#### Abstract

2-Bromo-6-chloro- and 6-bromo-2-chloropyridin-3-yl deoxyribonucleosides were prepared by the Heck coupling of bromo-chloro-iodopyridines with TBS-protected deoxyribose glycal. Some of their Pd-catalyzed cross-coupling reactions proceeded chemoselectively at the position of the bromine, whereas nucleophilic substitutions were unselective and gave mixtures of products. The mono-substituted intermediates were used for another coupling or nucleophilic substitution giving rise to a small library of title 2,6-disubstituted pyridine C-deoxyribonucleosides. The title nucleosides did not exert antiviral or cytostatic effects.

## Introduction

$C$-Nucleosides are important analogues of natural nucleosides useful for many applications in medicinal chemistry and chemical biology. ${ }^{1}$ Diverse aryl and hetaryl-C-2'-deoxyribonucleosides were extensively studied as candidates for novel base-pairs in the quest for extension of the genetic alphabet and some of their artificial base-pairs were efficiently replicated by DNA polymerases with high fidelity. ${ }^{2}$ Moreover, some pyridine $C$-nucleosides have been used as probes for studying the mechanism of polymerases. ${ }^{3}$ Most of the current approaches to the synthesis of $C$-nucleosides suffer from moderate efficiency and/or stereoselectivity. ${ }^{1}$ Our group has developed a modular approach ${ }^{4}$ based on the synthesis of halogenated (het)aryl $C$-nucleoside intermediates and their functionalization by Pd-catalyzed cross-couplings, aminations, carbonylations or hydroxylations. Very recently, the same approach was used even for the functionalization of $C$-nucleoside triphosphate derivatives. ${ }^{5}$ Apart from the variation of one substituent, the synthesis of a 2 D library of 2,4-disubstituted pyrimidin-5-yl $C$-2'-deoxyribonucleosides has been developed ${ }^{6}$ through two consecutive regioselective cross-coupling

[^0]reactions of the corresponding 2,4-dichloropyrimidine $C$-nucleoside intermediate. Here we report on the synthesis of a series of 2,6-disubstituted pyridine $C$-nucleosides.

## Results and discussion

In our previous synthesis of 2,4-disubstituted pyrimidine $C$-nucleosides, ${ }^{6}$ we have advantageously used the different reactivities of the two chlorines in 2,4-dichloropyrimidine for regioselective reactions. However, in the analogous 2,6-dichloropyridine $C$-nucleosides, the reactivity of the chlorines is comparable and thus no selectivity would be expected. Therefore our strategy for the target 2,6-disubstituted pyridin-3-yl C-2'deoxyribonucleosides was based on chemoselective transformations ${ }^{7,8}$ of either 2-bromo-6-chloro- or 6-bromo-2-chloropyridin3 -yl $C$-deoxyribonucleoside intermediates.

The synthesis of both bromo-chloropyridine $C$-nucleoside intermediates started from 3'-O-TBS-protected glycal 1 which can be easily prepared in three steps from thymidine. ${ }^{9}$ The Heck coupling of 6-bromo-2-chloro-3-iodopyridine with glycal 1 in the presence of $\mathrm{Pd}(\mathrm{OAc})_{2}$, tris(pentafluorophenyl)phosphine and silver carbonate was performed in freshly distilled chloroform at $70{ }^{\circ} \mathrm{C}$ (Scheme 1). After 10 hours all starting material was consumed and, because partial desilylation was observed by TLC, the crude reaction mixture was directly treated with $\mathrm{Et}_{3} \mathrm{~N} \cdot 3 \mathrm{HF}$ in THF to give fully deprotected ketone 2 in $52 \%$ yield (for two steps) as a pure $\beta$-anomer. The subsequent stereoselective reduction of 2 by $\mathrm{NaBH}(\mathrm{OAc})_{3}$ proceeded smoothly giving rise to the desired $C$-2'-deoxyribonucleoside intermediate 3 in very good $85 \%$ yield. The crystal

Scheme 1 Reagents and conditions: (i) 1. $\mathrm{Pd}(\mathrm{OAc})_{2},\left(\mathrm{PhF}_{5}\right)_{3} \mathrm{P}_{1}, \mathrm{Ag}_{2} \mathrm{CO}_{3}, \mathrm{CHCl}_{3}$, $70^{\circ} \mathrm{C}, 10 \mathrm{~h}$; 2. Et ${ }_{3} \mathrm{~N} \cdot 3 \mathrm{HF}, \mathrm{THF}, \mathrm{rt}, 15 \mathrm{~min}$; (ii) $\mathrm{NaBH}(\mathrm{OAc})_{3}, \mathrm{AcOH}, \mathrm{CH}_{3} \mathrm{CN}, 0^{\circ} \mathrm{C}$, 5 min ; (iii) TBSCl, imidazole, DMF, rt, 14 h .
structure of 6-bromo-2-chloropyridine C-nucleoside 3 was determined by X-ray diffraction, which independently confirmed its $\beta$-configuration (Fig. 1). Re-protection of 3 by treatment with TBSCl gave the silylated C-nucleoside 4 in $78 \%$ yield. An analogous Heck coupling of 1 with 2 -bromo-6-chloro-3-iodopyridine under the same conditions as above gave regioisomeric ketone 5 in $59 \%$ yield (for two steps) (Scheme 1). Subsequent reduction by $\mathrm{NaBH}(\mathrm{OAc})_{3}$ afforded $C$-2'-deoxyribonucleoside 6 in $87 \%$ yield, which was again silylated to give the desired protected nucleoside intermediate 7 in excellent 92\% yield.

