SERIES EDITOR'S PREFACE v

PREFACE xi

CHAPTER 1

MATHEMATICAL MODELS OF DETERMINISTIC DISCRETE AND CONTINUOUS DYNAMICAL SYSTEMS 1

1. Simplest typical models of discrete dynamical systems 2
2. Chaotic motions of deterministic dynamical systems 19
3. Simplest mathematical models of continuous dynamical systems 25
4. Discrete version of continuous dynamical systems 31
5. Models for locally active continuous media 37

CHAPTER 2

ORDER AND CHAOS AS TWO GENERAL BASIC TRENDS IN THE EVOLUTION OF DYNAMICAL SYSTEMS 40

1. Order and chaos: stability and instability 41
2. Time synchronization phenomena 49
3. Spatial and temporal order and chaos 52

CHAPTER 3

STOCHASTICITY TRANSFORMERS, AMPLIFIERS AND GENERATORS 57

1. Stochasticity transformers 57
2. Stochasticity amplifiers 62
3. Stochasticity generators 70
4. Is the stochasticity of stochastic and chaotic motions of deterministic dynamical systems real? 78

CHAPTER 4

BRIEF SURVEY OF STUDIES RELATED TO THE APPEARANCE OF THE PROBLEM OF CHAOTIC AND STOCHASTIC MOTIONS AND TO TURBULENCE THEORY	81
------------------------------------------------------------------------------------------------------------------------------------	-----------

CHAPTER 5

LOCAL PHASE PORTRAITS OF THE SIMPLEST STEADY-STATE MOTIONS AND THEIR BIFURCATIONS	97
1. Equilibrium states	97
2. Bifurcations of equilibrium states	103
3. Phase portraits in the vicinity of periodic motions	115
4. Bifurcations of periodic motions	116
5. Toroidal integral manifolds	127

CHAPTER 6

STOCHASTIC AND CHAOTIC ATTRACTORS	132
1. Auxiliary mappings and sequences of point mappings	134
2. Transition from the “negative” to the “positive” and investigation of typical appearance of chaos	145
3. Conditions for the appearance of chaotic and stochastic attractors	173

CHAPTER 7

BIFURCATIONS AND ROUTES TO CHAOS AND STOCHASTICITY	177
1. General description of the tree of possible bifurcations	179
2. Series of bifurcations	183
3. Bifurcations and the stochastic attractor in a Lorenz system	201
4. Bifurcations and the phase portrait of parametrically excited oscillator or rotator	215
5. On the appearance of chaos and stochasticity in dissipative dynamical systems	231

CHAPTER 8

QUANTITATIVE CHARACTERISTICS OF STOCHASTIC AND CHAOTIC MOTIONS. SOME UNIVERSAL PROPERTIES IN ORDER-CHAOS AND INVERSE TRANSITIONS	241
1. Statistical characteristics	241
2. Lyapunov exponents. Dimension and entropy of a stochastic attractor	252
3. Synchronization threshold as a quantitative characteristic of chaotic motions	264
4. Certain universal laws in order-chaos transitions, and analogy with phase transitions	266

CHAPTER 9

EXAMPLES OF MECHANICAL, PHYSICAL, CHEMICAL, AND BIOLOGICAL SYSTEMS WITH CHAOTIC AND STOCHASTIC MOTIONS	293
1. Non-linear impact negative-friction oscillator and other systems with discontinuous characteristics	293
2. Tunnel-diode generators	295
3. Non-linear oscillators with periodic external force	298
4. Lorenz equations and other systems of order three	322
5. Action of a harmonic external force on periodic and chaotic oscillation generators	351
6. Interaction of oscillation generators of various kinds	368
7. Certain discrete models of turbulence	373
8. Examples of models for chemical kinetics	383
9. Systems with delay and other continuous systems	401
10. Stochasticity in quantum systems	430
