### ***MMWR Summary of Notifiable Diseases, United States, 1993***

This publication contains summary tables of the official statistics for the occurrence of nationally notifiable diseases in the United States for calendar year 1993. This information is collected and compiled from reports to the National Notifiable Diseases Surveillance System (NNDSS).

Part 1 contains information on morbidity for each of the 49 currently notifiable conditions. In all tables, leprosy is listed as Hansen disease, typhus fever (flea-borne) as murine typhus fever, and typhus fever (tick-borne) as Rocky Mountain spotted fever (RMSF). The tables show the number of cases of notifiable diseases reported to CDC for 1993, as well as the distribution of cases by month and geographic location, and by patient's age, race, and ethnicity.

Part 2 contains graphs and maps depicting summary data for many of the notifiable conditions described in tabular form in Part I.

Part 3 includes tables showing the number of cases of notifiable diseases reported to CDC and to the National Office of Vital Statistics since 1944. It also includes a table on deaths associated with specified notifiable diseases reported to the National Center for Health Statistics, CDC, for the period 1982-1991.

## **Background**

As of January 1, 1994, 49 infectious diseases were designated as notifiable at the national level. *A notifiable disease is one for which regular, frequent, and timely information on individual cases is considered necessary for the prevention and control of the disease.* This section briefly summarizes the history of national notifiable disease reporting in the United States.

In 1878, Congress authorized the U.S. Public Health Service (PHS) to collect morbidity reports on cholera, smallpox, plague, and yellow fever from U.S. consuls overseas; this information was to be used for instituting quarantine measures to prevent the introduction and spread of these diseases into the United States. In 1879, a specific Congressional appropriation was made for the collection and publication of reports of these notifiable diseases. The authority for weekly reporting and publication was expanded by Congress in 1893 to include data from states and municipal authorities. To increase the uniformity of the data, Congress enacted a law in 1902 directing the Surgeon General to provide forms for the collection and compilation of data and for the publication of reports at the national level. In 1912, state and territorial health authorities—in conjunction with PHS—recommended weekly telegraphic reporting of five infectious diseases and monthly reporting by letter of 10 additional diseases. The first annual summary of *The Notifiable Diseases* in 1912 included reports of 10 diseases from 19 states, the District of Columbia, and Hawaii. By 1928, all states, the District of Columbia, Hawaii, and Puerto Rico were participating in national reporting of nearly 30 specified conditions. At their meeting in 1950, the State and Territorial Health Officers authorized a conference of state epidemiologists whose purpose was to determine which diseases should be reported to PHS. CDC assumed responsibility for the collection and publication of data on nationally notifiable diseases in 1961.

Public health officials at state health departments and CDC continue to collaborate in determining which diseases should be nationally notifiable; the Council of State and Territorial Epidemiologists (CSTE) makes recommendations annually for additions and deletions to the national notifiable disease list on the basis of CDC suggestions. However, reporting of nationally notifiable diseases to CDC by the states is voluntary. Reporting is currently mandated only at the state level. The list of diseases that are considered notifiable, therefore, varies slightly by state. All states generally report the internationally quarantinable diseases (i.e., cholera, plague, and yellow fever) in compliance with the World Health Organization's International Health Regulations.

The list of nationally notifiable diseases is revised periodically. Diseases are added to the list as new pathogens emerge; diseases are deleted as their incidence declines. During 1993, 49 infectious diseases were considered notifiable at the national level and were reported to CDC; 41 were reported on a weekly basis, and eight were reported monthly. CSTE will review the principles of notifiable disease reporting in late fall 1994.

## Data Sources

Provisional data on the reported occurrence of notifiable diseases are published routinely in *MMWR*; these data are compiled in final form in this summary. Notifiable disease reports published in the annual *MMWR Summary of Notifiable Diseases* are the authoritative and archival counts of cases. Data from surveillance records for selected diseases, which are useful for detailed epidemiologic analyses, are published on a periodic basis. Data appearing in those surveillance reports may not agree exactly with reports published in *MMWR* due to differences in the timing of reports or the source of the data or due to refinements in case definitions.

Data in this summary are primarily derived from electronic reports transmitted to the Epidemiology Program Office, CDC, by state and territorial health departments through the National Electronic Telecommunications System for Surveillance (NETSS). Final data for other diseases are from surveillance program records of the CDC programs listed below. Requests for further information regarding these data should be directed to the appropriate source.

### **National Center for Health Statistics**

Office of Vital and Health Statistics Systems (deaths from selected notifiable diseases)

### **National Center for Infectious Diseases**

Division of Bacterial and Mycotic Diseases (cholera and toxic-shock syndrome)

Division of HIV/AIDS (human immunodeficiency virus/acquired immunodeficiency syndrome)

Division of Vector-Borne Infectious Diseases (arboviral infections of the central nervous system and plague)

Division of Viral and Rickettsial Diseases (animal rabies)

### **National Center for Prevention Services**

Division of Sexually Transmitted Diseases and HIV Prevention (gonorrhea, syphilis, chancroid, granuloma inguinale, and lymphogranuloma venereum)

Division of Tuberculosis Elimination (tuberculosis)

### **National Immunization Program**

Epidemiology and Surveillance Division (poliomyelitis)

Disease totals for the United States, unless otherwise stated, do not include data for American Samoa, Guam, Puerto Rico, the Virgin Islands, and the Commonwealth of the Northern Mariana Islands (CNMI).

Data on notifiable diseases before 1960 are obtained from publications of the National Office of Vital Statistics.

Population estimates for states are based on the July 1, 1993, post-censal estimates made by the U.S. Department of Commerce, Bureau of the Census, Population Division, Population Estimates Branch, Press Release CB93-219.

Population estimates for territories are from the 1990 census, U.S. Department of Commerce, Bureau of the Census, Press Releases CB91-142, 242, 243, 263, and 276.

Rates in the *1993 Summary of Notifiable Diseases* were based on data for the U.S. total resident population. However, population data from states in which diseases were not notifiable or not available were excluded from rate calculations.

### **Interpreting Data**

Although the data reported in this summary are important for analyzing disease trends and determining relative disease burdens, these data must be interpreted with caution. Some diseases, such as plague and rabies, that cause severe clinical illness and are associated with serious consequences probably are diagnosed and reported accurately. However, diseases that are clinically mild and infrequently associated with serious consequences (e.g., salmonellosis and mumps) are less likely to be reported. Additionally, subclinical cases are seldom detected except in the course of special studies. The degree of completeness of reporting also is influenced by the diagnostic facilities available, the control measures in effect, and the interests and priorities of state and local officials responsible for disease control and surveillance. Finally, factors such as the introduction of new diagnostic tests and the discovery of new disease entities may cause changes in disease reporting that are independent of the true incidence of disease.

Public health surveillance data are published for selected racial and ethnic population groups because these variables may be risk markers for certain notifiable diseases. Risk markers can identify potential risk factors for investigation in future studies. Data on race and ethnicity also can be useful for identifying groups to target for prevention efforts. Year 2000 Objectives for racial and ethnic groups have been established for several of the notifiable diseases.

### **EXPLANATION OF SYMBOLS USED IN TABLES, GRAPHS, AND MAPS**

Data not available .....	NA
No reported cases.....	-
Report of disease not required by state health department (not notifiable).....	NN

## **1993 HIGHLIGHTS FOR SELECTED DISEASES**

This section highlights important developments in the reported occurrences of certain notifiable and non-notifiable infectious diseases. Those diseases that currently are not nationally notifiable are highlighted under the subheading "Emerging Infections."

### **AIDS**

In 1993, the number of AIDS cases reported to CDC increased 127% from the number reported in 1992. The large increase in the number of cases was largely due to changes in the 1993 AIDS surveillance case definition. As of January 1, 1993, HIV-infected persons with additional clinical conditions, as well as those with markers of severe immunosuppression, were defined as having AIDS.

### **Botulism**

In 1993, two restaurant-associated outbreaks of botulism occurred in which unusual vehicles of transmission were implicated. In one of the outbreaks, which occurred in Georgia, the toxin was transmitted by a canned cheese sauce; in the other outbreak in Texas, toxin was transmitted by a dip containing baked potatoes.

### **Cholera**

Epidemics of cholera caused by a new pathogen, *Vibrio cholerae* O139, occurred in late 1992 and early 1993 in southern Asia; in the United States, the first recognized case of infection caused by *Vibrio cholerae* O139 occurred during 1993 in a California resident who had visited India in January 1993.

### **Diphtheria**

Outbreaks of diphtheria were reported from the Newly Independent States of the former Soviet Union (especially Russia and Ukraine) and Ecuador. No cases were reported last year among U.S. travelers to these countries.

### ***Haemophilus influenzae***

The rate of *Haemophilus influenzae* disease as reported through the National Notifiable Diseases Surveillance System (NNDSS) has continued to decline. Rates decreased 95% between 1987 and 1993. Data collected by active surveillance from selected sites indicate that the decline is primarily in *Haemophilus influenzae* type b (Hib) disease among children <5 years of age. This decline is associated with the use of the newly licensed Hib conjugate vaccines.

### **Hepatitis B**

The reported incidence of hepatitis B decreased 59% from 1985 through 1993. This decline was caused by decreases in the number of cases reported among homosexual men between 1985 and 1989 (61%) and in the number reported among injecting-drug users from 1989 through 1992 (51%). These decreases are thought to result from an increase in AIDS awareness, which has resulted in behavioral changes (e.g., safer sex and needle-using practices).

### **Hepatitis, Non-A, Non-B**

The steady increase in the number of cases of non-A, non-B hepatitis reported to NNDSS since 1990 is not thought to be caused by an increase in incidence, but rather caused by the screening of blood for the presence of antibody to the hepatitis C virus (anti-HCV, available beginning in May, 1990). Persons testing positive for anti-HCV, regardless of the presence of illness, have been reported as having non-A, non-B hepatitis. Surveillance at sentinel sites has actually shown a steady decrease in the incidence of non-A, non-B hepatitis, with a decline of >50% from 1988 through 1993. This decline is primarily attributable to a 58% decrease in the number of reported cases among injecting-drug users.

### **Legionnaires' Disease**

Although only 1,280 cases of Legionnaires' disease were reported through NNDSS in 1993, data from recent prospective pneumonia studies suggest that between 10,000 and 15,000 cases occur each year.

### **Lyme Disease**

In 1993, the number of cases of Lyme disease reported to CDC nationwide decreased by 15% from 1992. Hunterdon, New Jersey meanwhile experienced an increase in reported cases of Lyme disease from 75 cases in 1992 to 206 cases in 1993; upon investigation, the increase in reported cases was found to be due to both increased reporting by physicians and an increase in disease incidence.

### **Malaria**

In August 1993, three persons without recent bloodborne exposure and who had not recently traveled were diagnosed with *Plasmodium falciparum* malaria infection in New York City. The results of the epidemiologic investigation suggest local acquisition through mosquito-borne transmission.

### **Measles**

The total number of measles cases reported to CDC in 1993—312—was the lowest number ever recorded in the United States. This reduction in reported measles cases may reflect cyclical changes in measles incidence as well as increases in measles vaccination coverage among preschool-aged children, increased use of a second dose of measles vaccine among school- and college-aged persons, and increased efforts to control measles throughout the Western Hemisphere.

### **Meningococcal disease**

Several clusters of group C disease were recognized in 1993, resulting in mass vaccinations with meningococcal vaccine. Because approximately one half of severe meningococcal disease in this country is caused by serogroup B and because the vaccine is only effective for disease caused by serogroups A, C, Y, and W, the clusters illustrate the importance of serogroup determination and reporting for all cases of invasive *Neisseria meningitidis*.

### **Mumps**

The total number of mumps cases reported in 1993—1,692—was the lowest number ever reported in the United States.

### **Pertussis**

The 6,503 pertussis cases reported in the United States in 1993 represent the highest annual total since 1967. Of 1,347 cases of pertussis among children 7 months to 4 years of age with known vaccination status, 630 (46.8%) had received fewer than three doses of DTP vaccine—the minimum number of doses necessary for clinical protection.

### **Rubella**

The total number of rubella cases reported to the CDC remained low in 1993 (N=192), although the number increased by 19% over the record low number of cases reported in 1992.

### **Sexually Transmitted Diseases**

Nationally, the rates for gonorrhea and primary and secondary syphilis have declined since 1990, reaching low points in 1993 that were below or approaching the Year 2000 Objectives (1) ( $\leq 225$  cases gonorrhea and  $\leq 10$  cases primary and secondary syphilis per 100,000 persons). However, rates for both diseases remained higher than the Year 2000 Objectives for certain population subgroups: adolescents and young adults, minorities (especially blacks), and persons living in the southern United States.

### ***Shigella***

The number of cases of *Shigella* reported through NNDSS increased 35% from 1992 to 1993, with increases of 27%–405% reported from nine states. This increase was also reported through the national *Shigella* surveillance system, which receives reports of laboratory isolates of *Shigella* through the Public Health Laboratory Information System (PHLIS); 91% of *Shigella* isolates reported through PHLIS in 1993 were *Shigella sonnei*.

### **Tuberculosis**

Between 1992 and 1993, the number of reported tuberculosis (TB) cases in the United States decreased from 26,673 to 25,313. This decrease may be associated with the effectiveness of prevention and control measures implemented during the period 1989–1993. However, two other factors also may be responsible for the decrease, including a) delayed reporting caused by use of the new TB surveillance reporting form and the change from paper records to a computerized system and b) underreporting because of modification of the AIDS surveillance case definition in January 1993.

## **EMERGING INFECTIONS**

NOTE: The term "emerging infectious diseases" refers to those "infectious diseases whose incidence in humans has increased within the past two decades or threatens to increase in the near future" (2). These can be new or previously unrecognized infectious diseases, reemerging diseases, or infectious diseases that have developed resistance to previously effective antimicrobial drugs.

### **Coccidioidomycosis**

The outbreak of coccidioidomycosis in California that began in 1991 continued in 1993. From an annual average number of 428 cases reported per year in California during the period 1981–1990, 1,200 cases were reported in 1991, 4,516 in 1992, and

4,137 in 1993, 70% of which were reported from Kern County in central California. Key factors that may be associated with the ongoing outbreak include weather conditions that are conducive to the growth and spread of *Coccidioides immitis* (e.g., protracted drought followed by heavy rains), activities that disturb the soil and facilitate airborne spread of the organism, and an increasing population of persons who are susceptible to the organism because of migration from areas where coccidioidomycosis is not endemic.

### **Cryptosporidiosis**

In spring 1993, a municipal water supply in Milwaukee, Wisconsin, contaminated with *Cryptosporidium* caused the largest recognized outbreak of waterborne illness in the history of the United States. More than 400,000 persons became ill, 4,400 of whom required hospitalization.

### ***Escherichia coli* O157:H7**

In 1993, an outbreak of *E. coli* O157:H7 affected more than 500 people in four western states, resulting in 56 cases of hemolytic uremic syndrome and four deaths. Because of this outbreak, many clinical laboratories began screening stool samples for *E. coli* O157:H7, which resulted in the identification of many more cases and outbreaks. In May 1993, the Council of State and Territorial Epidemiologists (CSTE) passed a resolution recommending that *E. coli* O157:H7 infection be made reportable by all states and territories.

### **Group A Streptococcal Disease**

During 1993, CDC surveillance for invasive group A streptococcal infections consisted of a passive nationwide surveillance system. This system operated through the collection of isolates from normally sterile sites and the collection of case reports. Although current data on incidence and trends for invasive disease, streptococcal toxic shock syndrome, and necrotizing fasciitis are not available, population-based active surveillance for these infections has begun in several geographic areas and will be expanded in 1994 as part of surveillance for emerging infectious diseases.

### **Hantavirus Pulmonary Syndrome**

Hantavirus Pulmonary Syndrome (HPS), a newly recognized illness characterized by an influenza-like prodrome followed by the acute onset of respiratory failure, was first identified in the southwestern United States in June 1993 during the investigation of a cluster of unexplained deaths. A new hantavirus (*Sin Nombre virus*) and a rodent reservoir for the virus (the deer mouse [*Peromyscus maniculatus*]) were identified. As of August 31, 1994, national surveillance for HPS, initiated by CDC in coordination with CSTE, has identified 91 confirmed cases of HPS (with 48 deaths) in 20 states (case fatality rate: 53%).

### **Drug-Resistant Pneumococcus**

The increasing incidence of drug-resistant *Streptococcus pneumoniae* (DRSP) strains in the United States has created an emerging public health challenge. CDC surveillance data from 1992 indicated that the prevalence of pneumococcal strains that are highly resistant to penicillin increased 60-fold (from 0.02% to 1.3%) when compared with the prevalence of isolates collected from 1979 through 1987. CDC, CSTE, and the infectious diseases and microbiology communities are developing

recommendations for the surveillance of DRSP infections. This surveillance data will be used to determine optimal empiric treatment regimens for pneumococcal infections.

#### **Vancomycin-Resistant Enterococci (VRE)**

From 1989 through 1993, the percentage of nosocomial enterococci resistant to vancomycin reported from hospitals participating in the National Nosocomial Infections Surveillance System increased from 0.3% to 7.9%. During this period, numerous VRE outbreaks (occurring primarily among immunocompromised patients) were reported. Because of the public health importance of the emergence of VRE, CDC has published draft *Guidelines for Preventing the Spread of Vancomycin Resistance* and is conducting studies to assess the effectiveness of these guidelines in preventing disease transmission.

\*For measles only; imported includes both out-of-state and international importations.

†Ten suspected cases of paralytic poliomyelitis were reported in 1993. Three cases have been confirmed as of August 12, 1994, two of which were vaccine-associated; one was classified as imported. The number of reported cases is subject to change due to retrospective case evaluations or late reports.

\* AIDS total updated through December 31, 1993.

† Age data are collected on aggregate forms different from those used for numbers of reported cases. Therefore, total cases reported on this table may differ slightly from other tables. Cases among persons  $\geq 9$  years of age are not shown because some of these may not be due to sexual transmission; however, they are included in the totals.

§ The number of reported cases of non-A, non-B hepatitis is misleading because in some states, reported cases included persons positive for antibody to hepatitis C virus (anti-HCV) who were identified in routine screening programs but who did not have acute hepatitis.

¶ Subject to change due to retrospective case evaluations or late reports.

## SUMMARY TABLES — 1993

### NOTIFIABLE DISEASES — summary of reported cases, by race,\* United States, 1993

Disease	Total	American Indian or Alaska Native	Asian or Pacific Islander	Black	White	Other	Race not stated†

**ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS) — annual rates, by selected age group and sex for reported cases, United States, 1993**

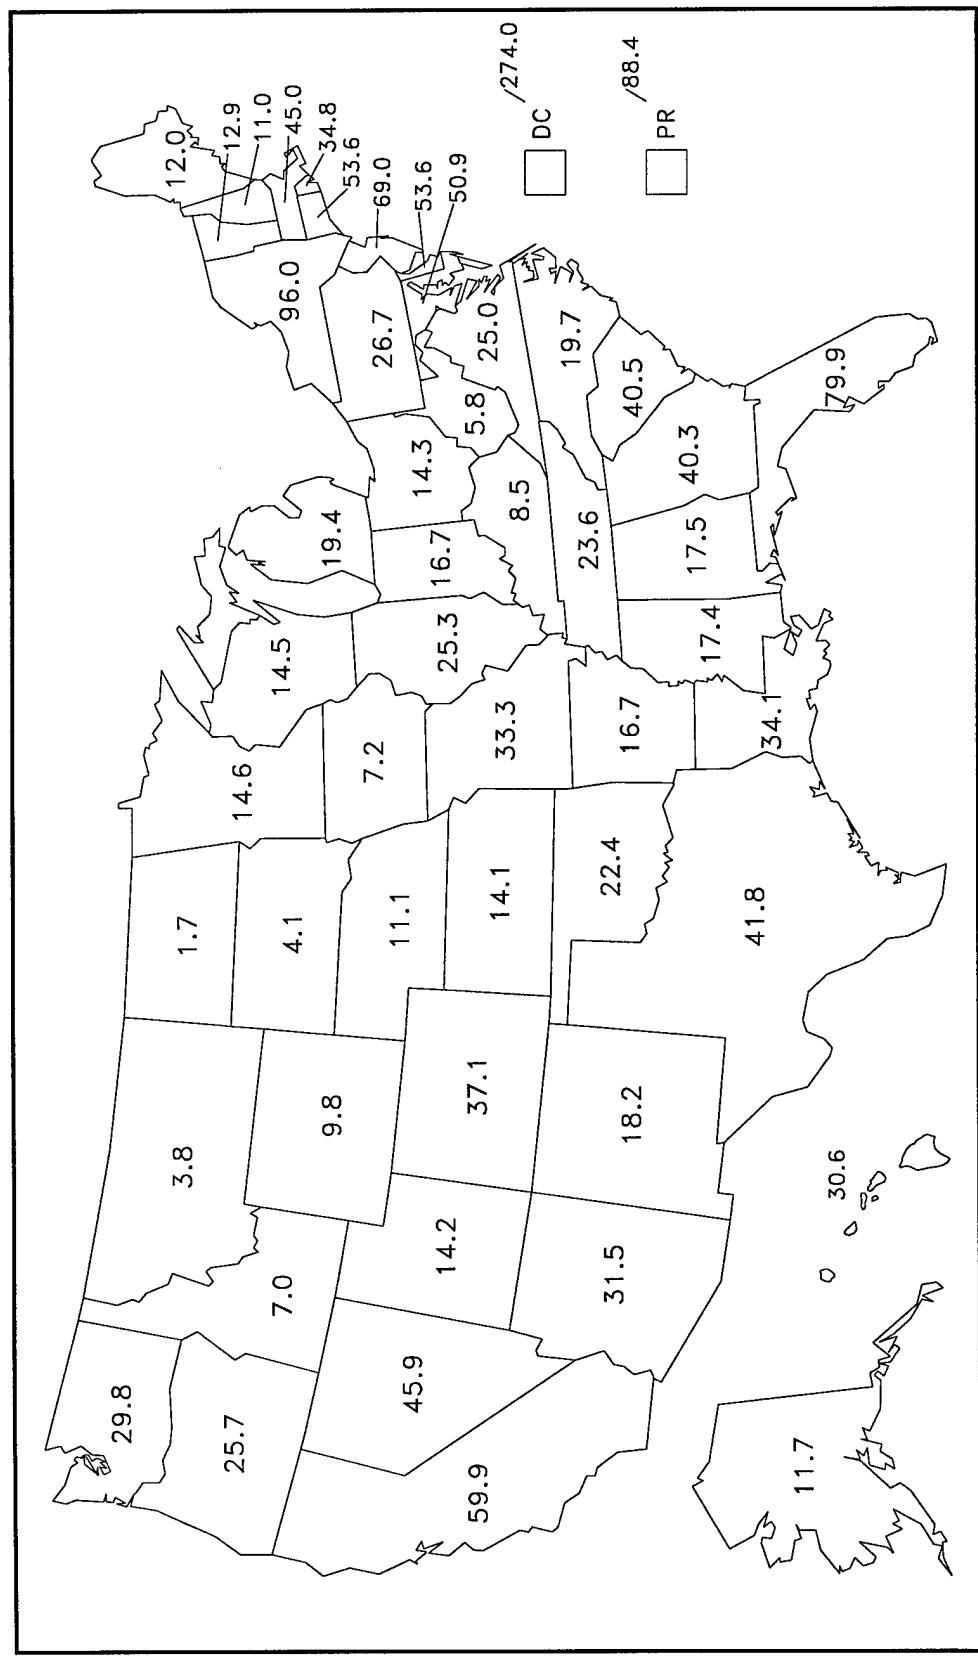

## GRAPHS AND MAPS

ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS) — reported pediatric cases,\* United States and Puerto Rico, 1993

\*Children <13 years of age.

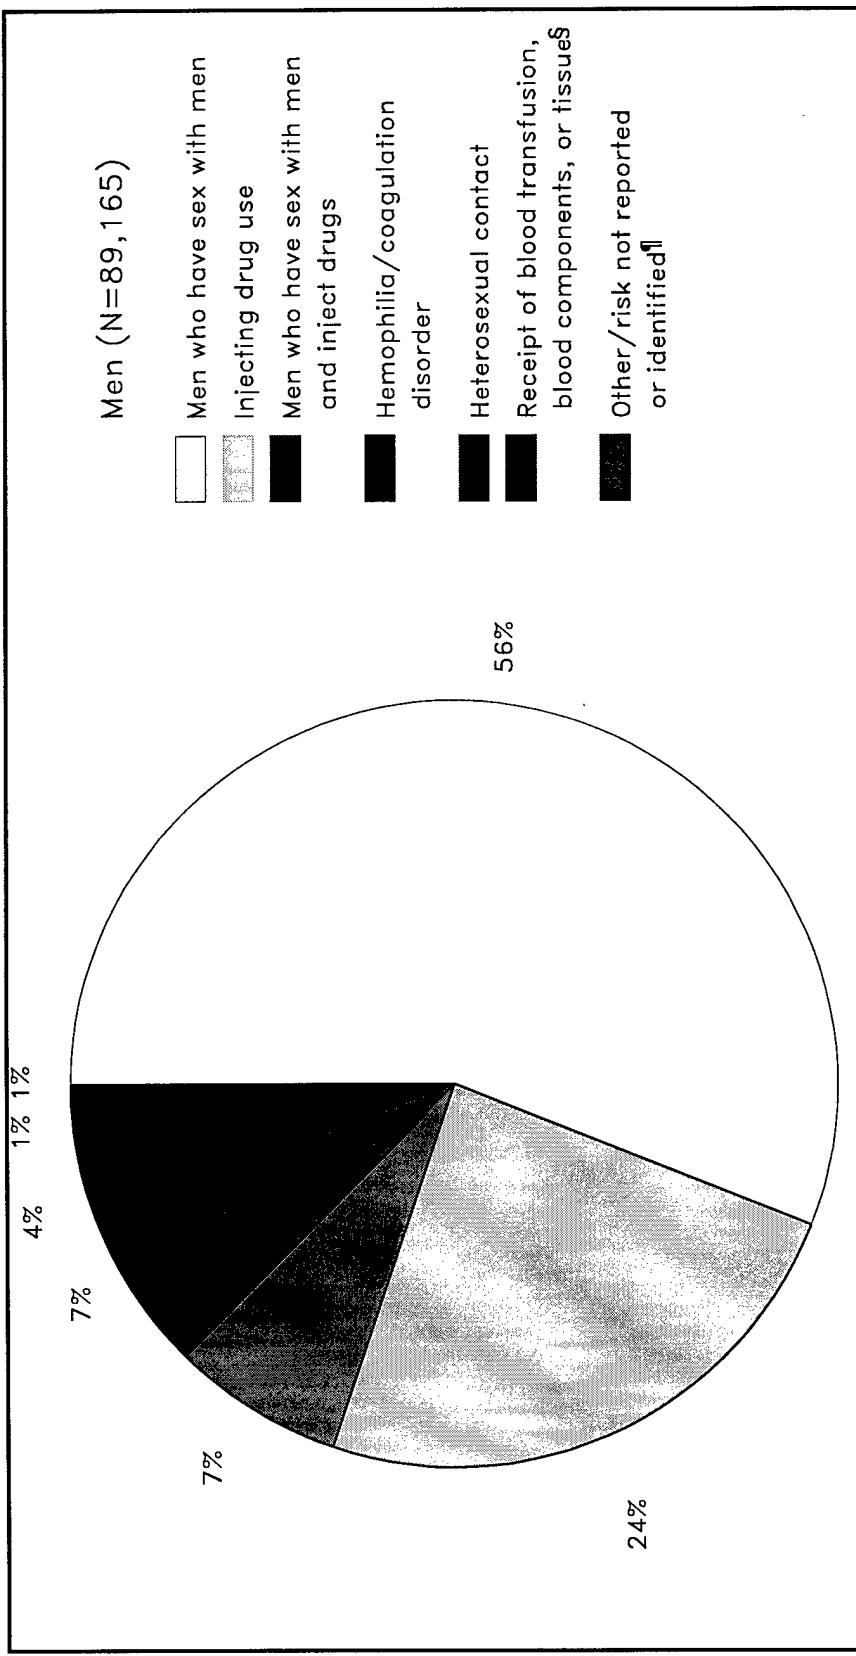

**ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS) — reported cases, per 100,000 population, United States and Puerto Rico, 1993\***

\* The denominator for Puerto Rico is based on extrapolations from U.S. Bureau of Census population data from 1980 and 1990 censuses.

## GRAPHS AND MAPS

**ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS) — reported adult/adolescent cases among men, by exposure category,\* United States,† 1993**

\* For surveillance purposes, AIDS cases are counted only once in a hierarchy of exposure categories. Persons with more than one reported mode of exposure to HIV are classified in the exposure category listed first in the hierarchy except for men with both a history of sexual contact with other men and injecting-drug use. These persons make up a separate exposure category.

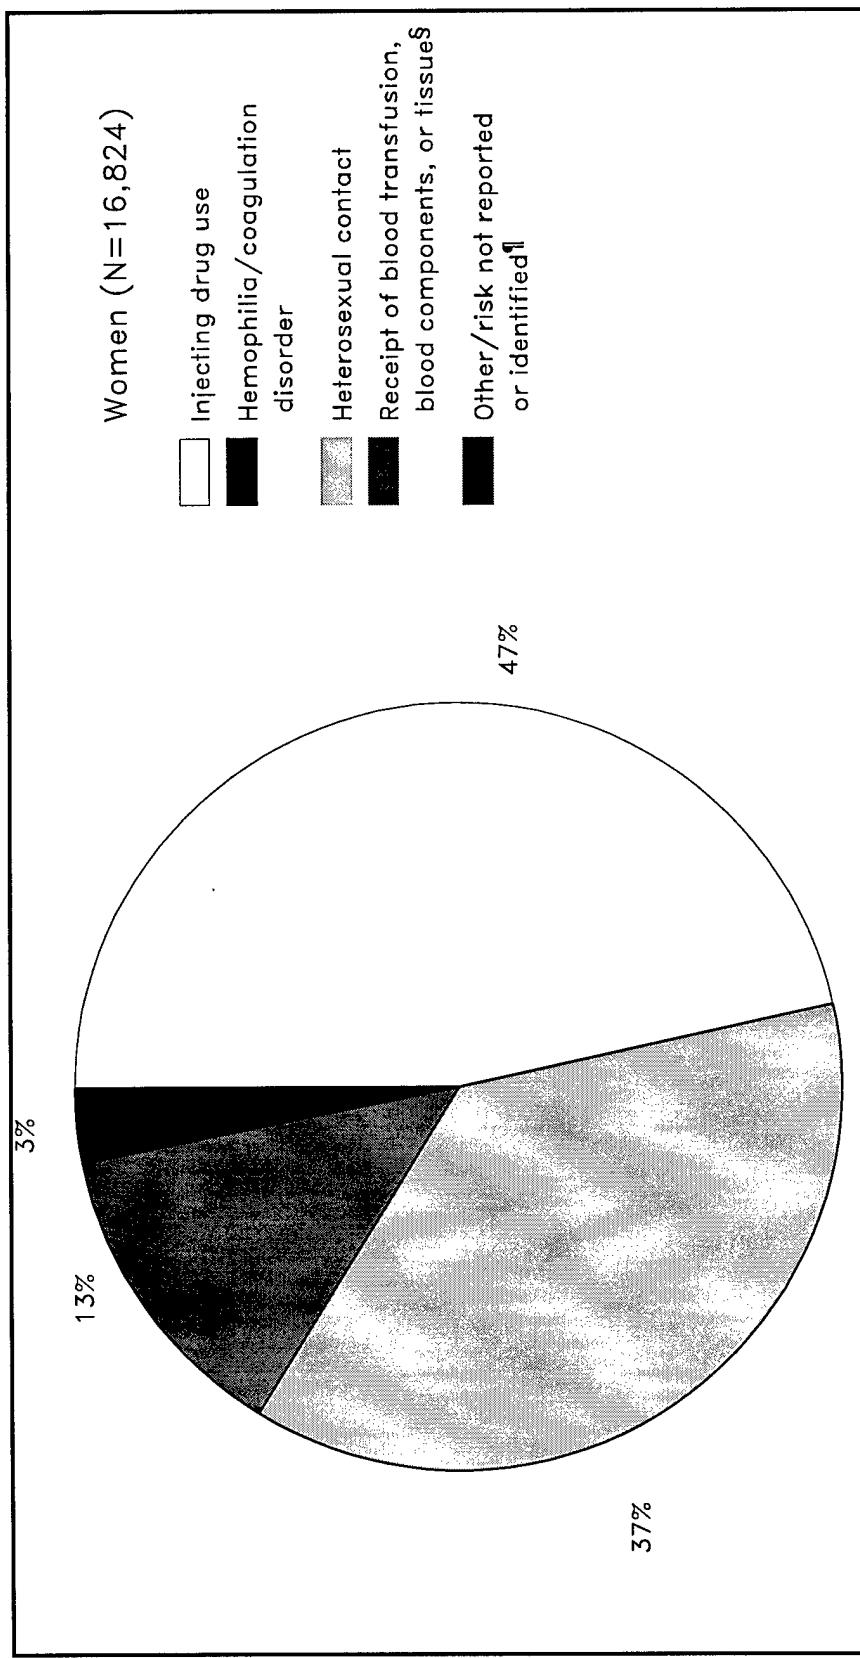

† Includes Guam, Puerto Rico, the U.S. Pacific Islands, and the U.S. Virgin Islands.