Having the free ( $\mathbf{3}$ and 6 ) as well as the protected ( $\mathbf{4}$ and 7) key bromo-chloropyridine $C$-nucleoside intermediates, we investigated the chemoselectivity of cross-coupling reactions and nucleophilic substitutions. The bromine atom should be more reactive than chlorine but, on the other hand, steric and other factors can also play a role.

The cross-coupling of protected 6-bromo-2-chloropyridine $C$-nucleoside 4 with 1.1 equiv. of $\mathrm{Me}_{3} \mathrm{Al}$ in the presence of $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ proceeded chemoselectively to give 2-chloro-6methylpyridine $8 \mathbf{8 a}$ as the only product in excellent $87 \%$ yield (Scheme 2). When the same reaction was performed with 4 equiv. of $\mathrm{Me}_{3} \mathrm{Al}$ and prolonged reaction time, the product of disubstitution 9a was isolated in $80 \%$ yield. Deprotection of $8 \mathbf{8 a}$ and $\mathbf{9 a}$ with $\mathrm{Et}_{3} \mathrm{~N} \cdot 3 \mathrm{HF}$ afforded free $C$-nucleosides $\mathbf{8 b}$ (89\%) and $\mathbf{9 b}(88 \%)$. The structure of free 2 -chloro- 6 -methylpyridine

Fig. 1 Crystal structures of compounds (a) $\mathbf{3}$ (CCDC 927315) and (b) 8b (CCDC 927314).
$C$-nucleoside $\mathbf{8 b}$ was also confirmed by X-ray analysis (Fig. 1). In contrast, cross-coupling of the isomeric 2 -bromo-6-chloropyridine intermediate 7 with 1.1 equivalents of $\mathrm{Me}_{3} \mathrm{Al}$ was completely nonselective and only an unseparable mixture of the starting compound and both products of mono-substitution was obtained.

Mono-methylated 2-chloropyridine nucleoside 8a was used for a series of follow-up transformations (Scheme 2). The Sonogashira cross-coupling with trimethylsilylacetylene catalyzed by $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}$ followed by ammonolysis afforded 2-ethynyl-6methylpyridine $C$-nucleoside 10a (56\%). Pd-catalyzed HartwigBuchwald amination ${ }^{10}$ with a mixture of $\operatorname{LiN}\left(\mathrm{SiMe}_{3}\right)_{2}$ and $\mathrm{Ph}_{3} \mathrm{SiNH}_{2}$ gave 2-amino-6-methylpyridine $C$-nucleoside 11a in 68\% yield. Deprotection of silylated intermediates 10a and 11a furnished free $C$-nucleosides 10b (65\%) and 11b ( $82 \%$ ). The reaction of unprotected 2-chloro-6-methylpyridine $C$-nucleoside $\mathbf{8 b}$ with sodium methoxide in MeOH was very sluggish (full conversion was accomplished only after 10 days of heating at $120{ }^{\circ} \mathrm{C}$ ) but finally gave 2-methoxy-6-methylpyridine $C$-nucleoside 12 in good 77\% yield. Attempted Pd-catalyzed hydroxylation ${ }^{11}$ using KOH and $t$-butyl-XPhos did not proceed and only the starting compound and some degradation products were observed (probably due to instability of the pyridone product ${ }^{4 f}$ ).

The Suzuki-Miyaura cross-coupling of 2-bromo-6-chloropyridine $C$-nucleoside 7 with 0.9 equivalent of phenylboronic acid in the presence of $\mathrm{Ph}\left(\mathrm{PPh}_{3}\right)_{4}$ at $60{ }^{\circ} \mathrm{C}$ proceeded chemoselectively at position 2 by displacement of the bromine to afford

Scheme 2 Reagents and conditions: (i) 1.1 equiv. $\mathrm{Me}_{3} \mathrm{Al}, \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$, heptane, $70^{\circ} \mathrm{C}, 3 \mathrm{~h}$; (ii) 4 equiv. $\mathrm{Me}_{3} \mathrm{Al}, \mathrm{Pd}^{2}\left(\mathrm{PPh}_{3}\right)_{4}$, heptane, $70{ }^{\circ} \mathrm{C}, 12 \mathrm{~h}$; (iii) $\mathrm{Et} t_{3} \mathrm{~N} \cdot 3 \mathrm{HF}, \mathrm{THF}$, rt, 14 h ; (iv) 1. TMSA, $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}, \mathrm{Cul}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DMF}, 90^{\circ} \mathrm{C} ; 2 . \mathrm{NH}_{3}, \mathrm{MeOH}, \mathrm{rt}, 30 \mathrm{~min} ;(\mathrm{v}) \mathrm{LiN}\left(\mathrm{SiMe}_{3}\right)_{2}, \mathrm{Ph}_{3} \mathrm{SiNH}_{2}, \mathrm{CyJohnPhos}^{2}, \mathrm{Pd}_{2}(\mathrm{dba})_{3}, \mathrm{THF}, 50{ }^{\circ} \mathrm{C}, 3 \mathrm{~h} ;(\mathrm{vi}) \mathrm{MeONa}$, $\mathrm{MeOH}, 120^{\circ} \mathrm{C}, 10 \mathrm{~d}$; (vii) $\mathrm{KOH}, t$-butyl-XPhos, $\mathrm{Pd}_{2} \mathrm{dba}_{3}, 100^{\circ} \mathrm{C}$.

