# Synthesis of Cyclopropane Derivatives Starting from the Baylis-Hillman Adducts Using Sulfur Ylide Chemistry 

Ka Young Lee, Seung Chan Kim, and Jae Nyoung Kim*<br>Department of Chemistry and Insilute of Basic Science, Chonnam National University, Gwangin 500-757, Korea<br>${ }^{*}$ E-mail: kimjn(w.honnam.ac:kr Received November 7, 2005

Key Words: Cyclopropane, Baylis-F Iillman adducts, Sulfiur ylide, Michael acceptor

Cyclopropane moiety is a fundamental class ol functional group that is the focus of many organic synthesis programs and performs a key structural role in a wide range of biologically active molecules. ${ }^{1.2}$ The importance of cyclopropanes is rellected in the enormous effort that has been invested in their diastereo- and enantioselective synthesis. ${ }^{1-4}$ In addition, eyclopropane derivatives could be transformed to structurally diverse compounds. ${ }^{\text {ºn }}$

During the extensive studies on the chemical transtormations of Baylis-Itillman adducts, ${ }^{\text {b }}$ we examined the introduction of cyclopropane moicty at the primary position of Baylis-IIillman adducts to form vinyl cyctopropane derivatives 2 (Scheme 1). Such vinyl cyclopropane backbone is an important entity in many naturally occurring and synthetic pyrethroidal insectides, ${ }^{2 a}$ and could be used for further chemical transformations."

Our synthetic rationale is shown in Scheme I. The starting cinnamyl bromide 1 a was prepared from the Baylis-IItlman adduct and HBr according to the reported method. ${ }^{7}$ The reaction of 1 a and dimethyl sulfide in $\mathrm{CH}_{3} \mathrm{C} . \mathrm{V}$ generated the sulfonium salt (I), which was converted into the corresponding sulfur ylide (II) by treatment with NaOII . The in situgenerated sulfur ylide (II) reacted with methyl vinyl ketone to give the desired cyclopropane derivative 2 a in $45 \%$ yield as shown in Schene 1 via the intermediate (III). The synthesis of 2a was carried out in $\mathrm{CH}_{3} \mathrm{CN}$ at room temperature within 12 h . Fincouraged by the suceessful results we
prepared other cyelopropane derivatives $\mathbf{2 b}$ - $\mathbf{h}$ and the results are summarized in Table 1.*

The use of $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ instead of NaOH I showed similar yield of 2a. Iowever, the use of $\mathrm{K}_{2} \mathrm{CO}_{\text {s }}$ gave 2a in only trace amounts. When we used nitrogen ylide, which was made from the reaction of 1 a and $\mathrm{D} \angle \mathrm{BCO}$ in the presence of NaOII , we could not observe the formation of 2 a at all. Variation of the electron-withdrawing substituents (-COOMe, -COOEL, -COMe, -CN ) of the starting materials 1 a-f did not alter the reactivity for the formation of cyclopropanes. Ethyl vinyl ketone (entry 2) could also be used successfully as the Michael acceptor in the reaction with 1a. However, we failed to obtain the corresponding products when we replaced methyl vinyl ketone with other Michacl acceptors such as methyl acrylate, acrylonitrile, and 2-cyclohexen-Ione. In these cases we could not observe any major component on TLC. The reason for the tailure could be explained either by the hydrolysis or low reactivity of these Michael acceptors. Fortunately, 2-chloroacrylonitrile could be used as the Michael acceptor elficiently to give $\mathbf{2 g}$ (entry 7) as inseparable cis-trans mixtures in $57 \%$ yield.

The relative stereochemistry of the two substituents of cyclopropane was trans in all cases as reported in similar systems. ${ }^{3.4}$ We could not isolate the other stereoisomer from the reaction mixtures. Further synthetic applications of the eyclopropane products are currently underway.

Scheme 1

Table 1. Synthesis of cyclopropane derivatives
Cntry
"The stereochemistry of double bond of ta-e is $Z$ and that of 1 f is $E$. "Mes ( 1.5 equiv), NaOH ( 1.5 equiv), CII CN, rt, given time. We obtained troms isomers in all eases (exeep for entry 7). "The use of $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ ( 1.5 equiv) insiead of NaO I under the same conditions gave $48 \%$ of 2 a . " wo stereoisomers were mixed in a ratio of $3: 2$.

## Experimental Section

Typical procedure for the synthesis of cimnamyl bromide 1a and cyclopropane derivative 2 a . The cinnamyl bromide derivative la was prepared in $92 \%$ yield by the treatment of the Baylis-Hillman adduct of benzaldenyde and methyl acrylate with aq $\mathrm{HBr}(\mathrm{rt}, 5 \mathrm{~h}){ }^{7}$ Synthesis of $\mathbf{1 b}$-f was also carried out similarly with HBr at room temperature (5$16 \mathrm{~h}, 85-95 \%$ ). To a stirred solution of $\mathbf{1 a}$ ( $254 \mathrm{mg}, 1.0$ mmol) and methyl vinyl ketone ( $105 \mathrm{mg}, 1.5 \mathrm{mmol}$ ) in $\mathrm{CH}_{3} \mathrm{CN}(3 \mathrm{~mL})$ was added successively dimethyl sulfide ( 93 $\mathrm{mg}, 1.5 \mathrm{mmol}$ ) and NaOH ( $60 \mathrm{mg}, 1.5 \mathrm{mmol}$ ) at room
temperature. The reaction mixture was stirred for 12 h at room temperature. After the normal aqueous workup and column chromatographic purification process (hexanes/ether $=10: 1$ ) we obtained 2 a as clear oil, 110 mg ( $45 \%$ ). Synthesis of $\mathbf{2 b}$-li was carried out similarly and the spectroscopic data of $2 a-l$ are as follows.
Compound 2a: 45\%: clear oil; $\operatorname{IR}(\mathrm{KBr})$ 1712, 1628, 1254 $\mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 0.90-0.97(\mathrm{~m}, 1 \mathrm{H})$, 1.47-1.53 (m, 1H), 1.94-2.04 (m, 1H), $2.19(\mathrm{~s}, 3 \mathrm{H}), 2.29-$ $2.36(\mathrm{~m}, 1 \mathrm{H}), 3.82(\mathrm{~s}, 3 \mathrm{H}), 7.34-7.46(\mathrm{~m}, 5 \mathrm{H}), 7.76(\mathrm{~d}, J=$ $1.8 \mathrm{~Hz}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (CDCl $\left.{ }_{3}, 75 \mathrm{MHz}\right) \delta 19.98,23.33$, $31.01,31.99,52.23,128.46,129.16,130.20,130.34,134.70$,