§ Includes transfusion, tissue, and organ recipients from donors who were screened as negative for HIV antibody at the time of donation.

¶ "Other" refers to persons who developed AIDS after exposure to HIV-infected blood within the health-care setting, as documented by evidence of seroconversion or other laboratory studies. "Risk not reported or identified" refers to patients whose mode of exposure to HIV is unknown. This includes patients under investigation; patients who died, were lost to follow-up, or refused interview; and patients whose mode of exposure to HIV remains undetermined after investigation.

## GRAPHS AND MAPS

**ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS) — reported adult/adolescent cases among women, by exposure category,\* United States, † 1993**

\*For surveillance purposes, AIDS cases are counted only once in a hierarchy of exposure categories. Persons with more than one reported mode of exposure to HIV are classified in the exposure category listed first in the hierarchy.

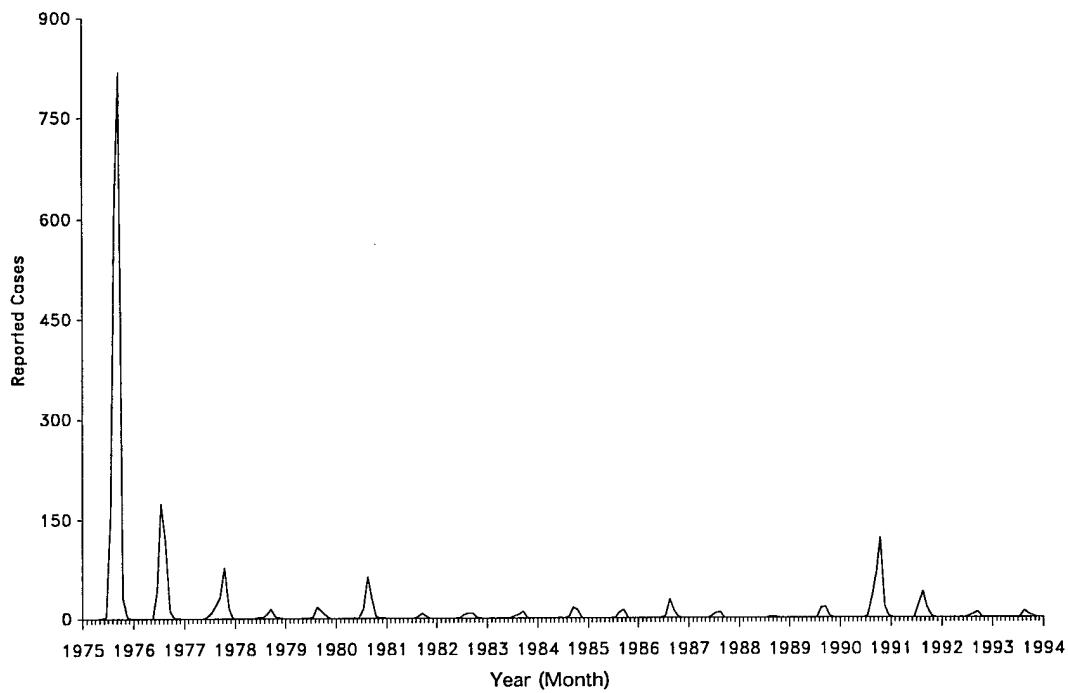

†Includes Guam, Puerto Rico, the U.S. Pacific Islands, and the U.S. Virgin Islands.

§Includes transfusion, tissue, and organ recipients from donors who were screened as negative for HIV antibody at the time of donation.

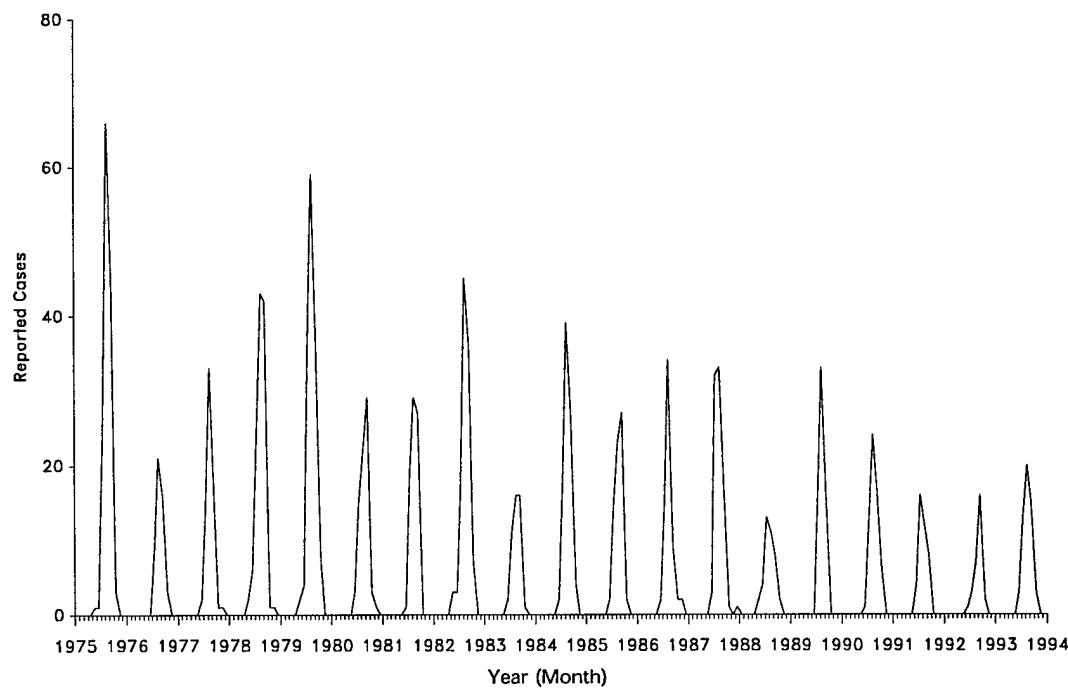

¶"Other" refers to persons who developed AIDS after exposure to HIV-infected blood within the health-care setting, as documented by evidence of seroconversion or other laboratory studies. "Risk not reported or identified" refers to patients whose mode of exposure to HIV is unknown. This includes patients under investigation; patients who died, were lost to follow-up, or refused interview; and patients whose mode of exposure to HIV remains undetermined after investigation.

## GRAPHS AND MAPS

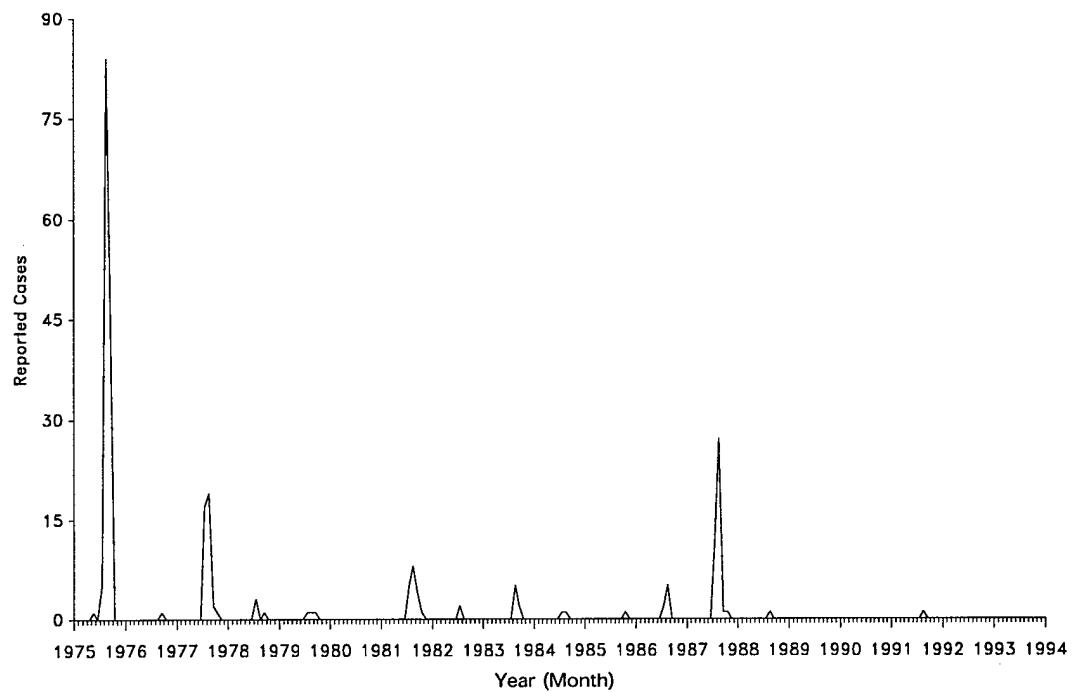

**ARBOVIRAL INFECTIONS (of the central nervous system) — cases due to St. Louis encephalitis virus, by month, United States, 1975–1993**

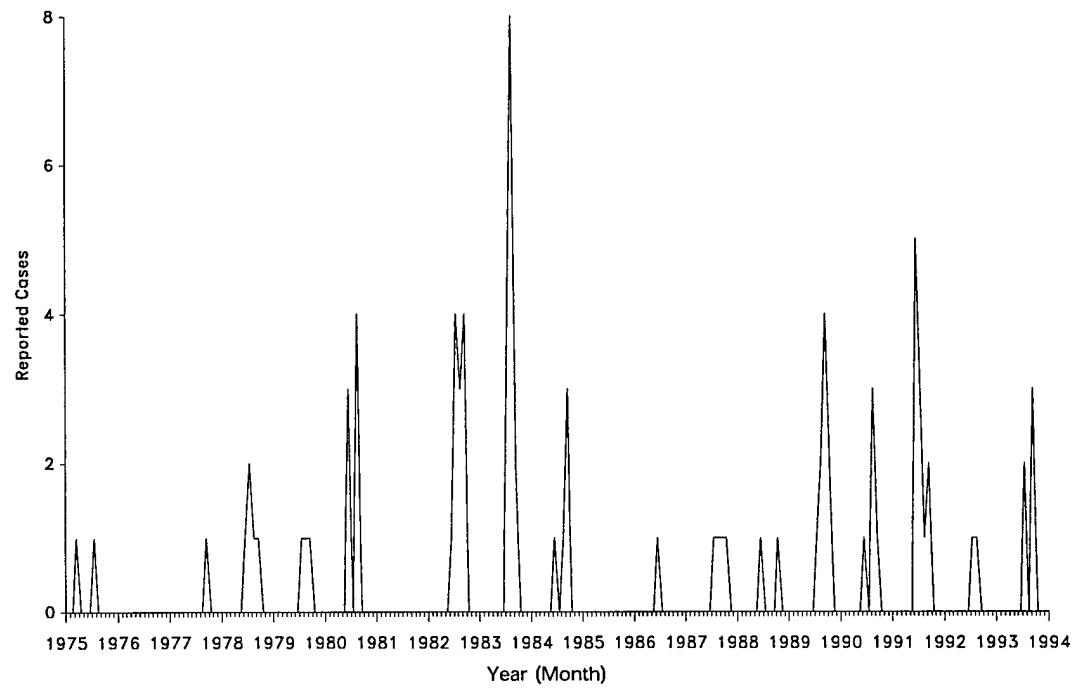

**ARBOVIRAL INFECTIONS (of the central nervous system) — cases due to California serogroup viruses, by month, United States, 1975–1993**

**ARBOVIRAL INFECTIONS (of the central nervous system) — cases due to Western equine encephalitis virus, by month, United States, 1975–1993**

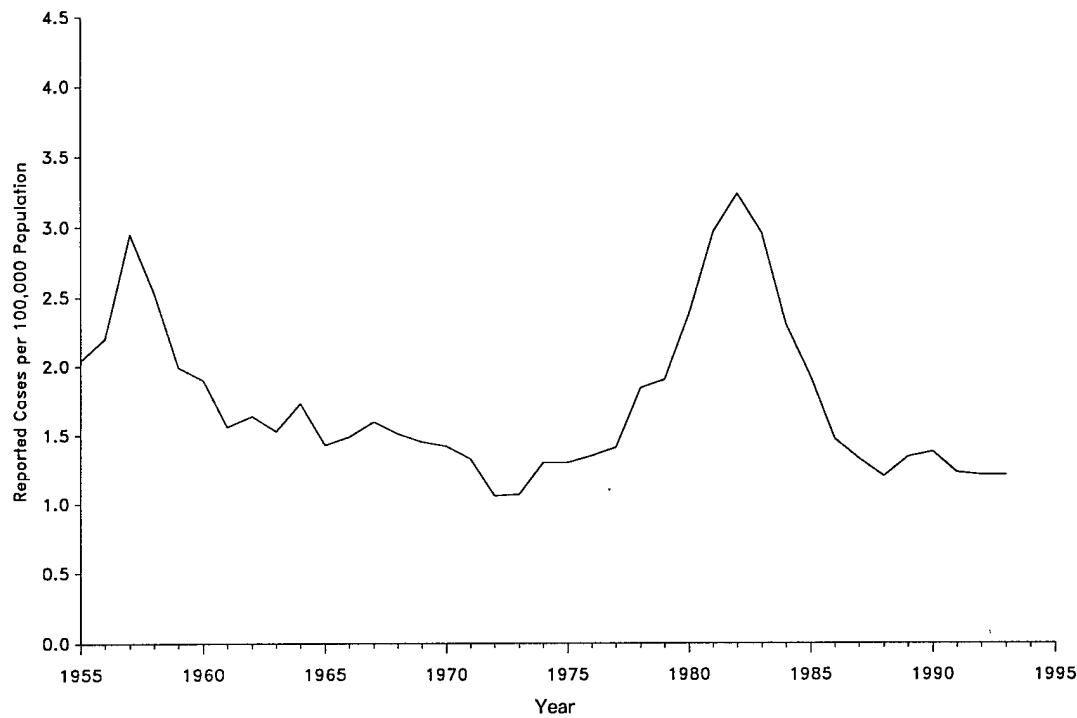

**ARBOVIRAL INFECTIONS (of the central nervous system) — cases due to Eastern equine encephalitis virus, by month, United States, 1975–1993**