6-chloro-2-phenylpyridine $C$-nucleoside 13a in $63 \%$ yield (Scheme 3). When we used 3 equiv. of phenylboronic acid and increased the temperature to $100{ }^{\circ} \mathrm{C}, 2,6$-diphenylpyridine $C$-nucleoside 14a was obtained as a product of double substitution in excellent $95 \%$ yield. An analogous reaction of regioisomeric 6 -bromo-2-chloropyridine $C$-nucleoside 4 with 1 equiv. of phenyl boronic acid afforded an unseparable mixture of the starting compound with the product of substitution of the bromine atom at position 6. Silylated nucleosides 13a and 14a were deprotected using $\mathrm{Et}_{3} \mathrm{~N} \cdot 3 \mathrm{HF}$ to obtain free $C$-nucleosides 13b (91\%) and 14b (81\%).

Mono-substituted 6-chloro-2-phenylpyridine $C$-nucleoside 13a was then used for subsequent cross-coupling reactions. Hartwig-Buchwald amination with $\operatorname{LiN}\left(\mathrm{SiMe}_{3}\right)_{2}$ gave 6 -amino-2-phenylpyridine $C$-nucleoside 15 a in excellent $91 \%$ yield. Cross-coupling with trimethylaluminum afforded 6-methyl-2phenylpyridine $C$-nucleoside 16a in excellent 91\% yield. Deprotection of silylated intermediates gave free $C$-nucleosides 15b (67\%) and 16b (85\%).

In order to introduce amino or methoxy groups, we have studied the reactivity of intermediates $\mathbf{3}$ and 6 in nucleophilic substitutions. Our previous studies ${ }^{6}$ showed good regioselectivity of nucleophilic aminations of 2,4-dichloropyrimidine $C$-nucleoside. Therefore, we tested reactions of 3 or 6 with methanolic ammonia or copper( I )-catalyzed reaction with
liquid ammonia ${ }^{12}$ in an autoclave using temperatures up to $120^{\circ} \mathrm{C}$ but in all cases only the starting material was recovered and we did not observe any reaction. Surprisingly, attempted Buchwald-Hartwig aminations of protected intermediates 4 or 7 did not work either. Nucleophilic substitution of 6 with NaOMe proceeded only at elevated temperature $\left(80^{\circ} \mathrm{C}\right)$ to give an unseparable mixture of the starting compound and both mono-substituted derivatives. The same reaction at higher temperature $\left(120{ }^{\circ} \mathrm{C}\right)$ led to complex mixtures. It seems that the mono-substituted intermediates (containing an electrondonating substituent) are deactivated for another nucleophilic substitution.

Next we studied nucleophilic substitutions with sodium methanethiolate (Scheme 4). The reaction of silylated intermediate 4 with 10 equivalents of NaSMe in DMF at $80^{\circ} \mathrm{C}$ led to double substitution with simultaneous deprotection (due to basic conditions) affording 2,6-bis(methylsulfanyl)pyridine $C$-nucleoside 17 in good $79 \%$ yield. The reaction of $\mathbf{4}$ with 1.2 equivalents of sodium methanethiolate at rt in DMF gave a mixture of both mono-substituted derivatives 18a and 19a in the ratio $c a .1: 1$. Luckily, we were able to separate them using the flash purification system with a very slow gradient of hexanes to $1 \%$ EtOAc in hexanes to obtain 2-chloro-6-(methylsulfanyl)pyridine $C$-nucleoside 18 a ( $48 \%$ ) and 6 -bromo-2(methylsulfanyl)pyridine $C$-nucleoside 19a (43\%). Pd-catalyzed

iii) $\left[\begin{array}{l}\text { 16a, } R=\operatorname{TBS}(91 \%) \\ \text { 16b, } R=H \quad(85 \%)\end{array}\right.$

Scheme 3 Reagents and conditions: (i) 0.9 equiv. $\mathrm{PhB}(\mathrm{OH})_{2}, \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}, \mathrm{~K}_{2} \mathrm{CO}_{3}$, PhMe, $60^{\circ} \mathrm{C}, 12 \mathrm{~h}$; (ii) 3 equiv. $\mathrm{PhB}(\mathrm{OH})_{2}, \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}, \mathrm{~K}_{2} \mathrm{CO}_{3}, \mathrm{PhMe}, 100^{\circ} \mathrm{C}, 12 \mathrm{~h}$; (iii) $\mathrm{Et}_{3} \mathrm{~N} \cdot 3 \mathrm{HF}, \mathrm{THF}, \mathrm{rt}, 14 \mathrm{~h}$; (iv) $\mathrm{LiN}\left(\mathrm{SiMe}_{3}\right)_{2}, \mathrm{CyJohnPhos}, \mathrm{Pd}_{2}(\mathrm{dba})_{3}, \mathrm{THF}, 60^{\circ} \mathrm{C}$, $12 \mathrm{~h} ;(\mathrm{v}) \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}, \mathrm{Me}_{3} \mathrm{Al}, \mathrm{THF}, 70^{\circ} \mathrm{C}, 12 \mathrm{~h}$.
methylation of compounds 18a or 19a with trimethylaluminum gave two regioisomeric methyl-(methylsulfanyl)pyridine $C$-nucleosides 20a (49\%) and 21a (58\%). All silylated compounds were deprotected to afford free $C$-nucleosides 18b-21b.

