Resources for Public Schools

The indicators in this chapter describe major fiscal, physical, curricular, and workforce conditions in rural public schools. The indicators highlight the fact that rural public schools depend more on state funding than city and suburban schools (which tend to receive a greater proportion of their funding from local sources) and that rural public schools spend more per student than public schools in cities, suburbs, and towns when adjusted for geographic cost differences (indicators 3.1 and 3.2). Rural public schools also have lower pupil-to-teacher ratios than schools in other locales (indicator 3.6). Compared to city public schools, rural public schools have lower average numbers of students per school counselor, social worker, school psychologist, and special education instructional aides (indicator 3.12).

Compared with public high school students in cities and suburbs, those in rural areas have less access to Advanced Placement and International Baccalaureate courses or programs, but about the same access to dual credit courses (indicator 3.4). In rural public schools, elementary and secondary students had
slightly greater access to instructional computers with Internet connectivity than students in city and suburban schools (indicator 3.5).

Public school teachers in rural areas also differ in some ways, on average, from those in other locales. Compared with public school teachers in cities, those in rural areas have more years of experience and are less racially and/or ethnically diverse (indicators 3.7 and 3.8). Public school teachers in rural areas earn less, on average, than their peers in towns, suburbs, and cities, even after adjusting for geographic cost differences (indicator 3.10). In addition, their perception of their work tends to differ: rural public school teachers generally report student behavioral problems as less frequent in their schools than teachers across the nation as a whole (indicator 3.9). Also, a larger proportion of rural teachers than teachers in other locales report being satisfied with the teaching conditions in their school, though a smaller proportion of rural teachers than suburban teachers report being satisfied with their salaries (indicator 3.9).

### 3.1. Public school revenues

Compared with city and suburban public schools, rural public schools tended to receive a greater proportion of their revenues in 2003-04 from state sources and a smaller proportion from local sources. Rural public schools received a smaller proportion of their revenues from federal sources than city public schools, but a greater proportion than suburban public schools.

In 2003-04, U.S. public elementary and secondary school revenues totaled $\$ 453.4$ billion (table 3.1). These revenues came from federal, state, and local sources in varying proportions by locale.

Rural public schools received a smaller percentage of their revenue from federal sources ( 9 percent) than city schools ( 11 percent), but a larger percentage than suburban schools (6 percent) (figure 3.1). Rural schools also received a larger percentage of their revenue from federal Impact Aid ( 0.7 percent $)^{7}$ than schools in other locales ( 0.1 to 0.3 percent) (table 3.1).

In the nation as a whole, rural public schools relied on state funding more than city and suburban schools. ${ }^{8}$ Specifically, 52 percent of rural schools' revenues came from state sources compared with 42 and 46 percent, respectively, for suburban and city schools (figure 3.1). Conversely, a smaller percentage of rural school revenues came from local sources (primarily, local property taxes) (39 percent) than suburban schools ( 52 percent) and city schools ( 43 percent). Little difference was noted
in the distribution of revenues by source between rural and town schools.

Within rural areas, public schools in remote rural areas received a greater percentage ( 2 percent) of their revenue from federal Impact Aid than those in fringe ( 0.3 percent) or distant ( 0.4 percent) rural areas, while schools in fringe rural areas relied more on local funding ( 43 percent) than those in distant ( 36 percent) or remote rural ( 35 percent) areas.

Rural public schools located in high-poverty school districts received a larger percentage of their revenue from federal sources (19 percent) than rural schools located in districts at each of the other poverty levels (3 to 12 percent) (table 3.1). ${ }^{9}$ Rural schools located in high-poverty districts also received a smaller percentage of their revenues from local sources ( 23 percent) and a larger percentage from state sources ( 58 percent), when compared with other rural schools. These same patterns were noted in each of the other locales, to varying degrees, and within rural areas.

### 3.2. Public school expenditures

In rural areas, adjusted current public school expenditures per student were higher in 2003-04 than in cities, suburbs, and towns. Public schools had higher adjusted current expenditures per student in highpoverty rural school districts than in middle-poverty and middle high-poverty rural school districts.

Expenditures for public schools are typically discussed as either current expenditures for regular school programs, which are instruction, administrative, and operation and maintenance expenditures, or else as total expenditures, which include current expenditures plus capital outlay and interest on school debt. In 2003-04, current expenditures for public elementary and secondary schools amounted to $\$ 8,100$ per student and total expenditures amounted to $\$ 9,800$ per student (table 3.2).

In order to make an appropriate comparison across locales, this indicator examines differences in current expenditures per student, with adjustments to reflect geographic cost differences. ${ }^{10}$ Adjusted current expenditures per student for public schools in rural areas $(\$ 8,400)$ were higher than in cities $(\$ 8,100)$ and suburban areas $(\$ 7,900)$.

Rural public schools in high-poverty school districts had lower adjusted current expenditures per student $(\$ 8,400)$ than rural schools located in low-poverty $(\$ 9,100)$ or middle-low poverty $(\$ 8,500)$ districts (figure 3.2). ${ }^{11}$ However, the adjusted current expenditures per student for rural schools located in high-poverty districts were greater than the adjusted current expenditures for rural schools located in middle high-poverty school districts $(\$ 8,100)$ and middle-poverty districts $(\$ 8,200)$. A similar pattern was seen in rural fringe areas, although not in distant and remote rural areas.

In contrast, city schools located in high-poverty school districts had higher adjusted current expenditures per student than low-poverty, middle low-poverty, middlepoverty, and middle high-poverty school districts.

[^20]Figure 3.2. Total adjusted current expenditures per public elementary and secondary student, by locale and district poverty level: 2003-04

NOTE: Value labels for the highest and lowest expenditure per student are shown for each locale. District poverty was determined by ranking school districts by the percentage of enrolled children ages 5-17 from families with an income below the poverty threshold, and then dividing these districts into five categories with equal proportions of the total enrollment. The low-poverty district category consists of 20 percent of students in districts with the lowest percentages of poor school-age children. Conversely, the high-poverty district category consists of the 20 percent of students in districts with the highest percentages of poor school-age children. Once determined, each school district's poverty status remained unchanged when the data were examined by locale. For a comparison of poverty definitions, see appendix B. NCES's Comparable Wage Index (CWI) was used to adjust for geographic cost differences. The same geographic adjustment factor was used for the overall rural locale and the detailed rural locales. For more details on the CWI, see A Comparable Wage Approach to Geographic Cost Adjustment (NCES 2006-321).

${ }^{1}$ District poverty was determined by ranking school districts by the percentage of enrolled children ages 5-17 from families with an income below the poverty threshold, and then dividing these districts into five categories with equal proportions of the total enrollment. The low-poverty district category consists of 20 percent of students in districts with the lowest percentages of poor school-age children. Conversely, the high-poverty district category consists of the 20 percent of students in districts with the highest percentages of poor school-age children. Once determined, each school district's poverty status remained unchanged when the data were examined by locale. For a comparison of poverty definitions, see appendix B.
${ }^{2}$ NCES's Comparable Wage Index (CWI) was used to adjust for geographic cost differences. The same geographic adjustment factor was used for the overall rural locale and the detailed rural locales. For more details on the CWI, see A Comparable Wage Approach to Geographic Cost Adjustment (NCES 2006-321). NOTE: Current expenditures include instruction, student support services, food services, and enterprise operations. Total expenditures include current expenditures, capital outlay, and interest on debt. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua $2 k$.html. ### 3.3. Public school capacity

In rural areas, as well as nationally, a larger percentage of public schools reported being underenrolled than overenrolled in fall 2005. The percentage of public schools reporting severe underenrollment in rural areas was greater than in all other locales. In contrast, the percentage of public schools reporting severe overenrollment was lower in rural areas than in cities and suburbs.

In fall 2005, 60 percent of all public schools reported being underenrolled (i.e., enrolling more than 5 percent below the number of students the school was designed to accommodate in its permanent facilities), 18 percent reported being overenrolled (i.e., enrolling more than 5 percent above the designed capacity of the school's permanent facilities), and 22 percent reported enrollments within 5 percent of their designed capacity (table 3.3 and figure 3.3). Specifically, 38 percent of public schools reported moderate underenrollment (by 6 to 25 percent of capacity), 21 percent of public schools reported severe underenrollment (by more than 25 percent of capacity), 10 percent of public schools reported moderate overenrollment (of 6 to 25 percent of capacity), and 8 percent reported severe overenrollment (of more than 25 percent of capacity).

Similar to the national pattern, a greater percentage of rural public schools reported underenrollment ( 69 percent) than overenrollment ( 13 percent). Specifically, about 36 percent of rural public schools reported that they were moderately underenrolled,
and 33 percent reported severe underenrollment. In contrast, 8 percent of rural public schools reported moderate overenrollment, while 5 percent reported that they were severely overenrolled. In addition, 18 percent of rural public schools reported that their enrollment was within 5 percent of their designed capacity.

The percentage of rural public schools reporting that they were severely underenrolled ( 33 percent) was greater than the percentages in towns, cities, and suburban areas ( 18,16 , and 12 percent, respectively). In contrast, the percentage of rural public schools reporting that they were severely overenrolled (5 percent) was smaller than the percentages in cities and suburban areas ( 13 and 10 percent, respectively).

The percentage of rural public schools reporting that they were enrolled at capacity ( 18 percent) was lower than in suburban areas ( 27 percent), but was not measurably different from the percentages in cities or towns.

Table 3.3. Percentage distribution of public schools reporting being underenrolled, at capacity, or overenrolled, by school locale: Fall 2005

| School locale | Underenrolled ${ }^{1}$ |  | Enrollment within 5 percent of capacity | Overenrolled ${ }^{2}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | More than 25 percent | 6-25 percent |  | 6-25 percent | More than 25 percent |
| Total | 21.1 | 38.4 | 22.4 | 10.1 | 8.0 |
| City | 16.1 | 35.8 | 24.2 | 11.5 | 12.5 ! |
| Suburban | 12.3 | 40.9 | 27.2 | 9.8 | 9.8 |
| Town | 18.0 ! | 44.2 | 20.6 | 12.9 ! | 4.3 ! |
| Rural | 32.6 | 35.9 | 18.3 | 8.2 ! | 5.0 ! |

! Interpret data with caution.
1 "Underenrolled" indicates that the capacity of the permanent buildings and instructional space is greater than student enrollment by more than 5 percent.
2 "Overenrolled" indicates that the enrollment of the school is greater than the capacity of the permanent buildings and instructional space by more than 5 percent. NOTE: Detail may not sum to totals because of rounding.

[^21]
### 3.4. Dual credit, Advanced Placement, and International Baccalaureate courses

In 2002-03, the percentage of public high school students in rural areas attending schools offering dual credit courses was not measurably different from those in cities and suburbs, while the percentages of public high school students in rural areas attending schools that offered Advanced Placement and International Baccalaureate courses or programs were lower than those in cities and suburbs.