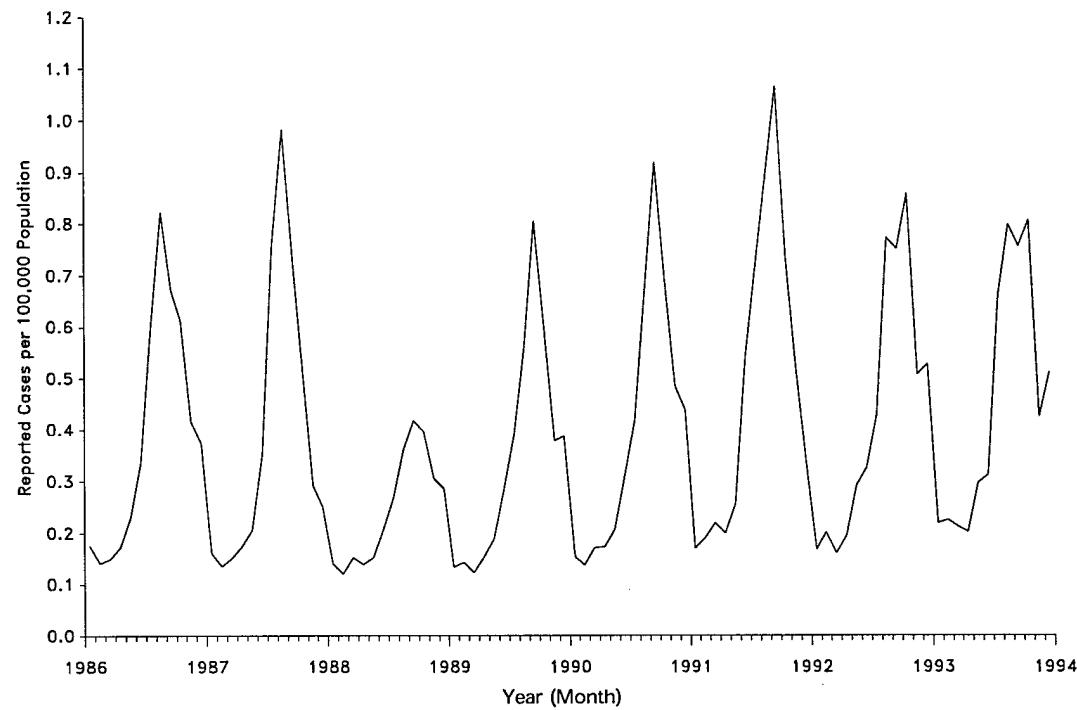

## GRAPHS AND MAPS

### AMEBIASIS — by year, United States, 1955–1993

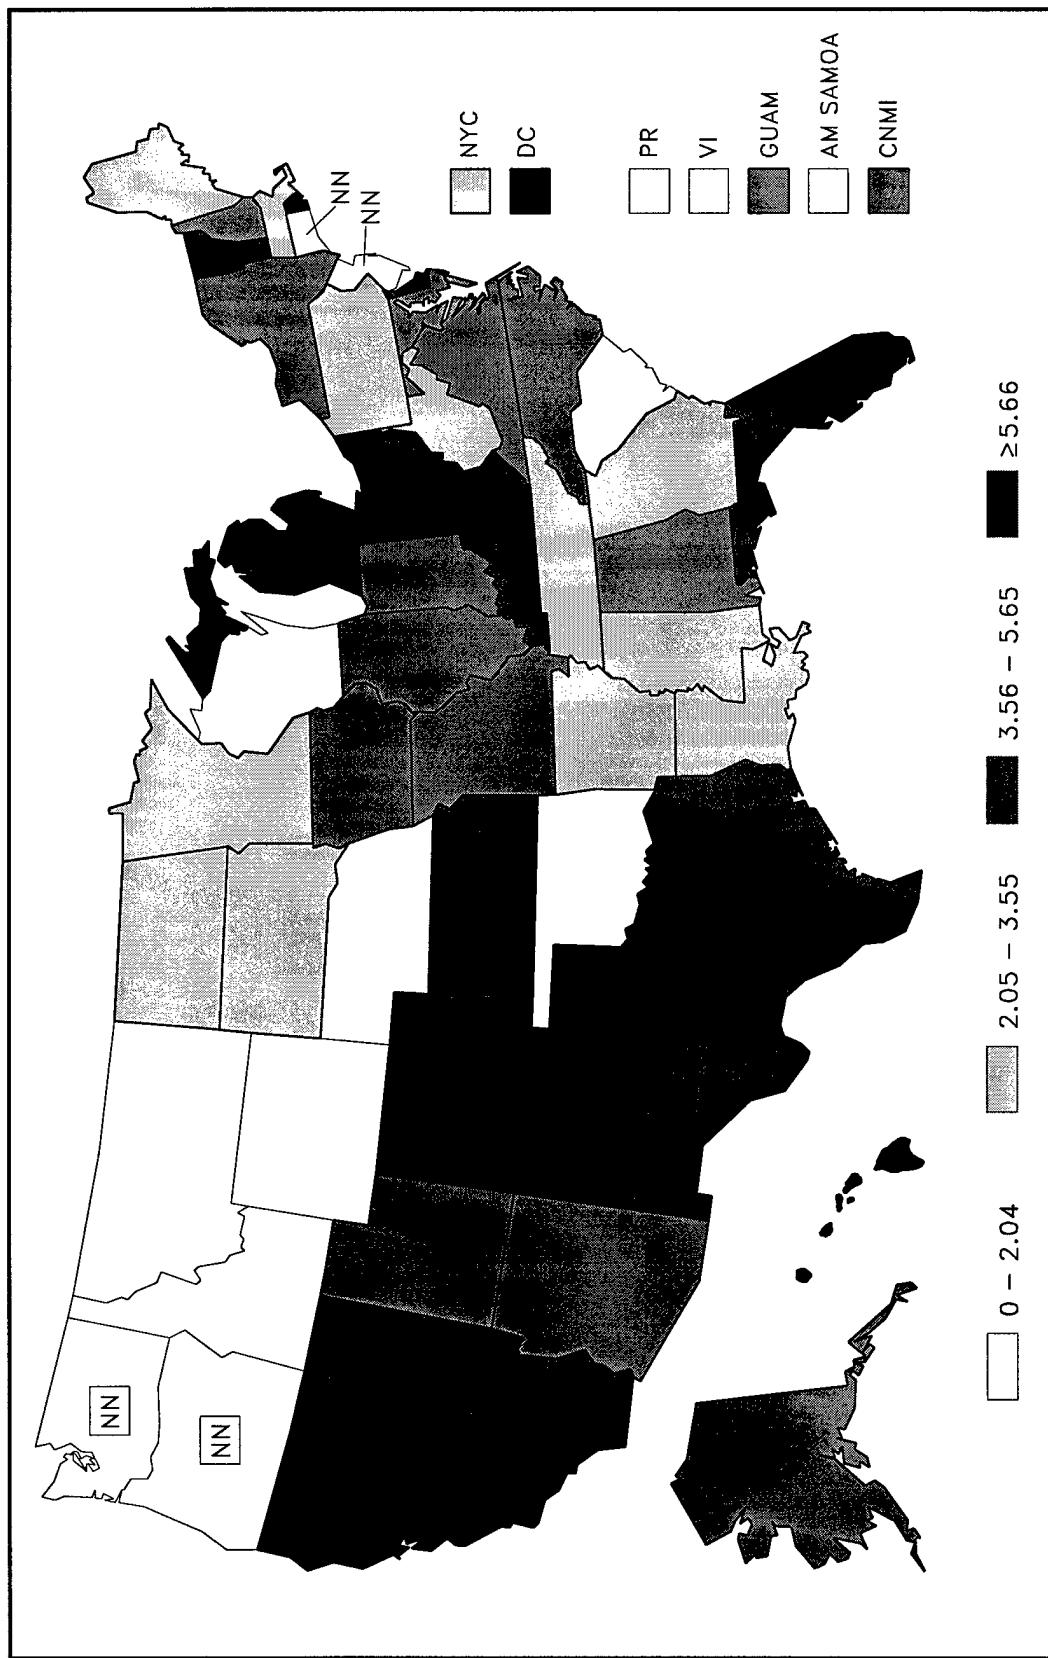

### ASEPTIC MENINGITIS — by month, United States, 1986–1993

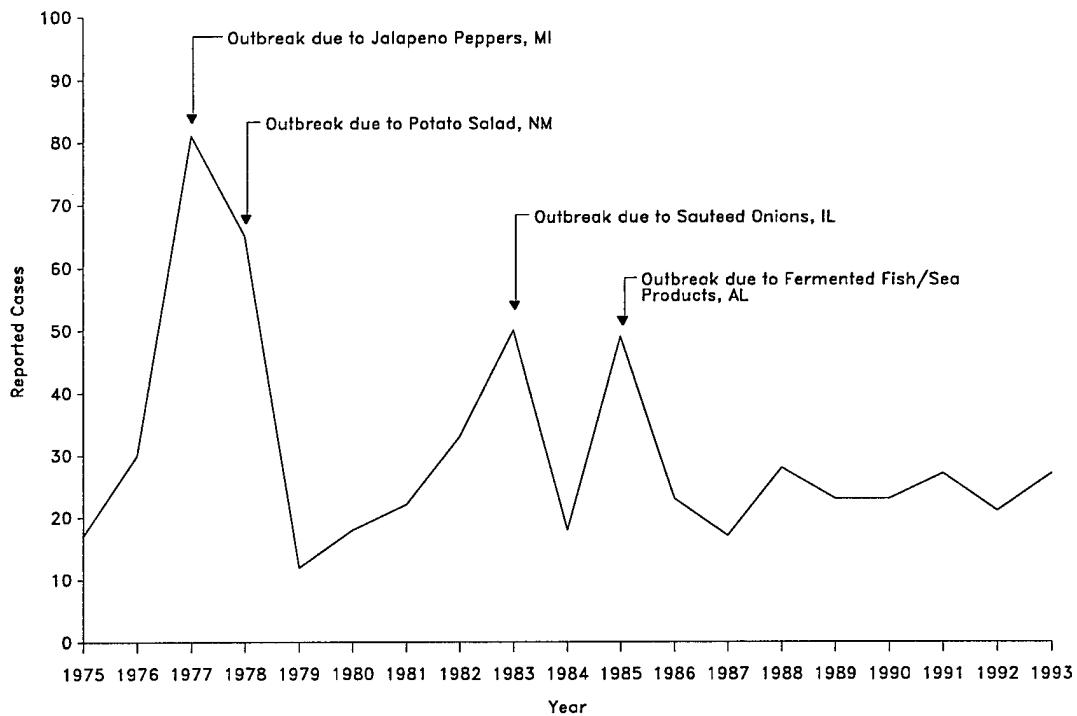

## GRAPHS AND MAPS

**ASEPTIC MENINGITIS — reported cases, per 100,000 population, United States and territories, 1993**

## GRAPHS AND MAPS

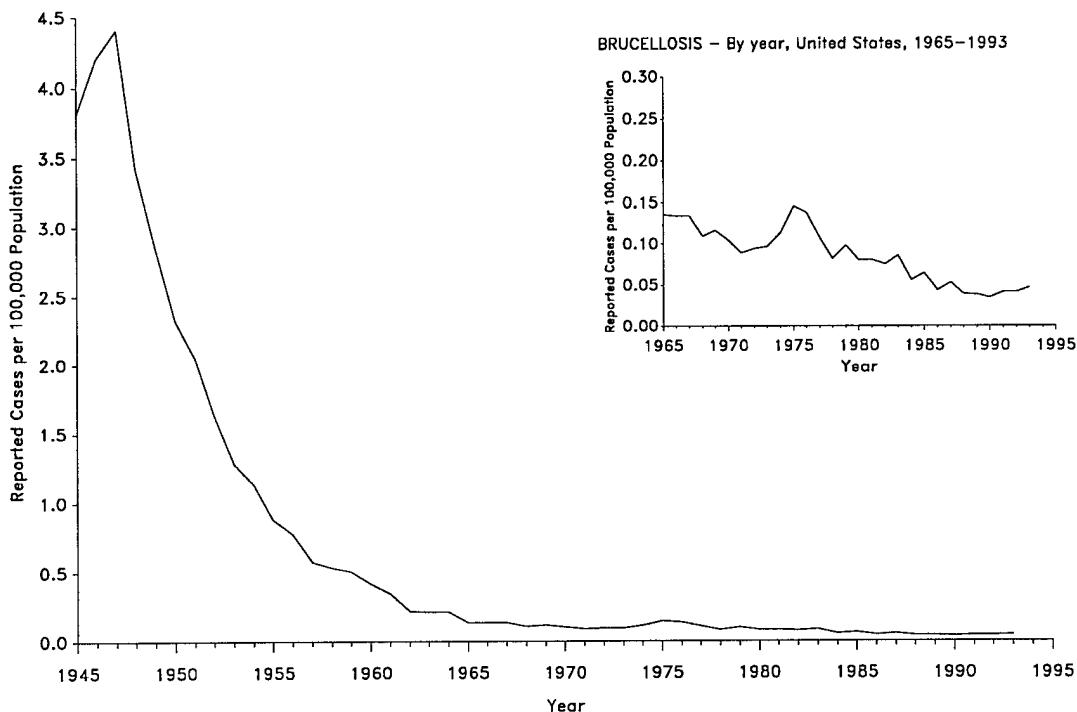

### BOTULISM (foodborne) — by year, United States, 1975–1993

### BOTULISM (infant) — by year, United States, 1975–1993

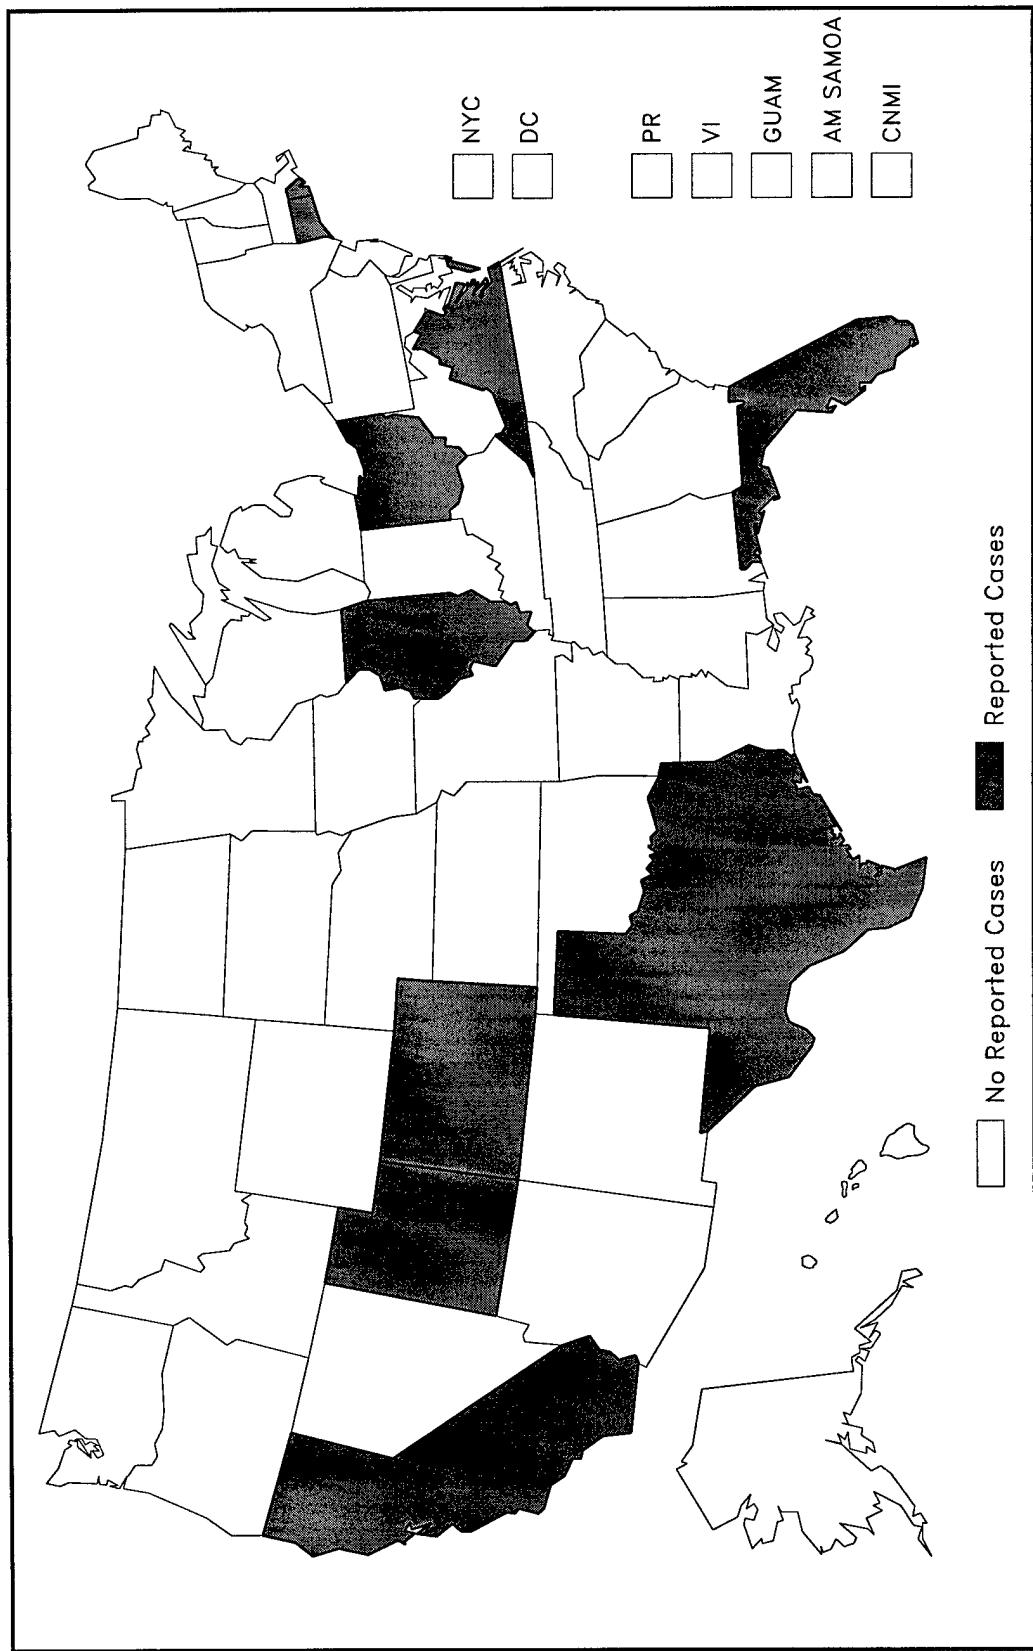

**BRUCELLOSIS — by year, United States, 1945–1993**

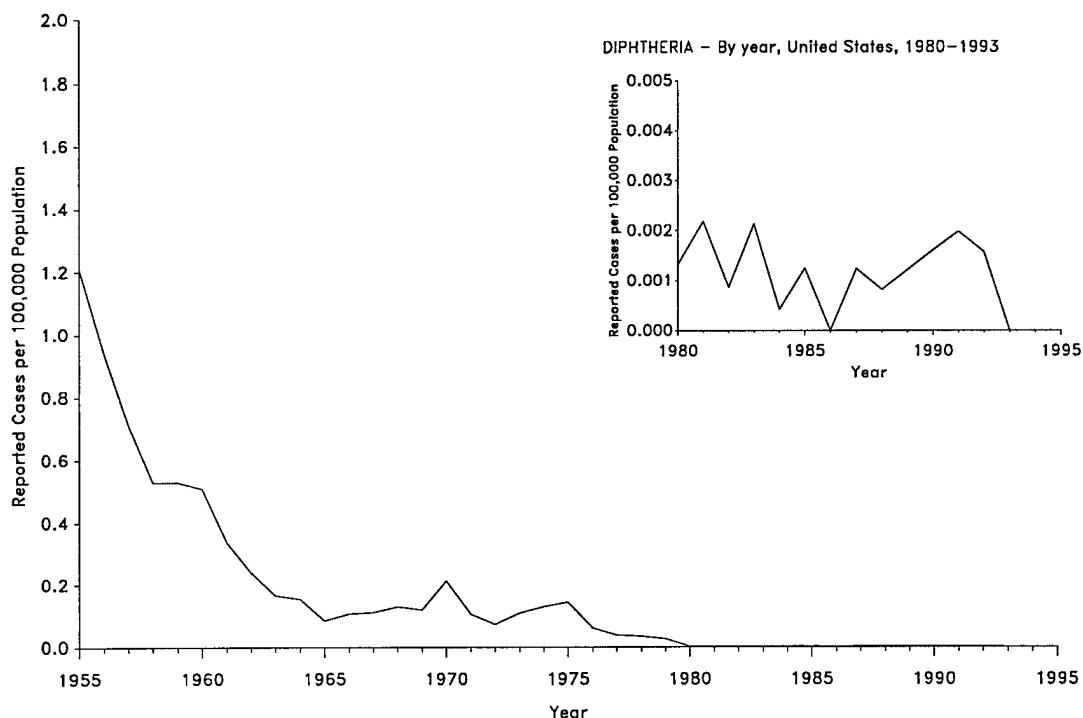

## GRAPHS AND MAPS

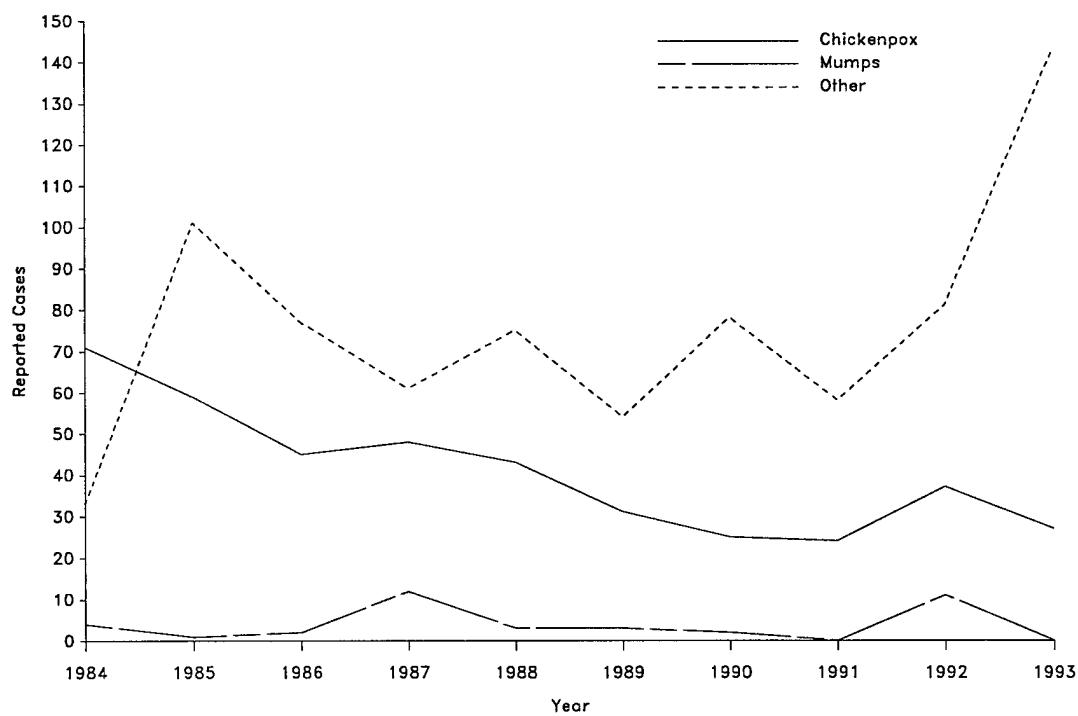

CHOLERA — reported cases, United States and territories, 1993

**DIPHTHERIA — by year, United States, 1955–1993**

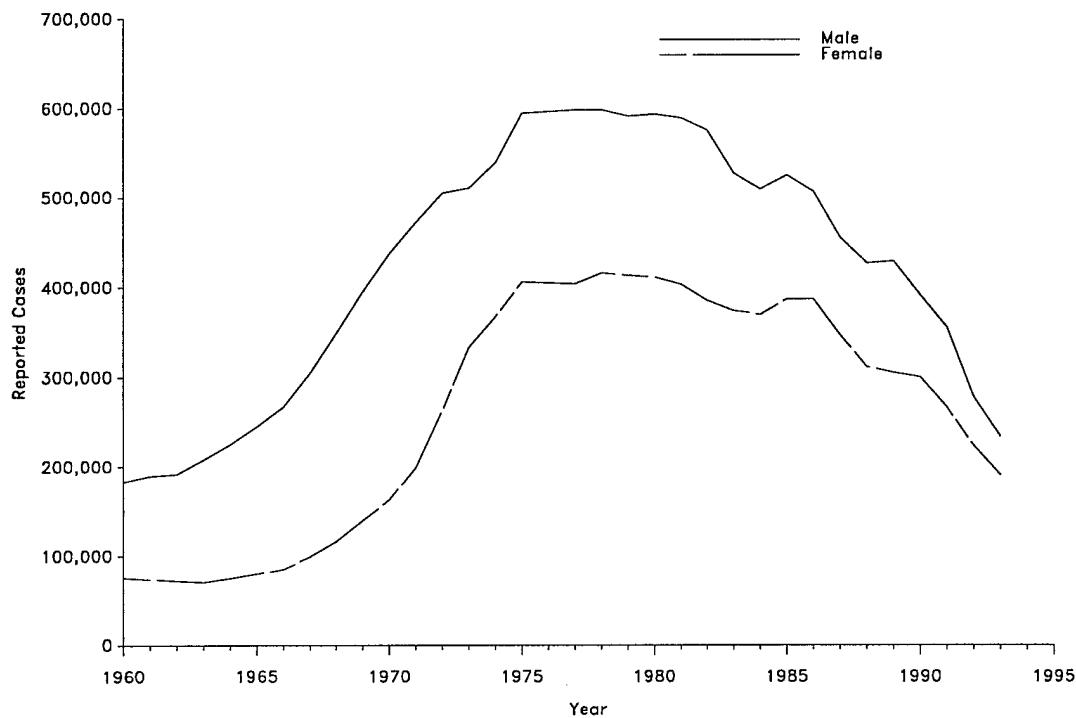

**ENCEPHALITIS (post-infectious) — by year, United States, 1984–1993**

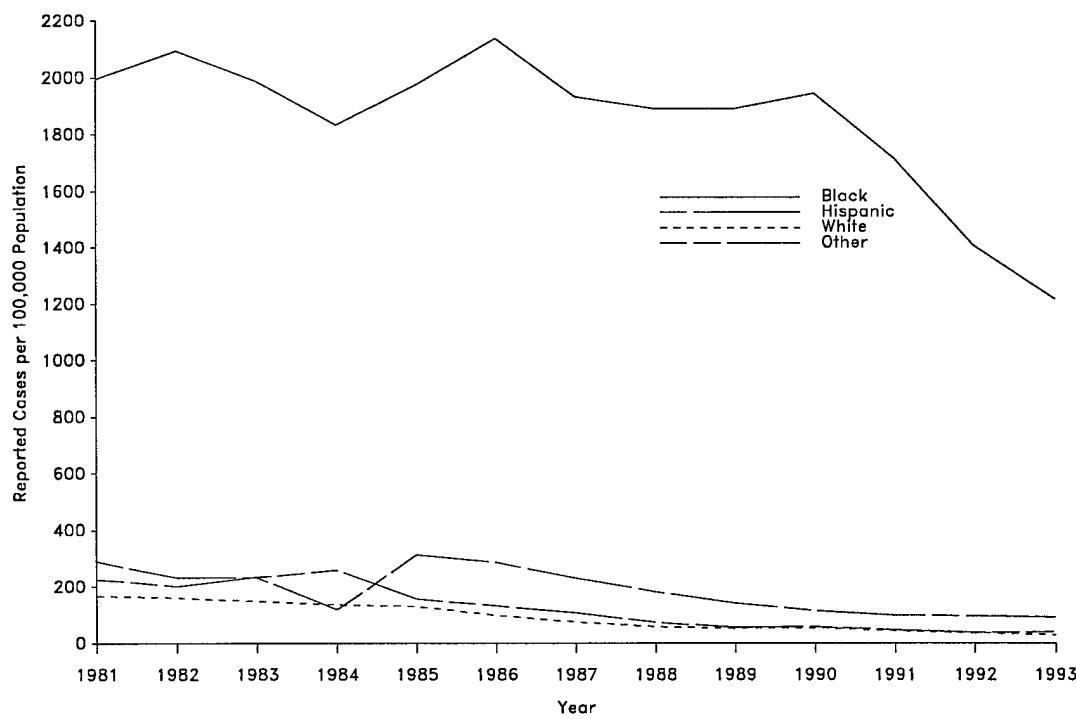

## GRAPHS AND MAPS

### GONORRHEA — by sex, United States, 1960–1993

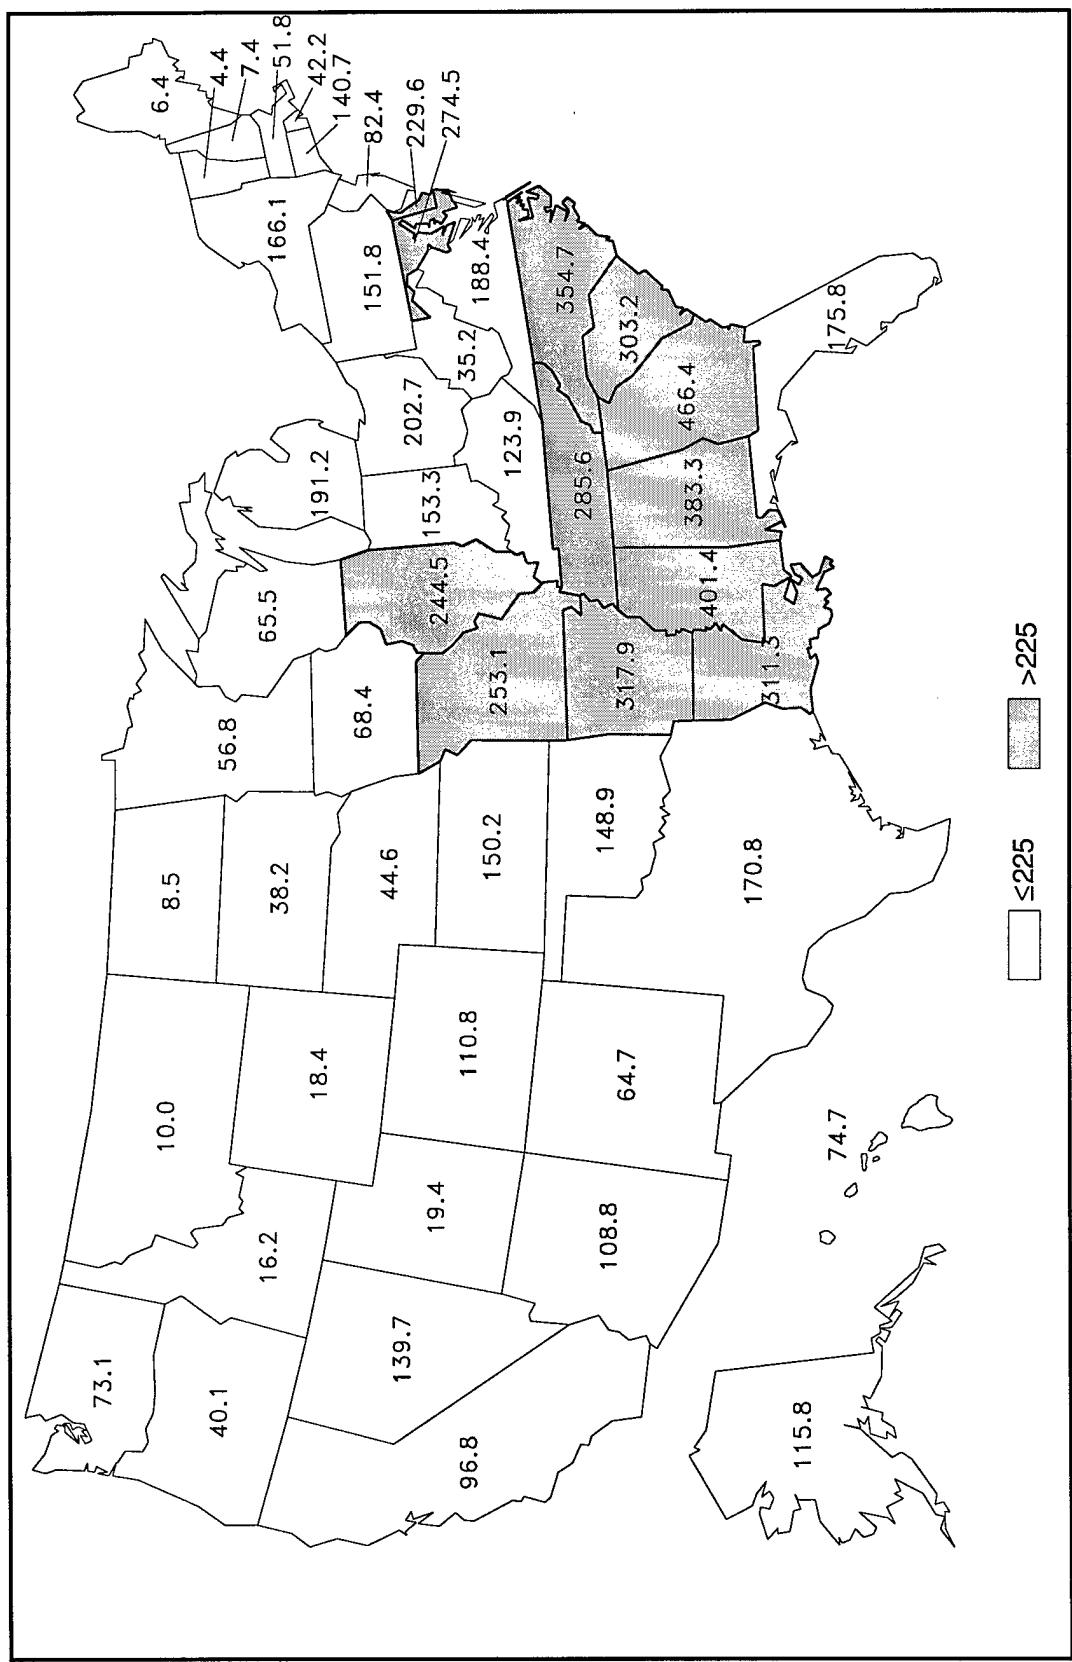

### GONORRHEA — by race and ethnicity, United States, 1981–1993

## GRAPHS AND MAPS

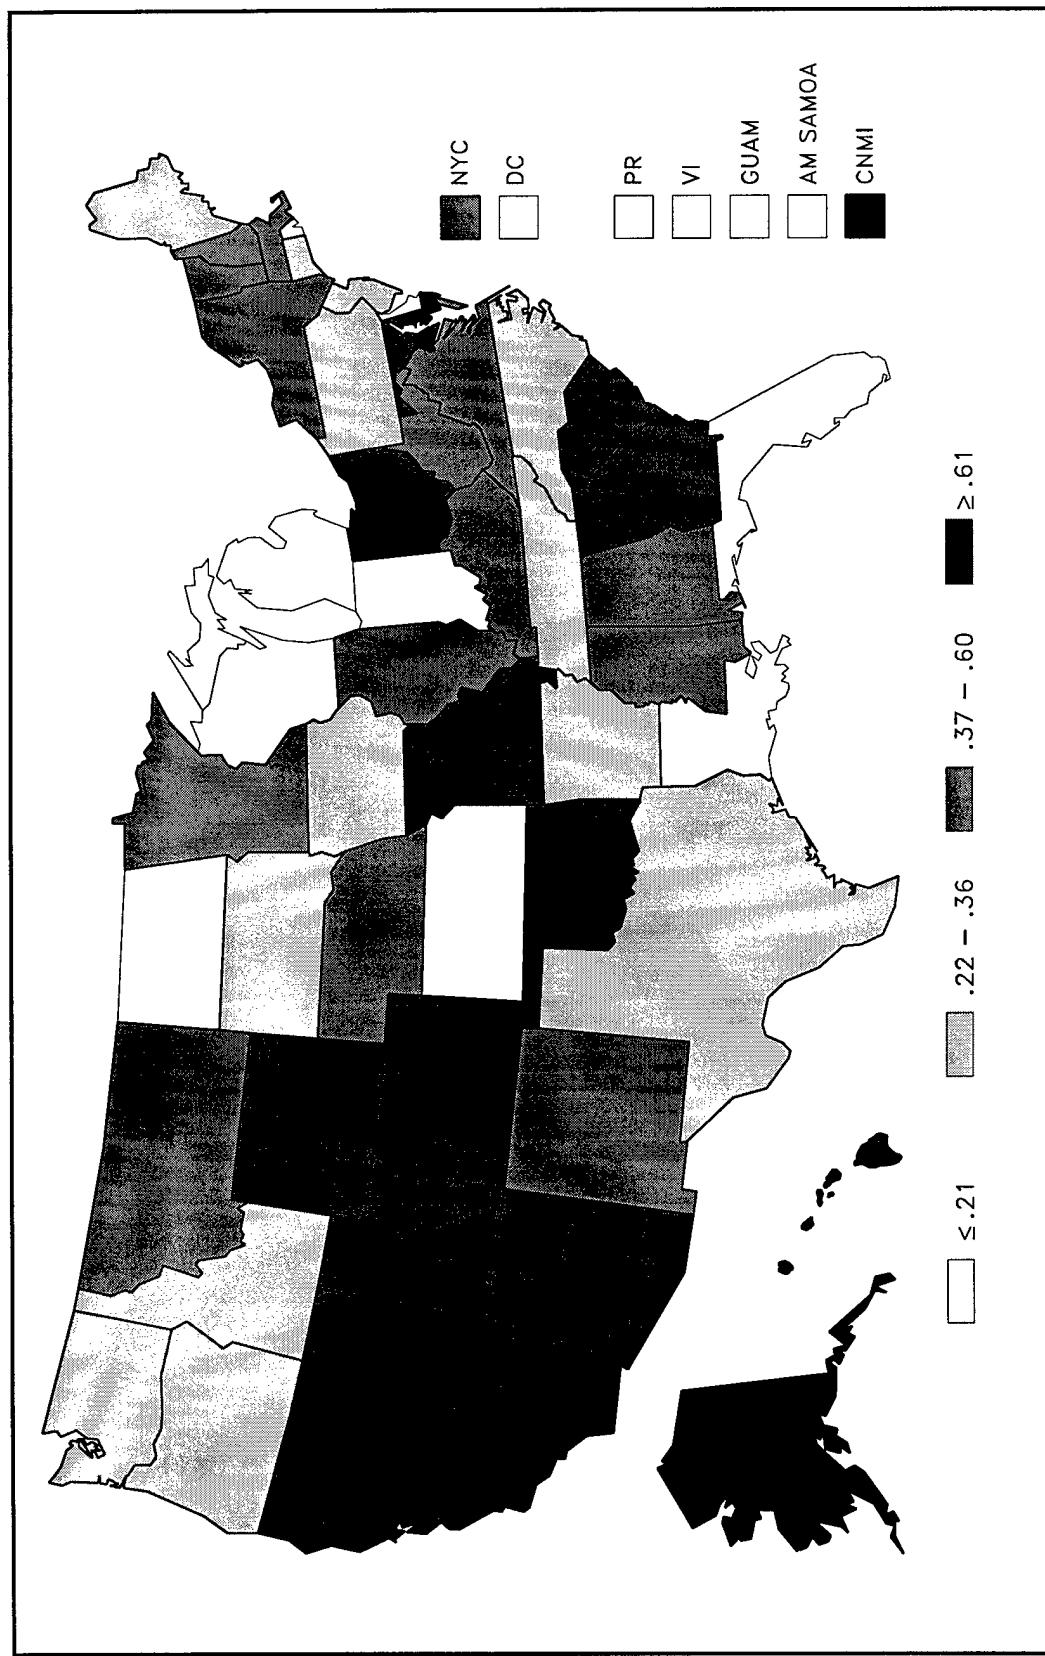

GONORRHEA — reported cases, per 100,000 population,\* United States, 1993

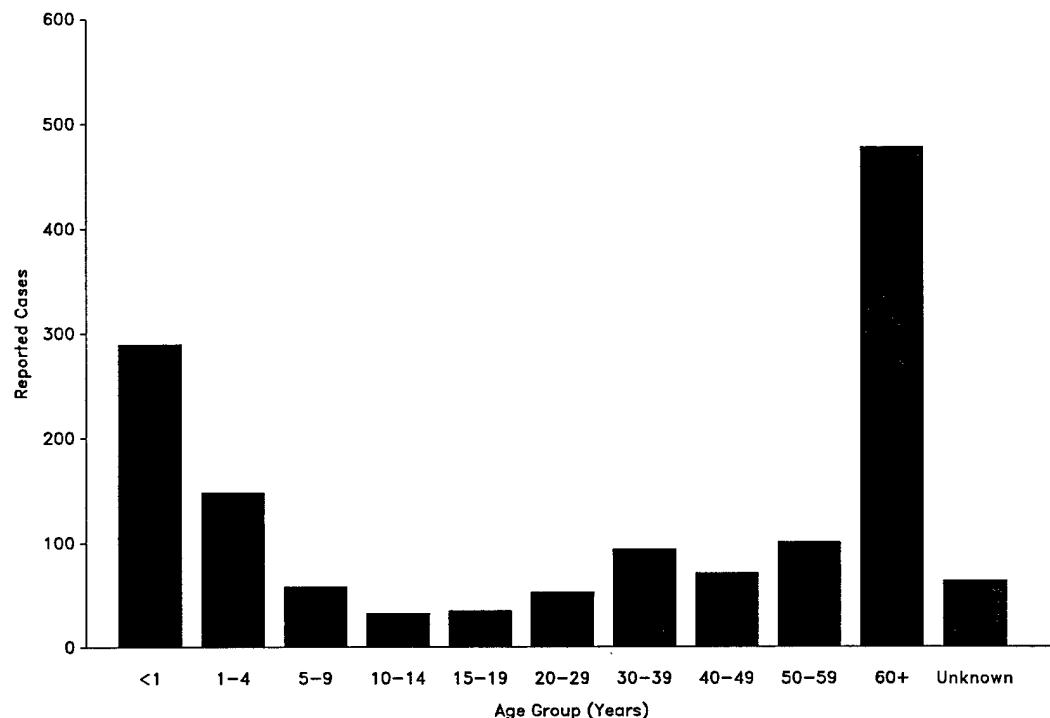

\* The total rate of gonorrhea for the United States was 172.40 per 100,000 population. The Year 2000 Objective is ≤225 per 100,000 population.

## GRAPHS AND MAPS

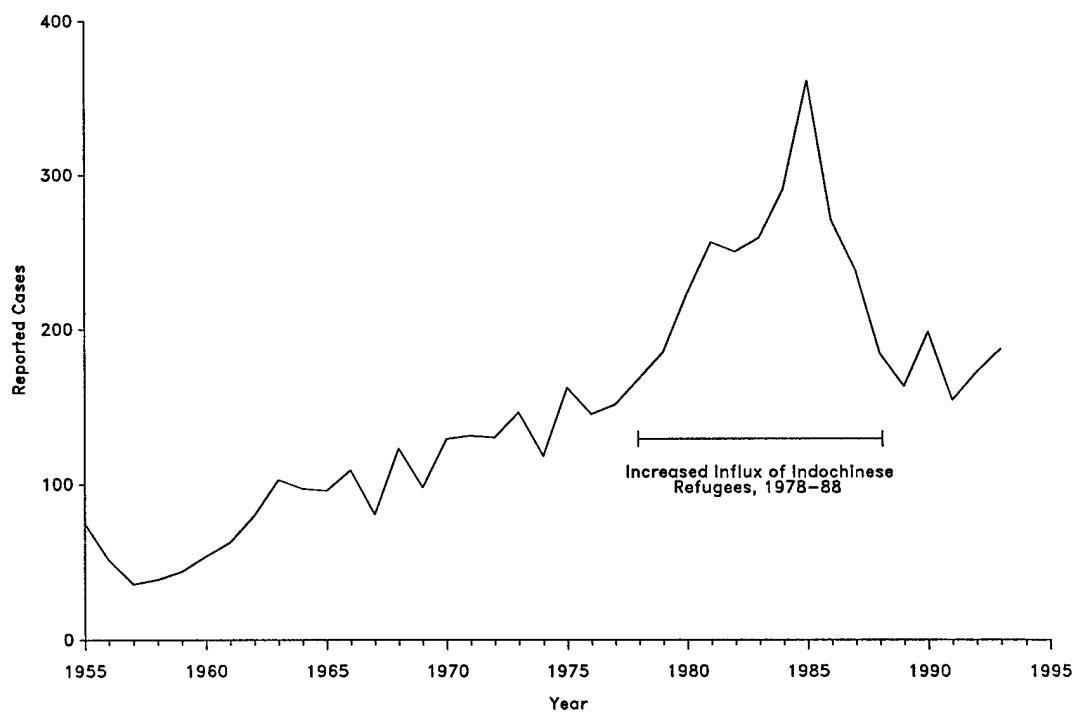

*HAEMOPHILUS INFLUENZAE* — reported cases, per 100,000 population, United States and territories, 1993

**HAEMOPHILUS INFLUENZAE — by age group, United States, 1993**

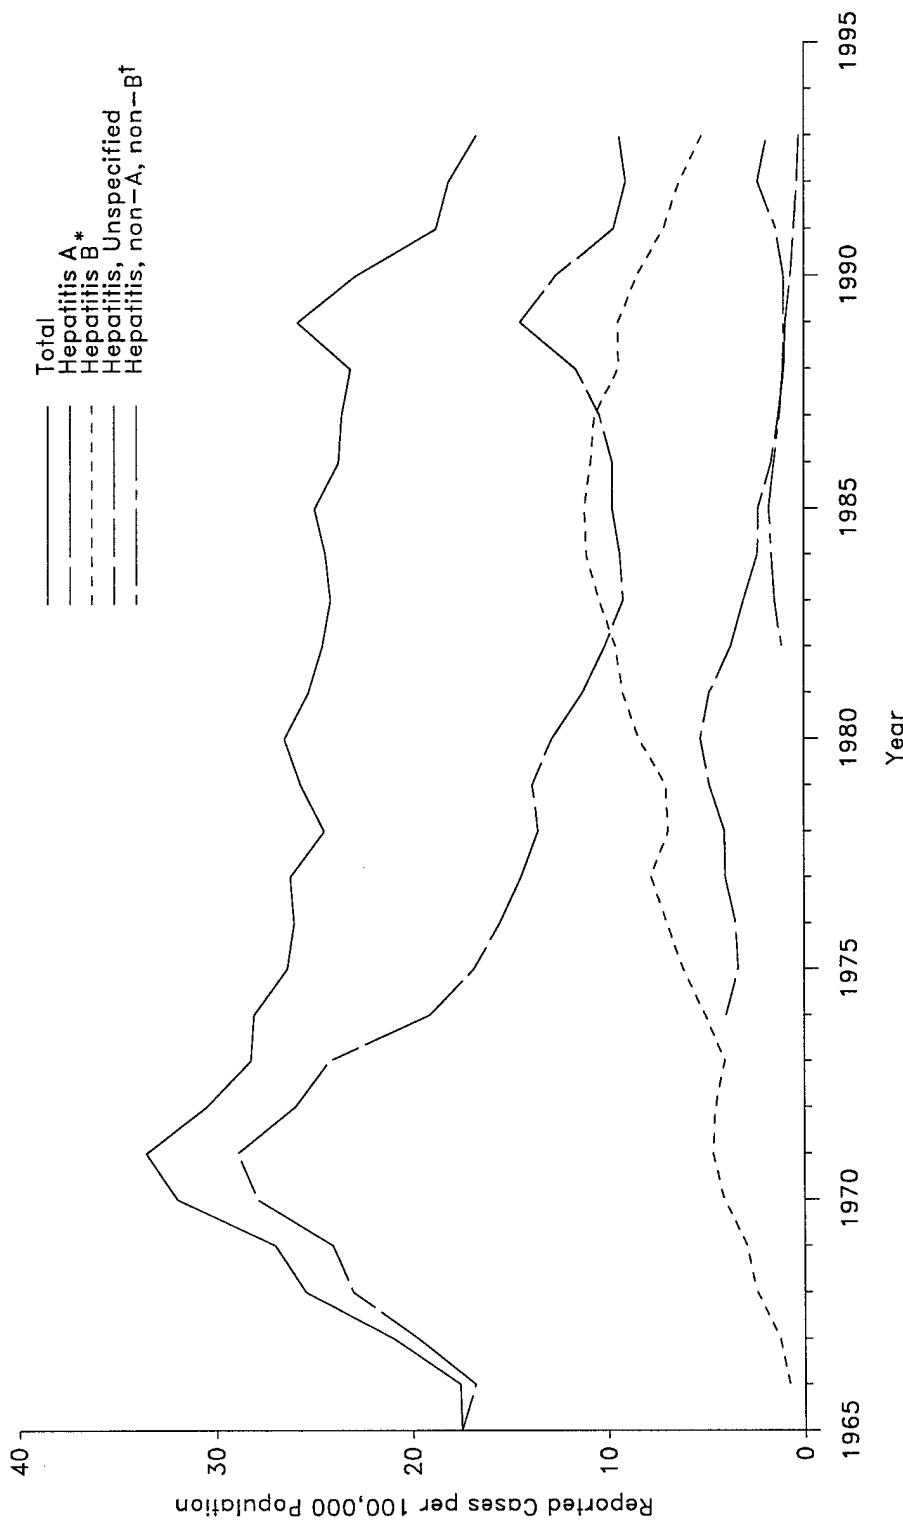

**HANSEN DISEASE (leprosy) — by year, United States, 1955–1993**

## GRAPHS AND MAPS

### HEPATITIS — by year, United States, 1965–1993

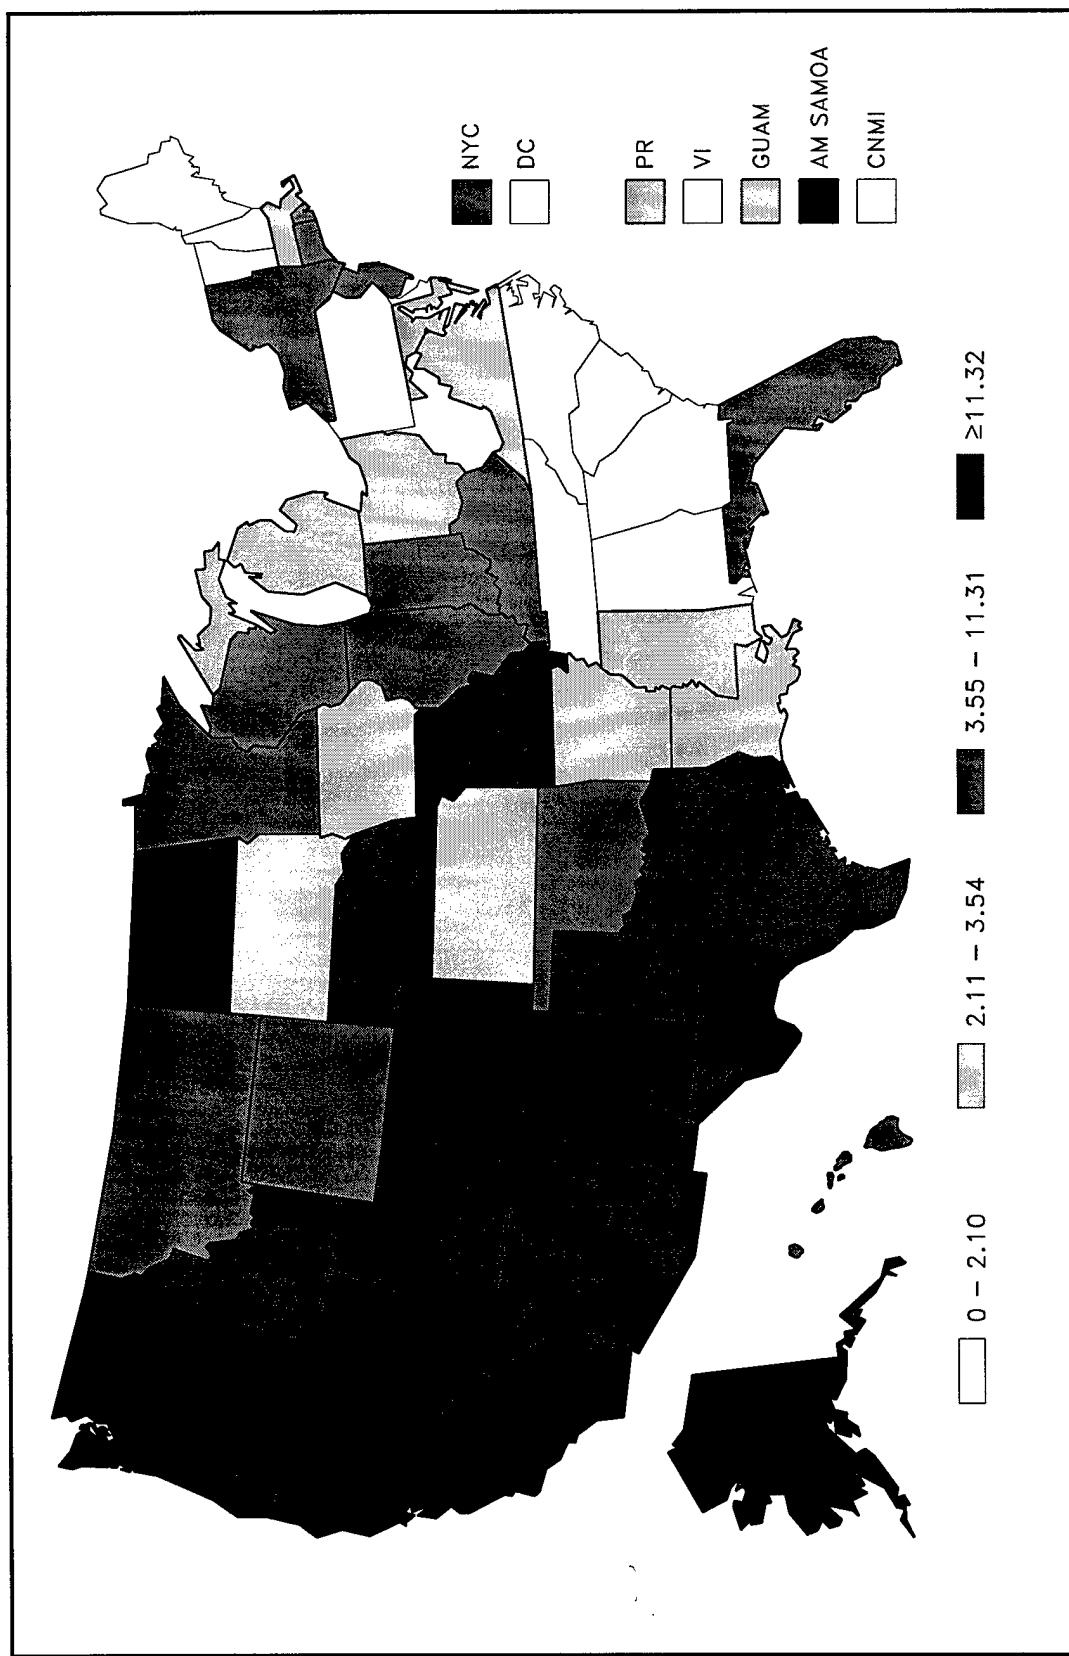

\*The first hepatitis B vaccine was licensed June 1982.