Attempted Sonogashira chemoselective cross-couplings of 4 with (trimethylsilyl)acetylene (TMSA) (Scheme 5) were very difficult to perform since the desired 2-chloro-6-(TMS-ethynyl)pyridine $C$-nucleoside was unseparable from starting intermediate 4. Finally, we found out that Sonogashira cross coupling with 1 equiv. of trimethylsilylacetylene catalyzed by $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}$ followed by direct amonolysis gave us a separable mixture of starting compound $4(37 \%)$ and desired product 22a in acceptable $53 \%$ yield. When we performed the same reaction with the excess of trimethylsilylacetylene (10 equiv.) and increased the temperature to $90^{\circ} \mathrm{C}$, the product of disubstitution, protected 2,6-bis(ethynyl)pyridine $C$-nucleoside 23a, was isolated in excellent $95 \%$ yield. In order to convert the ethynyl groups to acetyl, we have prepared partially and fully deprotected bis(ethynyl)pyridine $C$-nucleosides 23b and 23c and attempted a gold catalyzed hydration of the triple bond. ${ }^{13}$

iii) $\left[\begin{array}{l}\mathbf{2 1 a}, \mathrm{R}=\mathrm{TBS}(58 \%) \\ \mathbf{2 1 b}, \mathrm{R}=\mathrm{H} \\ \text { (81 \%) }\end{array}\right.$

Scheme 4 Reagents and conditions: (i) MeSNa 10 equiv., DMF, $80^{\circ} \mathrm{C}, 12 \mathrm{~h}$; (ii) MeSNa 1.2 equiv., DMF, rt, 12 h; (iii) Et ${ }_{3} N \cdot 3 H F$, THF, rt, 14 h; (iv) Me $\mathrm{H}_{3} \mathrm{Al}, \mathrm{Pd}$ $\left(\mathrm{PPh}_{3}\right)_{4}, 90^{\circ} \mathrm{C}, 12 \mathrm{~h}$.

Unfortunately, only deprotection was observed despite having tried many different conditions.

The Stille cross-coupling reaction was used for the synthesis of bipyridine and terpyridine $C$-nucleosides (Scheme 6). The reaction of $\mathbf{4}$ with tributyl(2-pyridyl)stannane catalyzed by $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ gave only compound 24a, as a product of chemoselective replacement of the bromine atom, in very good $82 \%$ yield even when we used 2 equiv. of stannane. The palladium catalyst is probably strongly coordinated to the bipyridine scaffold and any second reaction is prevented. In contrast, the Stille cross-coupling catalyzed by $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ cleanly afforded terpyridine $C$-nucleoside 25a, as a product of double substitution, in excellent $92 \%$ yield. Deprotection gave bi- and terpyridine $C$-nucleosides 24b and 25b which could be used in metallabase pairs. ${ }^{14}$

Finally, we attempted to introduce a vinyl group by Fürstner's Fe-catalyzed cross-coupling reaction ${ }^{15}$ with vinylmagnesium bromide (Scheme 7). Unfortunately the cross-coupling did not proceed and, instead, the magnesiation of the bromopyridine occurred which, after hydrolytic work-up, gave chloropyridine 26a, as a product of debromination, in moderate $47 \%$ yield. Also this compound was deprotected to free nucleoside 26b.

All the title free nucleosides were subjected to biological activity screening. The cytotoxic activity in vitro was studied on

the following cell cultures: (i) human promyelocytic leukemia HL60 cells (ATCC CCL 240); (ii) human cervix carcinoma HeLa S3 cells (ATCC CCL 2.2); (iii) human T lymphoblastoid CCRF-CEM cell line (ATCC CCL 119), and (iv) hepatocellular carcinoma cells HepG2 (ATCC HB 8065). Cell viability was determined following a 3-day incubation using a metabolic 2,3-bis-(2-methoxy-4-nitro-5-sulfophenyl)-2H-tetrazolium-5-carboxanilide (XTT) based method. ${ }^{16}$ The antiviral activity was tested against HCV genotype 1A, 1B and 2A replicons. ${ }^{17}$ None of the nucleosides showed any significant cytotoxicity or antiviral activity in these assays at concentrations up to $10 \mu \mathrm{M}$.

## Conclusions

Systematic study of the chemoselectivity of cross-coupling reactions and nucleophilic substitutions of regioisomeric 2-bromo-6-chloro- and 6-bromo-2-chloropyridin-3-yl deoxyribo-nucleosides 7 and 4 was performed. The cross-couplings generally proceeded with good chemoselectivity at the position of the bromine but the choice of the starting compound depended on the separability of the mono-substituted products from the starting compound. On the other hand, nucleophilic substitution with NaSMe was unselective giving a separable mixture of both mono-substituted products, whereas the reactions with ammonia or NaOMe did not proceed or led to complex mixtures (at elevated temperature). The mono-substituted halopyridine $C$-nucleoside intermediates were used for another coupling or $\mathrm{S}_{\mathrm{N}}$ to give a small library of 2,6-disubstituted pyridin-3-yl $C$-deoxyribonucleosides. None of the title nucleosides exerted any antiviral or cytostatic activity in concentrations up to $10 \mu \mathrm{M}$. Some of the disubstituted pyridine nucleosides will be converted to triphosphates and further tested for polymerase incorporation in the quest for the extension of the genetic alphabet. ${ }^{2}$