The size of public high schools is positively related to the percentage of such schools offering dual credit courses (Waits, Setzer, and Lewis 2005). As a result, the percentage of public high school students with access to these courses in 2002-03 was higher than the percentage of schools offering these courses. Nationally, 78 percent of public high school students attended high schools that offered dual credit courses, 87 percent attended schools that offered Advanced Placement (AP) courses, and 5 percent attended schools that offered International Baccalaureate (IB) programs (table 3.4) (see Glossary for details on these types of courses or programs).

The percentage of public high school students in rural areas attending schools offering dual credit courses ( 76 percent) was lower than in towns ( 86
percent), but not measurably different from cities and suburbs. A lower percentage of public high school students in rural areas were enrolled in schools offering AP courses ( 69 percent) than in suburban areas ( 96 percent), cities ( 93 percent), or towns ( 83 percent). Finally, the percentage of public high school students who were enrolled in schools offering IB programs was lower in rural areas (1 percent) than in cities ( 8 percent) and suburbs ( 7 percent), but not significantly different from the percentage in towns.

The differences across locales in the percentages of public high schools offering dual credit courses followed the same pattern as detected in the percentage of public school students with access to these courses at their high school.

Table 3.4. Number and percentage of public high schools that offered dual credit, Advanced Placement (AP), or International Baccalaureate (IB) courses during the 12-month school year, and percentage of all public high school students who were enrolled in these schools during this school year, by locale: 2002-03

| Course offering and locale | Number of schools | Percent of schools | Percent of students |

### 3.5. Internet and computer access

#### Abstract

Nearly all public schools, both nationally and in rural areas, had Internet access in 2005. In rural areas, the number of public school students per instructional computer with Internet access in school was lower than in suburban and city schools.

In 2005, virtually all public schools, in all locales, had some type of Internet access. Among public schools with Internet access, 97 percent used a broadband Internet connection and 45 percent had wireless Internet connections. Internet access in instructional rooms was available in 94 percent of all public schools, and 15 percent of all public schools offered wireless Internet connections in instructional classrooms (table 3.5a). In general, there were few variations detected in these percentages between public schools in rural areas and in other locales. However, the percentage of public schools with Internet access in instructional rooms was higher in rural areas ( 95 percent) than in cities (88 percent) (figure 3.5).

Nationwide, on average there was one instructional computer with Internet access for every 3.8 public school students (table 3.5b). In rural areas, the ratio
was one instructional computer with Internet access for every 3.0 public school students, which was lower than the corresponding ratios in suburban areas ( 1 to 4.3 ) and cities ( 1 to 4.2 ), though not measurably different from the ratio in towns (1 to 3.3).

In rural areas, 19 percent of public schools provided teachers with hand-held computers ${ }^{12}$ for instructional purposes, 7 percent provided hand-held computers to students, and 12 percent loaned laptop computers to students. In general, the percentage of public schools providing these services to their teachers or students did not show much variation between rural areas and other locales. However, a greater percentage of public schools in rural areas loaned laptop computers to students ( 12 percent) than schools in cities (7 percent) (figure 3.5).

Table 3.5a. Percentage of public schools with internet access, by type of access available and locale: 2005

| Locale | With internet access in school |  |  | Instructional classrooms |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total ${ }^{1}$ | Using broadband internet connection ${ }^{2}$ | Using any type of wireless internet connection ${ }^{2,3}$ | With internet access | With <br> wireless connection ${ }^{1,3}$ |
| Total | 99.6 | 97.3 | 45.4 | 93.6 | 15.0 |
| City | 99.4 | 97.8 | 49.7 | 87.5 | 17.1 |
| Suburban | 99.3 | 97.6 | 49.2 | 95.6 | 16.2 |
| Town | 100.0 | 100.0 | 40.2 | 97.6 | 14.0 |
| Rural | 100.0 | 95.4 | 41.4 | 94.8 | 12.4 |

${ }^{1}$ Percentages are based on all public schools.
${ }^{2}$ Percentages are based on public schools with internet access.
${ }^{3}$ Percentages include schools using solely wireless internet connections (both broadband and narrowband), as well as schools using both wireless and wired connections.
NOTE: For estimates that are 100 percent, the event defined could have been reported by fewer schools had a different sample been drawn. ### 3.6. Pupil-teacher ratio in public schools

## Rural public schools generally had fewer pupils per teacher than schools in other locales in 2003-04.

In the 2003-04 school year, average pupil-teacher ratios in public schools were lowest in rural areas (15.3), followed by towns (15.9), and then cities (16.9) and suburbs (16.9) (table 3.6 and figure 3.6). Among the rural subcategories, fringe rural areas had the highest average pupil-teacher ratio (16.3), followed by distant rural areas (15.0) and remote rural areas (13.1). Average pupil-teacher ratios generally increased with school size for schools of all levels across all locales. In public schools enrolling fewer than 200 students in rural areas, the average pupil-teacher ratio was 12 percent, while those enrolling 2,000 or more students had an average pupil-teacher ratio of 20 percent (table 3.6). The same was true for cities, with a pupil-teacher ratio of 11 percent in schools enrolling fewer than 200 students and 20 percent in those enrolling 2,000 or more students.

Among the smallest rural public schools (those with enrollments under 200 students), combined schools had the lowest pupil-teacher ratio (9.4), followed by secondary schools (11.0) and elementary schools (12.6).

The average pupil-teacher ratio in public elementary schools was lower in rural areas (15.4) than in towns (15.9), cities (16.6), and suburbs (16.7) (table 3.6). The same was true for public secondary schools: the pupil-teacher ratio in rural schools (15.3) was lower than in towns (16.2), suburbs (17.5), and cities (18.1). This pattern, however, did not hold true for public combined schools: in rural areas combined schools had a higher average ratio than in suburban areas (13.9 vs. 13.1). Pupil-teacher comparisons among locales varied for the different school sizes.

Figure 3.6. Average pupil-teacher ratios in public schools, by locale: 2003-04

NOTE: Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua_2k.html.

| 2,000 or more | 19.8 | 20.5 | 19.7 | 26.1 |

[^22]
### 3.7. Selected characteristics of public school teachers

Racial/ethnic minorities accounted for a smaller percentage of public school teachers in rural areas than in all other locales in 2003-04. A smaller proportion of rural public school teachers than suburban and city public school teachers had a master's degree or higher.

During the 2003-04 school year, there were more than 3.2 million teachers in public elementary and secondary schools (table 3.7). The number of public school teachers working in rural areas ( 739,000 or 23 percent of all such teachers) was smaller than the number in suburban areas ( 1.1 million or 34 percent) or cities ( 914,000 or 28 percent), but greater than in towns ( 472,000 or 15 percent). The distribution of these teachers across locales did not vary by sex, varied little by age, and varied markedly by education, teaching assignment, and race/ethnicity.

Nationally, 75 percent of public school teachers were female, a percentage that held relatively constant across all locales. A greater percentage of public school teachers across the nation were between 50 and 59 years old ( 29 percent) than between 40 and 49 ( 26 percent), between 30 and 39 ( 25 percent), under 30 ( 17 percent), or over 60 (4 percent). As with sex, the percentage of teachers in specific age categories was relatively constant across all locales.

The percentage of public school teachers in rural areas who held a master's degree or higher (43 percent) was lower than in suburban areas ( 52 percent) and cities (49 percent), but was not measurably different from the percentage in towns ( 45 percent) (table 3.7). Within rural areas, a greater percentage of teachers in rural fringe areas and distant rural areas had a master's degree as their highest level of education (40 and 38 percent, respectively) than in remote rural areas ( 32 percent) (table A-3.7).

Public school teachers in rural areas also differed somewhat from such teachers in other locales in both
the level and subject of their teaching assignment. In both cities and suburbs, a larger percentage of teachers worked in elementary schools than in secondary schools, but in rural areas and towns there was no measurable difference between the percentages of elementary and secondary school teachers (see table 3.7). Public schools in rural areas and towns had a larger percentage of secondary teachers teaching vocational/technical education ( 14 percent) than public schools in cities and suburbs ( 10 percent each). However, public schools in rural areas had a smaller percentage of secondary teachers teaching foreign languages ( 4 percent) than public schools in cities ( 5 percent) and suburbs ( 6 percent). Otherwise, the distribution of secondary teachers across specific subject areas did not differ significantly between public schools in rural areas and other locales.

Some measurable differences were detected in the proportion of racial/ethnic groups in rural areas compared with other locales. Racial/ethnic minorities made up a smaller percentage of public school teachers in rural areas ( 8 percent) than in cities ( 29 percent), suburban areas ( 15 percent), and towns ( 12 percent) (figure 3.7). American Indian/Alaska Native teachers were the only racial/ethnic minority with a higher proportion in rural areas than in the other locales. Overall, 23 percent of all public school teachers worked in rural areas; however, among American Indian/Alaska Native public school teachers, 41 percent worked in rural areas, with 18 percent of those working in remote rural areas (data not shown). American Indian/Alaska Native teachers accounted for 2 percent of all teachers in remote rural areas, a higher proportion than in all other locales (table A-3.7).

### 3.8. Teaching experience

Compared with public school teachers in cities, rural public school teachers averaged more years of experience in 2003-04.

In the 2003-04 school year, the average amount of teaching experience for all public school teachers across the United States was 14.2 years (tables 3.8 and A-3.8). For rural public school teachers, the average was 14.5 years, which was greater than the average for public school teachers in cities ( 13.6 years), but not measurably different than the average for public school teachers in suburbs ( 14.1 years) and towns ( 15.1 years).

As these averages suggest, the majority of public school teachers have over 10 years of teaching experience. Nationally, 10 percent of public school teachers were beginning teachers (those with less than 3 years of teaching experience), 32 percent had between 3 and 9 years of teaching experience, 29 percent had be-
tween 10 and 20 years of teaching experience, and 28 percent had over 20 years of teaching experience.

The percentages of public school teachers in rural areas with these different levels of teaching experience were not significantly different from the national percentages. When compared with the percentages of public school teachers in these categories of experience in other locales, rural public school teachers were different in two ways: a smaller percentage had between 3 and 9 years of teaching experience ( 30 percent) than public school teachers in suburbs ( 33 percent) and cities ( 34 percent), and a larger percentage had over 20 years of teaching experience ( 30 percent) than public school teachers in cities ( 27 percent).

Table 3.8. Average number of years of teaching experience for public school teachers and percentage distribution of such teachers, by years of teaching experience, locale, and grade level taught: 2003-04

| Locale and grade level taught | Average number of years of teaching experience | Percentage distribution by years of teaching experience |  |  |  |  |

| Rural | 14.4 | 100.0 | 11.2 | 29.8 | 29.2 | 29.9 |

! Interpret data with caution.
NOTE: Total includes combined level schools not separately shown. Years of teaching experience counts 1 year of part-time teaching the same as 1 year of full-time teaching. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua $2 k$.html. Detail may not sum to totals because of rounding.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, "Teacher Questionnaire," 2003-04.