†Cases reported as acute non-A, non-B hepatitis may include many chronic hepatitis C virus (HCV) infections because the test for antibody to HCV (anti-HCV) does not distinguish acute infections from chronic infections.

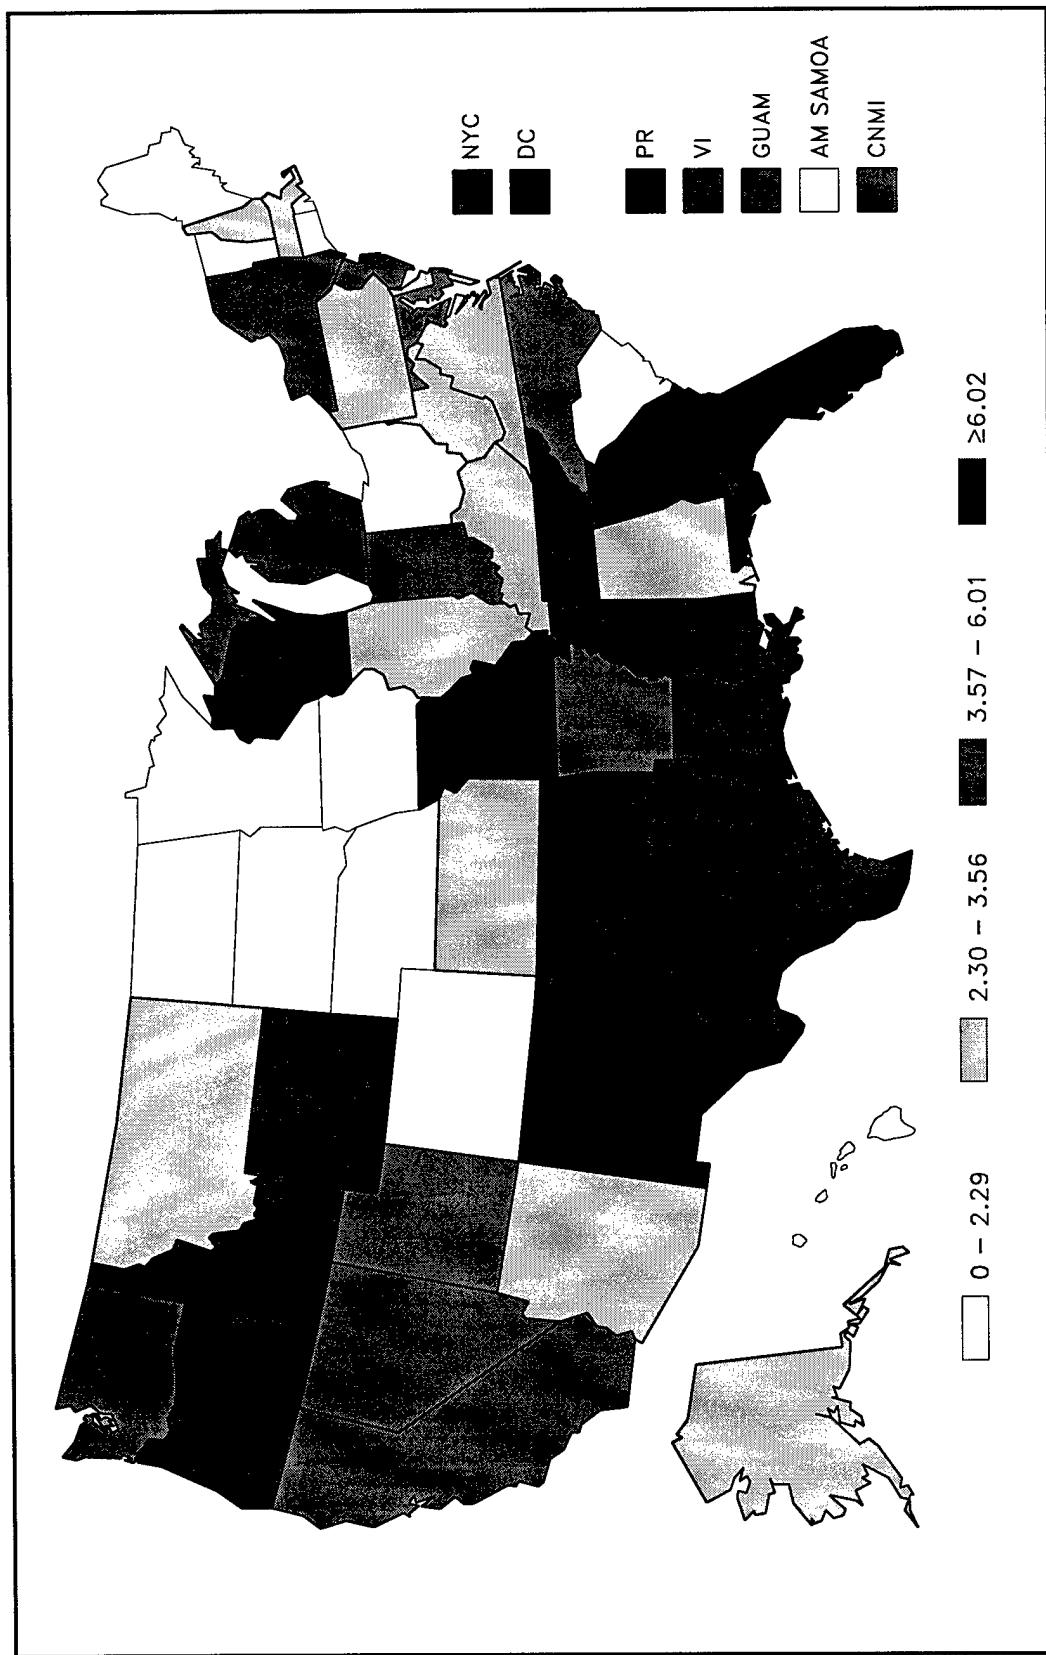

## GRAPHS AND MAPS

HEPATITIS A — reported cases, per 100,000 population, United States and territories, 1993

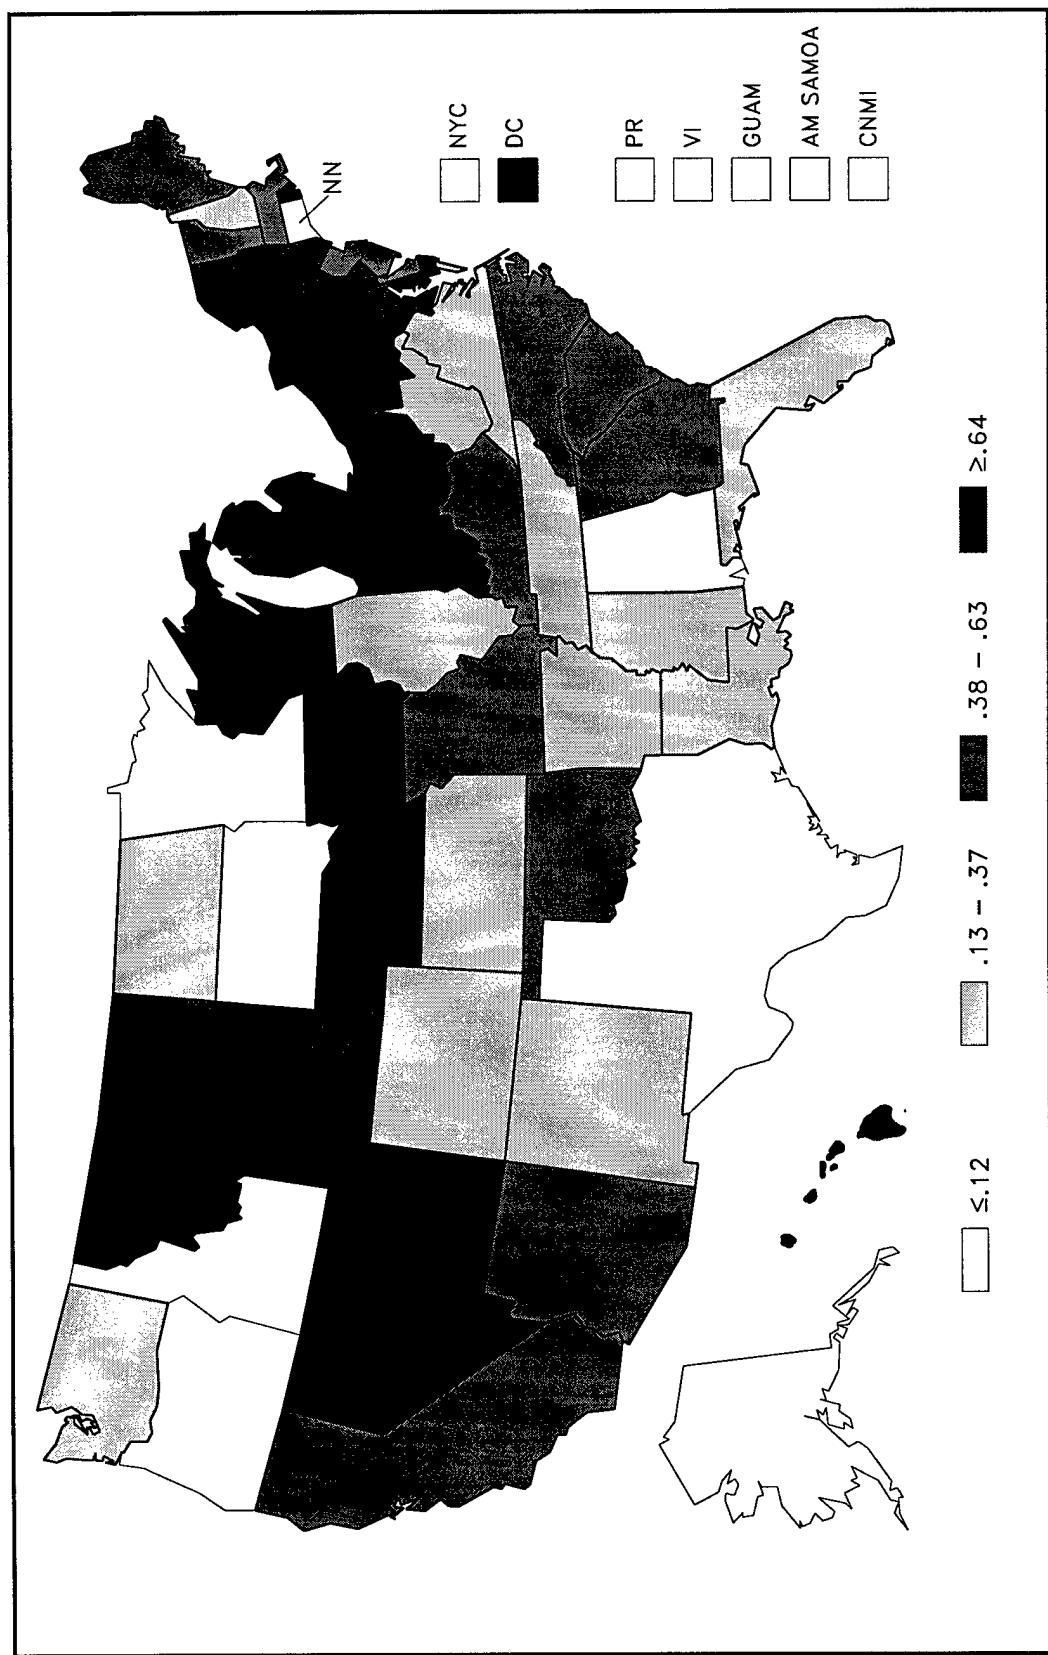

## GRAPHS AND MAPS

**HEPATITIS B — reported cases, per 100,000 population, United States and territories, 1993**

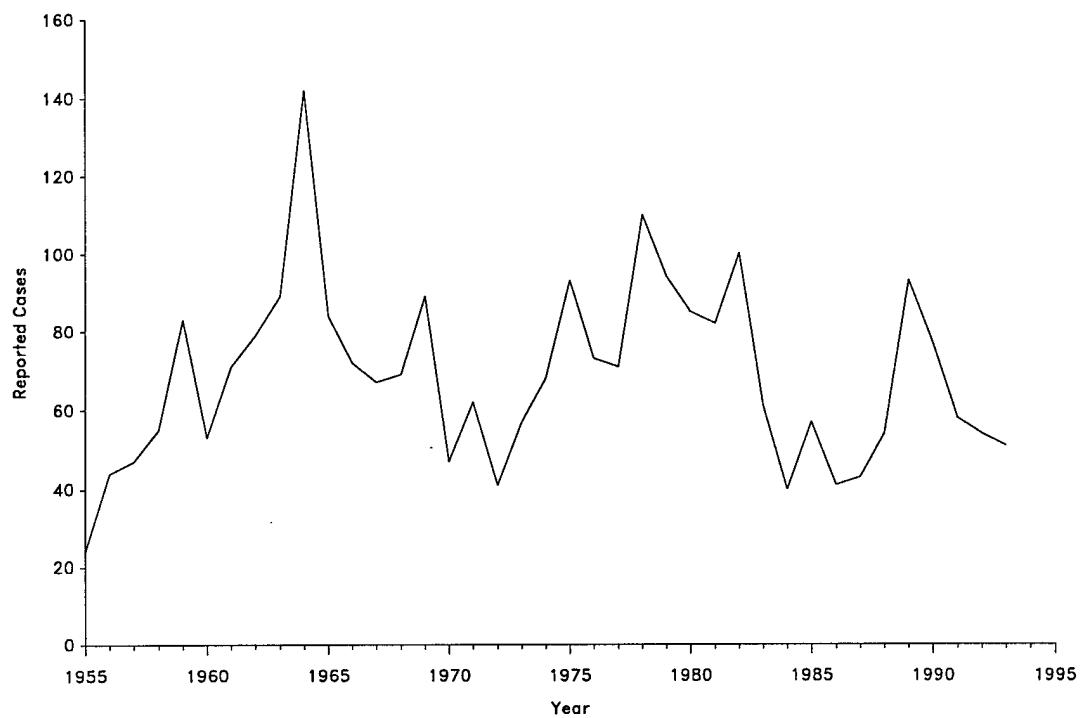

## GRAPHS AND MAPS

**LEGIONELLOSIS — reported cases, per 100,000 population, United States and territories, 1993**

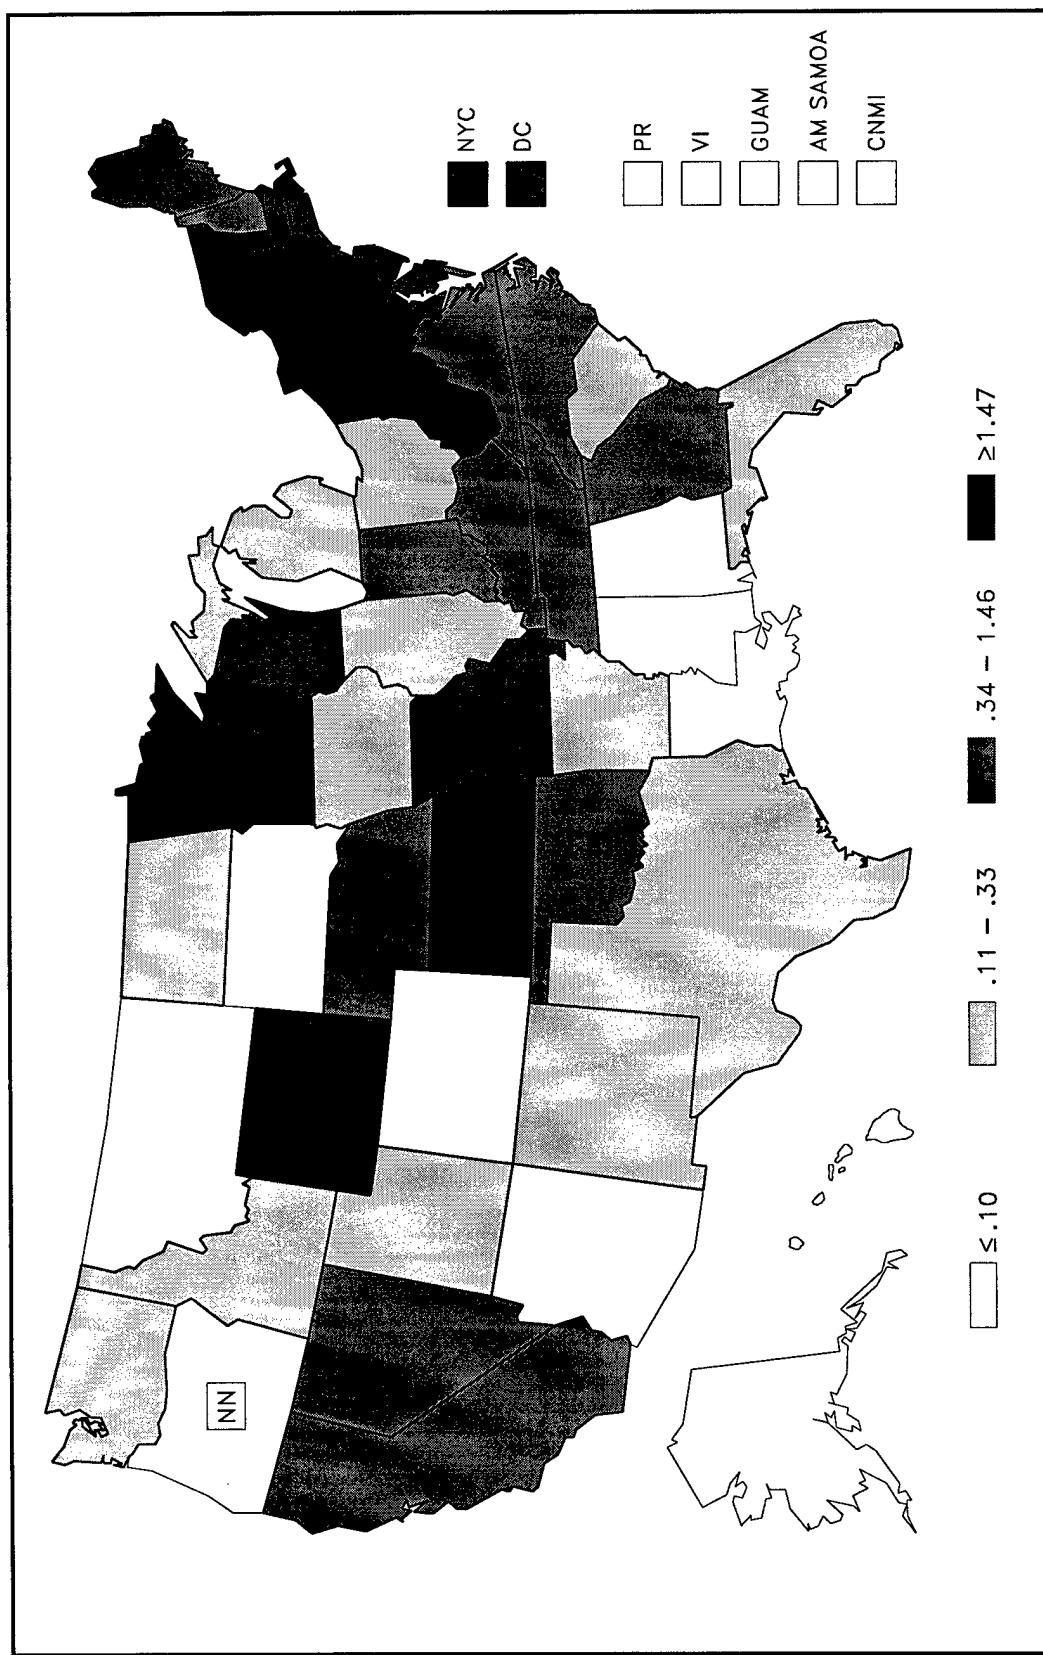

## GRAPHS AND MAPS

### LEPTOSPIROSIS — by year, United States, 1955–1993

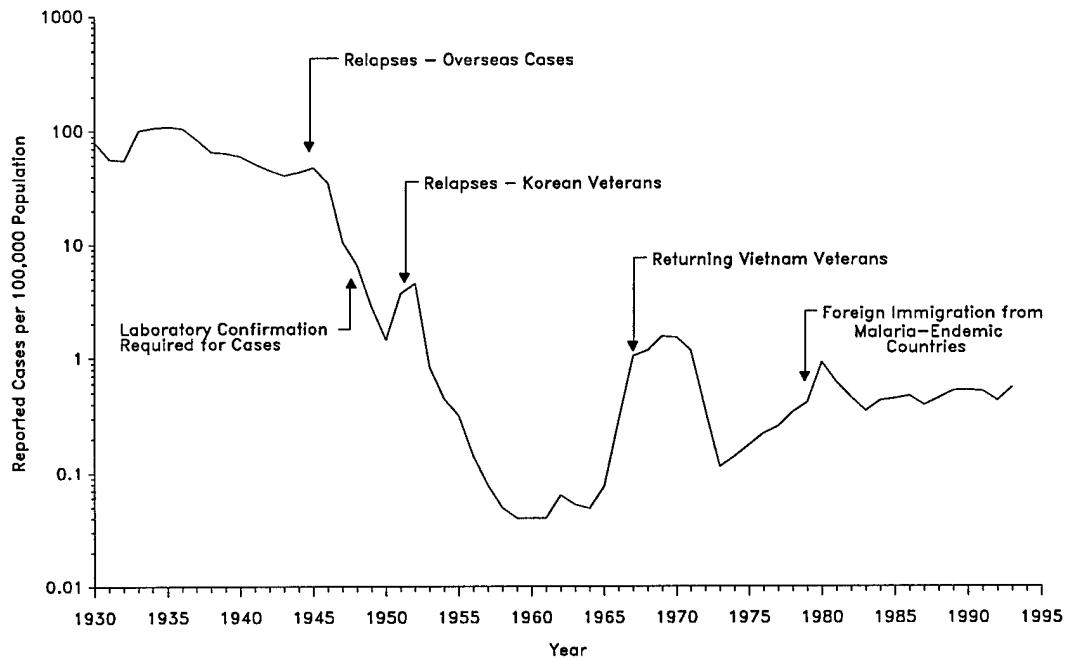

## GRAPHS AND MAPS

LYME DISEASE — reported cases, per 100,000 population, United States and territories, 1993