## Experimental

All cross-coupling reactions were carried out in evacuated flame-dried glassware with magnetic stirring under an argon atmosphere. THF, toluene, and hexanes were dried and distilled from sodium-benzophenone. Other reagents were purchased from commercial suppliers and used as received. NMR
spectra were recorded on a 400 MHz spectrometer ( ${ }^{1} \mathrm{H}$ at $400 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 100.6 MHz$)$, a 500 MHz spectrometer $\left({ }^{1} \mathrm{H}\right.$ at 500 and ${ }^{13} \mathrm{C} \mathrm{MHz}$ at 125.8), and/or a 600 MHz spectrometer $\left({ }^{1} \mathrm{H}\right.$ at $600 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 151 MHz$)$. The samples were measured in $\mathrm{CDCl}_{3}$ using TMS as an internal standard or in DMSO-d ${ }_{6}$ referenced to the residual solvent signal ( ${ }^{1} \mathrm{H}$ NMR $\delta 2.50 \mathrm{ppm}$, ${ }^{13} \mathrm{C}$ NMR 39.7 ppm ). Chemical shifts are given in ppm ( $\delta$ scale) and coupling constants $(J)$ in hertz. Complete assignment of all NMR signals was performed using a combination of 2D-NMR (H,H-COSY, H,C-HSQC, and H,C-HMBC) experiments and configurations were established by two-dimensional ROESY spectra. High performance flash chromatography (HPFC) purifications were performed with Biotage SP1 apparatus on KP-Sil and KP-C18-HS columns. Cytostatic ${ }^{16}$ and anti$\mathrm{HCV}^{17}$ activity screening was performed according to literature procedures.

