TABLE OF CONTENTS

Foreword		v
Preface		vii
Chapter 1.	Introduction	1
Chapter 2.	Historical Review	3
	2.1 Brownian motion	3
	2.2 Turbulent diffusion	4
Chapter 3.	Applicable Physics of Turbulence	7
	3.1 Reinterpretation of the Langevin equation for turbulent diffusion	7
	3.2 Kolmogorov's similarity hypotheses	8
	3.3 Lagrangian structure function	8
	3.4 Lagrangian and Eulerian statistics	9
	3.5 A solution for stationary homogeneous turbulence	9
	3.6 An alternate to the integral Lagrangian timescale	10
Chapter 4.	Definitions for Stochastic Diffusion	13
	4.1 Random, stochastic, and Markov processes	13
	4.2 White noise and the Wiener process	14
	4.3 Realizable probability distribution functions	18
Chapter 5.	The Fokker-Planck Equation	19
	5.1 Mathematical properties	19
	5.2 Derivation	20
	5.3 The forward and backward equations	23
	5.4 The Kramers-Moyal expansion	23
Chapter 6.	Stochastic Differential Equations for Turbulent Diffusion	25
	6.1 Langevin equation for stationary, inhomogeneous, Gaussian turbulence	25
	6.2 The Ito and Stratonovich interpretations	25
	6.3 The diffusion limit: The random displacement equation	28
	6.4 Applicability of the Langevin and random displacement equations	30
Chapter 7.	Criteria for Stochastic Models of Turbulent Diffusion	31
	7.1 Descriptions of criteria	31
	7.2 Applying the well-mixed criterion	31
Chapter 8.	Turbulent Diffusion in Three Dimensions	35
	8.1 Multivariate Gaussian distribution	35
	8.2 Applicable Langevin and Fokker-Planck equations	36
	8.3 Solution for the stochastic term in the Langevin equation	37
	8.4 Solutions for the deterministic term in the Langevin equation	37
	8.5 The Borgas solution and Thomson's "simplest" solution	40
	8.6 Solutions for the random displacement and diffusion equations	41
Chapter 9.	Applications of Thomson's "Simplest" Solution	43
	9.1 Simplification for three dimensions	43
	9.2 Simplification to two dimensions and one dimension	44
Chapter 10.	Application to the Convective Boundary Layer	45
	10.1 Approximating non-Gaussian turbulence	45
	10.2 Pioneering applications	47
	10.3 Model of Luhar-Britter and Sawford-Weil	47
	10.4 Four-moment model of Du, Wilson, and Yee	49
	10.5 Closure of Luhar, Hibberd, and Hurley	49

Chapter 11. The Boundary Condition Problem	51
11.1 Historical review	51
11.2 Study by Wilson and Flesch	52
11.3 The random displacement model	54
11.4 Appendix: A reflection algorithm	54
Chapter 12. Parameterization of Turbulence Statistics for Model Inputs	59
12.1 Basic scaling parameters	59
12.2 Vertical velocity variance	61
12.3 Dissipation of turbulence kinetic energy	62
12.4 Universal constant for the Lagrangian structure function	63
12.5 Skewness of the vertical velocity	63
12.6 Horizontal velocity variances	63
12.7 Shear stress	64
12.8 Unfinished business	64
Chapter 13. Brief Review of Four Topics	65
13.1 Two-particle dispersion	65
13.2 Intermittency and turbulent diffusion	65
13.3 Kolmogorov's refined hypotheses	66
13.4 Fractional Brownian motion	67
Chapter 14. In Conclusion	69
Acknowledgments	69
References	71
Annotated Bibliography	77
Author Index	81
Subject Index	83
