#### Abstract

Condensation of 1-propyl- and 1-(3-phenylpropyl)imidazo[1,2-a]indoles with ortho-hydroxy-substituted aromatic aldehydes afforded 1'-[ $N$-propyl- and $N$ -(3-phenylpropyl)carbamoyl]methylspiro[1-benzopyran-2,2'-indoles]. Treatment of the latter with potassium hydroxide gave bridged oxazepino[3,2-a]indole derivatives.

Key words: propyl group, indole, imidazo[1,2-a]indole, spirobenzopyran, oxa-zepino[3,2-a]indole

## INTRODUCTION

The formation of heterocyclic rings on cyclization reactions of in situ generated azomethine ylides has emerged as a widely used synthetic method [1]. The attraction of this synthetic construction is the ease of generation of 1,3 -dipoles and a high degree of molecular complexity provided in a single cyclization reaction step. Recent examples of this approach included the synthesis of a wide variety of fused [2], spiro [3] and bridged [4] heterocyclic ring systems.

We have recently developed a new method for the construction of the pyrrolo[2,1-a]isoquinoline ring system based on condensation of 2 -carbamoyl-metyl-1-methyl-3,4-isoquinolinium salts or their cyclic form 10b-methylimidazo[2,1-a]isoquinolines with aromatic and heteroaromatic aldehydes followed by intramolecular addition of the methylene carbon atom to the double bond of the ethenyl moiety [5]. The proposed mechanism of such transformation includes generation of an intermediate azomethine methylide. It was found also that condensation of 1-carbamoylmethyl-2,3,3-trimethyl-3H-indolium salts with benzaldehydes afforded 9a-styrylimidazo[1,2a]indole derivatives, which did not undergo further transformation to pyrrolo[1,2-a]indole ring system [6]. However, similar condensation of 1-( N -substituted carbamoylmethyl)-2,3,3-trimethyl-3H-indolium

[^0]salts with salicyl aldehydes produced 1-(N-substituted carbamoylmethyl)indoline spiropyrans which easily underwent rearrangement to the bridged oxa-zepino[3,2-a]indole derivatives under treatment with strong bases [7]. The latter found application in preparation of imprinted polymer stationary phases. It has been shown that the structure of a substituent at the nitrogen atom of the carbamoylmethyl group has a significant influence on enantiorecognition of chiral molecules [8].

We now report further synthetically useful examples where indoline spiropyrans, bearing a substituted methylene group at the nitrogen atom, are transformed to bridged oxazepino $[3,2-a]$ indole derivatives. In the present work, synthesis and base catalysed cyclization of 1'-[(N-propylcarbamoyl)methyl]-1',3'-dihydrospiro[1-ben-zopyran-2,2'-indole] have been explored.

## RESULTS AND DISCUSSION

The starting 9,9,9a-trimethyl-1,2,3,9a-tetrahydro-9H-imidazo[1,2-a]indol-2-one 1 was prepared by the reaction of 2,3,3-trimethyl-3H-indole with $\alpha$-chloroacetamide [9]. Alkylation of 1 with propyl iodide afforded 1-propylimidazo[1,2-a]indol-2-one 2a [10], while the use 3-bromopropylbenzene gave new derivative 2b.

Reaction of 1-substituted imidazo[1,2-a]indol-2ones 2 a, b with 5 -nitrosalicylaldehyde was carried out in acetic acid. Work-up of the reaction mixture with base gave 6-nitrospirobenzopyrans 3a, b. The

2a $\mathrm{R}=\mathrm{H}, \mathbf{b} \mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{5} ; \mathbf{3}-\mathbf{5}$ a $\mathrm{R}=\mathrm{R}^{2}=\mathrm{H}, \mathrm{R}^{1}=\mathrm{NO}_{2} ; \mathbf{b}$ $\mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{5}, \mathrm{R}^{1}=\mathrm{NO}_{2}, \mathrm{R}^{2}=\mathrm{H} ; \mathbf{c} \mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{5}, \mathrm{R}^{1}+\mathrm{R}^{2}=$ $\mathrm{CH}=\mathrm{CH}-\mathrm{CH}=\mathrm{CH}$
${ }^{1} \mathrm{H}$ NMR spectra of $\mathbf{3 a}, \mathbf{b}$ contained a characteristic doublet of the methine proton in the area of 5.805.89 ppm with vicinal $3_{3,4}=10.3-10.6 \mathrm{~Hz}$, which evidences a cis-allocation of vinylic protons in the spiropyran system [11], while in the ${ }^{13} \mathrm{C}$ NMR spectra the signal of the spirocarbon $\mathrm{C}-2$ was situated at 105.96 and 106.05 ppm , respectively.