## General procedure for the deprotection of the TBDMS group

$\mathrm{Et}_{3} \mathrm{~N} \cdot 3 \mathrm{HF}(320 \mu \mathrm{~L}, 1.95 \mathrm{mmol})$ was added to a solution of silylated $C$-nucleoside ( 0.4 mmol ) in THF ( 2 mL ), and the mixture was stirred at room temperature for 14 h . After the reaction was completed (TLC in hexanes-EtOAc 10:1), solvents were removed under reduced pressure, and the crude product was chromatographed on silica gel ( 20 g ) eluted with a gradient of chloroform to $15 \% \mathrm{MeOH}$ in chloroform to give free $C$-nucleosides.
1 $\beta$-(6-Bromo-2-chloropyridin-3-yl)-1,2,3-trideoxy-3-oxo-d-ribofuranose (2). Freshly distilled $\mathrm{CHCl}_{3}(20 \mathrm{~mL})$ was added to an argon-purged, flame-dried flask containing $\operatorname{Pd}(\mathrm{OAc})_{2}(390 \mathrm{mg}$, $1.74 \mathrm{mmol})$ and $\mathrm{P}\left(\mathrm{PhF}_{5}\right)_{3}(1.85 \mathrm{~g}, 3.47 \mathrm{mmol})$, and the mixture was stirred at room temperature for 30 min . This solution was then added via a syringe to a mixture of 6 -bromo-2-chloro-3iodopyridine ( $3.32 \mathrm{~g}, 10.42 \mathrm{mmol}$ ), glycal $1(2.00 \mathrm{~g}, 8.68 \mathrm{mmol})$ and $\mathrm{Ag}_{2} \mathrm{CO}_{3}(3.58 \mathrm{~g}, 13.02 \mathrm{mmol})$ in $\mathrm{CHCl}_{3}(20 \mathrm{~mL})$, and the reaction mixture was stirred at $70{ }^{\circ} \mathrm{C}$ for 10 h . The reaction mixture was then cooled and filtered on a pad of Celite and eluted with $\mathrm{CHCl}_{3}$. Solvents were removed under vacuum, the crude product was dissolved in THF ( 100 mL ), $\mathrm{Et}_{3} \mathrm{~N} \cdot 3 \mathrm{HF}$ ( $2 \mathrm{~mL} ; 12.3 \mathrm{mmol}$ ) was added and the solution was stirred at rt for 15 min . The solvents were removed under vacuum, and the crude product was chromatographed on silica gel eluting with a gradient of chloroform to $1 \% \mathrm{MeOH}$ in chloroform to give 2 ( $1.38 \mathrm{~g}, 52 \%$ for two steps) as a yellow oil. HRMS (ESI) for $\mathrm{C}_{10} \mathrm{H}_{9} \mathrm{BrClNO}_{3}:[\mathrm{M}-\mathrm{H}]$ calculated, 303.9382; found, 303.9382. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $2.26\left(\mathrm{dd}, 1 \mathrm{H}, J_{\text {gem }}=18.2 \mathrm{~Hz}, J_{2^{\prime} a, 1^{\prime}}=\right.$ $10.6 \mathrm{~Hz}, \mathrm{H}-2^{\prime} \mathrm{a}$ ); 3.18 (dd, $1 \mathrm{H}, J_{\text {gem }}=18.2 \mathrm{~Hz}, J_{2^{\prime} b, 1^{\prime}}=6.2 \mathrm{~Hz}$, $\left.\mathrm{H}-2^{\prime} \mathrm{b}\right) ; 3.99-4.05\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-5^{\prime}\right) ; 4.11\left(\mathrm{t}, 1 \mathrm{H}, J_{4^{\prime}, 5^{\prime} a}=J_{4^{\prime}, 5^{\prime} b}=\right.$ $\left.3.4 \mathrm{~Hz}, \mathrm{H}-4^{\prime}\right) ; 5.43$ (ddt, $1 \mathrm{H}, J_{1^{\prime}, 2^{\prime} a}=10.6 \mathrm{~Hz}, J_{1^{\prime}, 2^{\prime} b}=6.2 \mathrm{~Hz}$, $\left.J_{1^{\prime}, 4}=J_{1^{\prime}, 5}=0.7 \mathrm{~Hz}, \mathrm{H}-1^{\prime}\right) ; 7.52\left(\mathrm{bd}, 1 \mathrm{H}, J_{5,4}=8.1 \mathrm{~Hz}, \mathrm{H}-5\right) ; 7.97$ (dd, $\left.1 \mathrm{H}, J_{4,5}=8.1 \mathrm{~Hz}, J_{4,1^{\prime}}=0.7 \mathrm{~Hz}, \mathrm{H}-4\right) .{ }^{13} \mathrm{C}$ NMR ( 125.7 MHz , $\left.\mathrm{CDCl}_{3}\right): 43.70\left(\mathrm{CH}_{2}-2^{\prime}\right) ; 61.51\left(\mathrm{CH}_{2}-5^{\prime}\right) ; 73.30\left(\mathrm{CH}-1^{\prime}\right) ; 82.08$ (CH-4'); 127.52 (CH-5); 134.64 (C-3); 137.72 (CH-4); 139.64 (C-6); 147.73 (C-2); 212.08 (C-3'). 1 $\beta$-(2-Bromo-6-chloropyridin-3-yl)-1,2-dideoxy-3,5-di-O( $t$-butyldimethylsilyl)-d-ribofuranose (7). Imidazole ( 0.69 g ,
$10.18 \mathrm{mmol})$ and then TBDMSCl ( $2.45 \mathrm{mg}, 16.3 \mathrm{mmol}$ ) were added to a flame-dried flask containing a solution of the nucleoside $6(1.26 \mathrm{~g}, 4.07 \mathrm{mmol})$ in dry DMF $(25 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ under argon and the solution was allowed to warm to room temperature and was stirred for 14 h . The reaction mixture was then poured into a saturated solution of $\mathrm{NaCl}(100 \mathrm{~mL})$ and extracted with EtOAc ( $3 \times 50 \mathrm{~mL}$ ). Collected organic fractions were washed with a saturated NaCl solution, dried over $\mathrm{MgSO}_{4}$, and the solvents were evaporated under vacuum. The crude product was chromatographed on silica gel in a gradient of hexanes to 3\% EtOAc in hexanes to give the desired nucleoside 7 (2.01 g, 92\%) as a colorless oil. HRMS (ESI) for $\mathrm{C}_{22} \mathrm{H}_{39} \mathrm{BrClNO}_{3} \mathrm{Si}_{2}$ : $[\mathrm{M}+\mathrm{H}]$ calculated, 536.1413; found, 536.1412. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $0.085,0.089$ and 0.10 $\left(4 \times \mathrm{s}, 4 \times 3 \mathrm{H}, \mathrm{CH}_{3} \mathrm{Si}\right) ; 0.90$ and $0.91\left(2 \times \mathrm{s}, 2 \times 9 \mathrm{H},\left(\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}\right)\right)$; $1.68\left(\mathrm{ddd}, 1 \mathrm{H}, J_{\mathrm{gem}}=12.6 \mathrm{~Hz}, J_{2^{\prime} a, 1^{\prime}}=9.4 \mathrm{~Hz}, J_{2^{\prime} a, 3^{\prime}}=5.6 \mathrm{~Hz}\right.$, $\mathrm{H}-2^{\prime} \mathrm{a}$ ); 2.45 (ddd, $1 \mathrm{H}, J_{\mathrm{gem}}=12.6 \mathrm{~Hz}, J_{2^{\prime} b, 1^{\prime}}=5.9 \mathrm{~Hz}, J_{2^{\prime} b, 3^{\prime}}=$ $\left.2.6 \mathrm{~Hz}, \mathrm{H}-2^{\prime} \mathrm{b}\right) ; 3.72\left(\mathrm{dd}, 1 \mathrm{H}, J_{\mathrm{gem}}=10.9 \mathrm{~Hz}, J_{5^{\prime} a, 4^{\prime}}=4.5 \mathrm{~Hz}\right.