Rasmussen, 1990). The calculations were made by the program CFF with the energy parameter set NIKIPAR6 (Niketić \& Rasmussen, 1977) on an AMDAHL VP1100 computer. The lowest strain energy is found for the en $(l e l), \operatorname{tn}(p$-chair $), \operatorname{tmd}(l e l)$ conformation. The observed conformation in the crystal is the second lowest on the energy scale with an energy difference of only $2.2 \mathrm{~kJ} \mathrm{~mol}^{-1}$, which may be compensated by intermolecular interactions. The skew-boat form of the tn chelate ring has a strain energy which is larger than that of the chair form by ca $5 \mathrm{~kJ} \mathrm{~mol}^{-1}$. However, the $l e l_{3}$ conformation has the second lowest strain energy because of relatively small non-bonded $\mathrm{H}^{\cdots} \mathrm{H}$ repulsions between the chelate rings.

The authors thank Dr Masaaki Kojima of Nagoya University for providing crystal specimens and for valuable discussions. A part of the present work was supported by Grant-in-Aid for Scientific Research Number 63628513 from the Ministry of Education, Science and Culture, to which the authors thanks are due. The conformational analysis was made by one
of the authors (SO) at the Technical University of Denmark with financial support from the Danish Research Academy and Yamada Science Foundation.

# Structure of trans-Bis[4-amino-3,5-bis(pyridin-2-yl)-1,2,4-triazole$N^{1}, N^{\prime} \mid$ diaquamanganese(II) Dibromide 

By C. Faulmann, P. J. van Koningsbruggen, R. A. G. de Graaff, J. G. Haasnoot* and J. Reedijk<br>Department of Chemistry, Gorlaeus Laboratories, Leiden University, PO Box 9502, 2300 RA Leiden, The Netherlands

(Received 2 March 1990; accepted 19 April 1990)

Abstract. $\left[\mathrm{Mn}\left(\mathrm{C}_{12} \mathrm{H}_{10} \mathrm{~N}_{6}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \mathrm{Br}_{2}, \quad M_{r}=727 \cdot 28$, orthorhombic, $P b c a, a=10.734$ (6), $b=17.084$ (0), $c$ $=15 \cdot 182(6) \AA, \quad V=2784 \AA^{3}, \quad Z=4, \quad D_{x}=$ $1.734 \mathrm{~g} \mathrm{~cm}^{-3}, \quad \lambda(\mathrm{Mo} \mathrm{K} \mathrm{\alpha})=0.71073 \AA, \quad \mu=$ $33.23 \mathrm{~cm}^{-1}, \quad F(000)=1450, T=295 \mathrm{~K}$, final $R=$ 0.032 for 1493 reflections [ $I>2 \sigma(I)$ ]. The title compound is the first reported mononuclear compound with the ligand 4 -amino-3,5-bis(pyridin-2-yl)-1,2,4triazole. The manganese ions, situated on an inversion centre, are coordinated by four nitrogen atoms with an $\mathrm{N}-\mathrm{Mn}-\mathrm{N}$ angle of $74 \cdot 1(1)^{\circ}$ and $\mathrm{Mn}-\mathrm{N}$ distances of $2 \cdot 188$ (4) and $2 \cdot 266$ (4) $\AA$. Two axial water molecules $[\mathrm{Mn}-\mathrm{O}=2 \cdot 200$ (4) $\AA$ ] complete the coordination sphere of the metal, which is pseudo-octahedral. The two bromide ions are not

[^0]0108-2701/90/122357-04\$03.00
coordinated but are involved in an extended hydrogen-bridging network with the water ligands and the amino group of the triazole.

Introduction. In order to study magnetic exchange between first-row transition metals, the use of ligands derived from 1,2,4-triazole has proved to be of great value. Many studies have already been reported on polynuclear compounds (Engelfriet, Groeneveld \& Nap, 1980, and references cited therein; Vos, Haasnoot, Verschoor, Reedijk \& Schaminee, 1985, and references cited therein; Haasnoot \& Groeneveld, 1979). In this respect, the ligand 4 -amino-3,5-bis(pyridin-2-yl)-1,2,4-triazole (hereafter abbreviated to abpt) which was first synthesized by Dallacker (1960), has been shown to act as a tetradentate nitrogen-donor ligand. Up to now, only nickel and (C) 1990 International Union of Crystallography
cobalt compounds of abpt have been reported (Keij, de Graaff, Haasnoot \& Reedijk, 1984). A closely related ligand such as 3,5 -bis(pyridin-2-yl)-1,2,4triazole, synthesized by Geldard \& Lions (1965), has also been reported to yield dinuclear compounds with copper (Prins, Birker, Haasnoot, Verschoor \& Reedijk, 1985). However, no further reports of this type of ligand with manganese have appeared. This paper describes the structure of a manganese compound $\left[\mathrm{Mn}\left(\mathrm{C}_{12} \mathrm{H}_{10} \mathrm{~N}_{6}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \mathrm{Br}_{2}$, which is, surprisingly, the first mononuclear coordination compound containing the ligand abpt.