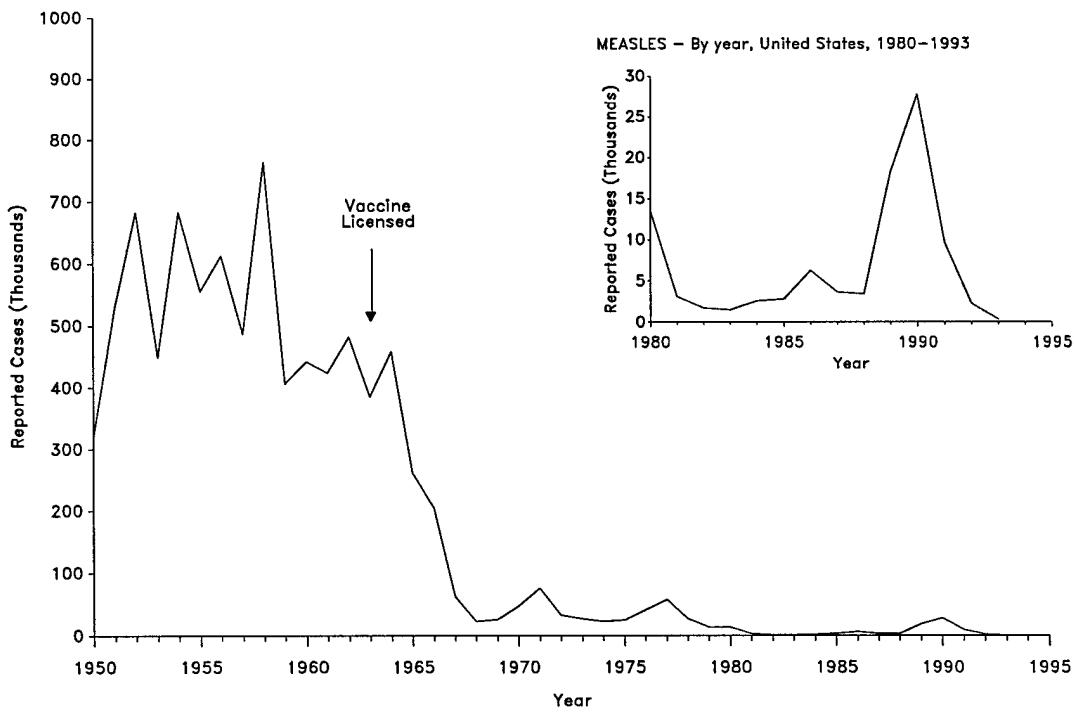

## GRAPHS AND MAPS

### MALARIA — by year, United States, 1930–1993

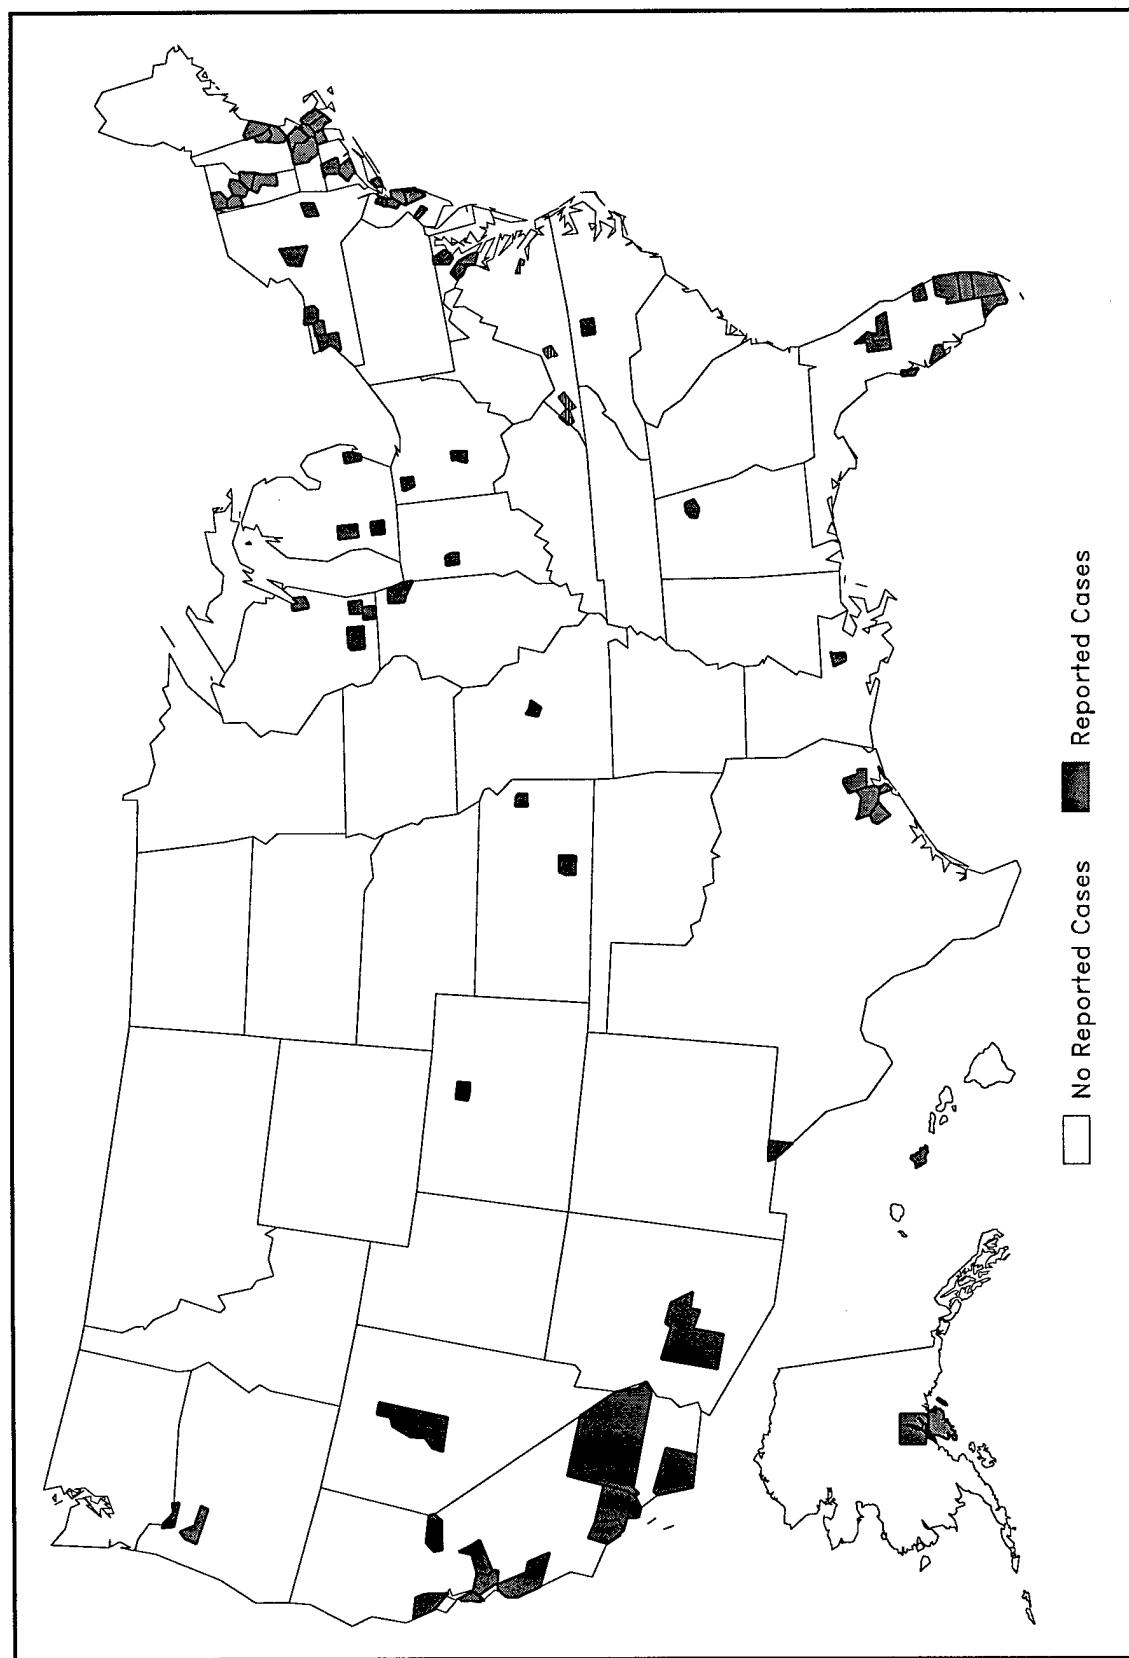

### MEASLES (rubeola) — by year, United States, 1950–1993

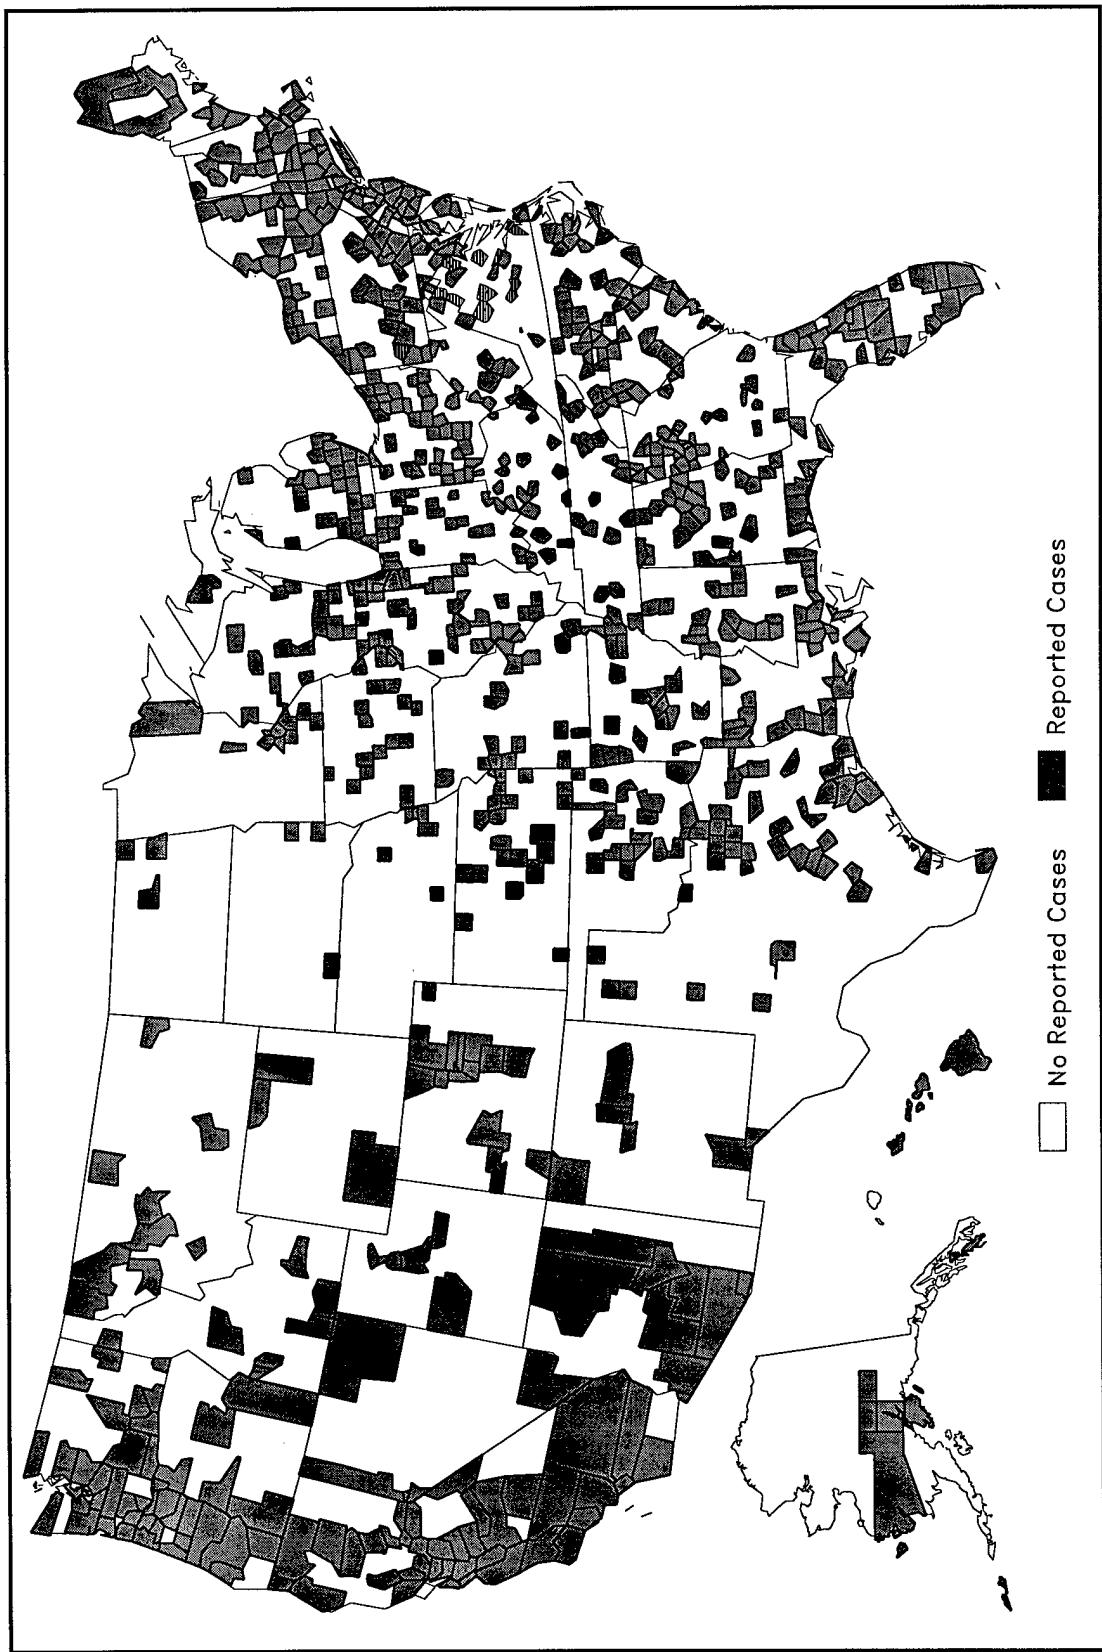

## GRAPHS AND MAPS

MEASLES (rubeola) — counties reporting cases, United States, 1993

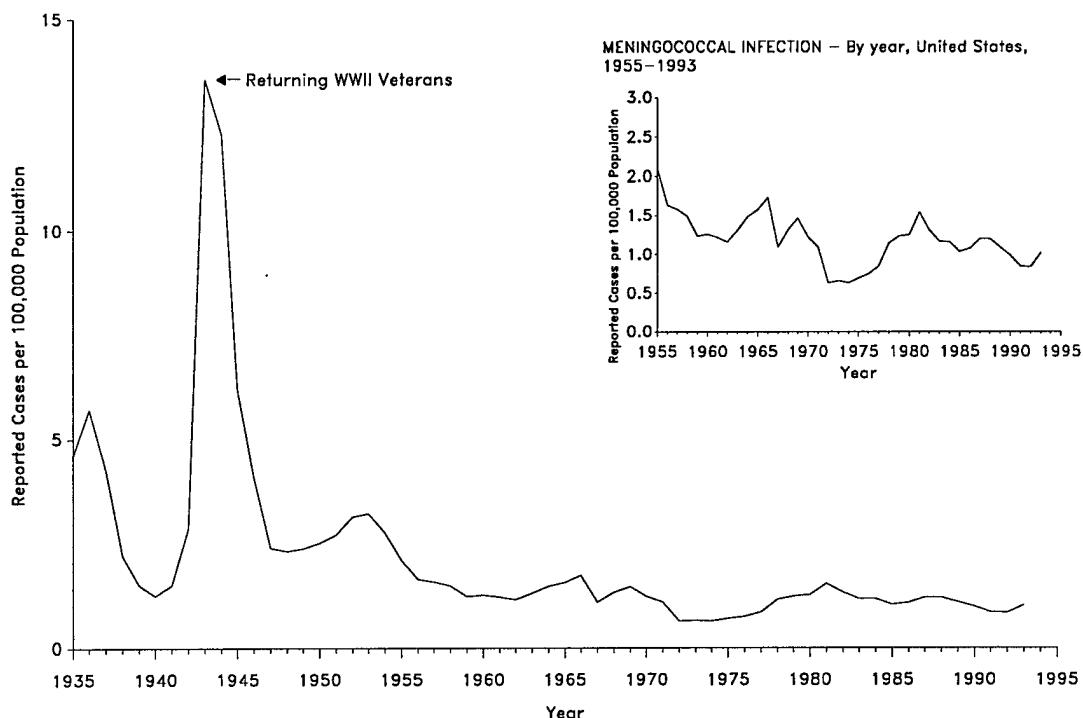

## GRAPHS AND MAPS

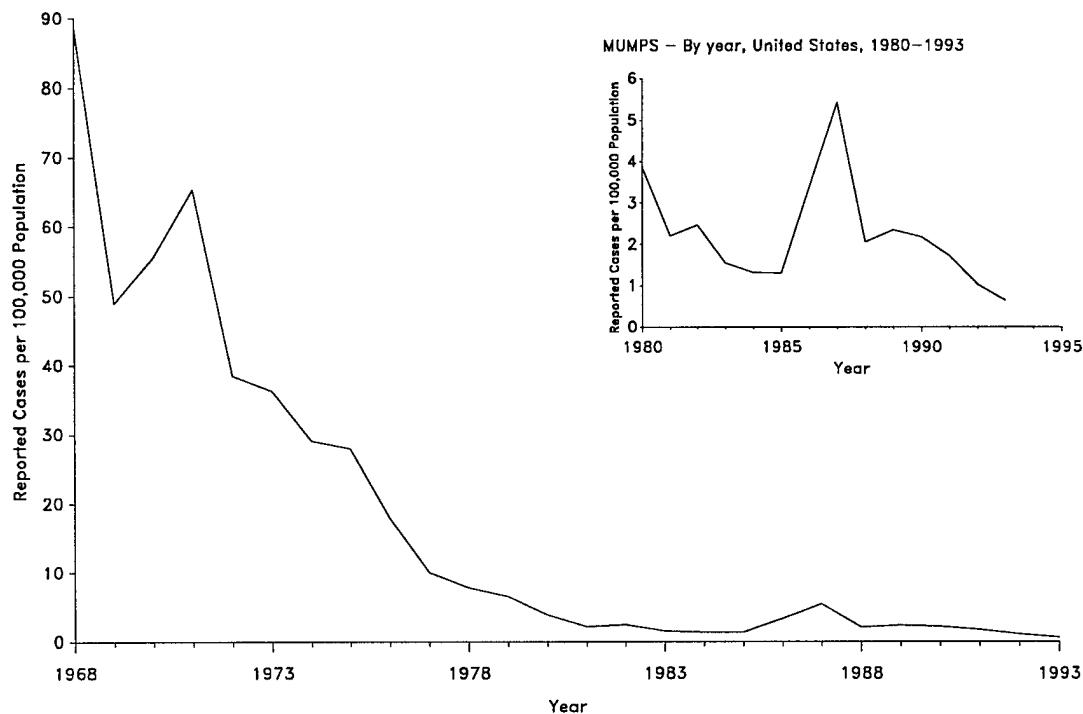

MENINGOCOCCAL INFECTION — counties reporting cases, United States, 1993

**MENINGOCOCCAL INFECTION — by year, United States, 1935–1993**

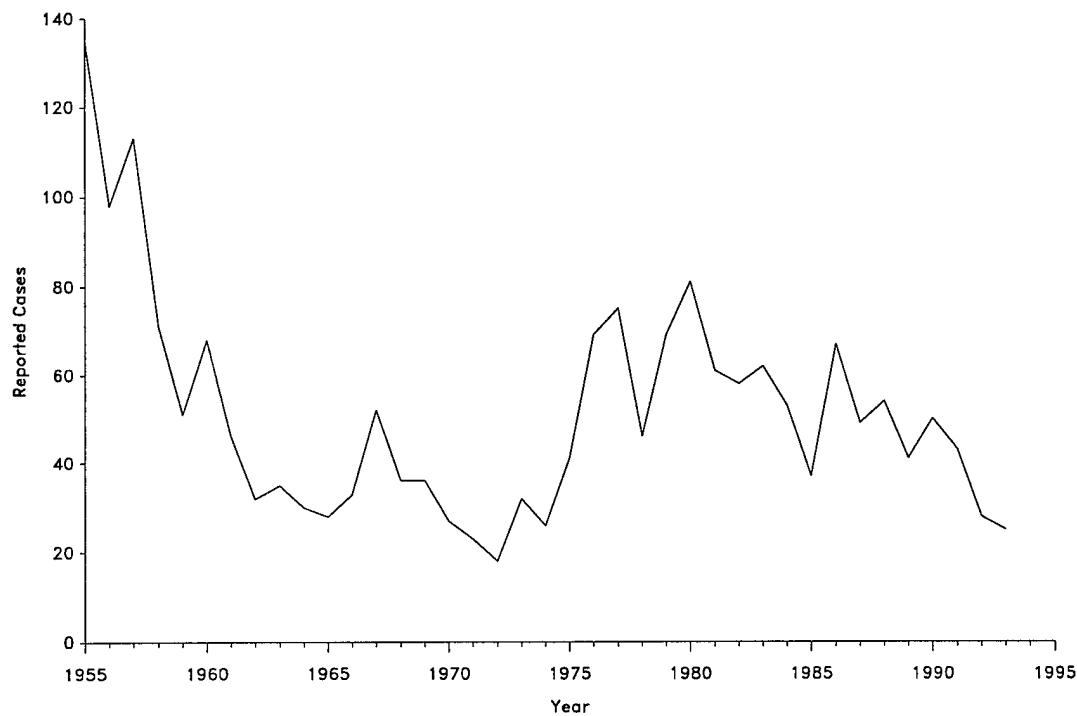

**MUMPS — by year, United States, 1968–1993**

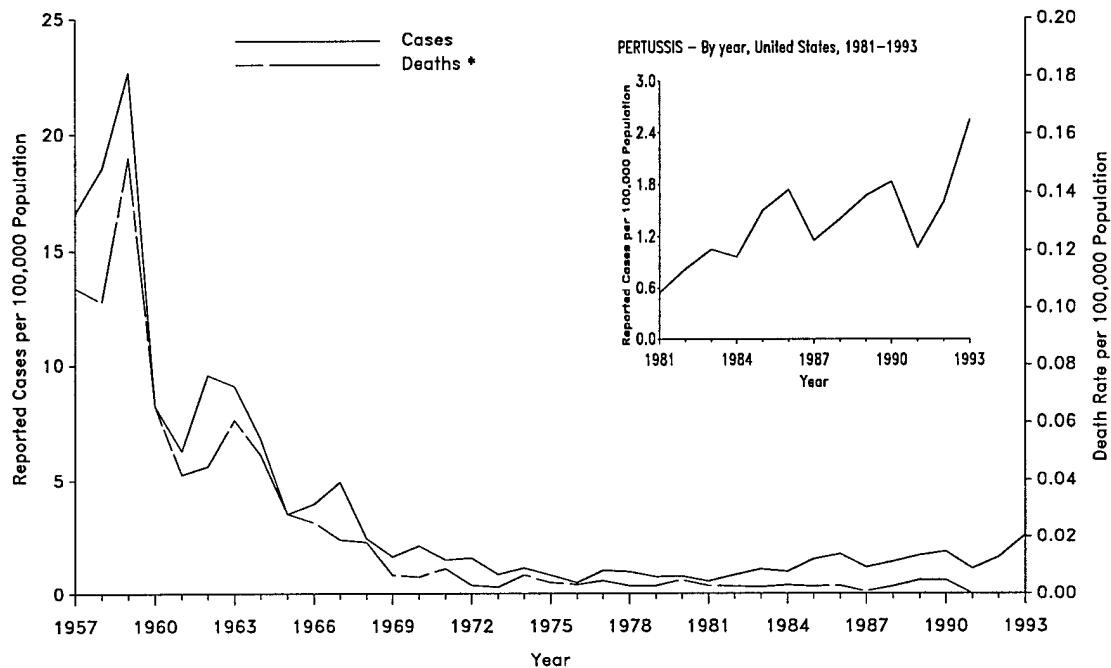

NOTE: Mumps vaccine licensed December 1967.

## GRAPHS AND MAPS

### MURINE TYPHUS FEVER — by year, United States, 1955–1993

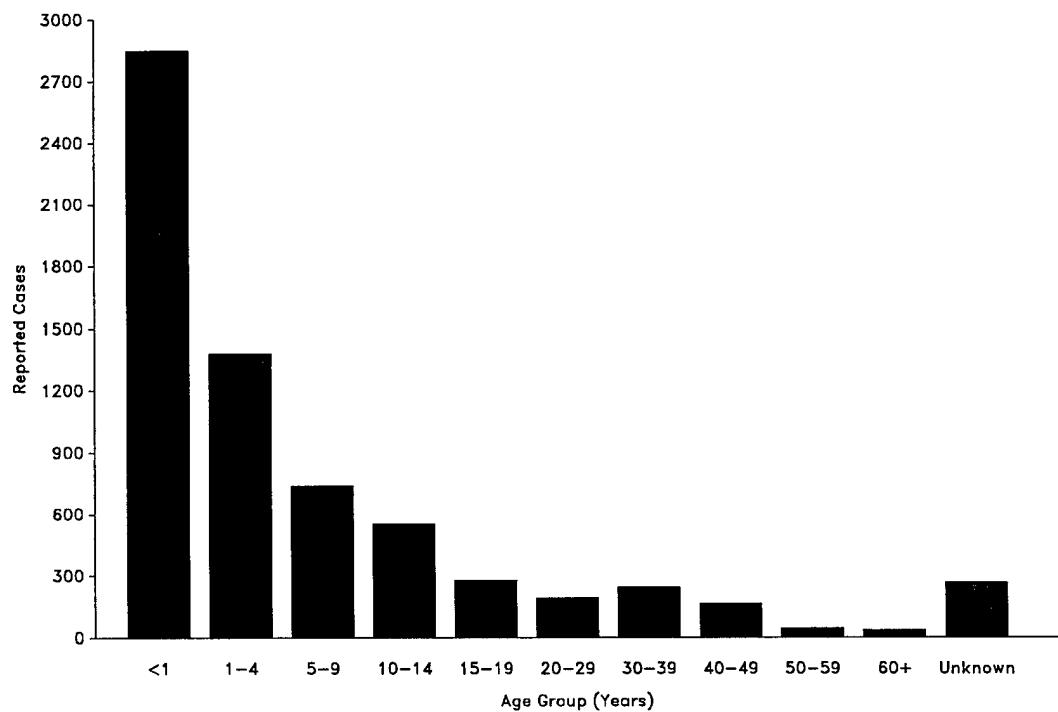

**PERTUSSIS (whooping cough) — by year, United States, 1957–1993**

NOTE: DTP vaccine licensed 1948.

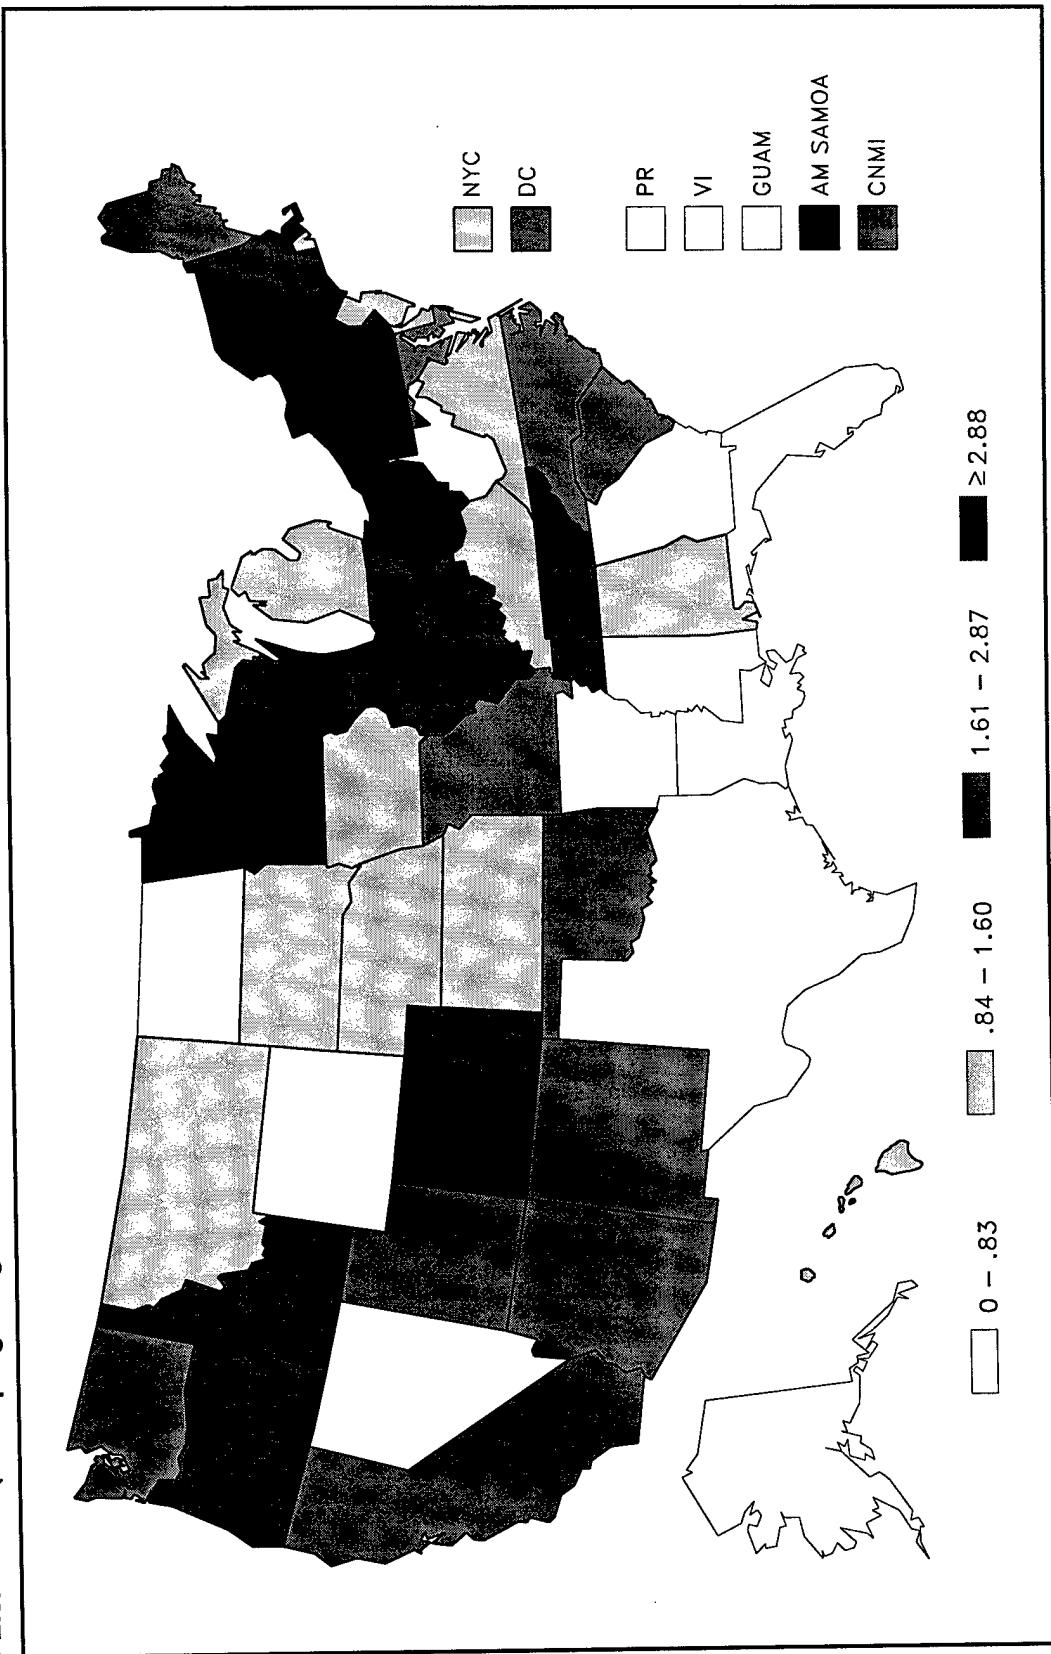

\* Data on mortality are not yet available for 1992 and 1993.