$, H-5'a); 3.77 (dd, $\left.1 \mathrm{H}, J_{\text {gem }}=10.9 \mathrm{~Hz}, J_{5^{\prime} b, 4^{\prime}}=3.3 \mathrm{~Hz}, \mathrm{H}-5^{\prime} \mathrm{b}\right) ; 3.97$ (ddd, $1 \mathrm{H}, J_{4^{\prime}, 5^{\prime} a}=4.5 \mathrm{~Hz}, J_{4^{\prime}, 5^{\prime} b}=3.3 \mathrm{~Hz}, J_{4^{\prime}, 3^{\prime}}=2.6 \mathrm{~Hz}, \mathrm{H}-4^{\prime}$ ); 4.38 (bdtd, $1 \mathrm{H}, J_{3^{\prime}, 2^{\prime} a}=5.6 \mathrm{~Hz}, J_{3^{\prime}, 4^{\prime}}=J_{3^{\prime}, 2^{\prime} b}=2.7 \mathrm{~Hz}, J_{3^{\prime}, 1^{\prime}}=$ $\left.0.6 \mathrm{~Hz}, \mathrm{H}-3^{\prime}\right) ; 5.31$ (ddq, $1 \mathrm{H}, J_{1^{\prime}, 2^{\prime} a}=9.4 \mathrm{~Hz}, J_{1^{\prime}, 2^{\prime} b}=5.9 \mathrm{~Hz}$, $\left.J_{1^{\prime}, 3^{\prime}}=J_{1^{\prime}, 4}=J_{1^{\prime}, 5}=0.6 \mathrm{~Hz}, \mathrm{H}-1^{\prime}\right) ; 7.26\left(\mathrm{dd}, 1 \mathrm{H}, J_{5,4}=8.1 \mathrm{~Hz}, J_{5,1^{\prime}}=\right.$ $0.6 \mathrm{~Hz}, \mathrm{H}-5) ; 7.95\left(\mathrm{dd}, 1 \mathrm{H}, J_{4,5}=8.1 \mathrm{~Hz}, J_{4,1^{\prime}}=0.7 \mathrm{~Hz}, \mathrm{H}-4\right)$. ${ }^{13} \mathrm{C}$ NMR (125.7 MHz, $\mathrm{CDCl}_{3}$ ): $-5.50,-5.42,-4.76$ and -4.62 $\left(\mathrm{CH}_{3} \mathrm{Si}\right) ; 17.98$ and $18.28\left(\left(\mathrm{CH}_{3}\right)_{3} \mathbf{C}\right) ; 25.74$ and $25.87\left(\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}\right)$; $42.47\left(\mathrm{CH}_{2}-2^{\prime}\right) ; 63.21\left(\mathrm{CH}_{2}-5^{\prime}\right) ; 73.65\left(\mathrm{CH}-3^{\prime}\right) ; 77.50\left(\mathrm{CH}-1^{\prime}\right)$; 88.00 (CH-4'); 123.41 (CH-5); 138.08 (CH-4); 139.00 and 139.07 (C-2,3); 148.66 (C-6). 1 $\beta$-[2,6-Bis(2-pyridyl)pyridin-3-yl]-1,2-dideoxy-3,5-di- $O$-( $t$-butyl-dimethylsilyl)-d-ribofuranose (25a). Toluene ( 3.0 mL ) was added to a flame-dried and argon-purged flask, containing 4 ( $159 \mathrm{mg}, 0.29 \mathrm{mmol}$ ), and $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(65 \mathrm{mg}, 0.058 \mathrm{mmol}$, $20 \mathrm{~mol} \%$ ). After 5 min of stirring at room temperature, tributyl (2-pyridinyl)stannane ( $0.38 \mathrm{~mL}, 1.16 \mathrm{mmol}, 4.0$ equiv.) was added, and the mixture was heated to $110{ }^{\circ} \mathrm{C}$ for 12 h . The crude reaction mixture was diluted with $\mathrm{Et}_{2} \mathrm{O}(300 \mathrm{~mL})$, and washed with $2 \mathrm{M} \mathrm{HCl}(80 \mathrm{~mL})$ and saturated $\mathrm{NaHCO}_{3}$ ( 100 mL ). After evaporation of the solvents under reduced pressure, the crude product was chromatographed on silica gel eluting with a gradient of hexanes to $12 \%$ EtOAc in hexanes to obtain 25 a ( $197 \mathrm{mg}, 92 \%$ ) as a colorless oil. 1 $\beta$-(2-Chloropyridin-3-yl)-1,2-dideoxy-d-ribofuranose (26b). Compound 26b was prepared from $26 \mathbf{a}(80 \mathrm{mg}, 0.17 \mathrm{mmol})$ by the general procedure to yield $\mathbf{2 6 b}(32 \mathrm{mg}, 82 \%)$ as a white solid. HRMS (ESI) for $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{ClNO}_{3}$ : $[\mathrm{M}+\mathrm{Na}]$ calculated, 252.0398; found, 252.0398. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ): 1.78 (ddd, $1 \mathrm{H}, J_{\mathrm{gem}}=13.1 \mathrm{~Hz}, J_{2^{\prime} a, 1^{\prime}}=10.1 \mathrm{~Hz}, J_{2^{\prime} a, 3^{\prime}}=6.0 \mathrm{~Hz}, \mathrm{H}-2^{\prime} \mathrm{a}$ ); 2.50 (ddd, $1 \mathrm{H}, J_{\text {gem }}=13.1 \mathrm{~Hz}, J_{2^{\prime} b, 1^{\prime}}=5.7 \mathrm{~Hz}, J_{2^{\prime} b, 3^{\prime}}=2.0 \mathrm{~Hz}$, $\left.\mathrm{H}-2^{\prime} \mathrm{b}\right) ; 3.70\left(\mathrm{dd}, 1 \mathrm{H}, J_{\mathrm{gem}}=11.8 \mathrm{~Hz}, J_{5^{\prime}, a, 4^{\prime}}=5.0 \mathrm{~Hz}, \mathrm{H}-5^{\prime} \mathrm{a}\right) ; 3.72$ (dd, $\left.1 \mathrm{H}, J_{\text {gem }}=11.8 \mathrm{~Hz}, J_{5^{\prime} b, 4^{\prime}}=4.6 \mathrm{~Hz}, \mathrm{H}-5^{\prime} \mathrm{b}\right) ; 3.99$ (td, 1 H , $\left.J_{4^{\prime}, 5^{\prime} a}=J_{4^{\prime}, 5^{\prime} b}=4.8 \mathrm{~Hz}, J_{4^{\prime}, 3^{\prime}}=2.7 \mathrm{~Hz}, \mathrm{H}-4^{\prime}\right) ; 4.33$ (dddd, 1 H , $\left.J_{3^{\prime}, 2^{\prime} a}=6.0 \mathrm{~Hz}, J_{3^{\prime}, 4^{\prime}}=2.7 \mathrm{~Hz}, J_{3^{\prime}, 2^{\prime} b}=2.0 \mathrm{~Hz}, J_{3^{\prime}, 1^{\prime}}=0.7 \mathrm{~Hz}, \mathrm{H}-3^{\prime}\right) ; 5.38$ (ddpent, $1 \mathrm{H}, J_{1^{\prime}, 2^{\prime} a}=10.1 \mathrm{~Hz}, J_{1^{\prime}, 2^{\prime} b}=5.7 \mathrm{~Hz}, J_{1^{\prime}, 4}=J_{1^{\prime}, 5}=J_{1^{\prime}, 6}=$ $J_{1^{\prime}, 3^{\prime}}=0.7 \mathrm{~Hz}, \mathrm{H}-1^{\prime}$ ); 7.41 (ddd, $1 \mathrm{H}, J_{5,4}=7.7 \mathrm{~Hz}, J_{5,6}=4.8 \mathrm{~Hz}$, $J_{5,1^{\prime}}=0.6 \mathrm{~Hz}, \mathrm{H}-5$ ); 8.17 (ddd, $1 \mathrm{H}, J_{4,5}=7.7 \mathrm{~Hz}, J_{4,6}=2.0 \mathrm{~Hz}$, $\left.J_{4,1^{\prime}}=0.8 \mathrm{~Hz}, \mathrm{H}-4\right) ; 8.27$ (ddd, $1 \mathrm{H}, J_{6,5}=4.8 \mathrm{~Hz}, J_{6,4}=2.0 \mathrm{~Hz}$, $\left.J_{6,1^{\prime}}=0.5 \mathrm{~Hz}, \mathrm{H}-6\right) .{ }^{13} \mathrm{C}$ NMR ( $125.7 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ): 43.11 $\left(\mathrm{CH}_{2}-2^{\prime}\right) ; 63.72\left(\mathrm{CH}_{2}-5^{\prime}\right) ; 74.13$ (CH-3'); 77.46 (CH-1'); 89.17 (CH-4'); 124.54 (CH-5); 137.86 (CH-4); 138.87 (C-3); 149.10 (CH-6); 149.33 (C-2). IR spectrum (KBr): 3359, 1630, 1580, 1571, 1450, 1442, 1389, 1181, 1073, 1063, 1043, 1023, 951.