Comparing the national averages for public elementary, middle, and high school teachers reveals no measurable differences in the average years of teaching experience. When locale is considered, however, a difference can be found between public elementary school teachers in rural areas and in cities ( 15 vs. 13 years of teaching experience), but not between public middle or high school teachers in rural areas and cities (see table 3.8). A greater percentage of public elementary
school teachers in rural areas had more than 20 years of experience than in cities or suburban areas ( 30 vs . 25 percent each). No such difference was detected between public middle school or high school teachers from the various locales, with the exception that a larger percentage of middle school teachers in towns had over 20 years of teaching experience than middle school teachers in rural areas (33 vs. 28 percent).

Figure 3.8. Percentage distribution of teachers in public schools, by years of teaching experience and detailed locale: 2003-04

NOTE: Years of teaching experience counts 1 year of part-time teaching the same as 1 year of full-time teaching. Cities are territories that are inside both an urbanized area and a principal city; suburbs are territories that are inside an urbanized area but outside a principal city. Urbanized areas are densely settled areas containing at least 50,000 people. A principal city is a city that contains the primary population and economic center of a metropolitan statistical area. Large cities and suburbs have populations of 250,000 or more; midsize cities and suburbs have populations of less than 250,000 and greater than or equal to 100,000; and small cities and suburbs have populations of less than 100,000. Towns are territories that are outside of any urbanized area, but inside an urban cluster. Urban clusters are densely settled areas with populations of 2,500 to 49,999 . Fringe towns are 10 miles or less from an urbanized area; distant towns are more than 10 miles and less than or equal to 35 miles from an urbanized area; and remote towns are more than 35 miles from an urbanized area. Rural areas are located outside any urbanized area or urban cluster. Fringe rural areas are 5 miles or less from an urbanized area and 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, and more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua_2k.html. Detail may not sum to totals because of rounding. SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, "Teacher Questionnaire," 2003-04.

### 3.9. Teacher perceptions of problems in schools

In general, smaller percentages of rural public school teachers reported problems as "serious" and behavioral problems as frequent in their schools than public school teachers across the nation as a whole in 2003-04.

## Serious problems in schools

In the 2003-04 school year, the Schools and Staffing Survey (SASS) asked public elementary, middle, and high school teachers to rate the severity of eight potential problems in their school: students coming to school unprepared to learn, lack of parental involvement, poverty, student apathy, student tardiness, student class cutting, students dropping out, and student pregnancy. Teachers were asked to rate them
as "not a problem," a "minor problem," a "moderate problem," or a "serious problem." This analysis examines the percentage of public school teachers who reported each of these potential problems as a "serious problem" in their school.

Nationally, public school teachers reported students coming to school unprepared to learn as the most prevalent serious problem facing public schools, with 27 percent of public school teachers reporting

Figure 3.9a. Percentage of public school teachers who reported potential problems as "serious problems" in their schools, by type of problem and locale: 2003-04

SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, "Teacher Questionnaire," 2003-04.
this as a serious problem in their school (table 3.9a). Lack of parental involvement and poverty were the next most common problems reported as serious ( 22 and 21 percent, respectively), followed by student apathy ( 17 percent), student tardiness ( 14 percent), student class cutting ( 6 percent), students dropping out ( 3 percent), and student pregnancy ( 2 percent). In rural areas, the relative ranking of these problems by public school teachers mirrored this national order. However, for each potential problem (except apathy and student pregnancy), the percentage of rural public school teachers who considered the problem serious was lower than the national percentage.

For each of the potential problems, a smaller percentage of public school teachers in rural areas than in cities and towns reported it as being a serious problem, with the one exception that there was no measurable difference between the percentages of
teachers in rural areas and towns rating a lack of parental involvement as a serious problem (table 3.9a and figure 3.9a). ${ }^{13}$ The percentages of teachers in rural areas who reported that poverty, student tardiness, and student class cutting were serious problems differed from those in suburban areas. A greater percentage of rural teachers than suburban teachers reported poverty as a serious problem ( 18 vs. 15 percent), but a smaller percentage of rural teachers than suburban teachers reported student tardiness ( 9 vs. 12 percent) and student class cutting ( 3 vs. 4 percent) as serious problems.

Among all rural public school teachers, a higher percentage of high school teachers than middle school teachers rated each of these problems (except poverty) as serious. In rural areas there were no measurable differences in the ratings for poverty across all three school levels.

Table 3.9a. Percentage of public school teachers who reported potential problems as "serious problems" in their schools, by type of problem, locale, and grade level taught: 2003-04

| Locale and grade level taught | Students come to school unprepared to learn | Lack of parental involvement | Poverty | Student apathy | Student tardiness | Student class cutting | Students dropping out | Student pregnancy |

[^24]
## Behavioral problems

The 2003-04 SASS also asked public elementary, middle, and high school teachers to report how often the following student behavioral problems occurred in their schools: student acts of disrespect for teachers, student bullying, physical conflicts among students, student verbal abuse of teachers, and widespread disorder in classrooms. This analysis examines the percentages of teachers who reported that the problem "happens daily" or "happens at least once a week" (other possible responses were "happens at least once a month," "happens on occasion," and "never happens").

Nationally, public school teachers reported student acts of disrespect for teachers as the most common of these behavioral problems (reported as a daily or weekly
problem in their school by 22 percent of teachers), followed by student bullying ( 18 percent), physical conflicts among students and student verbal abuse of teachers (12 percent each), and widespread disorder in classrooms ( 5 percent) (table 3.9b). The relative ranking of these problems by rural public school teachers closely mirrored the national order, with the one exception being that student verbal abuse of teachers was more commonly reported than physical conflicts between students ( 8 vs. 7 percent). However, as with the serious problems presented in table 3.7a, all the behavioral problem areas were less commonly reported in rural areas than in the nation as a whole.

Each of the student behavior problems was reported at lower rates by public school teachers in rural areas than in cities (table 3.9b and figure 3.9b). Other differences

Figure 3.9b. Percentage of public school teachers who reported behavioral problems occurring in their schools at least weekly, by type of problem and locale: 2003-04

SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, "Teacher Questionnaire," 2003-04.
between locales were smaller, with rural public school teachers reporting physical conflicts among students as less frequent than teachers in both towns and suburban areas ( 7 vs .9 and 11 percent, respectively). Also, rural public school teachers reported student bullying as less frequent than teachers in towns ( 15 vs. 17 percent), and rural teachers reported student acts of disrespect ( 17 vs .19 percent), student verbal abuse of teachers ( 8 vs .10 percent), and widespread disorder in classrooms ( 3 vs. 4 percent) as less frequent than suburban public school teachers.

The findings for each of the school levels (elementary, middle, and high schools) were similar to the findings for all schools. At all three levels student behavior problems were reported at lower rates by public school teachers in rural areas than in cities. The only additional differences noted at the elementary school level were that physical conflicts were reported as less frequent by public elementary school teachers in rural areas than in towns and suburbs ( 8 vs. 11 and 12 percent, respectively). At the middle school level, rural public school teachers less frequently reported both physical conflicts ( 8 vs. 13 percent) and widespread disorder ( 3 vs. 5 percent) than their
peers in suburban areas. At the high school level, rural public school teachers reported each of the selected problems as less frequent than their peers in each of the other locales, with the lone exception being that no measurable difference was detected in the reports on physical conflicts in rural areas and towns.

Across school levels, the percentage of rural public elementary school teachers reporting these student behaviors was generally lower than the percentages of rural public middle or high school teachers, with a few exceptions (see table 3.9b). No measurable differences were detected between rural public elementary and middle school teachers' reports of physical conflicts among students and widespread disorder in classrooms, and rural public elementary school teachers reported physical conflicts between students as more frequent than their high school peers. While no measurable differences were noted between rural public middle and high school teachers' reports of student acts of disrespect for teachers, student verbal abuse of teachers, and widespread disorder in classrooms, rural public middle school teachers reported student bullying and physical conflicts as more frequent than their high school peers.

## Teaching conditions

The 2003-04 SASS asked public elementary, middle, and high school teachers about their level of agreement with five positive statements regarding teachers' salaries, the availability of necessary materials, parental support, class size, and support for special needs students. This analysis examines the percentage of teachers who said that they "strongly agree" or "somewhat agree" with these statements (other response choices were "somewhat disagree" and "strongly disagree").

Nationally, 79 percent of public school teachers agreed with the statement that "necessary materials
such as textbooks, supplies, and copy machines are available as needed by the staff" at their schools (table 3.9c). A majority of teachers also responded positively to the following statements: "I am satisfied with my class size" ( 69 percent), "I am given the support I need to teach students with special needs" ( 64 percent), and "I receive a great deal of support from parents for the work I do" (61 percent). Less than half of teachers (46 percent) agreed with the statement "I am satisfied with my teaching salary."
Among rural public school teachers, agreement with these statements followed the same order as the national ranking, although the percentages were different. The

Figure 3.9c. Percentage of public school teachers who reported agreement with various statements about teaching conditions, by condition and locale: 2003-04

SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, "Teacher Questionnaire," 2003-04.
percentages of rural public school teachers who agreed with these statements about their school's teaching conditions (excluding their teaching salary) was greater than the national percentage and the percentages of teachers in cities and suburbs (table 3.9c and figure 3.9c). Larger percentages of teachers in rural areas than towns agreed with the statements about parental support ( 66 vs. 61 percent) and class size ( 75 vs. 72 percent), but no measurable differences were noted between their rates of agreement with the statements about necessary materials and special needs support.

The percentage of public school teachers who reported being satisfied with their teaching salaries in rural areas ( 44 percent) was lower than in suburban areas ( 50 percent), but was not measurably different from the percentages of public school teachers in cities (43 percent) and towns (46 percent). These same comparisons held true within each school level, with one exception: no measurable difference was detected between the percentages of rural and suburban middle school teachers who reported being satisfied with their teaching salary.

[^26]
### 3.10. Average base salary for full-time public school teachers

Public school teachers in rural areas earned, on average, lower salaries in 2003-04 than their peers in towns, suburbs, and cities, even after adjusting for geographic cost differences.

In the 2003-04 school year, the national average (mean) base salary for full-time public school teachers was $\$ 44,400$ (table 3.10). In order to accurately compare teacher salaries across various locales, the data presented in this indicator have been adjusted to reflect geographic cost differences (such as cost-of-living differences). ${ }^{14}$ Comparing these geographically adjusted base salaries, full-time public school teachers in rural areas had a lower average salary $(\$ 43,000)$ than their peers in towns $(\$ 45,900)$, suburbs ( $\$ 45,700$ ), and cities ( $\$ 44,000$ ).