**PERTUSSIS (whooping cough) — by age group, United States, 1993**

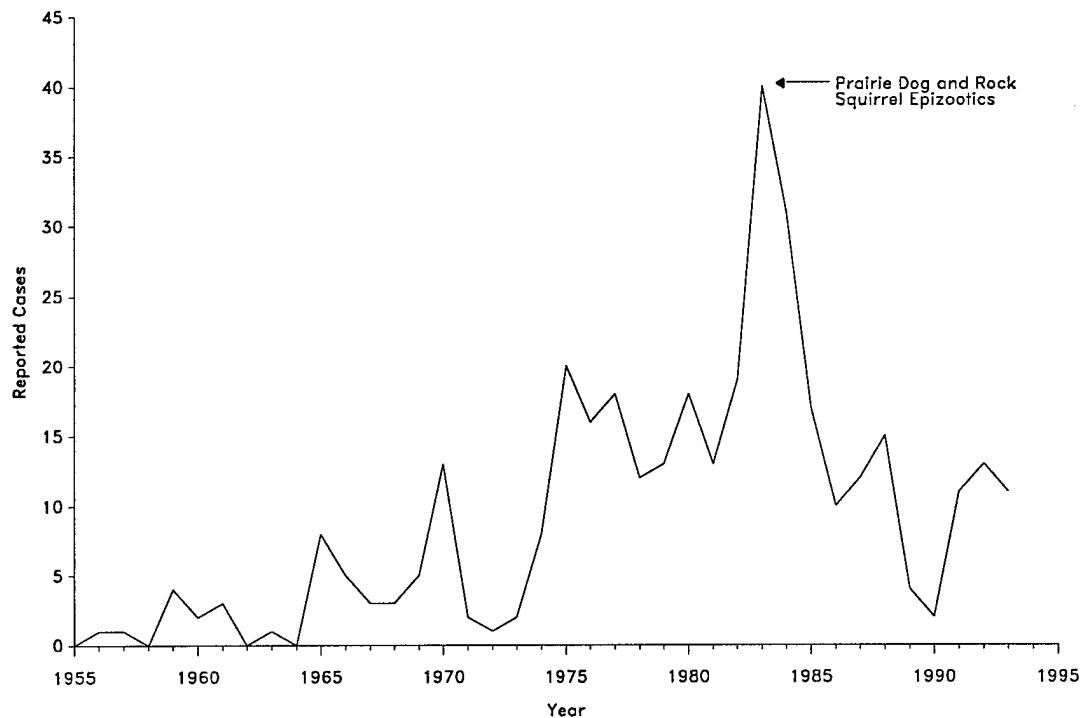

## GRAPHS AND MAPS

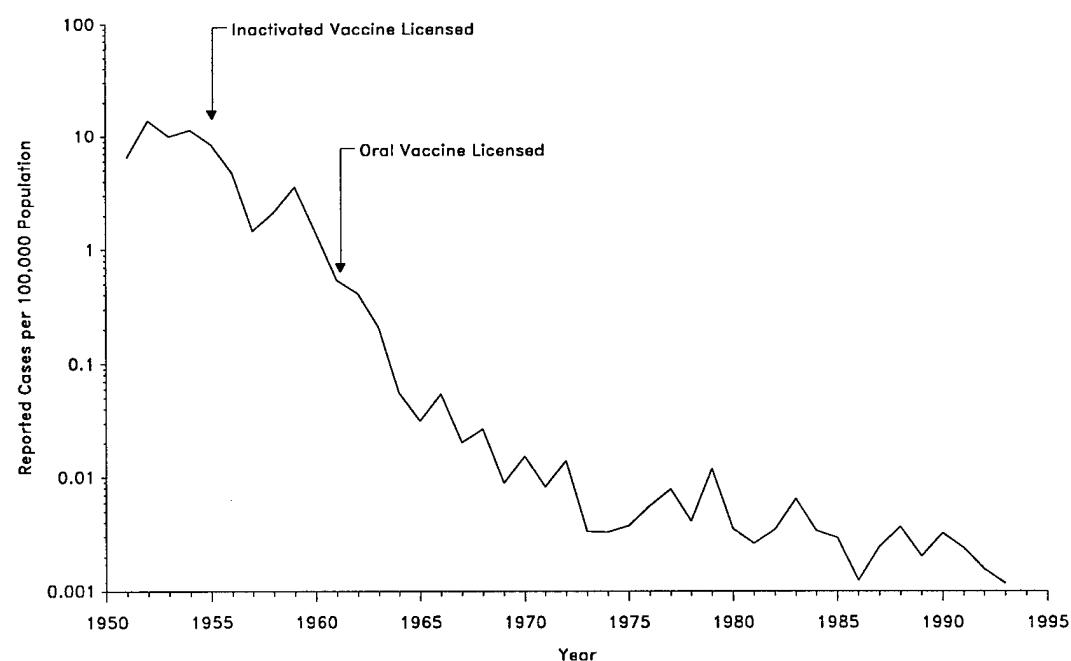

**PERTUSSIS (whooping cough) — reported cases, per 100,000 population, United States and territories, 1993**

**PLAUE — among humans, by year, United States, 1955–1993**

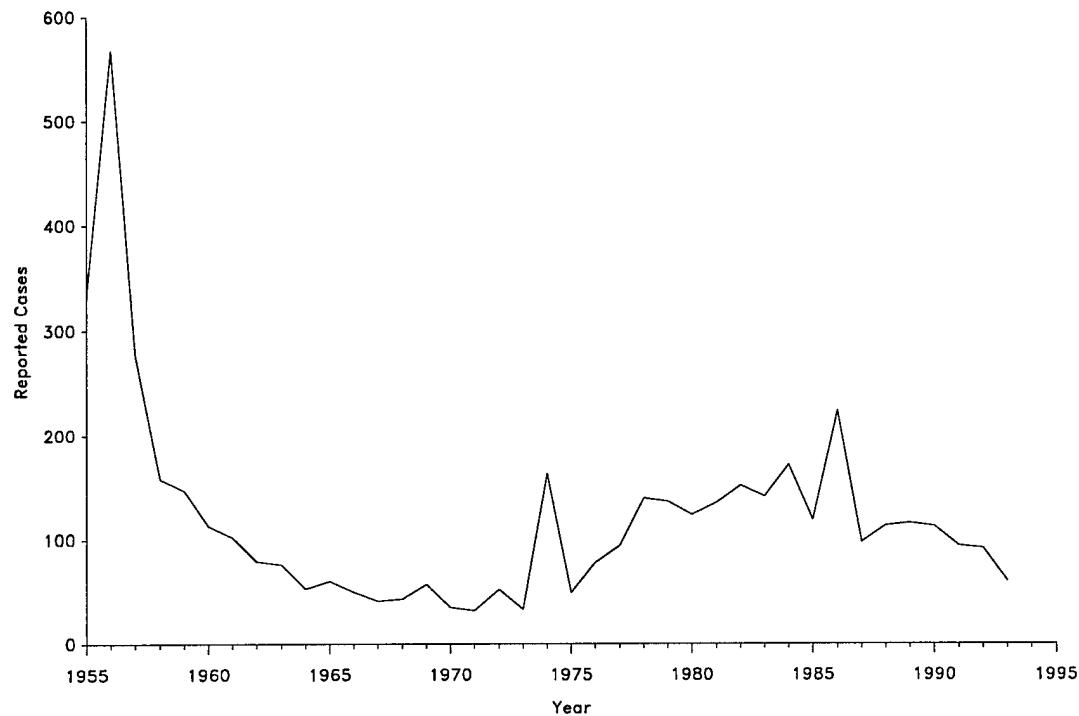

**POLIOMYELITIS (paralytic) — by year, United States, 1951–1993**

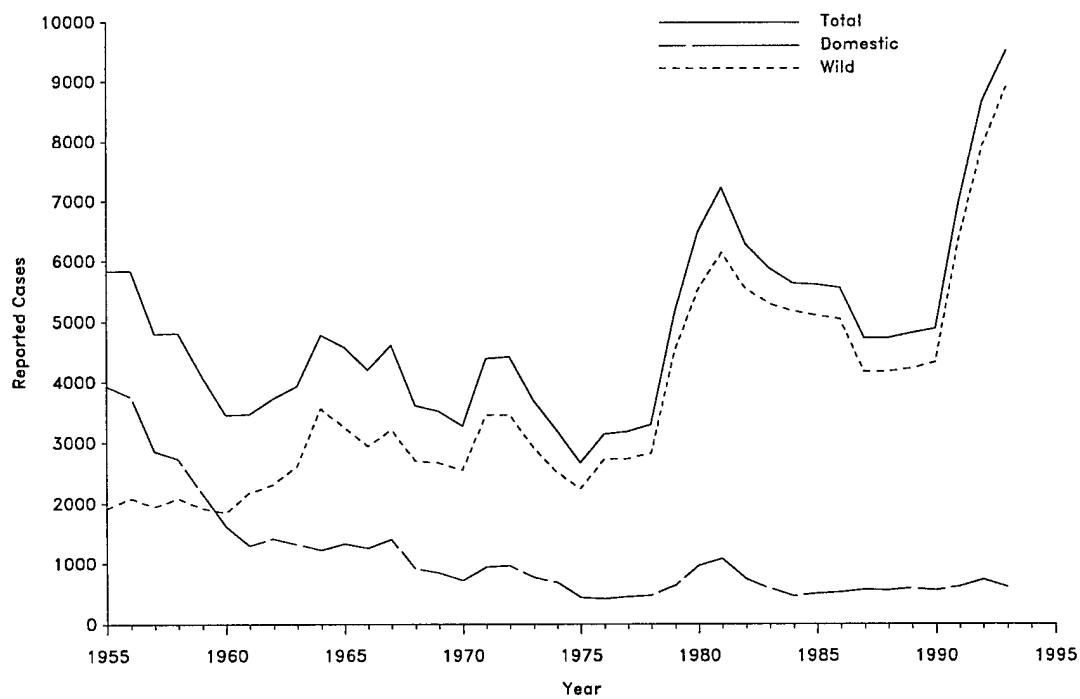

Y-AXIS IS LOG SCALE

## GRAPHS AND MAPS

### PSITTACOSIS — by year, United States, 1955–1993

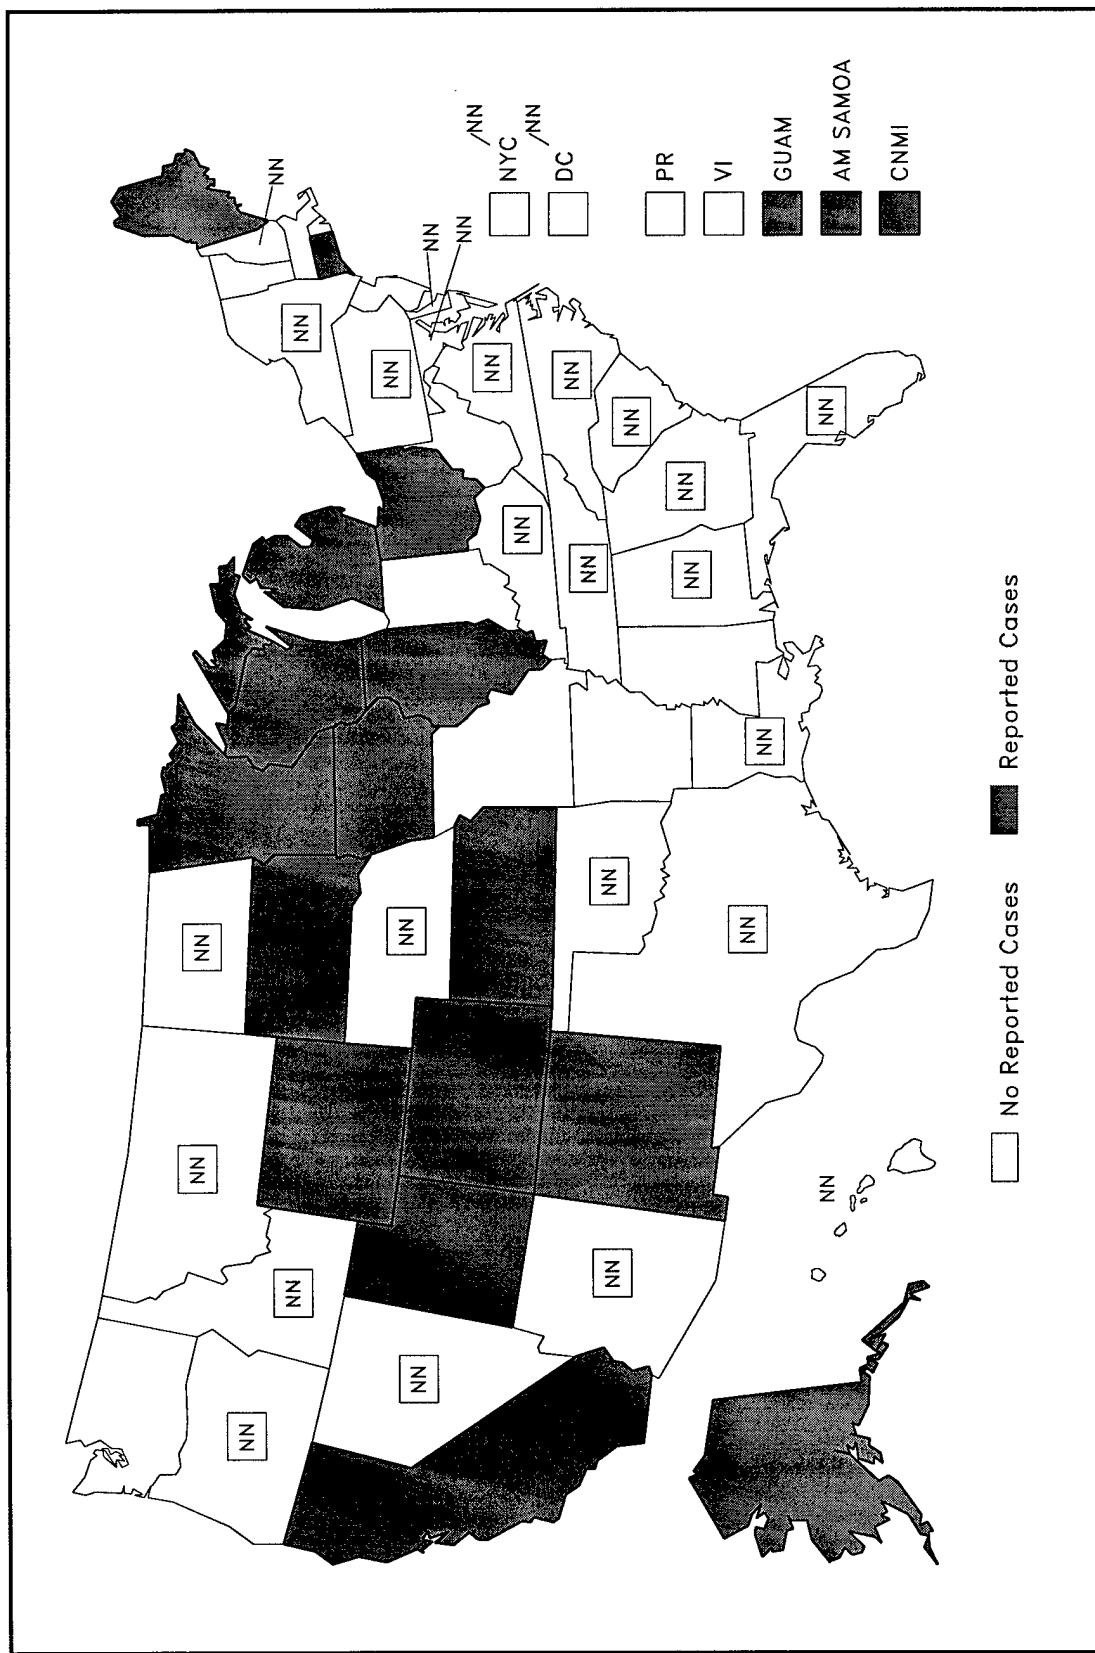

### RABIES — wild and domestic animals, by year, United States and Puerto Rico, 1955–1993

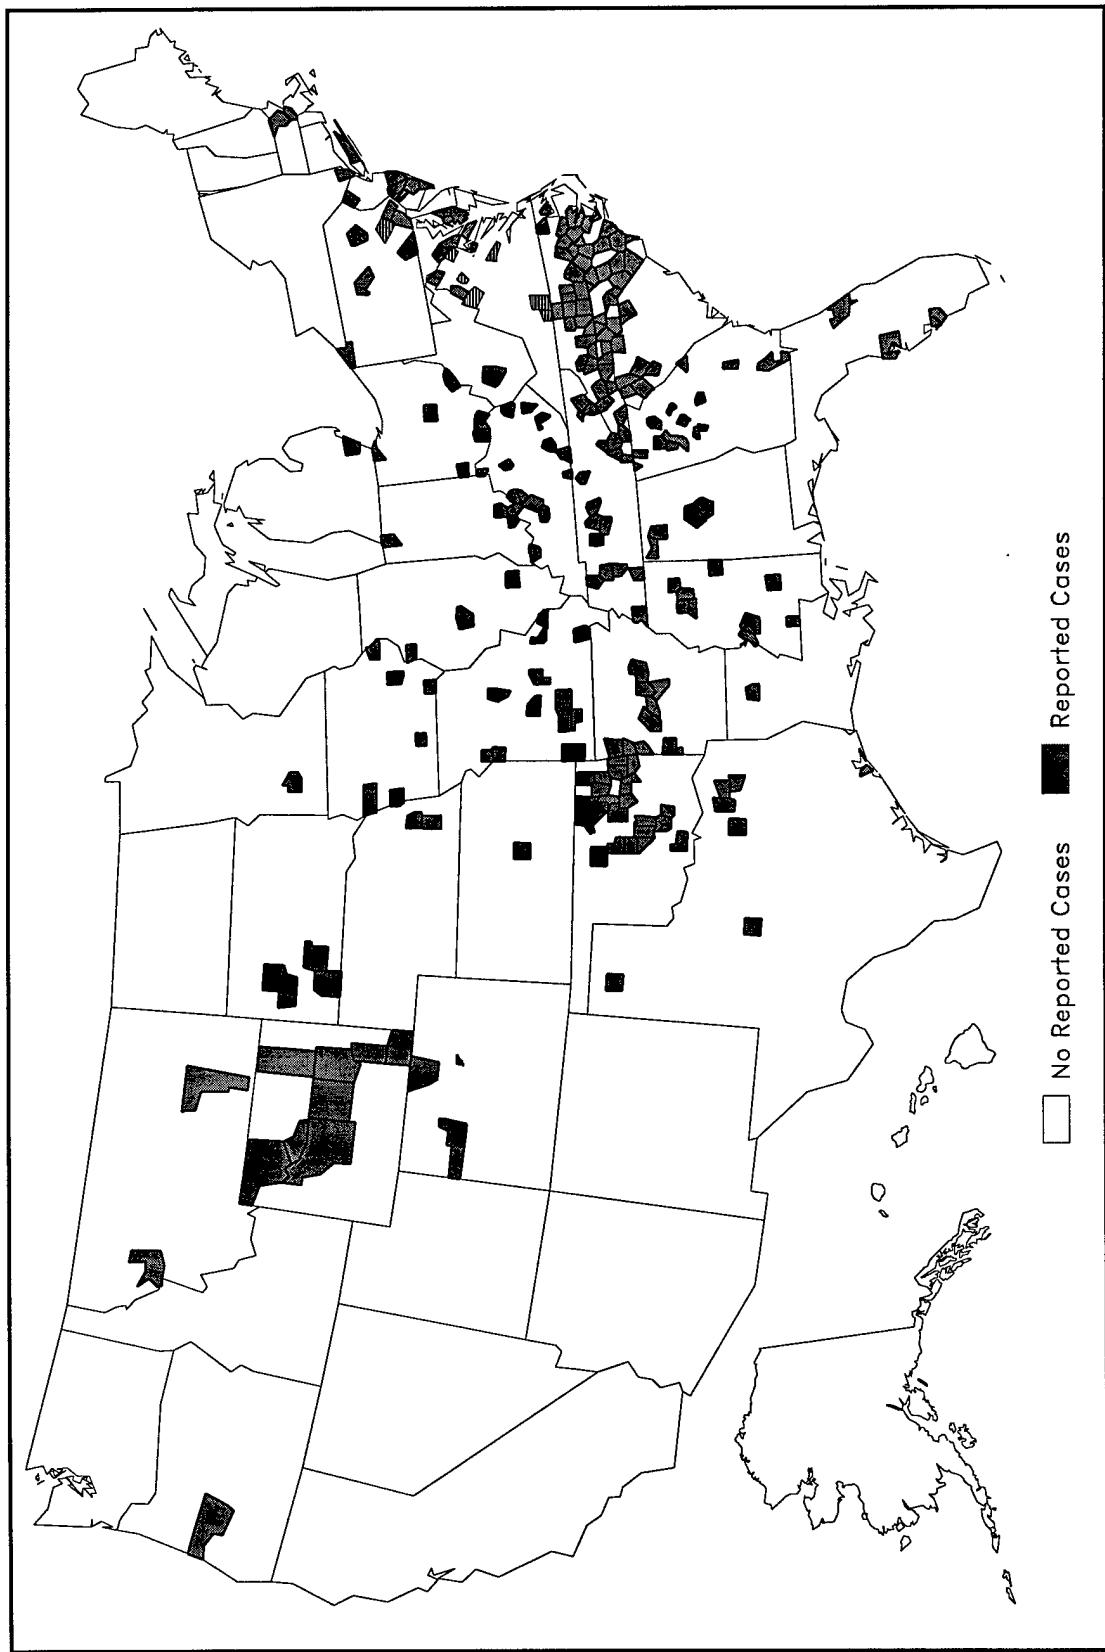

## GRAPHS AND MAPS

RHEUMATIC FEVER — reported cases, United States and territories, 1993

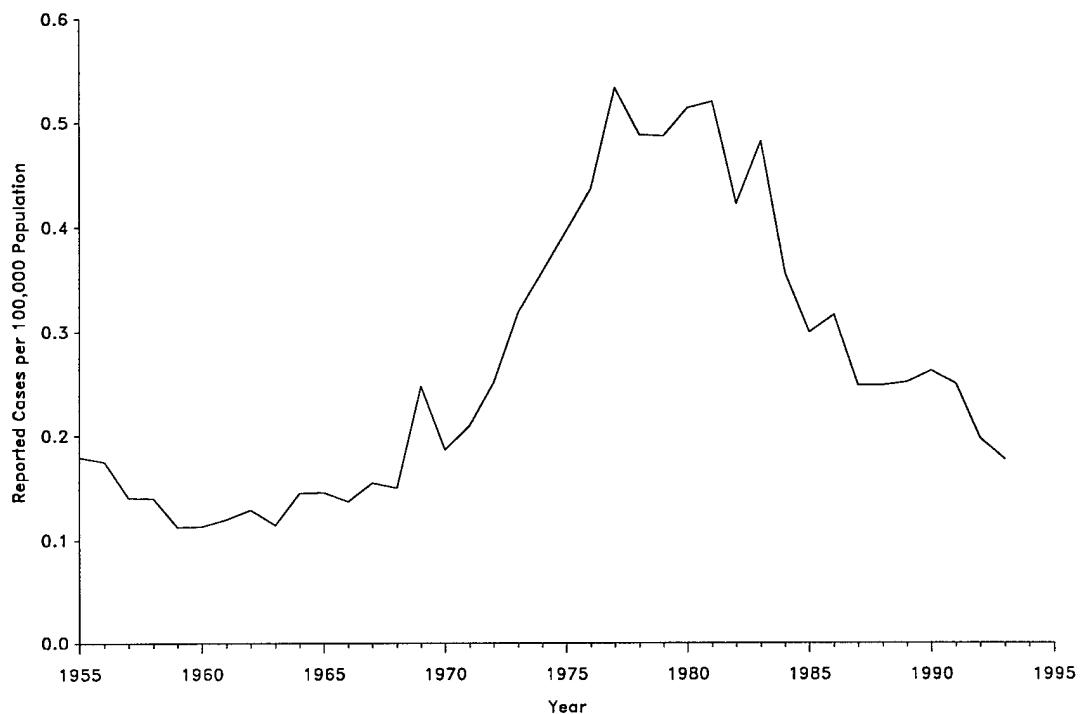

## GRAPHS AND MAPS

**ROCKY MOUNTAIN SPOTTED FEVER — counties reporting cases, United States, 1993**

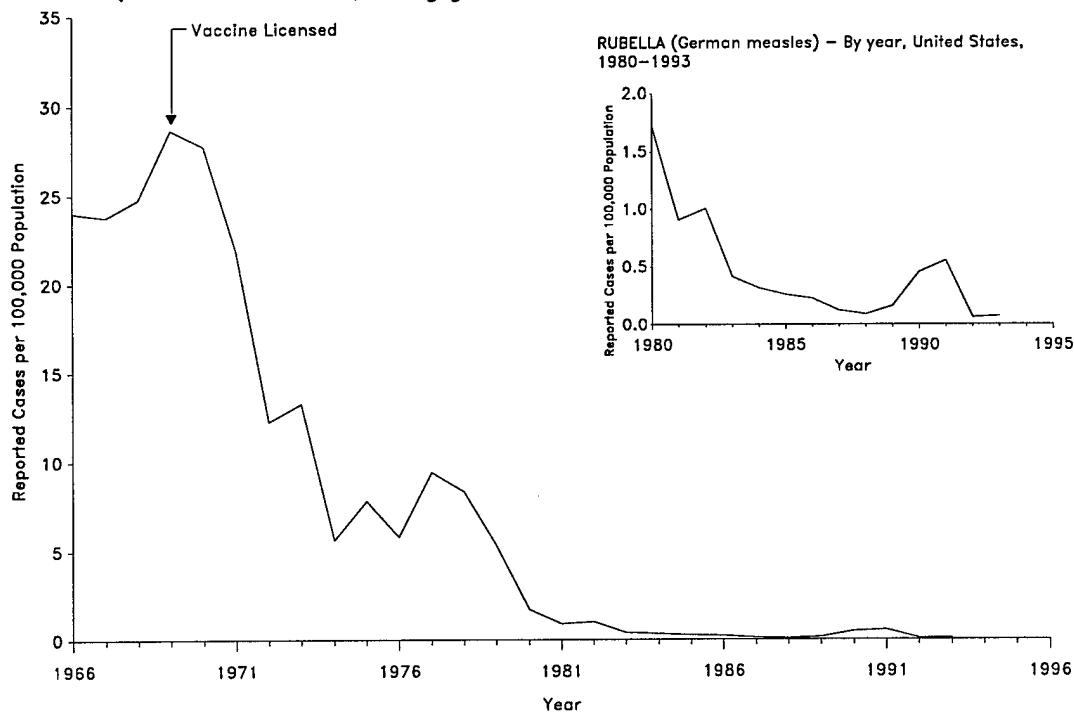

**ROCKY MOUNTAIN SPOTTED FEVER — by year, United States, 1955–1993**

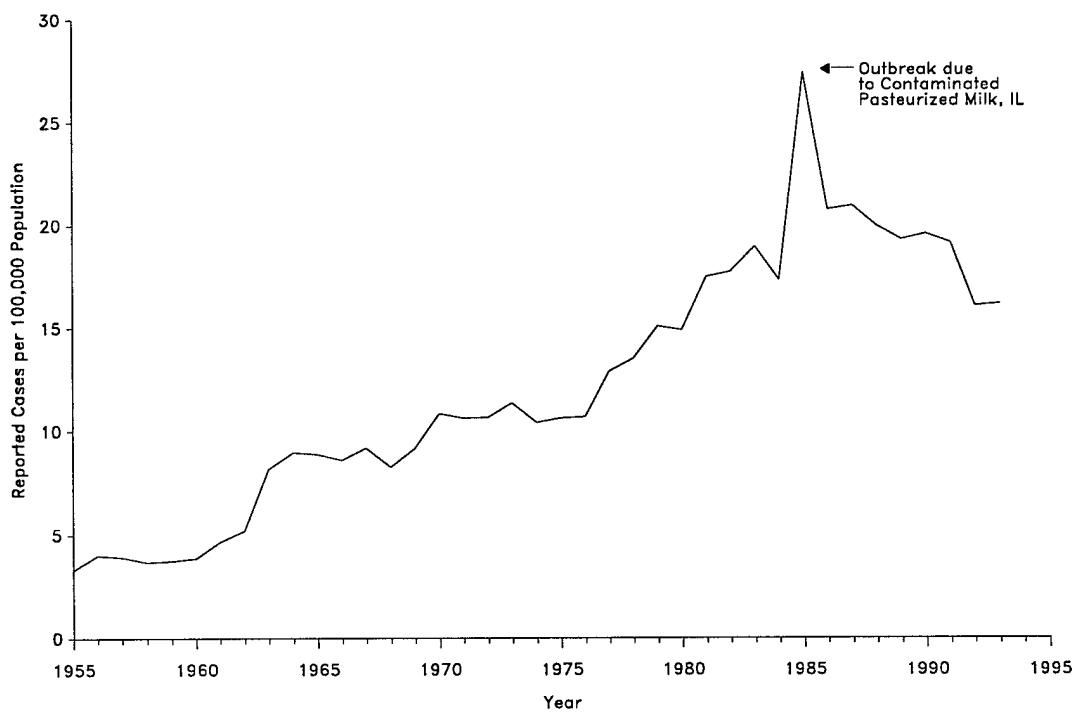

## GRAPHS AND MAPS

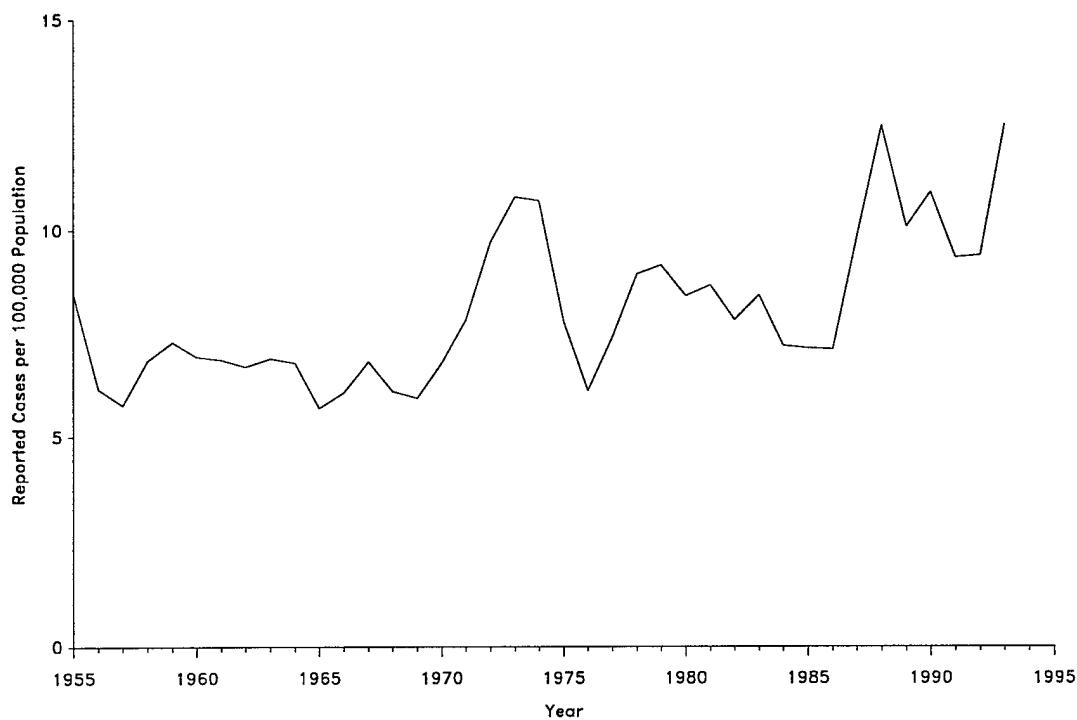

### RUBELLA (German measles) — by year, United States, 1966–1993

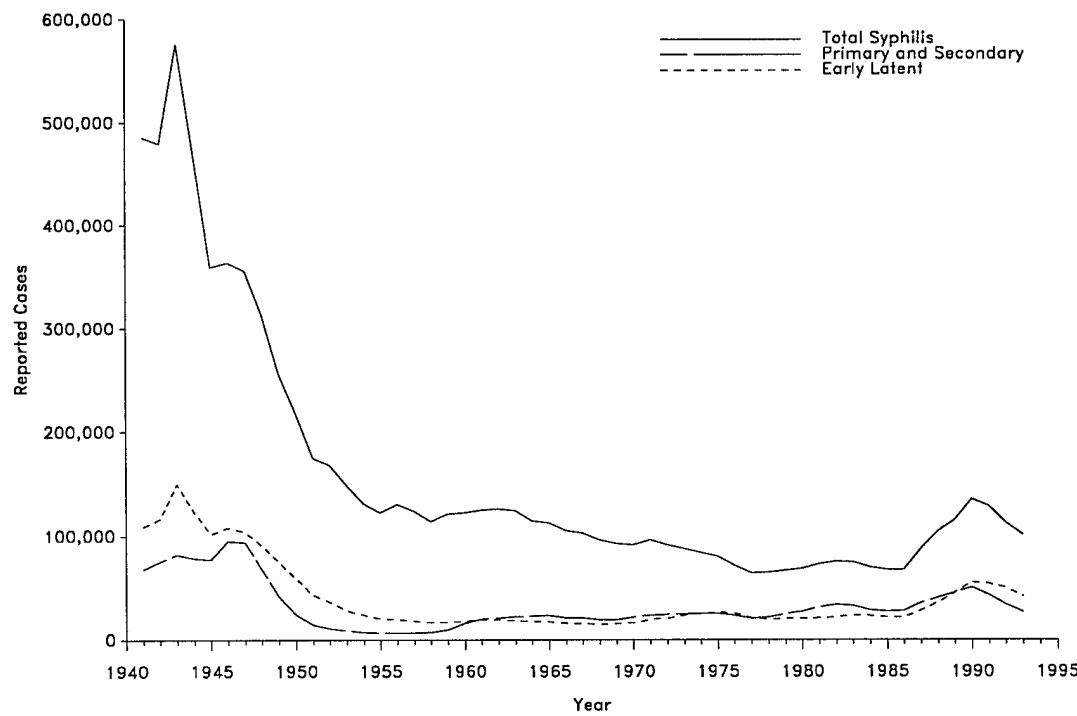

### SALMONELLOPSIS (excluding typhoid fever) — by year, United States, 1955–1993

### SHIGELLOSIS — by year, United States, 1955–1993

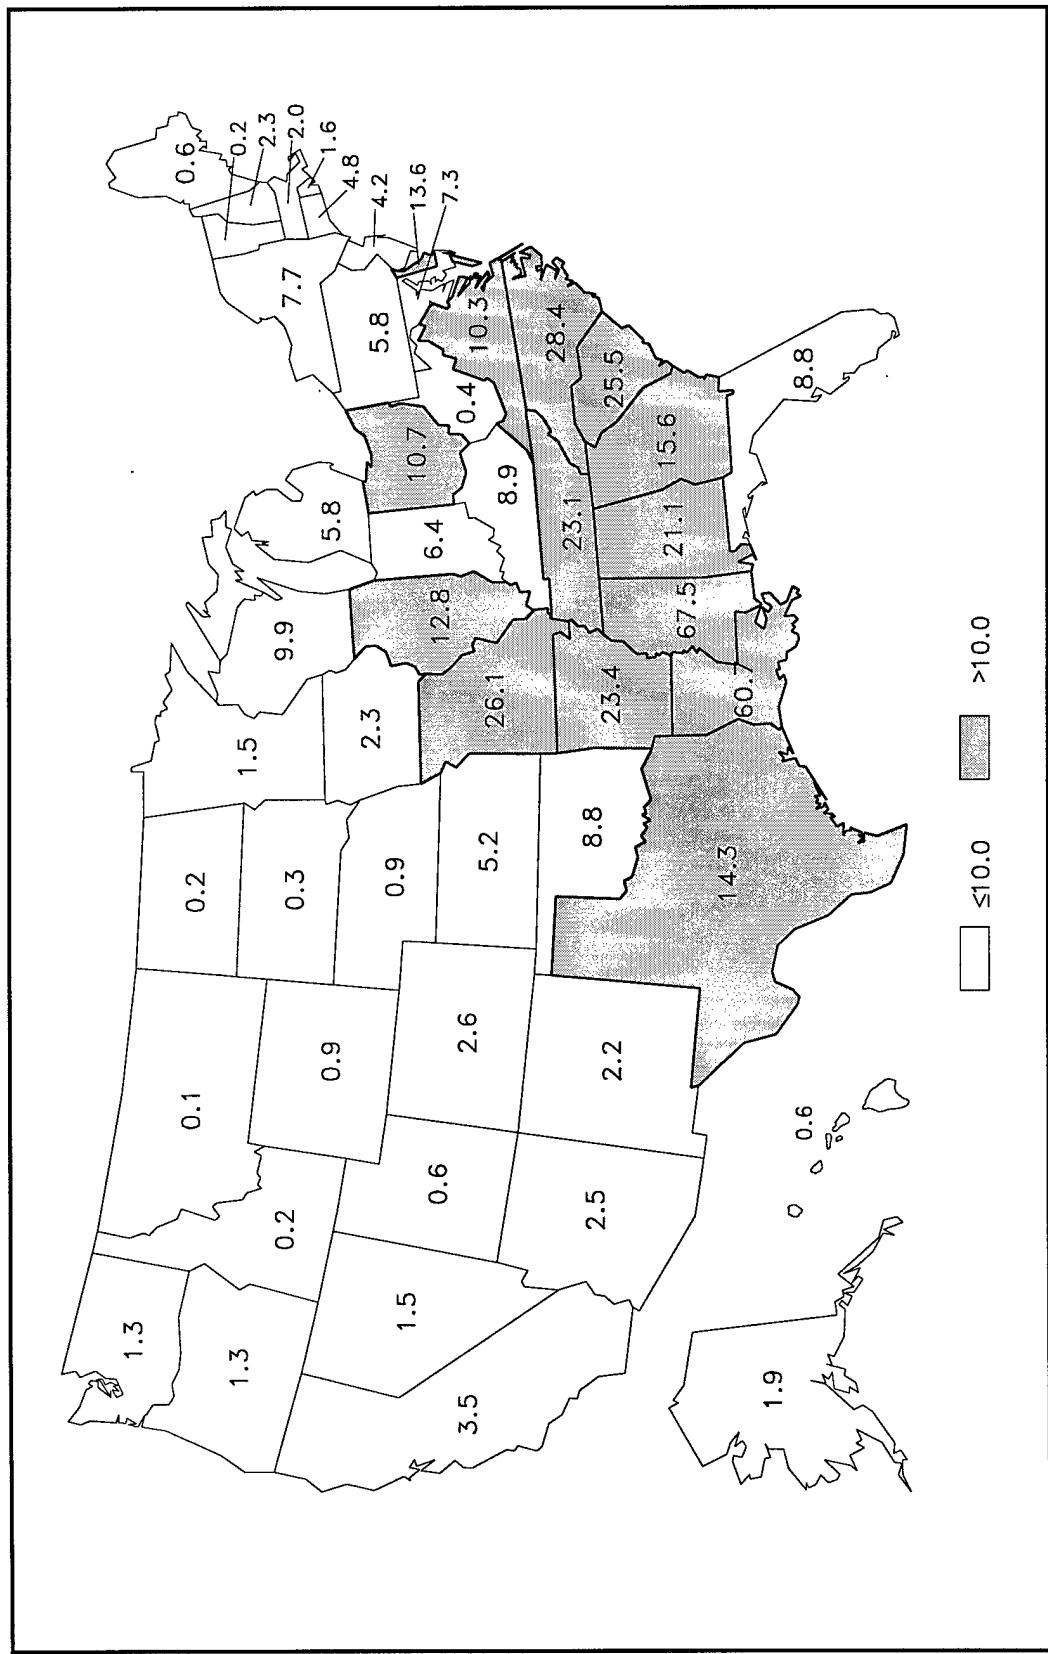