## Crystallographic data for 4

$M=308.55 \mathrm{~g} \mathrm{~mol}^{-1}$, monoclinic system, space group $P 2_{1}$, $a=8.9755$ (9) $\AA, b=6.9472$ (5) $\AA, c=9.1777$ (9) $\AA$ A,$\beta=90.968(9)^{\circ}$, $Z=2, V=572.19(9) \AA^{3}, D_{\mathrm{c}}=1.791 \mathrm{~g} \mathrm{~cm}^{-3}, \mu(\mathrm{Cu}-\mathrm{K} \alpha)=$ $7.002 \mathrm{~mm}^{-1}$, crystal dimensions of $0.58 \times 0.56 \times 0.21 \mathrm{~mm}$. Data were collected at 170 (2) K on an Xcalbur Onyx CCD diffractometer with graphite monochromated $\mathrm{Cu}-\mathrm{K} \alpha$ radiation. The structure was solved by charge flipping methods ${ }^{18}$ using the CRYSTALS suite of programs ${ }^{19}$ and anisotropically refined by full matrix least squares on $F$ value to final $R=0.036$ and $R_{\mathrm{w}}=$ 0.042 using 2220 independent reflections ( $\Theta_{\max }=77.3^{\circ}$ ) and 147 parameters. The absolute configuration on stereogenic centers was confirmed by refinement of the Flack parameter (resulting value -0.02 (2)). The structure was deposited into the Cambridge Structural Database under number CCDC 927315.

## Crystallographic data for 8b

$M=243.69 \mathrm{~g} \mathrm{~mol}^{-1}$, monoclinic system, space group $P 2_{1}$, $a=5.3111$ (3) $\AA, b=11.1077$ (6) $\AA, c=19.5383$ (13) $\AA, \beta=96.676$ (6) ${ }^{\circ}$, $Z=4, V=1144.84(12) \AA^{3}, D_{\mathrm{c}}=1.414 \mathrm{~g} \mathrm{~cm}^{-3}, \mu(\mathrm{Cu}-\mathrm{K} \alpha)=$ $2.908 \mathrm{~mm}^{-1}$, crystal dimensions of $0.49 \times 0.37 \times 0.26 \mathrm{~mm}$.

Data were collected at 190 (2) K on an Xcalbur Onyx CCD diffractometer with graphite monochromated $\mathrm{Cu}-\mathrm{K} \alpha$ radiation. The structure was solved by charge flipping methods ${ }^{1}$ using the CRYSTALS suite of programs ${ }^{2}$ and anisotropically refined by full matrix least squares on $F$ squared value to final $R=0.038$ and $R_{\mathrm{w}}=0.095$ using 4688 independent reflections $\left(\Theta_{\text {max }}=\right.$ $77.4^{\circ}$ ) and 291 parameters. The absolute configuration on stereogenic centers was confirmed by refinement of the Flack parameter (resulting value -0.008 (12)). The structure was deposited into the Cambridge Structural Database under number CCDC 927314.

## Acknowledgements

This work was supported by institutional support from the Academy of Sciences of the Czech Republic (RVO: 61388963) and Charles University, by a grant from the Czech Science Foundation (P207/11/0344) and by Gilead Sciences, Inc. The authors thank Mrs Eva Tlouštová (IOCB) for cytostatic and Dr Y.-J. Lee and Dr G. Bahador (Gilead Sciences, Inc.) for antiHCV screening.