Full-time public school teachers with a bachelor's degree as their highest level of education earned less on average in rural areas $(\$ 38,800)$ than in towns ( $\$ 41,600$ ), but no measurable difference was
detected between the salaries of these teachers in rural areas and in cities or suburbs (figure 3.10). Teachers with a master's degree as their highest level of education also earned less on average in rural areas $(\$ 48,400)$ than in both suburban areas $(\$ 50,600)$ and towns $(\$ 51,200)$. The average salary for rural public school teachers with a master's degree as their highest degree was equivalent to the salary of their peers in cities. No differences were detected between the average salaries of teachers in rural areas with more than a master's degree and teachers with similar educational attainment in other locales. However, teachers with an education specialist degree $(\$ 50,200)$ earned less on average in rural areas than their peers in suburban areas $(\$ 55,100)$.

Table 3.10. Average base salary for full-time teachers in public elementary and secondary schools adjusted for geographic cost differences, by highest degree earned and locale: 2003-04

| Locale | All teachers $^{1}$ | Bachelor's degree | Master's degree | Education specialist ${ }^{2}$ | Doctor's degree |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Total | $\mathbf{\$ 4 4 , 4 0 0}$ | $\mathbf{\$ 3 9 , 2 0 0}$ | $\mathbf{\$ 4 9 , 4 0 0}$ | $\mathbf{\$ 5 2 , 9 0 0}$ | $\mathbf{\$ 5 3 , 7 0 0}$ |
| City | 44,000 | 39,200 | 48,200 | 52,000 | 52,700 |
| Suburban | 45,700 | 39,800 | 50,600 | 55,100 | 55,600 |
| Town | 45,900 | 41,600 | 51,200 | 52,200 | 45,600 |
| Rural | 43,000 | 38,800 | 48,400 | 50,200 | 51,400 |

### 3.11. Difficulty hiring teachers

Public schools in rural areas in 2003-04 experienced the greatest difficulty filling vacancies in the fields of English as a second language (ESL) and foreign languages.

Nationally, 26 percent of public elementary and secondary schools during the 2003-04 school year reported stability in their teaching staff (i.e., having no teacher turnover or no new teaching positions that created a vacancy for which the school recruited and/or hired a new teacher). The percentage of public schools reporting stability in their teaching staff was higher in rural areas ( 31 percent) than in cities ( 25 percent) or suburban areas ( 22 percent), but was not measurably different from towns (29 percent) (data not shown).

The degree of difficulty experienced by public schools in filling a vacancy in a particular field varied extensively depending on the field and, to a lesser extent, on locale. During the 2003-04 school year, across all locales, 63 to 83 percent of public schools with a teaching vacancy in general elementary education or social studies reported that it was "easy" to fill the vacancy (table 3.11). Between 41 and 65 percent of public schools that had a teaching vacancy in English/language arts, music or art, or computer science reported that it was "easy" to fill the vacancy. Between 21 and 42 percent of public schools with a teaching vacancy in biology or life sciences, English as a second language (ESL), foreign languages, physical sciences, mathematics, special education, or vocational or technical education reported that it was "easy" to fill the vacancy.

Among these teaching fields, the hardest vacancies to fill in rural areas during the 2003-04 school year were vacancies in English as a second language (ESL) and in foreign languages. Some 37 percent of rural public schools reported that ESL vacancies were "very difficult" to fill, and an additional 5 percent reported that they could not fill their ESL vacancies (figure 3.11). Similarly, 35 percent of rural schools reported that foreign language vacancies were "very difficult" to fill, and an additional 8 percent reported that they could not fill their foreign languages vacancies. ${ }^{15}$

In rural areas, the percentage of public schools reporting that they could not fill teaching vacancies was higher for foreign languages ( 8 percent) than for computer science ( 3 percent), music or art ( 2 per-
cent), physical sciences (2 percent), English/language arts ( 1 percent), biology or life sciences ( 1 percent), or general elementary (less than 1 percent), but not measurably different from the percentages that could not fill vacancies for vocational or technical education, ESL, special education, or mathematics.

The percentage of public schools reporting that it was "very difficult" to fill ESL teaching vacancies was higher in rural areas than in cities ( 37 vs .24 percent). The percentage of public schools reporting that they could not fill these vacancies in rural areas was higher than in suburban areas ( 5 vs. 1 percent).

The percentage of public schools reporting that it was "very difficult" to fill foreign language teaching vacancies was higher in rural areas than in suburban areas ( 35 vs. 27 percent). The percentage of public schools that could not fill their foreign language vacancies was higher in rural areas than in suburbs and towns ( 8 vs .2 percent for both).

In comparison with public schools in cities, a lower percentage of rural public schools reported that it was "very difficult" to fill vacancies in biology or life sciences ( 17 vs. 24 percent) while a higher percentage of rural public schools reported this level of difficulty filling vacancies in music or art (21 vs. 13 percent). A greater percentage of rural public schools reported that it was "very difficult" to fill vacancies in English/language arts (11 percent) than the percentages of town and suburban public schools ( 6 and 5 percent, respectively). The percentage of rural public schools reporting this level of difficulty in filling social studies vacancies ( 5 percent) was also greater than the percentage of suburban public schools (1 percent).

Apart from the previously mentioned differences in the foreign language and ESL fields, the percentage of public schools in rural areas that reported that they could not fill teaching vacancies in particular fields was not measurably different from the percentages in other locales.

[^28]Figure 3.11. Percentage of public elementary and secondary schools with a teaching vacancy in selected teaching fields that reported filling the vacancy as "very difficult" or that the vacancy could not be filled, by teaching field and locale: 2003-04

### 3.12. Use of professional support staff and paraprofessionals

#### Abstract

In public schools, the average number of students per school counselor, social worker, school psychologist, and special education instructional aide was lower in rural areas in 2003-04 than in cities at both the elementary and secondary levels.

Public schools employ a wide range of staff in order to provide and support their students' education. In addition to classroom teachers, these support staff include licensed or certified professionals (such as school counselors and nurses) and also instructional and noninstructional aides. The data discussed in this indicator pertain to these support staff in regular public schools, and do not distinguish between the full-time and part-time status of the staff.

During the 2003-04 school year, special education instructional aides were the most commonly found public school support staff in rural areas (and in all other locales), with both elementary and secondary rural public schools averaging almost 3 special education instructional aides per school (table 3.12). However, the average number of special education instructional aides per public school in rural areas was lower than the average in suburbs and cities at the elementary level (4.2 and 3.7, respectively) and lower than the average in towns, suburbs, and cities at the secondary level (4.0, 5.5, and 6.2 , respectively).

Rural public elementary schools averaged about 1 school counselor, nurse, speech therapist, and regular Title $I^{16}$ instructional aide per school. City, suburban, and town public elementary schools also averaged about 1 school counselor and nurse per school. However, the average number of speech therapists per school was lower among rural elementary schools than among city and suburban elementary schools (1.2 and 1.3, respectively).

Rural public secondary schools averaged about 1.6 school counselors and 1 nurse per school. City, sub-
urban, and town public schools also averaged about 1 nurse per school, while secondary schools in cities, suburbs, and towns had a higher number of school counselors per school (3.9, 3.8, and 2.1, respectively) than rural secondary schools.

To better account for enrollment differences between public schools in various locales, table 3.12 also shows the average number of students per support staff member (among schools that have such staff). This statistic is designed to be a proxy indicator for the access public school students have to these services in their schools. Students in schools with lower numbers of students per support staff member have a greater potential for access to these support services.

In public elementary schools, the average numbers of students per school counselor, social worker, or psychologist in rural areas ( 317,400 , and 378 , respectively) were lower than in cities ( 407,467 , and 548 ) and suburban areas ( 400,483 , and 517 ), but not measurably different from the averages in towns (figure 3.12a).

The average number of students per special education instructional aide in rural public elementary schools (104) was lower than in city public elementary schools (124), but not measurably different from suburban or town public elementary schools. A similar pattern was detected in the average number of elementary students per regular Title I instructional aide, where the average in rural areas (136) was lower than in cities (170), but not measurably different from suburban or town elementary schools. No differences across locales were detected in the average number of elementary students per English as a Second Language/bilingual instructional aide.

[^29]Figure 3.12a. Average number of students per student support staff in regular public elementary schools with such staff, by selected type of staff and locale: 2003-04

${ }^{1}$ Title I is designed to support state and local school reform efforts tied to challenging state academic standards in order to reinforce and amplify efforts to improve teaching and learning for students farthest from meeting state standards. Individual public schools with poverty rates at or above 40 percent may use Title I funds, along with other federal, state, and local funds, to operate a "schoolwide program" to upgrade the instructional program for the whole school. Schools with poverty rates below 40 percent, or those choosing not to operate a schoolwide program, offer a "targeted assistance program" in which the school identifies students who are failing, or most at risk of failing, to meet the state's challenging performance standards, then designs, in consultation with parents, staff, and district staff, an instructional program to meet the needs of those students.
NOTE: The average number of students to staff is based on the total number of full- and part-time staff. This measure differs from pupil-teacher ratios, which are based on the total number of full-time-equivalent teachers. Student enrollment data used to calculate this ratio are for schools with such staff. Regular public schools do not include alternative, special education, special program emphasis, or vocational/technical schools. Data for combined elementary and secondary schools and for ungraded schools are excluded. ESL is English as a second language.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, "Public School Questionnaire," 2003-04.

In public secondary schools, the average numbers of students per school counselor, social worker, or psychologist were lower in rural areas (298, 508, and 524, respectively) than in cities ( 334,987 , and 1,255 ), suburbs ( 323,941 , and 1,075 ), or towns (329, 664, and 670) (figure 3.12b).

The average number of students per special education instructional aide in rural public secondary schools (153) was lower than in suburban or city public secondary schools (198 and 187, respectively), but not
measurably different from public secondary schools in towns. This same pattern was detected in the average number of secondary students per ESL/bilingual instructional aide, where the average in rural areas (586) was lower than in suburbs (854) or cities (811), but not measurably different from towns. The average number of students per regular Title I instructional aide in secondary schools was also lower in rural areas (189) than in suburban areas (486), but no measurable differences were detected between the average in rural areas and the averages in cities and towns.

! Interpret data with caution.
${ }^{1}$ The average number of students to staff is based on the total number of full- and part-time staff. This measure differs from pupil-teacher ratios, which are based on the total number of full-time-equivalent teachers. Student enrollment data used to calculate this ratio are for schools with such staff.
${ }^{2}$ Title I is designed to support state and local school reform efforts tied to challenging state academic standards in order to reinforce and amplify efforts to improve teaching and learning for students farthest from meeting state standards. Individual public schools with poverty rates at or above 40 percent may use Title I funds, along with other federal, state, and local funds, to operate a "schoolwide program" to upgrade the instructional program for the whole school. Schools with poverty rates below 40 percent, or those choosing not to operate a schoolwide program, offer a "targeted assistance program" in which the school identifies students who are failing, or most at risk of failing, to meet the state's challenging performance standards, then designs, in consultation with parents, staff, and district staff, an instructional program to meet the needs of those students.
NOTE: All statistics shown do not distinguish between full- and part-time status of staff. Regular public schools do not include alternative, special education, special program emphasis, or vocational/technical schools. Data for combined elementary and secondary schools and for ungraded schools are excluded. ESL is English as a second language.