### SYPHILIS — by year, United States, 1941–1993

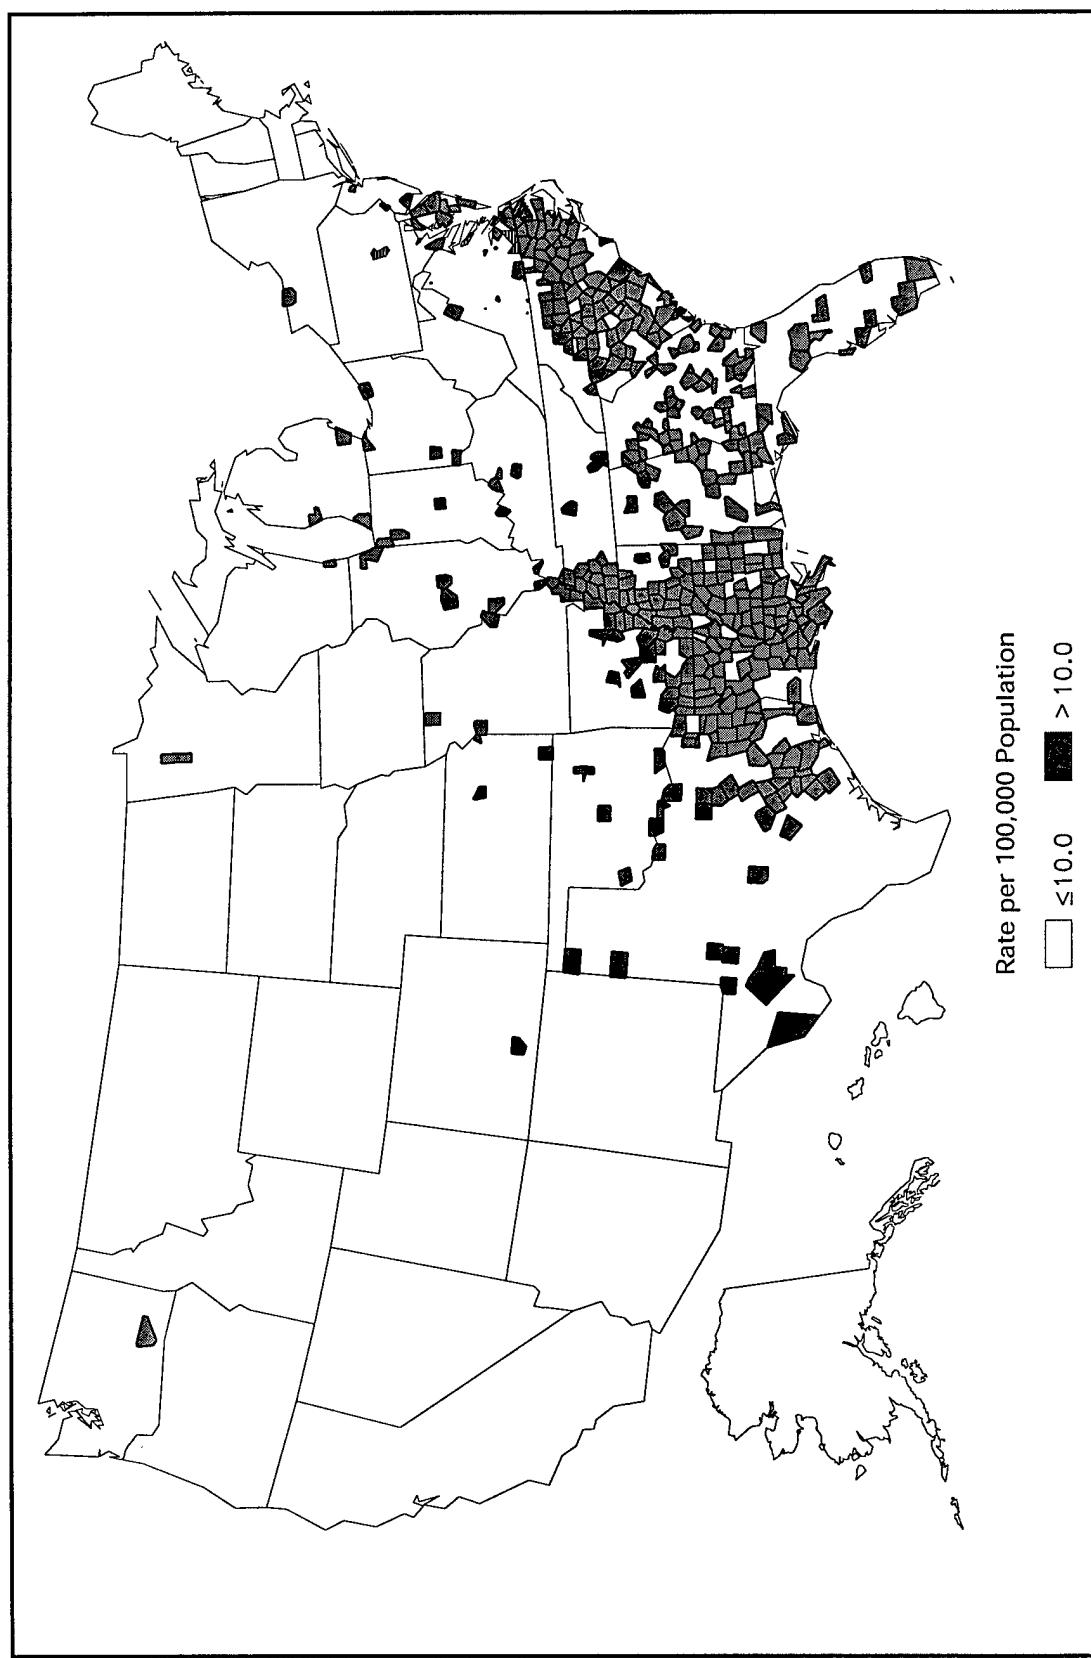

## GRAPHS AND MAPS

**SYPHILIS (primary and secondary) — reported cases, per 100,000 population,\* United States, 1993**

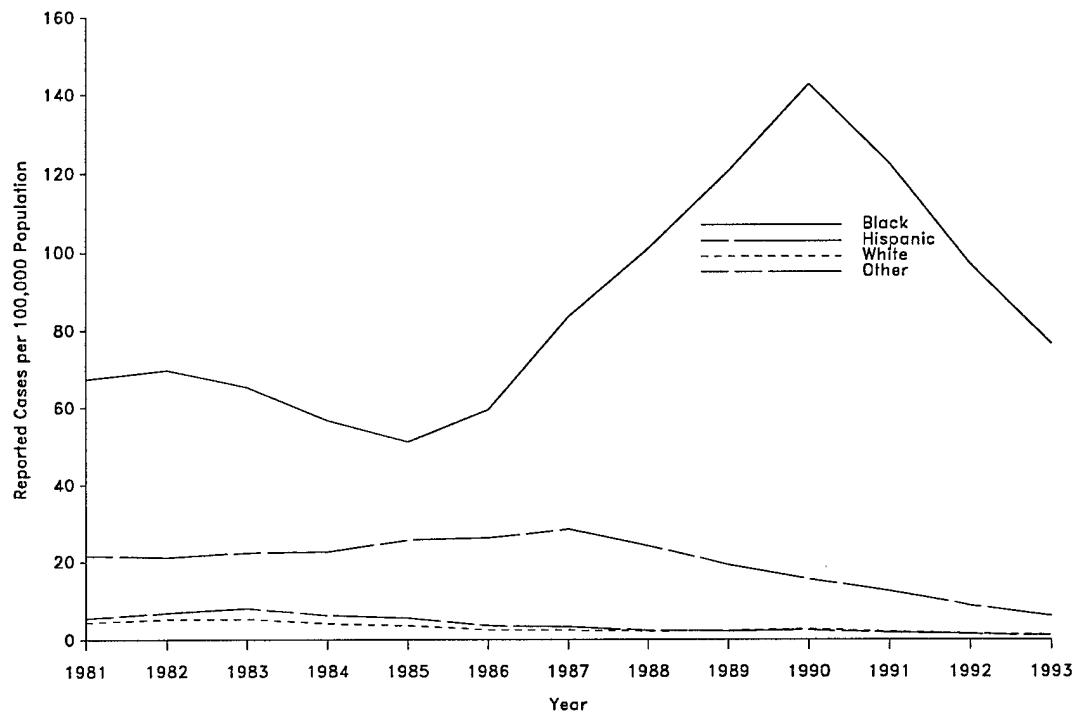

\*The total rate of primary and secondary syphilis for the United States was 10.4 per 100,000 population. The Year 2000 Objective is  $\leq 10.0$  per 100,000 population.

**SYPHILIS (primary and secondary) — counties with rates above and below the Year 2000 Objective, United States, 1993**

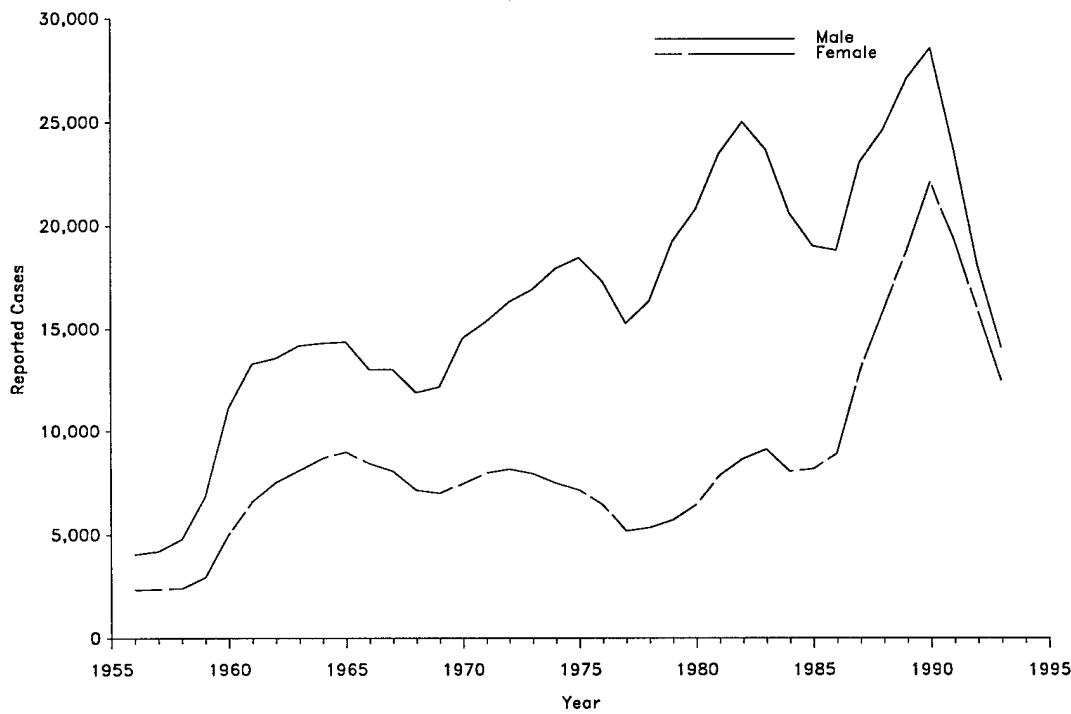

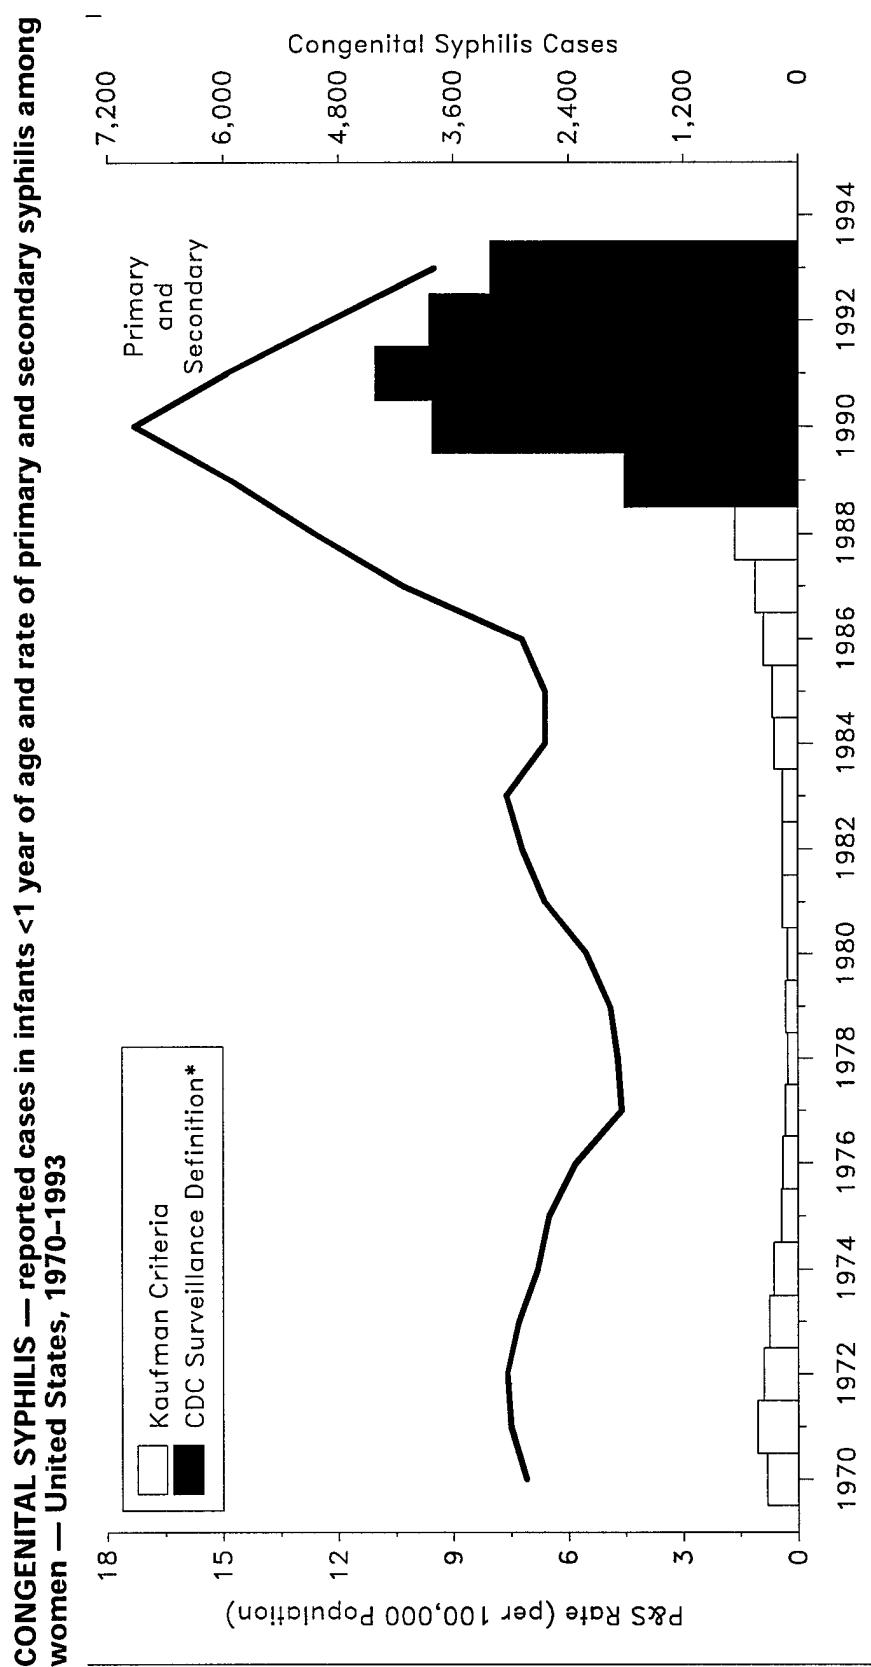

## GRAPHS AND MAPS

### SYPHILIS (primary and secondary) — by race and ethnicity, United States, 1981–1993

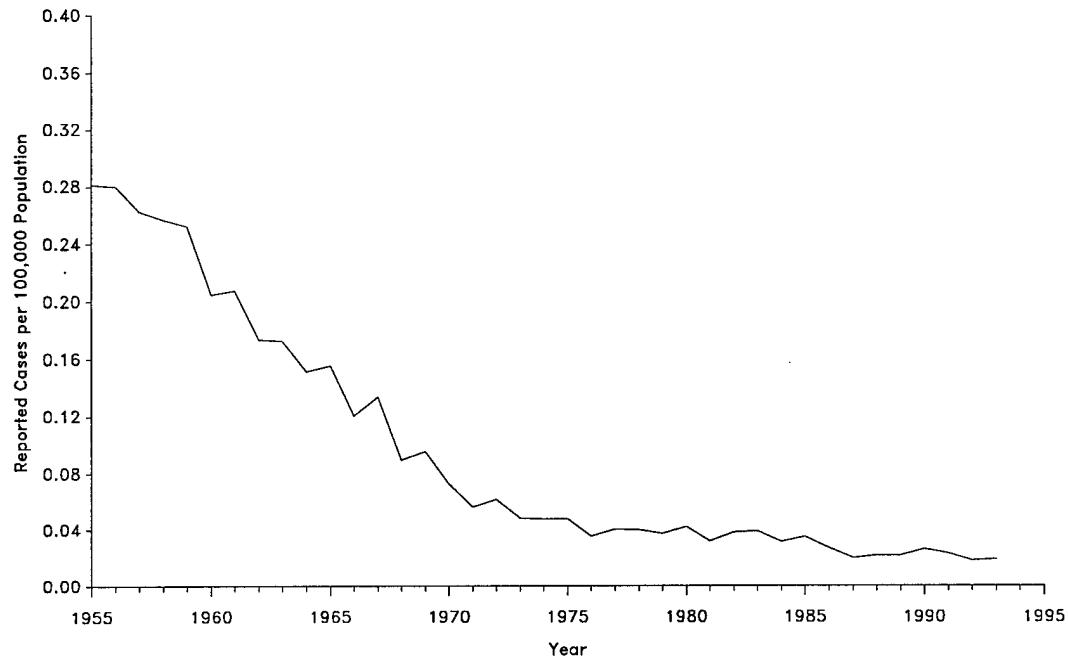

### SYPHILIS (primary and secondary) — by sex, United States, 1956–1993

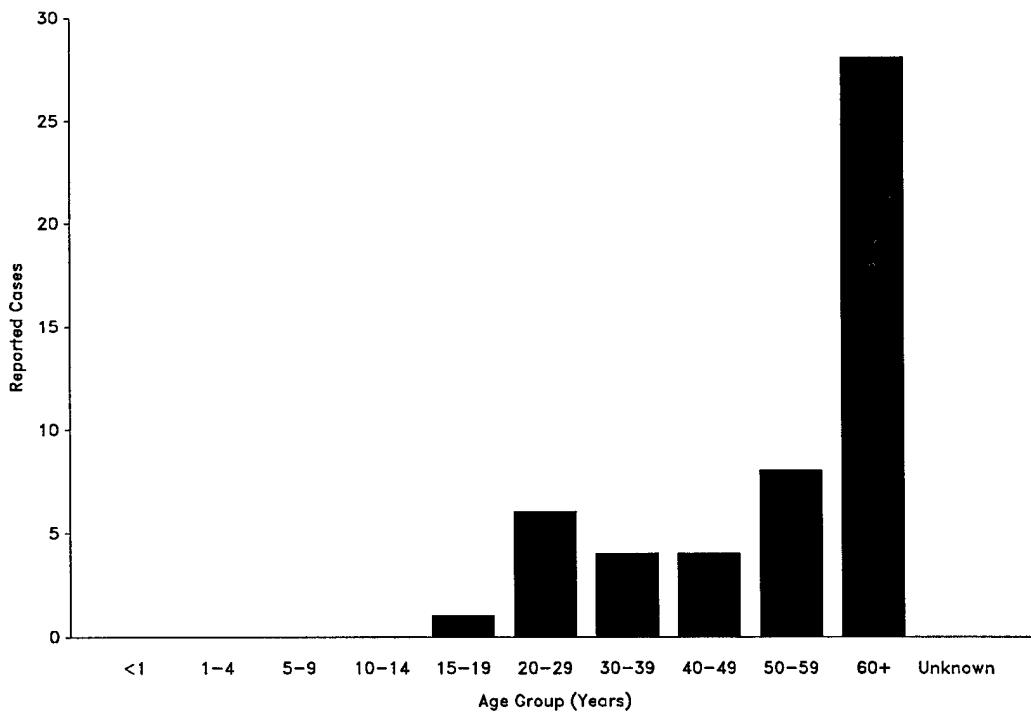

## GRAPHS AND MAPS

### TETANUS — by year, United States, 1955–1993

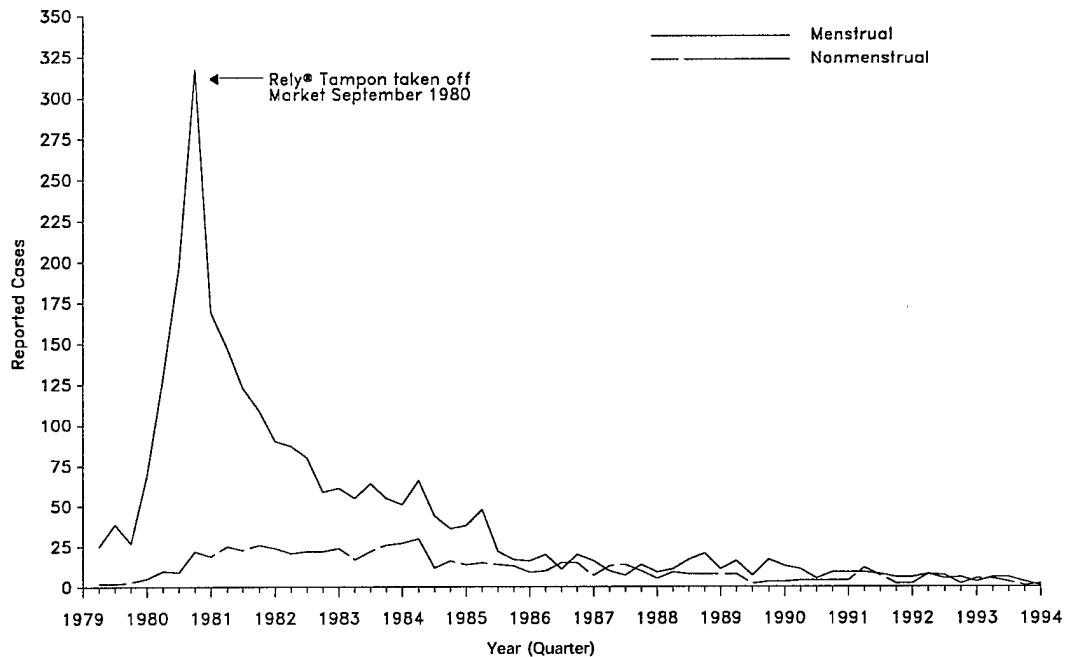

NOTE: Tetanus toxoid was first available in 1933.

### TETANUS — by age group, United States, 1993

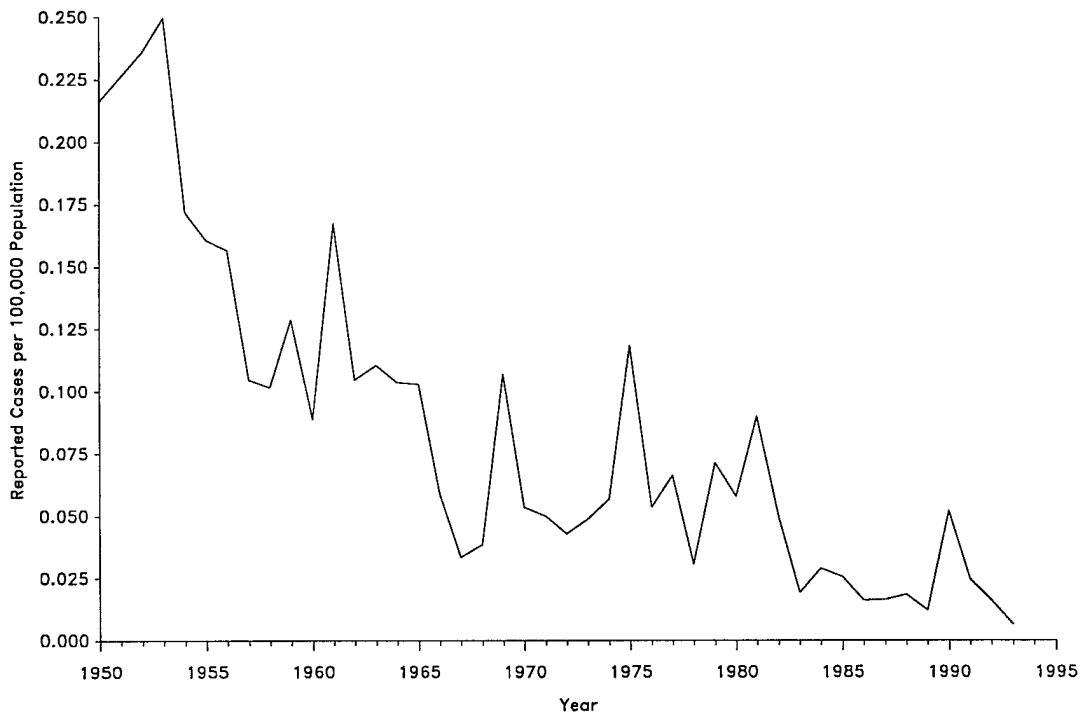

**TOXIC SHOCK SYNDROME — by quarter, United States, 1979–1993\***

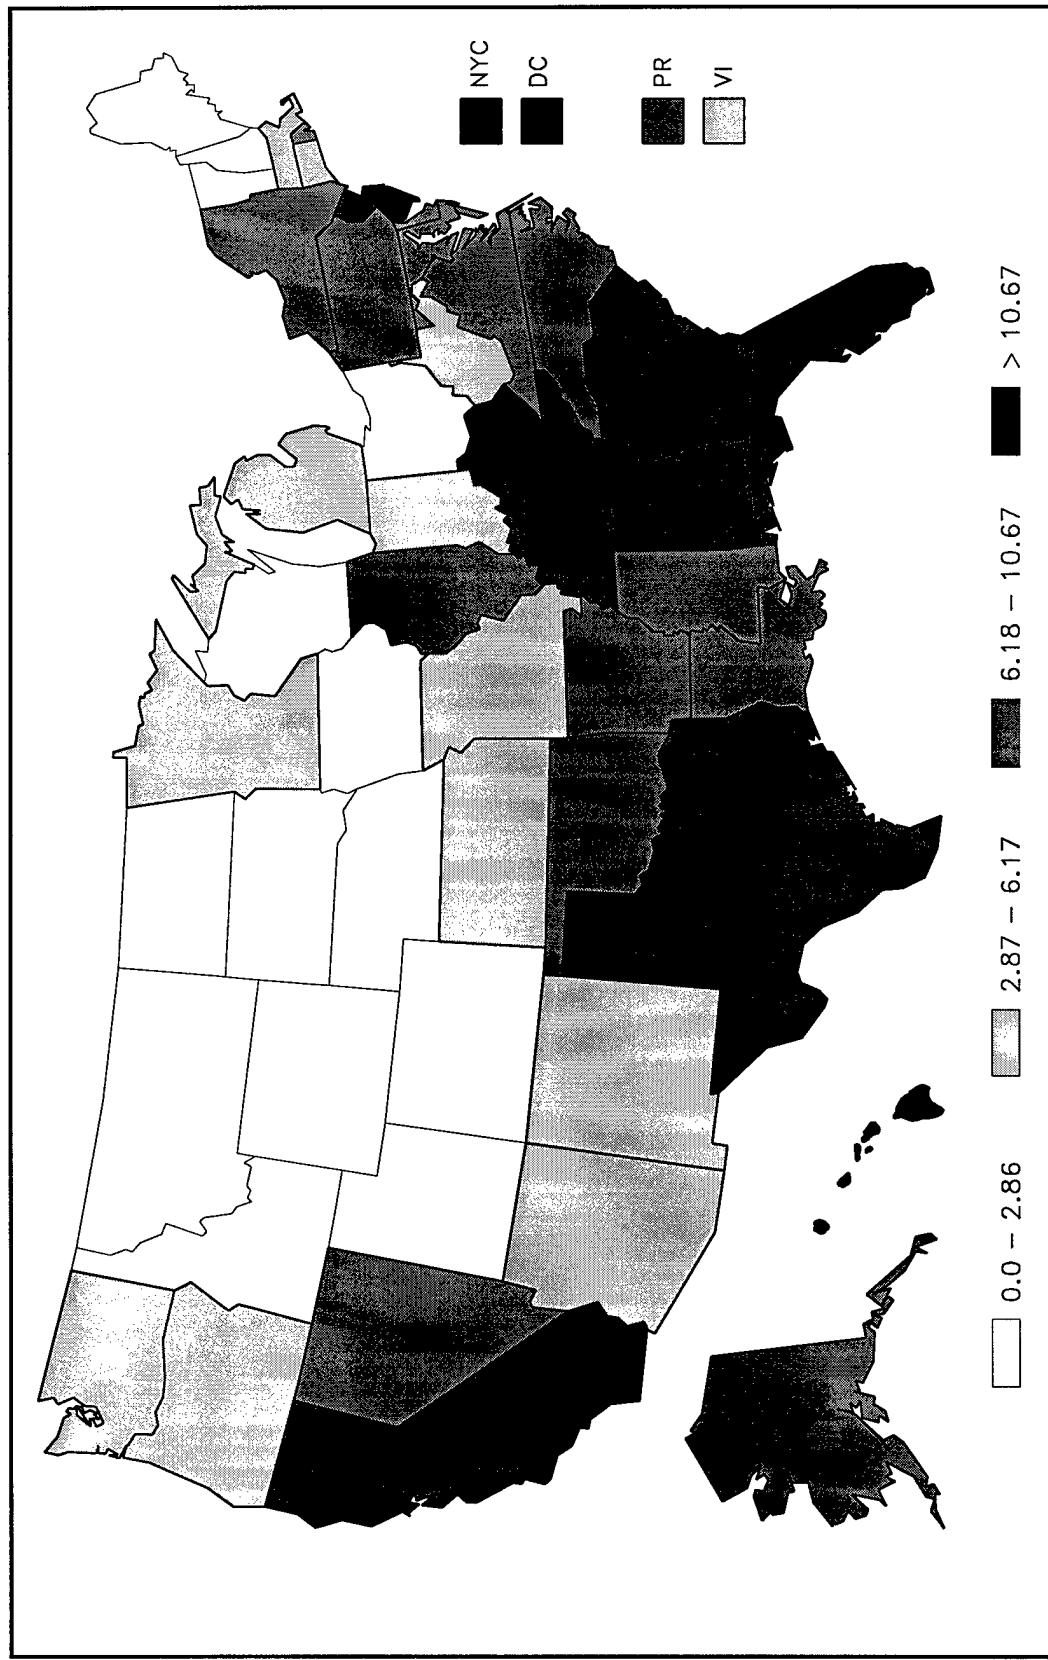

\* Includes only cases meeting the CDC case definition (N=3,245) for staphylococcal disease.

