Azadirachtin

- Azadirachtin was isolated from the seed of Indian neem tree *Azadirachta indica* (0.2 to 0.8 percent by weight) in 1968.
- It acts as an antifeedant and growth disruptor against over 200 species of insect yet displays very low mammalian toxicity ($LD_{50}(\text{rat}) > 5\text{g/kg}$).
- Its structure was elucidated in 1987.
- Commercially available: 10 mg@\$137

Butterworth, J. H. et al *Chem. Commun.* **1968**, 23 – 24.

Kraus, W et al *Tetrahedron* **1987**, 43, 2817 – 2830

Azadirachtin: Structural Features

- Sixteen contiguous stereogenic centers, seven quaternary carbons
- Highly oxygenated
- Sensitive functionalities (enol ether and epoxide)

Retrosynthesis

- Key transformations:

- Methyl acetal protection of the enol ether functionality
- Radical cyclization to provide the bridged ring system
- O-alkylation followed by Claisen rearrangement to install the C8 quaternary center

Preparation of Left Hand Fragment

Kolb, H. C. et al. *J. Chem. Soc. Perkin Trans. 1* **1992**, 2735

Preparation of Left Hand Fragment (cont.)

30 steps, 0.12% overall yield

Degradation Study

Ley, S. V. et al *Tetrahedron*, **1993**, 49, 1675

Demethylation of the C-8 Position

Koot, W. J. et al *Tetrahedron*, **1995**, 51, 2077

Methylation of the C-8 Position

3 steps, 46%

Preparation of Right Hand Fragment

22 steps, 4.1%

Veitch, G. et al *Angew. Chem. Int. Ed.* Early View

Fragment coupling

8 steps, 17%

A Relay Route to Azadirachtin

End Game

6 steps, 11%

Summary

- The authors have demonstrated a feasible pathway for the synthesis of azadirachtin: “22 years in the making”.
- 47 linear steps, 0.0010% overall yield
- Key steps include a Claisen rearrangement for the formation of C8-C14 bond and a radical cyclization to form the bridged ring system.
- End game relies on an intermediate prepared by the degradation of the target molecule.