## Appendix A. Supplemental Tables

The supplemental tables in this section include distributions at the detailed locale or twelve-locale level. Definitions for these twelve locale codes are provided on the next page; key concepts for these definitions are provided on this page. The supplemental tables are numbered to correspond with their respective indicators.

The new urban-centric classification system has four major locale categories-city, suburban, town, and rural-each of which is subdivided into three subcategories. Cities and suburbs are subdivided into the categories small, midsize, or large; towns and rural areas are subdivided by their proximity to an urbanized area into the categories fringe, distant, or remote. These twelve categories are based on several key concepts that Census uses to define an area's urbanicity: princi-
pal city, urbanized area, and urban cluster. A principal city is a city that contains the primary population and economic center of a metropolitan statistical area, which, in turn, is defined as one or more contiguous counties that have a "core" area with a large population nucleus and adjacent communities that are highly integrated economically or socially with the core. Urbanized areas and urban clusters are densely settled "cores" of Census-defined blocks with adjacent densely settled surrounding areas. Core areas with populations of 50,000 or more are designated as urbanized areas; those with populations between 25,000 and 50,000 are designated as urban clusters. For more information on urbanized areas and urban clusters, see http://www .census.gov/geo/www/ua/ua $2 \mathrm{k} . \mathrm{html}$. Rural areas are designated by Census as those areas that do not lie inside an urbanized area or urban cluster.

Several of the following supplemental tables include distributions at the detailed locale or twelve-locale
level. Definitions for these twelve locale codes are provided here:

| Locale | Definition |
| :---: | :--- |
| City | Territory inside an urbanized area and inside a principal city with population of 250,000 <br> or more <br> Territory inside an urbanized area and inside a principal city with population less than 250,000 <br> and greater than or equal to 100,000 <br> Territory inside an urbanized area and inside a principal city with population less than <br> 100,000 |
| Midsize |  |
| Small |  |
| Suburban | Territory outside a principal city and inside an urbanized area with population of 250,000 <br> or more |
| Large |  |

Table A-1.7. Percentage distribution of families with children under 18, by poverty level, locale, and family type: 2004

| Locale and family type | Total | Below the poverty threshold | 100-185 percent of the poverty threshold | Above 185 percent of the poverty threshold |
| :---: | :---: | :---: | :---: | :---: |
| Total | 100.0 | 15.5 | 17.2 | 67.4 |
| Married couple | 100.0 | 6.9 | 13.6 | 79.5 |
| Male householder, no wife present | 100.0 | 18.2 | 24.0 | 57.9 |
| Female householder, no husband present | 100.0 | 37.6 | 24.8 | 37.6 |
| City | 100.0 | 21.2 | 20.0 | 58.8 |
| Married couple | 100.0 | 9.3 | 16.5 | 74.2 |
| Male householder, no wife present | 100.0 | 21.3 | 26.5 | 52.2 |
| Female householder, no husband present | 100.0 | 41.6 | 24.6 | 33.8 |
| Suburban | 100.0 | 10.4 | 13.5 | 76.1 |
| Married couple | 100.0 | 4.8 | 10.0 | 85.2 |
| Male householder, no wife present | 100.0 | 13.4 | 20.5 | 66.1 |
| Female householder, no husband present | 100.0 | 28.4 | 23.1 | 48.6 |
| Town | 100.0 | 21.6 | 20.8 | 57.6 |
| Married couple | 100.0 | 9.1 | 17.4 | 73.5 |
| Male householder, no wife present | 100.0 | 23.6 | 27.4 | 49.1 |
| Female householder, no husband present | 100.0 | 47.3 | 26.1 | 26.6 |
| Rural | 100.0 | 13.1 | 17.9 | 68.9 |
| Married couple | 100.0 | 6.8 | 15.0 | 78.1 |
| Male householder, no wife present | 100.0 | 18.0 | 23.5 | 58.5 |
| Female householder, no husband present | 100.0 | 37.9 | 28.2 | 33.9 |

NOTE: A family is a group of two people or more residing together (one of whom is the householder) who are related by birth, marriage, or adoption.
Unmarried couples with children of their own are classified as either "Female householder, no husband present" or "Male householder, no wife present,"
determined by the householder of record. The householder of record is the person living or staying in the household in whose name the house or apartment is owned, being bought, or rented. For a comparison of poverty definitions, see appendix B. Detail may not sum to totals because of rounding. NOTE: The National School Lunch Program is a federally assisted meal program. To be eligible, a student must be from a household with an income at or below 130 percent of the poverty threshold for free lunch or between 130 percent and 185 percent of the poverty threshold for reduced-price lunch. Approximately 13,704 schools did not report information on the number of students eligible for a free or reduced-price school lunch. Therefore, this information is missing for $5,227,075$ students. For a comparison of poverty definitions, see appendix B. Detail may not sum to totals because of rounding. \#Rounds to zero.
! Interpret data with caution.
${ }^{1}$ Respondents were asked if each child in the household spoke a language other than English at home. If they answered "yes," they were asked how well each child could speak English. Categories used for reporting were "very well," "well," "not well," and "not at all." All those who reported speaking English less than "very well" were considered to have difficulty speaking English.
${ }^{2}$ Includes other racial/ethnic groups not separately shown.
NOTE: Race/ethnicity categories exclude persons of Hispanic origin unless otherwise specified.
SOURCE: U.S. Department of Commerce, Census Bureau, American Community Survey (ACS), 2004, previously unpublished data.

Table A-2.4. Percentage of 16- to 24-year-olds who were high school status dropouts, by race/ethnicity and locale: 2004

|  |  |  |  |  |  | Native <br> Hawaiian/ <br> Pacific | American <br> Indian/Alaska |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Locale | Total | White | Black | Hispanic | Asian | Islander | Native |

! Interpret data with caution.
NOTE: The data presented here represent the status dropout rate, which is the percentage of civilian, noninstitutionalized 16-to 24 -year-olds who are not in high school and who have not earned a high school credential (either a diploma or equivalency credential such as a GED). The status dropout rate includes all dropouts regardless of when they last attended school, as well as individuals who may have never attended school in the United States, such as immigrants who did not complete a high school diploma in their home country. Another way of calculating dropout rates is the event dropout rate, which is the percentage of 15 - to 24 -year-olds who dropped out of grades 10 through 12 in the 12 months preceding the fall of each data collection year. For a comparison of measures of educational attainment, see appendix B. Race/ethnicity categories exclude persons of Hispanic origin unless otherwise specified. SOURCE: U.S. Department of Commerce, Census Bureau, American Community Survey, 2004, previously unpublished data.

# Appendix B. Technical Notes and Glossary 

## Technical Notes

This report includes data from both universe and sample surveys. In the case of universe data, all individuals or institutions of interest are included in the data collection. There is no sampling error; thus, observed differences are reported as true. In the case of sample surveys, a nationally representative set of respondents is selected and asked to participate in the data collection. In order to allow for representative samples at the locale level, the samples are stratified. Since the sample represents just one of many possible samples that could be selected, there is error associated with the sample. To avoid reaching false conclusions about differences between groups or differences over time measured by sample survey data, sampling error is taken into account in statistical tests that are conducted to support statements about differences. Thus, all statements about differences in this report are supported by the data, either directly in the case of universe surveys or with statistical significance testing in the case of sample survey data. In addition, there are occasional references to apparent differences that are not statistically significant. Apparent differences that are not statistically significant are discussed in order to aid the reader in interpreting the data.

All significance tests of differences are tested at the .05 level of significance. Several test procedures were used, depending on the type of data interpreted and
the nature of the statement tested. The most commonly used test procedures were $t$ tests, linear trend tests, and equivalency tests. The $t$ tests were not adjusted to compensate for multiple comparisons being made simultaneously. Equivalence tests at the 0.15 level were used to determine whether two statistics were substantively equivalent or different by using a hypothesis test to determine whether the confidence interval of the difference between sample estimates was significantly greater or less than a preset substantively important difference. In most cases involving percentages, a difference of 3.0 percentage points was used to determine substantive equivalence or difference. In some indicators involving only very small percentages, a lower value was used.

The appearance of a "!" symbol (meaning "Interpret data with caution") in a table or figure indicates an unstable estimate; therefore, the reader should use caution when interpreting the data. These unstable estimates are discussed, however, when statistically significant differences are found despite large standard errors.

The indicators in this report present data from a variety of sources. The sources and their definitions of key terms are described in appendix C. Most of these sources are federal surveys and many are conducted by the National Center for Education Statistics (NCES). The majority of the sources are
sample surveys; these are the sources of the estimates for which standard errors are provided on the NCES website: http://nces.ed.gov/. A few sources provide universe data, meaning that they collect information on the entire population of interest, and therefore no standard errors are needed.

Although percentages reported in the tables are generally rounded to one decimal place (e.g., 76.5 percent), percentages reported in the text and figures are rounded from the original number to whole numbers (with any value of 0.50 or above rounded to the next highest whole number). Due to rounding, cumulative percentages may sometimes equal 99 or 101 percent, rather than 100. In addition, sometimes a whole number in the text may seem rounded incorrectly based on its value when rounded to one decimal place. For example, the percentage 14.479 rounds to 14.5 at one decimal place, but rounds to 14 when reported as a whole number.

Counts or numbers from universe data are reported unrounded. Estimated counts or numbers from sample survey data are reported rounded to hundreds when they are four- and five-digit numbers, and to thousands when they are six-digit numbers.

## Comparison of poverty measures

In this report, the definition of poverty varies by data source. A comparison of these different poverty definitions is provided below.

Data on household income and the number of people living in the household are combined with estimates of the poverty threshold published by the Bureau of the Census to classify children (or adults) as "below the poverty threshold" or "at or above the poverty threshold" in indicator 1.5. The thresholds that are used to determine whether an individual is below or at or above poverty differ for each survey year. (For background on how poverty is measured, see http://www.census.gov/hhes/www/poverty/poverty .html. For the weighted average poverty thresholds for various household sizes and years, see http://www .census.gov/hhes/www/poverty/threshld.html.)

Indicators 1.7, 2.4, and 2.9 use the categories of "poor," "near-poor," and "nonpoor." Poor is defined to include those families below the poverty threshold, near-poor is defined as those at $100-185$ percent of the poverty threshold, and nonpoor is defined as those above 185 percent of the poverty threshold.