Experimental. The abpt ligand has been prepared by literature methods (Geldard \& Lions, 1965). Crystals suitable for X-ray analysis were obtained as follows. 1 mmol of abpt was dissolved in 30 ml of warm methanol, to this solution was added an aqueous solution of 1 mmol of $\mathrm{MnBr}_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}$, yellow crystals were obtained on slow evaporation at room temperature. Experimental data are shown in Table 1. Enraf-Nonius CAD-4 four-circle diffractometer with graphite-monochromated Mo $K \alpha$ radiation. Cell constants were determined from setting angles of 24 reflections ( $\theta$ between 10 and $12^{\circ}$ ). The intensities were corrected for Lorentz and polarization effects. Absorption correction was applied by the use of Monte-Carlo methods (de Graaff, 1973). Scattering factors and corrections for anomalous dispersion were taken from International Tables for $X$-ray Crystallography (1974, Vol. IV). Bromide ions were located from a Patterson map. The structure was solved by automatic Fourier techniques, using the computer program AUTOFOUR (Kinneging \& de Graaff, 1984). Least-squares refinement, based on $F$, of non-hydrogen-atom positional and anisotropic thermal parameters. Positions of hydrogen atoms were calculated except those on the oxygen and the amino nitrogen. $\mathrm{C}-\mathrm{H}=1.00 \AA$ for hydrogens belonging to the pyridyl group. Isotropic temperature factors for the hydrogen atoms were $4 \cdot 0 \AA^{2}$. Leiden University Computer (IBM 3083); programs written or modified by Mrs E. W. Rutten-Keulemans and R. A. G. de Graaff.

Discussion. Positional parameters and equivalent isotropic thermal parameters for the non-hydrogen atoms are listed in Table 2. Bond distances and angles are given in Table 3.* An ORTEP drawing (Johnson, 1965), with the atomic labelling used in Tables 2 and 3, is given in Fig. 1. A stereoview of the

unit-cell contents is given in Fig. 2. The structure consists of $\left[\mathrm{Mn}\left(\mathrm{C}_{12} \mathrm{H}_{10} \mathrm{~N}_{6}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{2+}$ cations and two $\mathrm{Br}^{-}$anions, held together by various types of hydrogen bridges (Table 3). There is an inversion centre at the metal, which is in a pseudo-octahedral environment. The four equatorial coordinations are realized by two triazole N1 nitrogens and two pyridyl nitrogens. The octahedral coordination is completed by two axial water molecules. In contrast to the $\left[\mathrm{Ni}_{2}(\mathrm{abpt})_{2}\right]^{4+}$ cation (Keij et al., 1984) in which the ligand was nearly planar, we observe here a deviation in the planarity of the abpt ligand, especially beween the triazole ring and the coordinat-
ing pyridyl group: the dihedral angle between these rings is $8.6(2)^{\circ}$. Between the triazole and the noncoordinating pyridyl ring, however, the dihedral angle is only $2 \cdot 6$ (2) ${ }^{\circ}$.

Bond distances and in-plane angles of the triazole and the coordinating pyridyl group are similar to those observed for the dinuclear nickel compound. Some differences are observed in the values of the angles around the exocyclic $\mathrm{C}-\mathrm{C}$ bonds, which on one side connect the triazole ring to the noncoordinating pyridyl group and on the other side to the coordinating group whilst the angles at the triazole ring are similar $[\mathrm{N}(11)-\mathrm{C}(15)-\mathrm{C}(26)=$ 121.6 (4) and $\left.\mathrm{N}(12)-\mathrm{C}(13)-\mathrm{C}(36)=123 \cdot 5(4)^{\circ}\right]$, the angle $\mathrm{C}(15)-\mathrm{C}(26)-\mathrm{N}(21)\left[112.4(4)^{\circ}\right]$ is much

Fig. 1. Projection of $\left[\mathrm{Mn}\left(\mathrm{C}_{12} \mathrm{H}_{10} \mathrm{~N}_{6}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \mathrm{Br}_{2}$ with the atomic labelling system. Hydrogen atoms that are bonded to carbon atoms are omitted for clarity. Primed atoms are generated by 1 $-x,-y,-z$.
smaller than the analogous $\mathrm{C}(13)-\mathrm{C}(36)-\mathrm{C}(35)$ [ $\left.120.6(4)^{\circ}\right]$. This difference is ascribed to the presence of the five-membered chelate ring formed by the ligand and the manganese atom. Moreover the effect is increased by the presence of nitrogen $\mathrm{N}(16)$ from the amino group which is hydrogen bonded to the non-coordinating pyridyl nitrogen $\mathrm{N}(31)$, pulling the non-coordinating pyridyl ring into a six-membered