When 3a, b were treated with sodium hydroxide in boiling ethanol, formation of a mixture of cis- and trans-5a,13-methano-1,3-benzoxazepino[3,2a]indoles $\mathbf{4 a}, \mathbf{b}$ and $\mathbf{5 a}, \mathbf{b}$ took place, from which the target products were isolated by fractional crystallization and methods of a column chromatography. A ssignment of cis- and trans-configuration to $\mathbf{4 a}, \mathbf{b}$ and $\mathbf{5 a}, \mathbf{b}$ was based on comparisons with the ${ }^{1} \mathrm{H}$ NMR spectra of the relevant structure compounds [7] and results of M M 3* calculations. For example, the experimental value of a vicinal coupling constant between protons $12-\mathrm{H}$ and $13-\mathrm{H}$ ( $\left.{ }^{3}\right)_{12}$, ${ }_{13}$ ) is 4.8 Hz for cis- $\mathbf{4 b}$ and 0 Hz for trans-5b. Monte Carlo conformational searches using the M M 3* force field of the optimized structures followed by energy minimizations gave for the dihedral angle $\mathrm{H}-\mathrm{C}_{(12)}-\mathrm{C}_{(13)}-\mathrm{H}$ of the optimized structures of cis-4c and trans-5c $40.68^{\circ}$ and $88.46^{\circ}$. In such case, ${ }^{3}{ }_{12,13}$ calculated by the Karplus equation [12] is 6.99 Hz for cis-4b and 1.98 Hz for trans-5b, and agrees satisfactorily with the experimental values.

Condensation of 2c with 2-hydroxynaphthaldehyde afforded 1-(3-phenylcarbamoyl)methylindoline naphthopyran 3 c , which was cyclized to bridged oxa-zepino[3,2-a]indoles 4c, 5c by an analogous route as compounds 3a, $\mathbf{b}$. Trans5c was isolated from the mixture by fractional crystallization.

## EXPERIMENTAL

M elting points were determined on a Kleinfeld melting point apparatus. IR spectra were recorded on a Perkin Elmer Spectrum BXII spectrophotometer using KBr pellets. ${ }^{1} \mathrm{H}$ NMR spectra were recorded at 300 MHz and ${ }^{13} \mathrm{C} \mathrm{NMR}$ spectra were recorded at 75 MHz on a Varian Gemini 2000 instrument. Tetramethylsilane was used as the internal standard. For thin layer chromatographic (TLC) analyses, M erck precoated TLC plates (silica gel 60 F 254) were used. Separations by flash chromatography were performed on silica gel Merck, 9385, 230-400 mesh.

1,2,3,9a-Tetrahydro-9,9,9a-trimethyl-1-(3-phenyl-propyl)-9H-imidazo[1,2-a] indol-2-one (2b). 1,2,3,9a-Tetrahydro-9,9,9a-trimethyl-9H-imidazo[1,2-a]indol-2one 1 ( $1.52 \mathrm{~g}, 7.0 \mathrm{mmol}$ ) was dissolved in DMF (8 ml ), and finely powdered potassium hydroxide ( 0.98 $\mathrm{g}, 17.5 \mathrm{mmol}$ ) was added to the solution. 3-Phenylpropyl bromide ( $2.78 \mathrm{~g}, 14.0 \mathrm{mmol}$ ) was added dropwise, and the solution was stirred for 2 h at room temperature. Then the mixture poured into water $(100 \mathrm{ml})$ and extracted with ether ( $3 \times 50 \mathrm{ml}$ ). The organic layer was separated, washed with water ( 20 ml ) and dried with $\mathrm{CaCl}_{2}$. M ost the solvent was distilled off in vacuo and the residue kept at $4{ }^{\circ} \mathrm{C}$ overnight. The precipitated crystals were filtered off and recrystallized from ethanol. ## CONCLUSIONS

1. Indoline spiropyrans possessing N -propyl- and N -(3-phenylpropyl)carbamoylmethyl moieties at the indole ring nitrogen atom can be easily prepared by condensation of 1-propyl- and 1-(3-propylphenyl)imi-dazo[1,2-a]indol-2-one derivatives with ortho-hydro$x y$-substituted aromatic aldehydes.
2. 1'-[N-Propyl- and N-(3-phenylpropyl)carbamo-ylmethyl]spiro[1-benzopyran-2,2'-indoles] rearrange to bridged oxazepino[3,2-a]indole derivatives on treatment with postassium hydroxide in ethanol solution.