Eligibility for the National School Lunch Program also serves as a proxy measure of poverty status. The

National School Lunch Program is a federally assisted meal program operated in public and private nonprofit schools and residential child care centers. Unlike the poverty thresholds discussed above, which rely on dollar amounts determined by the Census Bureau, eligibility for the National School Lunch Program relies on the federal income poverty guidelines of the Department of Health and Human Services. To be eligible for free lunch, a student must be from a household with an income at or below 130 percent of the federal poverty threshold; to be eligible for reduced-price lunch, a student must be from a household with an income at or below 185 percent of the federal poverty threshold. Title I basic program funding relies on free and reduced-price lunch eligibility numbers as one (of four) possible poverty measures for levels of Title I federal funding. In indicators 1.8 and 1.9, moderate-to-high poverty schools are defined as schools with more than 50 percent of students eligible for free or reduced-price lunch.

In indicators 3.1 and 3.2, district poverty was determined by ranking school districts by the percentage of enrolled children ages 5-17 from families with an income below the poverty threshold, and then dividing these districts into five categories with equal proportions of the total enrollment. The low-poverty district category consists of the 20 percent of students nationally in districts with the lowest percentages of poor school-age children. Conversely, the highpoverty district category consists of the 20 percent of students nationally in districts with the highest percentages of poor school-age children.

## Measures of educational attainment

Various measures of educational attainment have been developed to provide information about the highest level of formal education completed by individuals or various population groups.

Indicator 2.4 uses American Community Survey (ACS) data to report on the high school status dropout rate among 16- to 24 -year-olds. The high school status dropout rate is defined as the percentage of the civilian, noninstitutionalized population ages 16 through 24 who are not in high school and who have not earned a high school credential (either a diploma or equivalency credential such as a General Educational Development [GED] certificate), irrespective of when they dropped out. Status dropout rates measure the extent of the dropout problem for a population and as such can be used to estimate the need for further education and training in that population.

Indicator 2.5 examines the percentage of public high school students who graduate by using the averaged freshman graduation rate (AFGR). The AFGR is an estimate of the percentage of the incoming freshman class that graduates with regular diplomas 4 years later. The AFGR is the number of graduates with regular diplomas divided by the estimated count of freshmen 4 years earlier as reported through the NCES Common Core of Data (CCD), the survey system based on state education departments' annual administrative records. The estimated count of freshmen is calculated by summing 10th-grade enrollment 2 years before the graduation year, 9th-grade enrollment 3 years before the graduation year, and 8th-grade enrollment 4 years before the graduation year and dividing this amount by 3 . The intent of this averaging is to account for the high rate of grade retention in the freshman year, which adds 9th-grade repeaters from the previous year to the number of students in the incoming freshman class each year. Enrollment counts include a proportional distribution of students not enrolled in a specific grade.

Indicators 1.14 and 2.9 use American Community Survey (ACS) data to examine levels of educational attainment among parents of school-age children and among adults age 25 and over, respectively. The levels of educational attainment reported by ACS include less than a high school diploma or equivalent, a high school diploma or equivalent, some college
or an associate's degree, a bachelor's degree, and a graduate or professional degree. The "less than a high school diploma or equivalent" category includes those currently enrolled in high school, while the "high school diploma or equivalent" category includes those currently enrolled in college. ACS data do not differentiate between those who graduated from public schools, graduated from private schools, or who earned an equivalency credential such as a GED. The data include individuals who never attended high school in the United States and is limited to the civilian, noninstitutionalized population. Indicator 1.14 reports on the percentages of students ages $6-18$ with a mother who had completed the various levels of attainment and the percentages of such students with a father who had completed these levels of educational attainment. Indicator 2.9 examines the percentages of adults age 25 and older with these levels of educational attainment.

Indicator 1.15 uses National Household Education Survey (NHES) data to report on parents' expectations for their children's highest level of educational attainment. The levels of attainment used by NHES differ slightly from those used by ACS. They include less than a high school diploma, a high school diploma, vocational or technical school, 2 or more years of college, a 4- or 5 -year college degree, and a graduate or professional degree.

## Glossary

Advanced Placement (AP) course A course within the Advanced Placement program (a set of college-level courses sponsored by the College Board). Each AP course is associated with a standardized AP examination, and students with qualifying AP examination scores are granted credit, placement, or both at most colleges and universities in the United States and Canada, and at institutions in more than 40 other countries.

Associate's degree A degree granted for the successful completion of a subbaccalaureate program of studies, usually requiring at least 2 years (or equivalent) of full-time college-level study. This includes degrees granted in a cooperative or work-study program.

Averaged freshman graduation rate A rate that provides an estimate of the percentage of public high school students who graduate on time. The rate is the number of graduates divided by the estimated count of freshmen 4 years earlier. The estimated averaged freshman enrollment count is the sum of the number of 8th-graders 5 years earlier, the number of 9 th-graders 4 years earlier (because this is when cur-rent-year seniors were freshmen), and the number of 10th-graders 3 years earlier, divided by 3 . Enrollment counts include a proportional distribution of students not enrolled in a specific grade. The averaging is intended to account for higher grade retentions in the 9th grade. Graduates include only those who earned regular diplomas or diplomas for advanced academic achievement (e.g., honors diplomas) as defined by the state or district.

Bachelor's degree A degree granted for the successful completion of a baccalaureate program of studies, usually requiring at least 4 years (or equivalent) of full-time college-level study. This includes degrees granted in a cooperative or work-study program.

Capital outlay Funds for the acquisition of land and buildings; building construction, remodeling, and additions; the initial installation or extension of service systems and other built-in equipment; and site improvement. The category also encompasses architectural and engineering services, including the development of blueprints.

Carnegie unit The number of credits a student received for a course taken every day, one period per day, for a full year; a factor used to standardize all credits indicated on transcripts across studies.

Catholic school A private school over which a Roman Catholic church group exercises some control or provides some form of subsidy. Catholic schools for the most part include those operated or supported by a parish, a group of parishes, a diocese, or a Catholic religious order.

Combined elementary and secondary school A school that encompasses instruction at both the elementary and the secondary levels; includes schools starting with grade 6 or below and ending with grade 9 or above.

Computer science A group of instructional programs that describes computer and information sciences, including computer programming, data processing, and information systems.

Constant dollars Dollar amounts that have been adjusted by means of price and cost indexes to eliminate inflationary factors and allow direct comparison across years.

Consumer Price Index (CPI) This price index measures the average change in the cost of a fixed market basket of goods and services purchased by consumers.

Current dollars Dollar amounts that have not been adjusted to compensate for inflation.

Current expenditures (elementary/secondary) The expenditures for operating local public schools, excluding capital outlay and interest on school debt. These expenditures include such items as salaries for school personnel, fixed charges, student transportation, school books and materials, and energy costs. Beginning in 1980-81, expenditures for state administration are excluded.

Degree-granting institutions Postsecondary institutions that are eligible for Title IV federal financial aid programs and grant an associate's or higher degree. For an institution to be eligible to participate in Title IV financial aid programs, it must offer a program of at least 300 clock hours in length, have accreditation recognized by the U.S. Department of Education, have been in business for at least 2 years, and have signed a participation agreement with the Department.

Doctor's degree An earned degree carrying the title of Doctor. The Doctor of Philosophy degree (Ph.D.) is the highest academic degree and requires mastery within a field of knowledge and demonstrated ability to perform scholarly research. Other doctorates are awarded for fulfilling specialized requirements in professional fields, such as education (Ed.D.), musical arts (D.M.A.), business administration (D.B.A.),
and engineering (D.Eng. or D.E.S.). Many doctor's degrees in academic and professional fields require an earned master's degree as a prerequisite. First-professional degrees, such as M.D. and D.D.S., are not included under this heading.

Dual credit course A course for which high school students can earn both high school and postsecondary credit.

Educational attainment The highest grade of regular school attended and completed.

Elementary school A school classified as elementary by state and local practice and composed of any span of grades not above grade 8. In this publication, prekindergarten and kindergarten programs are included under this heading.

Elementary/secondary school As reported in this publication, includes only regular schools (i.e., schools that are part of state and local school systems and most not-for-profit private elementary/secondary schools, both religiously affiliated and nonsectarian). Schools not reported include subcollegiate departments of institutions of higher education, residential schools for exceptional children, federal schools for American Indians, and federal schools on military posts and other federal installations.

Employment Includes civilian, noninstitutional persons who (1) worked during any part of the survey week as paid employees; worked in their own business, profession, or farm; or worked 15 hours or more as unpaid workers in a family-owned enterprise; or (2) were not working, but had jobs or businesses from which they were temporarily absent due to illness, bad weather, vacation, labor-management dispute, or personal reasons regardless of whether or not they were seeking another job.

English A group of instructional programs that describes the English language arts, including composition, creative writing, and the study of literature.

Enrollment The total number of students registered in a given school unit at a given time, generally in the fall of a year.

Expenditures Charges incurred, whether paid or unpaid, which are presumed to benefit the current fiscal year. For elementary/secondary schools, these include all charges for current outlays plus capital outlays and interest on school debt. For institutions of higher education, these include current outlays plus capital outlays. For government, these include
charges net of recoveries and other correcting transactions other than for retirement of debt, investment in securities, extension of credit, or as agency transactions. Government expenditures include only external transactions, such as the provision of perquisites or other payments in kind. Aggregates for groups of governments exclude intergovernmental transactions among the governments.

Expenditures per pupil Charges incurred for a particular period of time divided by a student unit of measure, such as average daily attendance or average daily membership.

Family A group of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together. All such persons (including related subfamily members) are considered as members of one family.

Federal funds Amounts collected and used by the federal government for the general purposes of the government. There are four types of federal fund accounts: the general fund, special funds, public enterprise funds, and intragovernmental funds. The major federal fund is the general fund, which is derived from general taxes and borrowing. Federal funds also include certain earmarked collections, such as those generated by and used to finance a continuing cycle of business-type operations.

First-professional degree A degree that signifies both completion of the academic requirements for beginning practice in a given profession and a level of professional skill beyond that normally required for a bachelor's degree. This degree usually is based on a program requiring at least 2 academic years of work prior to entrance and a total of at least 6 academic years of work to complete the degree program, including both prior required college work and the professional program itself. By NCES definition, first-professional degrees are awarded in the fields of dentistry (D.D.S. or D.M.D.), medicine (M.D.), optometry (O.D.), osteopathic medicine (D.O.), pharmacy (D.Phar.), podiatric medicine (D.P.M.), veterinary medicine (D.V.M.), chiropractic (D.C. or D.C.M.), law (J.D.), and theological professions (M.Div. or M.H.L.).

Foreign languages A group of instructional programs that describes the structure and use of language that is common or indigenous to people of the same community or nation, the same geographical area, or the same cultural traditions. Programs cover such features as sound, literature, syntax, phonology, semantics,
sentences, prose, and verse, as well as the development of skills and attitudes used in communicating and evaluating thoughts and feelings through oral and written language.

High school A secondary school offering the final years of high school work necessary for graduation, usually including grades $10,11,12$ or grades 9,10 , 11 , and 12 .

Household All the persons who occupy a housing unit. A house, apartment, mobile home, or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters, that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

Impact Aid Impact Aid was designed to assist local school districts that have lost property tax revenue due to the presence of tax-exempt Federal property, or that have experienced increased expenditures due to the enrollment of federally connected children, including children living on Indian lands.