Fig. 2. Stereoview of the packing of $\left[\mathrm{Mn}\left(\mathrm{C}_{12} \mathrm{H}_{10} \mathrm{~N}_{6}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \mathrm{Br}_{2}$.
chelate around one of the amino hydrogens (Table 3). Therefore a significant difference ( $\sim 10^{\circ}$ ) between the angles $\mathrm{C}(15)-\mathrm{C}(26)-\mathrm{C}(25)\left[125.5(4)^{\circ}\right]$ and $\mathrm{C}(13)-\mathrm{C}(36)-\mathrm{N}(31)\left[115 \cdot 9(4)^{\circ}\right]$ is also observed.

Two other kinds of hydrogen bonds (Table 3) exist in the cell packing, firstly between the bromide ion and the amino nitrogen $\mathrm{N}(16)$, and secondly between the bromide ion and the oxygen of a water molecule. These different hydrogen bridges may be classified as intra- and intermolecular, respectively.

CF thanks the 'Commission des Communautés Européennes' for financial support between March 1989 and February 1990. Dr E. Müller is thanked for very helpful discussions.

#### Abstract

Aqua(3,3,6,6,9,9-hexamethyl-4,8-diaza-undecane-2,10-dione dioximato)copper(II) perchlorate, $\left[\mathrm{Cu}\left(\mathrm{C}_{15} \mathrm{H}_{31} \mathrm{~N}_{4} \mathrm{O}_{2}\right)\left(\mathrm{H}_{2} \mathrm{O}\right)\right]\left(\mathrm{ClO}_{4}\right), \quad M_{r}=480 \cdot 44$, monoclinic, $P 2_{1} / c, a=7.918$ (1), $b=20 \cdot 265$ (2), $c=$ 13.707 (4) $\AA, \beta=104.34$ (2) ${ }^{\circ}, U=2130.7$ (2) $\AA^{3}, Z=$ $4, D_{x}=1.498 \mathrm{Mg} \mathrm{m}^{-3}, \lambda($ Mo $K \alpha)=0.71069 \AA, \mu=$ $1 \cdot 19 \mathrm{~mm}^{-1}, F(000)=1011 \cdot 79$, room temperature, final $R=0.035, \quad w R=0.030$ for 2924 observed reflections. The coordination about $\mathrm{Cu}^{\mathrm{II}}$ is distorted square pyramidal with the deprotonated diazadioxime equatorial and the O atom of the aqua group axial. The Cu atom is significantly ( $0.202 \AA$ ) out of the plane of the four nitrogens and towards the O atom of the aqua group. This O atom forms hydrogen bonds with the neighbouring oxime and perchlorate O atoms. The C -methyl groups in this complex impose significant constraint resulting in an increase of the N (amine) $-M-\mathrm{N}$ (amine) angle, decrease of the N (amine) $-M-\mathrm{N}$ (oxime) angles and elongation of the $\mathrm{O} \cdots \mathrm{O}$ distance. The important bond distances are $\mathrm{Cu}-\mathrm{O}=2 \cdot 321$ (3), average $\mathrm{Cu}-\mathrm{N}($ oxime $)=1.953(3)$, average $\mathrm{Cu}-\mathrm{N}($ amine $)=$

1.993 (3) and $\mathrm{O} \cdots \mathrm{O}=2.509(5) \AA$ for the intramolecular hydrogen bond.

Introduction. The deprotonated diazadioxime metal complexes allow a comprehensive structural study of the variation in intramolecular hydrogen bonding with $\mathrm{O} \cdots \mathrm{O}$ distance for short hydrogen bonds (Gavel \& Schlemper, 1979). Previously, structural studies have indicated that the $\mathrm{O} \cdots \mathrm{O}$ distance varies as a function of: (1) the size of the metal ion, (2) the constraint imposed by the methylene carbons bridging the amine N atoms, and (3) changing from an $s p^{3}$ amine nitrogen to an $s p^{2}$ imine nitrogen (Liss \& Schlemper, 1975; Pal, Murmann, Schlemper, Fair \& Hussain, 1986). The present study was undertaken to examine the steric effect of the copper(II) complex of deprotonated diazadioxime.

Experimental. The ligand, 3,3,6,6,9,9-hexamethyl-4,8-diazaundecane-2,10-dione dioxime $\left(6,6-\mathrm{Me}_{2}-\right.$ PnAO), was prepared as described by Murmann $(1957,1958)$ and Vassian \& Murmann (1967). Prepa© 1990 International Union of Crystallography