**TRICHINOSIS — by year, United States, 1950–1993**

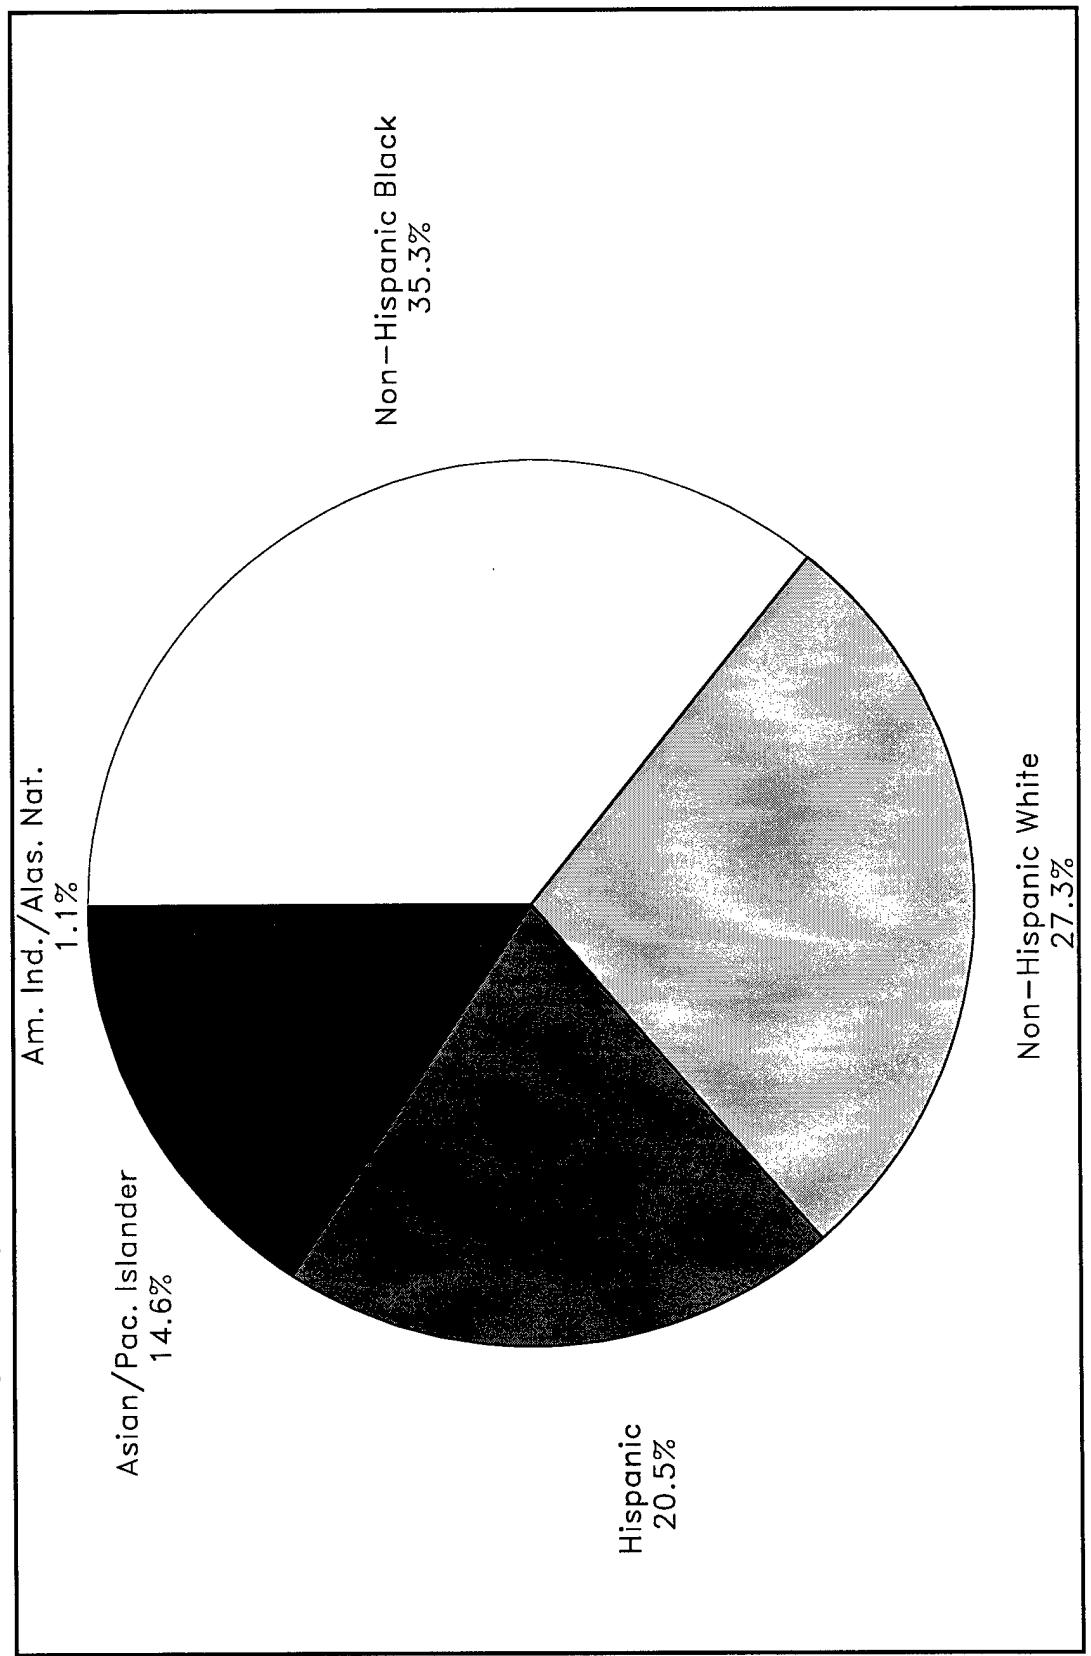

## GRAPHS AND MAPS

TUBERCULOSIS — rates by state, United States,\* 1993

\* Includes Puerto Rico and the U.S. Virgin Islands.

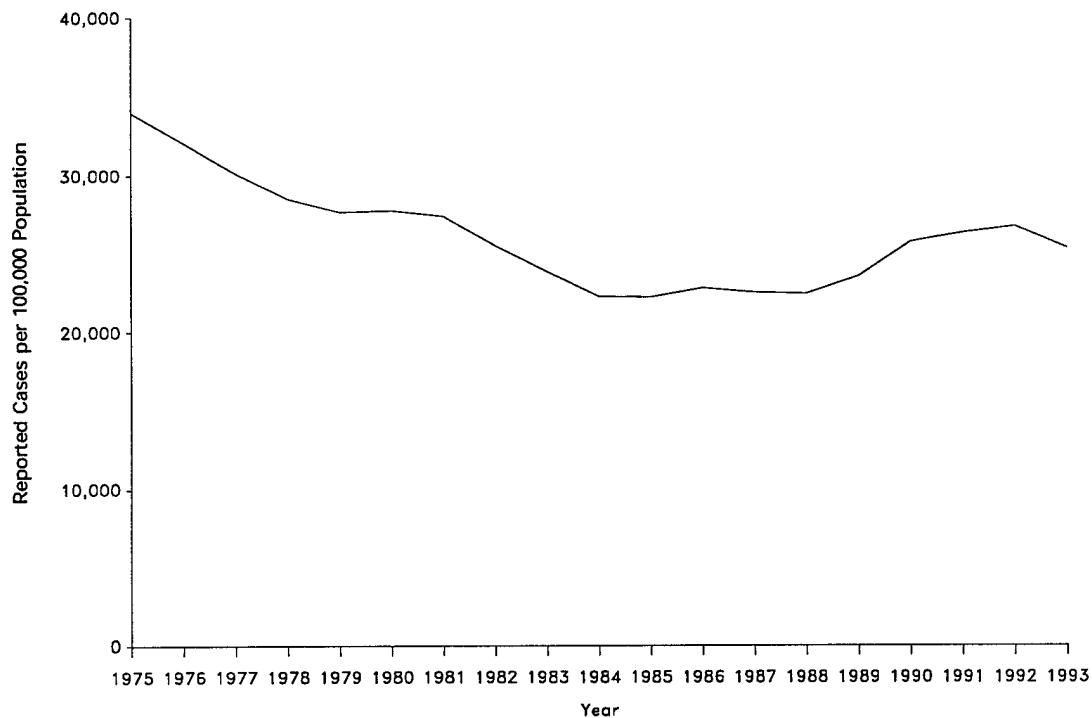

**TUBERCULOSIS — percentage of cases, by race and ethnicity,\* United States, 1993**

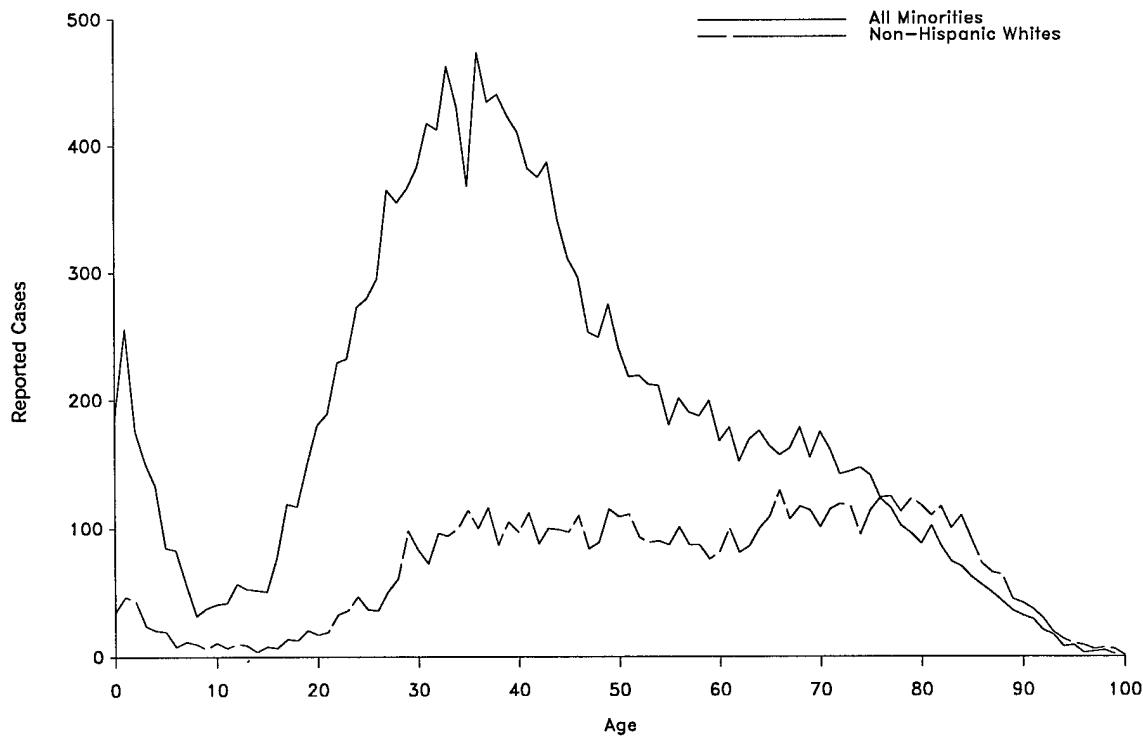

\*Excludes 300 cases (1.2%) with race and/or ethnicity unknown.

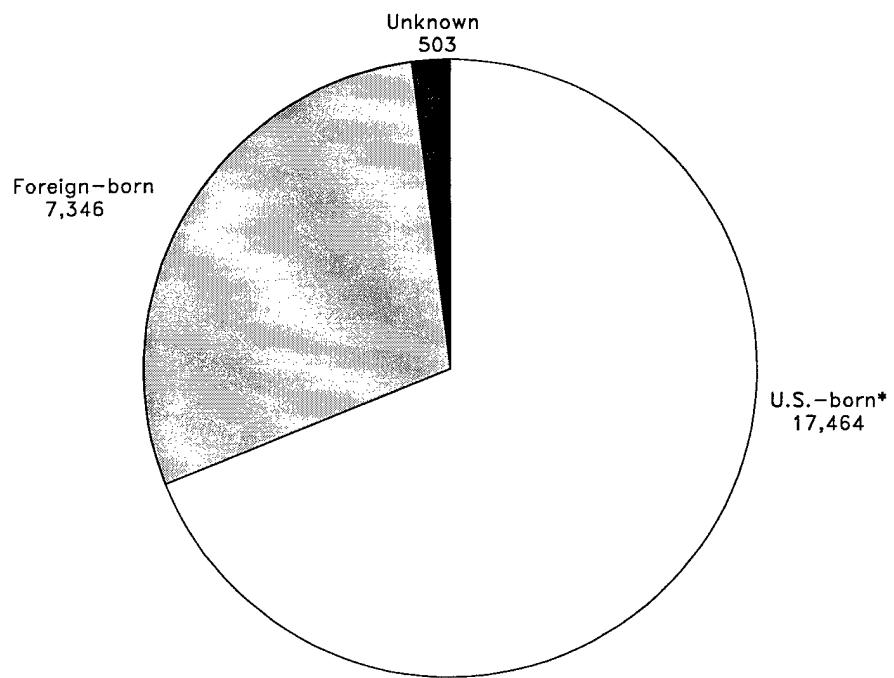

## GRAPHS AND MAPS

### TUBERCULOSIS — by year, United States, 1975–1993

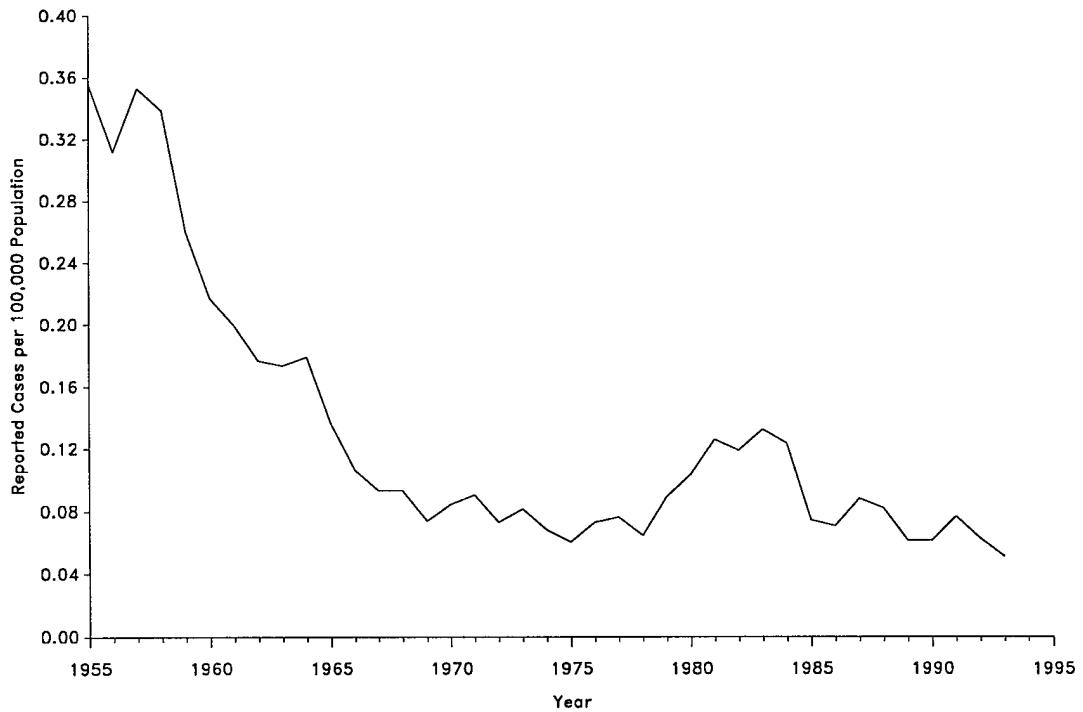

### TUBERCULOSIS — frequency distribution of cases by age, race, and ethnicity, United States, 1993

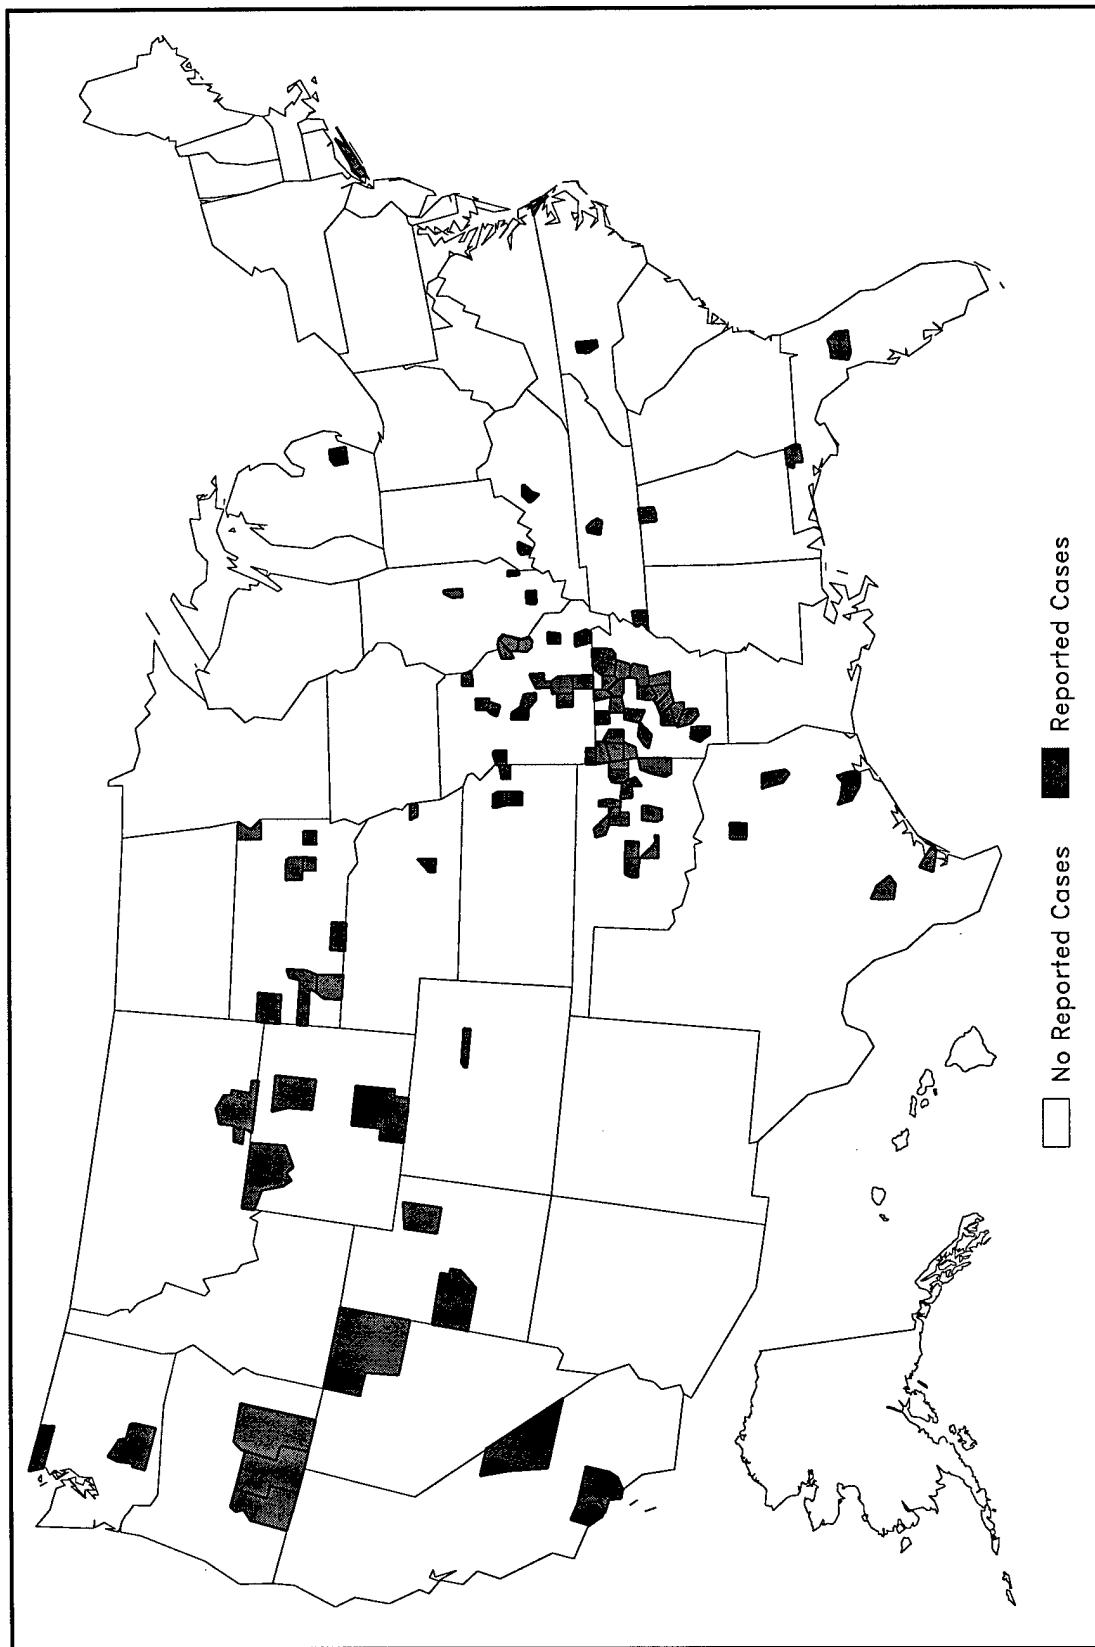

**TUBERCULOSIS — cases, among foreign-born persons and persons born in the United States, 1993**

\* Includes persons born in Puerto Rico.

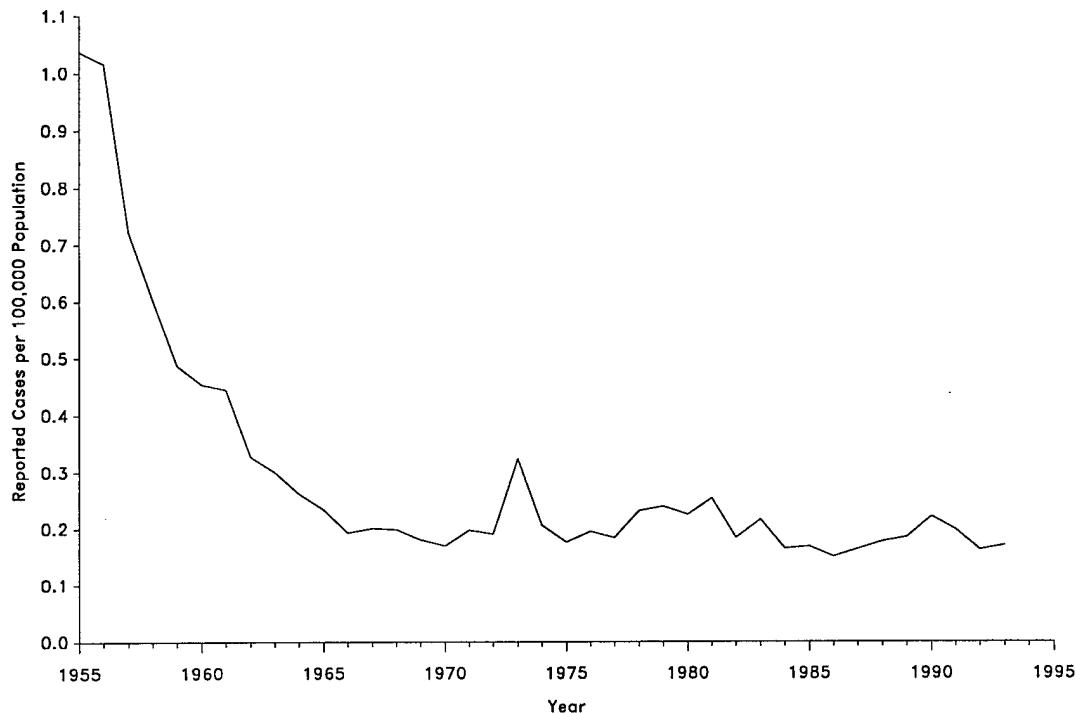

**TULAREMIA — by year, United States, 1955–1993**

## GRAPHS AND MAPS

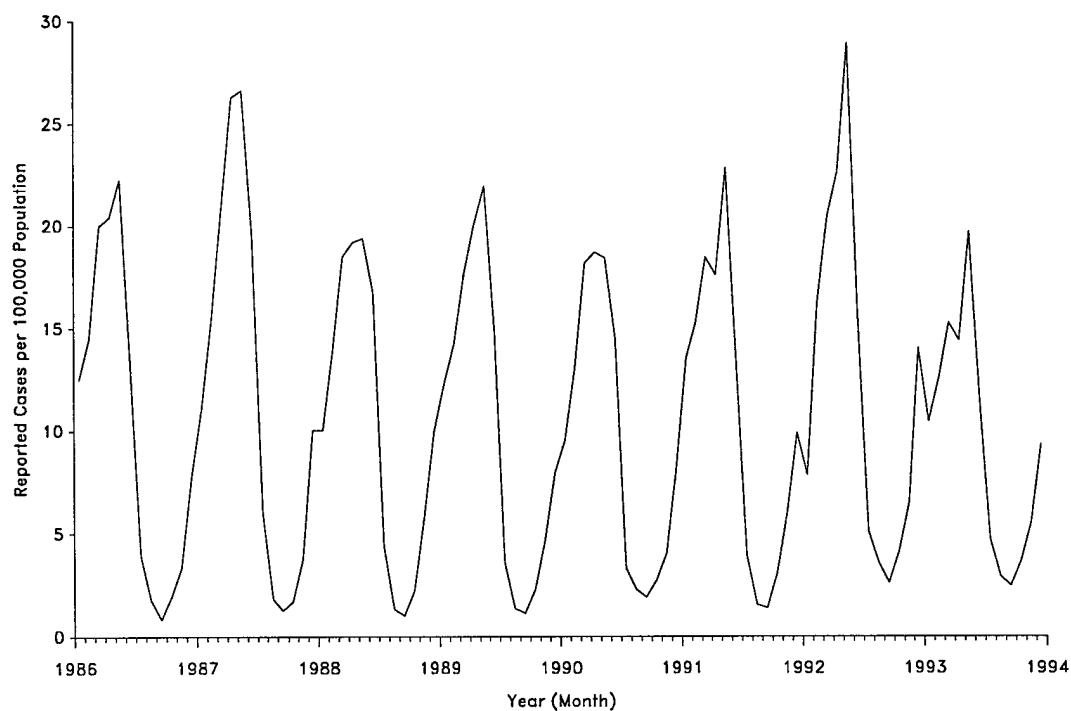

TULAREMIA — counties reporting cases, United States, 1993

**TYPHOID FEVER — by year, United States, 1955–1993**

**VARICELLA (chickenpox) — by month, United States, 1986–1993**

\* Numbers in ICD column refer to the category numbers listed in the *Ninth Revision of the International Classification of Diseases, 1975*. (The asterisks in the ICD column pertain to the ICD code, not a footnote. They indicate that the numbers are not part of the ICD but were introduced for use in the United States.)

† For 1983-1986, deaths are estimated from death certificates with mention of conditions coded to deficiency of cell-mediated immunity (ICD-9 No. 279.1). Includes other human immunodeficiency virus (HIV)-related deaths and other diseases classifiable as deficiency of cell-mediated immunity.

‡ Arthropod-borne encephalitis and other nonarthropod-borne viral diseases of the central nervous system.

Source: National Center for Health Statistics System, 1982-1991. Deaths are classified according to the Ninth Revision, ICD.

## **State and Territorial Epidemiologists and Laboratory Directors**

State and Territorial Epidemiologists and Laboratory Directors are gratefully acknowledged for their contributions to this report. The epidemiologists listed below were in the positions shown as of July 1994, and the laboratory directors listed below were in the positions shown as of June 1994.

<b>State/Territory</b>	<b>Epidemiologist</b>	<b>Laboratory Director</b>
Alabama	Charles H. Woernle, MD, MPH	William J. Callan, PhD
Alaska	John P. Middaugh, MD	Katherine A. Kelley, DrPH
Arizona	Lawrence Sands, DO, MPH	Barbara J. Erickson, PhD
Arkansas	Thomas C. McChesney, DVM	Michael G. Foreman
California	George W. Rutherford, III, MD	Michael G. Volz, PhD
Colorado	Richard E. Hoffman, MD, MPH	Ronald L. Cada, DrPH
Connecticut	James L. Hadler, MD, MPH	Sanders F. Hawkins, PhD
Delaware	A. LeRoy Hatchcock, Jr, PhD	Mahadeo P. Verma, PhD
District of Columbia	Martin E. Levy, MD, MPH	James B. Thomas, ScD
Florida	Richard S. Hopkins, MD, MSPH	E. Charles Hartwig, ScD
Georgia	Kathleen E. Toomey, MD, MPH	Elizabeth A. Franko, DrPH
Hawaii	Richard L. Vogt, MD	Vernon K. Miyamoto, PhD
Idaho	Jesse F. Greenblatt, MD, MPH	Richard H. Hudson, PhD
Illinois	Byron J. Francis, MD, MPH	David F. Carpenter, PhD
Indiana	Mary Lou Fleissner, DrPH	Barbara J. Wilder (MBA (Acting)
Iowa	Laverne A. Wintermeyer, MD	W. J. Hausler, Jr, PhD
Kansas	Andrew R. Pelletier, MD	Roger H. Carlson, PhD
Kentucky	Reginald Finger, MD, MPH	Thomas E. Maxson, DrPH
Louisiana	Louise McFarland, DrPH	Henry B. Bradford, Jr, PhD
Maine	Kathleen F. Gensheimer, MD, MPH	Philip W. Haines, DrPH
Maryland	Ebenezer Israel, MD, MPH	J. Mehser Joseph, PhD
Massachusetts	Alfred DeMaria, Jr, MD	Ralph J. Timperi, MPH
Michigan	Kenneth R. Wilcox, Jr, MD, DrPH	Robert Martin, DrPH
Minnesota	Michael T. Osterholm, PhD, MPH	Pauline Bouchard, JD, MPH
Mississippi	Mary Currier, MD, MPH	Joe O. Graves, PhD
Missouri	H. Denny Donnell, Jr, MD, MPH	Eric C. Blank, DrPH
Montana	Todd D. Damrow, PhD, MPH	Douglas O. Abbott, PhD
Nebraska	Thomas J. Safranek, MD	John D. Blosser
Nevada	Randall L. Todd, DrPH	Arthur F. DiSalvo, MD
New Hampshire	M. Geoffrey Smith, MD, MPH	Veronica C. Malmberg, MSN
New Jersey	Kenneth C. Spitalny, MD	Shahied I. Shahied, PhD
New Mexico	C. Mack Sewell, DrPH, MS	Loris W. Hughes, PhD
New York State	Susan Klitzman	Lawrence S. Sturman, MD, PhD
North Carolina	J. Newton MacCormack, MD, MPH	Samuel N. Merritt, DrPH
North Dakota	Larry A. Shirley, MS, MPH	James D. Anders, MPH
Ohio	Thomas J. Halpin, MD, MPH	Kathleen Meckstroth, DrPH
Oklahoma	James T. Rankin, Jr, DVM, PhD, MPH	Garry L. McKee, PhD
Oregon	David Fleming, MD	—
Pennsylvania	Maria E. Moll, MD	Bruce Kieger, DrPH
Rhode Island	Barbara A. DeBuono, MD, MPH	Walter Combs, PhD
South Carolina	James J. Gibson, MD, MPH	Harold Dowda, PhD
South Dakota	Susan Lance, DVM, MPH	Richard S. Steece, PhD
Tennessee	Kerry Gateley, MD	Michael W. Kimberly, DrPH
Texas	Diane M. Simpson, MD, PhD	David L. Maserang, PhD
Utah	Craig R. Nichols, MPA	Charles D. Brokopp, DrPH
Vermont	Robert O'Grady (Acting)	Burton W. Wilcke, Jr, PhD
Virginia	Grayson B. Miller, Jr, MD	James L. Pearson, DrPH
Washington	Paul Stehr-Green, DrPH	Jon M. Counts, DrPH
West Virginia	Loretta E. Haddy, MA, MS	Frank W. Lambert, Jr, DrPH
Wisconsin	Jeffrey P. Davis, MD	Ronald H. Laessig, PhD
Wyoming	Stanley I. Music, MD, DTPH	Carl H. Blank, DrPH
American Samoa	Julia L. Lyons, MD, MPH	—
Federated States of Micronesia	Steven B. Auerbach, MD, MPH	—
Guam	Robert L. Haddock, DVM, MPH	Jeff Benjamin (Acting)
Marshall Islands	Tony de Brum	—
Northern Mariana Islands	A. Mark Durand, MD, MPH	—
Palau	Jill McCready, MS, MPH	Adolpho Firpo Reforma, MD
Puerto Rico	Carmen C. Deseda, MD	Norbert Mantor, PhD
Virgin Islands	Donna M. Green, MD	

The *Morbidity and Mortality Weekly Report (MMWR)* Series is prepared by the Centers for Disease Control and Prevention (CDC) and is available on a paid subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402; telephone (202) 783-3238.

The data in the weekly *MMWR* are provisional, based on weekly reports to CDC by state health departments. The reporting week concludes at close of business on Friday; compiled data on a national basis are officially released to the public on the succeeding Friday. Inquiries about the *MMWR* Series, including material to be considered for publication, should be directed to: Editor/*MMWR* Series, Mailstop C-08, Centers for Disease Control and Prevention, Atlanta, GA 30333; telephone (404) 332-4555.

All material in the *MMWR* Series is in the public domain and may be used and reprinted without special permission; citation as to source, however, is appreciated.