Instruction (elementary and secondary) Instruction encompasses all activities dealing directly with the interaction between teachers and students. Teaching may be provided for students in a school classroom, in another location such as a home or hospital, and in other learning situations such as those involving cocurricular activities. Instruction may be provided through some other approved medium, such as television, radio, telephone, and correspondence. Instruction expenditures include salaries, employee benefits, purchased services, supplies, and tuition to private schools.

Instructional staff In local schools, includes all public elementary and secondary (junior and senior high) day-school positions that are in the nature of teaching or in the improvement of the teaching-learning situation. Instructional staff includes consultants or supervisors of instruction, principals, teachers, guidance personnel, librarians, psychological personnel, and other instructional staff, and excludes administrative staff, attendance personnel, clerical personnel, and junior college staff.

International Baccalaureate (IB) program High school program including an international curriculum certified by the International Baccalaureate Organization. IB courses compose a 2 -year liberal arts curriculum that leads to an IB diploma. Like AP courses, IB courses may earn students college credits.

Labor force Persons employed as civilians, unemployed but looking for work, or in the armed services during the survey week. The "civilian labor force" comprises all civilians classified as employed or unemployed. See also Unemployed.

Master's degree A degree awarded for successful completion of a program generally requiring 1 or 2 years of full-time college-level study beyond the bachelor's degree. One type of master's degree, including the Master of Arts degree, or M.A., and the Master of Science degree, or M.S., is awarded in the liberal arts and sciences for advanced scholarship in a subject field or discipline and demonstrated ability to perform scholarly research. A second type of master's degree is awarded for the completion of a professionally oriented program, for example, an M.Ed. in education, an M.B.A. in business administration, an M.F.A. in fine arts, an M.M. in music, an M.S.W. in social work, and an M.P.A. in public administration. A third type of master's degree is awarded in professional fields for study beyond the first-professional degree, for example, the Master of Laws (L.L.M.) and Master of Science in various medical specializations.

Mathematics A group of instructional programs that describes the science of numbers and their operations, interrelations, combinations, generalizations, and abstractions and of space configurations and their structure, measurement, transformations, and generalizations.

Operation and maintenance services Includes salary, benefits, supplies, and contractual fees for supervision of operations and maintenance, operating buildings (heating, lighting, ventilating, repair, and replacement), care and upkeep of grounds and equipment, vehicle operations and maintenance (other than student transportation), security, and other operations and maintenance services.

Private school or institution A school or institution that is controlled by an individual or agency other than a state, a subdivision of a state, or the federal government. It is usually supported primarily by other than public funds, and the operation of its program rests with other than publicly elected or appointed officials. Private schools and institutions include both not-for-profit and for-profit institutions.

Public school or institution A school or institution controlled and operated by publicly elected or appointed officials and deriving its primary support from public funds.

Pupil-to-teacher ratio The enrollment of pupils at a given period of time, divided by the full-time-equivalent number of classroom teachers serving these pupils during the same period.

Racial/ethnic group Classification indicating general racial or ethnic heritage based on self-identification, as in data collected by the Census Bureau, or based on observer identification, as in data collected by the Office for Civil Rights. These categories are in accordance with the Office of Management and Budget standard classification scheme presented below:

White A person having origins in any of the original peoples of Europe, North Africa, or the Middle East. Normally excludes persons of Hispanic origin.

Black A person having origins in any of the black racial groups in Africa. Normally excludes persons of Hispanic origin.

Hispanic A person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race.

Asian A person having origins in any of the original peoples of the Far East, Southeast Asia, or the Indian subcontinent, e.g., China, India, Japan, the Philippines, Vietnam, and Korea. Normally excludes persons of Hispanic origin.

Native Hawaiian/Other Pacific Islander A person having origins in any of the original peoples of the Pacific Islands, e.g., Hawaii, Guam, and Samoa. Normally excludes persons of Hispanic origin.

American Indian or Alaska Native A person having origins in any of the original peoples of North America and South America and maintaining their cultural identification through tribal affiliation or community recognition. Normally excludes persons of Hispanic origin.

Region The regions of the United States are defined by state as follows:

Northeast Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

Midwest Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mis-
sissippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia, and the District of Columbia.

West Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Revenue All funds received from external sources, net of refunds, and correcting transactions. Noncash transactions, such as receipt of services, commodities, or other receipts in kind are excluded, as are funds received from the issuance of debt, liquidation of investments, and nonroutine sale of property.

Salary The total amount regularly paid or stipulated to be paid to an individual, before deductions, for personal services rendered while on the payroll of a business or organization.

School A division of the school system consisting of students in one or more grades or other identifiable groups and organized to give instruction of a defined type. One school may share a building with another school or one school may be housed in several buildings.

School district An education agency at the local level that exists primarily to operate public schools or to contract for public school services. Synonyms are "local basic administrative unit" and "local education agency."

Science The body of related courses concerned with knowledge of the physical and biological world and with the processes of discovering and validating this knowledge.

Secondary school A school comprising any span of grades beginning with the next grade following an elementary or middle school (usually 7,8 , or 9 ) and ending with or below grade 12. Both junior high schools and senior high schools are included.

Social sciences A body of related courses concerned with knowledge of the social life of human groups and individuals, including economics, geography, history, political science, psychology, social studies, and sociology.

Status dropout rate The percentage of civilian, noninstitutionalized 16- to 24 -year-olds who are not in high school and who have not earned a high school credential (either a diploma or equivalency credential such as a GED). The status dropout rate includes all dropouts regardless of when they last attended school,
as well as individuals who may have never attended school in the United States, such as immigrants who did not complete a high school diploma in their home country.

Student An individual for whom instruction is provided in an educational program under the jurisdiction of a school, school system, or other education institution. No distinction is made between the terms "student" and "pupil," though "student" may refer to one receiving instruction at any level while "pupil" refers only to one attending school at the elementary or secondary level. A student may receive instruction in a school facility or in another location, such as at home or in a hospital. Instruction may be provided by direct student-teacher interaction or by some other approved medium, such as television, radio, telephone, and correspondence.

Title I Title I is designed to support State and local school reform efforts tied to challenging State academic standards in order to reinforce and amplify efforts to improve teaching and learning for students farthest from meeting State standards. Individual public schools with poverty rates above 40 percent may use Title I funds, along with other Federal, State,
and local funds, to operate a "schoolwide program" to upgrade the instructional program for the whole school. Schools with poverty rates below 40 percent, or those choosing not to operate a schoolwide program, offer a "targeted assistance program" in which the school identifies students who are failing, or most at risk of failing, to meet the State's challenging performance standards, then designs, in consultation with parents, staff, and district staff, an instructional program to meet the needs of those students.

## Unadjusted dollars See Current dollars.

Unemployed Civilians who had no employment but were available for work and (1) had engaged in any specific job-seeking activity within the past 4 weeks; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Vocational education (or Career/Technical education) Organized educational programs, services, and activities that are directly related to the preparation of individuals for paid or unpaid employment, or for additional preparation for a career, requiring other than a baccalaureate or advanced degree.

## Appendix C.

 Guide to Sources
## U.S. Department of Commerce, Census Bureau

## American Community Survey (ACS)

The American Community Survey (ACS) is a sample survey conducted by the U.S. Census Bureau. The ACS was first implemented in 1996 and has expanded in scope in subsequent years. The ACS will replace the long-form survey in the Decennial Census by 2010.

For more information on the American Community Survey, see http://www.census.gov/acs.

## U.S. Department of Education National Center for Education Statistics (NCES)

## Common Core of Data (CCD), Public Elementary/

## Secondary School Universe Survey

The Common Core of Data (CCD) is a universe survey database with comprehensive, annually updated information. The Public Elementary/Secondary School Universe Survey compiles data from state education agencies based on school records to provide a complete listing of all public elementary and secondary schools in the country and basic information and descriptive statistics on all schools, their students, and their teachers. American Indian/Alaska Native students on reservations are not included in the Public Elementary/Secondary School Universe Survey.

For more information on the CCD, see http://nces .ed.gov/ccd/index.asp.

Fast Response Survey System (FRSS)
The Fast Response Survey System (FRSS) was established in 1975 to collect issue-oriented data quickly and with minimum response burden. The FRSS, whose surveys collect and report data on key education issues at the elementary and secondary levels, was designed to meet the data needs of Department of Education analysts, planners, and decisionmakers when information could not be collected quickly through NCES's large recurring surveys.

For more information on the FRSS, see http://nces .ed.gov/surveys/frss.

## National Assessment of Educational Progress (NAEP)

The National Assessment of Educational Progress (NAEP) is a nationally representative and continuing assessment of what America's students know and can do in various subject areas. For over three decades, assessments have been conducted periodically in reading, mathematics, science, writing, history, geography, and other subjects.

For more information on NAEP, see http://nces .ed.gov/nationsreportcard.

## The National Household Education Surveys Program (NHES)

The National Household Education Surveys Program (NHES) was developed by NCES to complement its
institutional surveys. This program is the principal mechanism for addressing topics that cannot be addressed in institutional data collections. By collecting data directly from households, NHES enables NCES to gather data on a wide range of issues, such as early childhood care and education, children's readiness for school, parent perceptions of school safety and discipline, before- and after-school activities of school-age children, participation in adult and continuing education, parent involvement in education, and civic involvement.

For more information on the NHES Program, see http://nces.ed.gov/nhes.

## The Private School Universe Survey (PSS)

The target population for the PSS consists of all private schools in the United States that meet the NCES definition (i.e., a private school is not supported primarily by public funds, it provides instruction for one or more of grades $\mathrm{K}-12$ or comparable ungraded levels, and it has one or more teachers. Organizations or institutions that provide support for homeschooling without offering classroom instruction for students
are not included.). The PSS, conducted every 2 years, began with the 1989-90 school year and was administered again in 1991-92, 1993-94, 1995-96, 1997-98, 1999-2000, 2001-02, 2003-04.

For more information on the PSS, see http://nces .ed.gov/surveys/pss.

## Schools and Staffing Survey (SASS)

SASS has four core components: the School Questionnaire, the Teacher Questionnaire, the Principal Questionnaire, and the School District Questionnaire, which was known as the Teacher Demand and Shortage Questionnaire until the 1999-2000 SASS administration. These questionnaires are sent to respondents in public, private, and Bureau of Indian Affairs/tribal schools. In 1999-2000, public charter schools were also included in the sample. For the 2003-04 SASS, a sample of public charter schools are included in the sample as part of the public school questionnaire.

For more information on SASS, see http://nces .ed.gov/surveys/sass.

[^0]:    ${ }^{1}$ U.S. Code, Title 20, Chapter 76, Subchapter 1, Part C, Sec. 9543 (a)(3); P.L. 107-279, Part C, Sec. 153 (a)(3).

[^1]:    $\dagger$ Not applicable.
    ${ }^{1}$ This percentage, which represents the number under the new system divided by the number under the former system, is over 100 percent because the new classification system increased the total number classified as rural.
    SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Public Elementary/Secondary School Locale Code File," 2003-04.

[^2]:    ${ }^{1}$ Total includes schools not reporting enrollment or grade level.
    NOTE: Enrollment counts exclude schools with no reported enrollment. 1,749 schools and 86,690 students with no reported grade level are not separately shown. Detail may not sum to totals because of rounding or because of schools with no reported grade level that are not separately shown. SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Public Elementary/Secondary School Universe Survey", 2003-04.

[^3]:    \# Rounds to zero.
    NOTE: Excludes schools with no reported enrollment. 1,749 schools and 86,690 students with no reported grade level are not included in the calculations of these percentage distributions. Detail may not sum to totals because of rounding.
    SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Public Elementary/Secondary School Universe Survey," 2003-04.

[^4]:    ${ }^{1}$ Includes other racial/ethnic groups not separately shown.
    NOTE: The National School Lunch Program is a federally assisted meal program. To be eligible, a student must be from a household with an income at or below 130 percent of the poverty threshold for free lunch or between 130 percent and 185 percent of the poverty threshold for reduced-price lunch. Approximately 13,704 public schools did not report information on the number of students eligible for a free or reduced-price school lunch. Therefore, this information is missing for $5,227,075$ public school students. For a comparison of poverty definitions, see appendix B. Race/ethnicity categories exclude persons of Hispanic origin unless otherwise specified. Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua 2k.html. Detail may not sum to totals because of rounding.

[^9]:    ${ }^{3}$ The status dropout rate includes all dropouts regardless of when they last attended school, as well as individuals who may have never attended school in the United States, such as immigrants who did not complete a high school diploma in their home country. For a comparison of poverty definitions and measures of educational attainment, see appendix B.

[^10]:    ! Interpret data with caution.
    NOTE: The data presented here represent the status dropout rate, which is the percentage of civilian, noninstitutionalized 16 - to 24 -year-olds who are not in high school and who have not earned a high school credential (either a diploma or equivalency credential such as a GED). The status dropout rate includes all dropouts regardless of when they last attended school, as well as individuals who may have never attended school in the United States, such as immigrants who did not complete a high school diploma in their home country. Race/ethnicity categories exclude persons of Hispanic origin unless otherwise specified. For a comparison of measures of educational attainment, see appendix B.
    SOURCE: U.S. Department of Commerce, Census Bureau, American Community Survey, 2004, previously unpublished data.

[^11]:    ${ }^{4}$ The averaged freshman graduation rate provides an estimate of the percentage of public high school students who graduate on time. The rate is the number of graduates divided by the estimated count of freshmen 4 years earlier. The estimated averaged freshman enrollment count is the sum of the number of 8th-graders 5 years earlier, the number of 9 th-graders 4 years earlier (because this is when current year seniors were freshmen), and the number of 10 th-graders 3 years earlier, divided by 3. (Enrollment counts used for these calculations include a proportional distribution of students not enrolled in a specific grade.) The averaging is intended to account for higher grade retentions in the 9th grade. Graduates include only those who earned regular diplomas or diplomas for advanced academic achievement (e.g., honors diplomas) as defined by the state or district. This measure is sensitive to in and out migration at the school district level. Please see Seastrom et al. (2006) for a more detailed discussion of the averaged freshman graduation rate compared to other NCES graduation rate measures. For a comparison of measures of educational attainment, see appendix B.

[^12]:    ! Interpret data with caution.
    ${ }^{1}$ Full-time participation for all or part of the year in a college or university credential program or a vocational or technical diploma program was not counted as an adult educational activity. However, individuals who were enrolled part-time in a college or university credential program or vocational or technical diploma program were included in the denominator.
    ${ }^{2}$ Includes basic skills training, apprenticeships, and English as a Second Language (ESL) courses.
    SOURCE: U.S. Department of Education, National Center for Education Statistics, Adult Education Survey of the 2005 National Household Education Surveys Program (NHES).

[^13]:    ${ }^{1}$ Includes those currently enrolled in school.
    ${ }^{2}$ Includes those currently enrolled in college.
    SOURCE: U.S. Department of Commerce, Census Bureau, American Community Survey, 2004, previously unpublished data.

[^14]:    ${ }^{1}$ Includes those currently enrolled in school.
    ${ }^{2}$ Includes those currently enrolled in college.
    NOTE: For a comparison of poverty definitions, see appendix B. Detail may not sum to totals because of rounding.
    SOURCE: U.S. Department of Commerce, Census Bureau, American Community Survey, 2004, previously unpublished data.

[^15]:    ${ }^{1}$ Includes those currently enrolled in school.
    ${ }^{2}$ Includes those currently enrolled in college.
    NOTE: For a comparison of poverty definitions, see appendix B.
    SOURCE: U.S. Department of Commerce, Census Bureau, American Community Survey, 2004, previously unpublished data.

[^16]:    ${ }^{6}$ NCES's Comparable Wage Index (CWI) was used to adjust for geographic cost differences. For more details on the CWI, see A Comparable Wage Approach to Geographic Cost Adjustment (NCES 2006-321).

[^17]:    ${ }^{7}$ The Impact Aid program, originally enacted in 1950 under P.L. 815 and 874 (now Title VIII of P.L. 107-110, the No Child Left Behind Act of 2001), compensates local school districts for any "substantial and continuing financial burden" resulting from federal ownership of land that exempts it from property taxes as well as from the enrollment of children residing on Indian lands, military bases, low-rent housing properties, or other federal properties.
    ${ }^{8}$ This general national pattern was not true in all states; the most notable exceptions were Connecticut and Rhode Island where rural public schools relied more on local funding than city and suburban schools.
    ${ }^{9}$ District poverty was determined by ranking school districts by the percentage of enrolled children ages 5-17 from families with an income below the poverty threshold, and then dividing these districts into five categories with equal proportions of the total enrollment. The low-poverty district category consists of the 20 percent of students nationally in districts with the lowest percentages of poor school-age children. Conversely, the high-poverty district category consists of the 20 percent of students nationally in districts with the highest percentages of poor school-age children. For a comparison of poverty definitions see appendix B.

[^18]:    SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "National Public Education Financial Survey", 2003-04.

[^19]:    \# Rounds to zero.
    ${ }^{1}$ District poverty was determined by ranking school districts by the percentage of enrolled children ages 5-17 from families with an income below the poverty threshold, and then dividing these districts into five categories with equal proportions of the total enrollment. The low-poverty district category consists of 20 percent of students in districts with the lowest percentages of poor school-age children. Conversely, the high-poverty district category consists of the 20 percent of students in districts with the highest percentages of poor school-age children. For a comparison of poverty definitions, see appendix $B$.
    ${ }^{2}$ Impact Aid was designed to assist local school districts that have lost property tax revenue due to the presence of tax-exempt federal property, or that have experienced increased expenditures due to the enrollment of federally connected children, including children living on Indian lands.
    NOTE: Rural areas are located outside any urbanized area or urban cluster. Urbanized areas are densely settled areas containing at least 50,000 people. Urban clusters are densely settled areas with a population of 2,500 to 49,999 . Fringe rural areas are 5 miles or less from an urbanized area or 2.5 miles or less from an urban cluster. Distant rural areas are more than 5 miles but less than or equal to 25 miles from an urbanized area, or more than 2.5 miles but less than or equal to 10 miles from an urban cluster. Remote rural areas are more than 25 miles from an urbanized area and more than 10 miles from an urban cluster. For more details on Census-defined areas, see http://www.census.gov/geo/www/ua/ua $2 k$.html. Detail may not sum to totals because of rounding.

[^20]:    ${ }^{10}$ NCES's Comparable Wage Index (CWI) was used to adjust for geographic cost differences. For more details on the CWI, see A Comparable Wage Approach to Geographic Cost Adjustment (NCES 2006-321). These cost adjustments cannot be applied to total expenditures.
    ${ }^{11}$ District poverty was determined by ranking school districts by the percentage of enrolled children ages 5-17 from families with an income below the poverty threshold, and then dividing these districts into five categories with equal proportions of the total enrollment. The low-poverty district category consists of the 20 percent of students nationally in districts with the lowest percentages of poor school-age children. Conversely, the high-poverty district category consists of the 20 percent of students nationally in districts with the highest percentages of poor school-age children. For a comparison of poverty definitions see appendix B.

[^21]:    ! Interpret data with caution.
    1 "Underenrolled" indicates that the capacity of the permanent buildings and instructional space is greater than student enrollment by more than 5 percent.
    2 "Overenrolled" indicates that the enrollment of the school is greater than the capacity of the permanent buildings and instructional space by more than 5 percent. NOTE: Detail may not sum to totals because of rounding.

[^23]:    ! Interpret data with caution.
    ${ }^{1}$ Includes certificate of advanced graduate studies.
    ${ }^{2}$ Main teaching assignment.
    NOTE: Includes part-time and full-time teachers. Race/ethnicity categories exclude persons of Hispanic origin unless otherwise specified. Detail may not sum to totals because of rounding.
    SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, "Teacher Questionnaire," 2003-04.

[^24]:    ${ }^{13}$ For the problems of students dropping out and student pregnancy, comparisons are made only among public school teachers at the high school level. The percentages of public elementary and middle school teachers reporting these problems as serious were not measurable due to low frequencies and high standard errors.

[^27]:    ${ }^{14}$ NCES's Comparable Wage Index (CWI) was used to adjust for geographic cost differences. For more details on the CWI, see A Comparable Wage Approach to Geographic Cost Adjustment (NCES 2006-321).

[^28]:    ${ }^{15}$ The apparent differences between these fields (ESL and foreign languages) and the field of physical science (27 percent reporting "very difficult") were not statistically significant due to large standard errors.

[^29]:    ${ }^{16}$ Title I is designed to support state and local school reform efforts tied to challenging state academic standards in order to reinforce and amplify efforts to improve teaching and learning for students farthest from meeting state standards. Individual public schools with poverty rates at or above 40 percent may use Title I funds, along with other federal, state, and local funds, to operate a "schoolwide program" to upgrade the instructional program for the whole school. Schools with poverty rates below 40 percent, or those choosing not to operate a schoolwide program, offer a "targeted assistance program" in which the school identifies students who are failing, or most at risk of failing, to meet the state's challenging performance standards, then designs, in consultation with parents, staff, and district staff, an instructional program to meet the needs of those students.

    NOTE: The average number of students to staff is based on the total number of full- and part-time staff. This measure differs from pupil-teacher ratios, which are based on the total number of full-time-equivalent teachers. Student enrollment data used to calculate this ratio are for schools with such staff. Regular public schools do not include alternative, special education, special program emphasis, or vocational/technical schools. Data for combined elementary and secondary schools and for ungraded schools are excluded. ESL is English as a second language.
