#### Abstract

The protected poly-Aib oligopeptides $\mathrm{Z}-(\mathrm{Aib}) \mathrm{n}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}$ with $\mathrm{n}=2-6$ were prepared according to the 'azirine/oxazolone method', i.e., by coupling amino or peptide acids with 2,2,N-trimethyl-N-phenyl-2H-azirin-3-amine (1a) as an Aib synthon (Scheme 2). Following the same concept, the segments Z-(Aib)3-OH (9) and H-L-Pro-(Aib)3-N(Me)Ph (20) were synthesized, and their subsequent coupling with $\mathrm{N}, \mathrm{N}^{\prime}$-dicyclohexylcarbodiimide (DCC) $/ \mathrm{ZnCl} 2$ led to the protected heptapeptide Z-(Aib)3-L-Pro-(Aib)3-N(Me)Ph (21; Scheme 3). The crystal structures of the poly-Aib oligopeptide amides were established by X-ray crystallography confirming the 310-helical conformation of Aib peptides.

[^0]The protected poly-Aib oligopeptides Z-(Aib) $)_{n}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}$ with $n=2-6$ were prepared according to the 'azirine/oxazolone method', i.e., by coupling of amino or peptide acids with 2,2,N-trimethyl- N -phenyl-2H-azirin-3-amine (1a) as an Aib synthon (Scheme 2). Following the same concept, the segments $\mathrm{Z}-(\mathrm{Aib})_{3}-\mathrm{OH}(\mathbf{9})$ and $\mathrm{H}-\mathrm{L}-\mathrm{Pro}-(\mathrm{Aib})_{3}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}(\mathbf{2 0})$ were synthesized, and their subsequent coupling with $\mathrm{DCC} / \mathrm{ZnCl}_{2}$ led to the protected heptapeptide Z-(Aib) $)_{3}$ L-Pro-(Aib) $)_{3}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}(21$, Scheme 3). The crystal structures of the poly-Aib oligopeptide amides were established by X-ray crystallography confirming the $3_{10}$-helical conformation of Aib peptides.

1. Introduction. - The broad interest in Aib-containing oligopeptides is well documented [1], and a large number of recent articles show that this type of peptides still attract attention because of their structural (e.g. [2]) and antimicrobial properties (e.g. [3]). In the last twenty years, we have shown that $\mathrm{N}, \mathrm{N}$-disubstituted 2,2 -dimethyl- 2 H -azirin-3-amines $\mathbf{1}$ are useful building blocks for 2-aminoisobutyric acid (Aib) in the syntheses of heterocycles and peptides [4]. The so-called 'azirine/oxazolone method' proved to be a convenient synthetic approach for the introduction of Aib into peptides [5] (Scheme 1). After the coupling of an amino acid or peptide acid with 1, the resulting dipeptide amide 2 was hydrolyzed selectively to give the dipeptide acid 3. Subsequent coupling with an amino acid ester by using $\mathrm{DCC} / \mathrm{ZnCl}_{2}$ led, via the intermediate 1,3-oxazol-5(4H)-one 4, to the tripeptide 5. This method has been used successfully in the syntheses of model peptides and naturally occurring peptaibols ${ }^{2}$ ), e.g., segments of alamethicin [8] and zervamicin II-2 [9], derivatives of trichovirin I 1B [10] and trichotoxin $\mathrm{A}-50(\mathrm{G})$ [11], as well as hypomurocin A 1 [12].

Recently, the 'azirine/oxazolone method' has been adopted for solid phase synthesis [13].

## Scheme 1

The repetition of the reaction sequence of azirine coupling and selective hydrolysis of the C-terminal amide group allows the direct coupling of Aib segments with a peptide chain. This convenient and efficient approach has been used for the preparation of peptides like HO-

[^1]$\mathrm{CHR}^{1}-\mathrm{CO}-\left(\mathrm{NH}-\mathrm{CMe}_{2}-\mathrm{CO}\right)_{n}-\mathrm{N}(\mathrm{Me}) \mathrm{R}^{2} \quad[14]$ and $\mathrm{Z}-\mathrm{NH}-\mathrm{CHR}^{1}-\mathrm{CO}-\left(\mathrm{NH}-\mathrm{CMe}_{2}-\mathrm{CO}\right)_{n}-$ $\mathrm{N}(\mathrm{Me}) \mathrm{R}^{2}$ [15] as precursors of cyclic depsipeptides and peptides, respectively.

The goal of the present study was to demonstrate the usefulness of 2,2-dimethyl-2H-azirin-3-amines for the preparation of poly-Aib peptides and the determination of the conformation of these oligopeptides in the crystalline state.
2. Results and Discussion. - 2.1. Synthesis of Poly-Aib-Oligopeptides. The synthesis of the poly-Aib-oligopeptides was carried out in analogy to the preparations of the linear peptides of type $\mathrm{X}-\mathrm{CHR}^{1}-\mathrm{CO}-\left(\mathrm{NH}-\mathrm{CMe}_{2}-\mathrm{CO}\right)_{n}-\mathrm{N}(\mathrm{Me}) \mathrm{R}^{2}$ mentioned above [14][15]. The Z-protected 2-aminoisobutyric acid (Z-Aib-OH) [16], which had been prepared in 95\% yield by treatment of Aib with benzyl chloroformate in a mixture of 2 N aqueous NaOH and dioxane, was dissolved in $\mathrm{Et}_{2} \mathrm{O}$ and reacted with 1.1 equiv. 2,2,N-trimethyl- N -phenyl-2 H -azirin-3-amine (1a) at room temperature to give Z-Aib-Aib-N(Me)Ph (6a) in quantitative yield (Scheme 2). The dipeptide amide crystallized directly from the mixture and was isolated by filtration. Selective hydrolysis of the terminal amide group was achieved in THF/6N HCl (1:1) at room temperature and led to the dipeptide acid Z-Aib-Aib-OH (7) in $94 \%$ yield.

Scheme 2

The reaction sequence of azirine coupling and hydrolysis was repeated with 7 and subsequently three times in addition. A suitable solvent for the coupling step with 7 was THF; in the cases of the higher homologues $\mathbf{9}, \mathbf{1 1}$, and $\mathbf{1 3}$, DMF was used. To obtain a clear solution, the mixtures in DMF were heated to $40-70^{\circ}$ and then cooled to $0^{\circ}$. After addition of 1a, the solution was allowed to warm to room temperature. The peptide amides $\mathbf{8 a}$ and $\mathbf{1 2}$ crystallized directly from the mixture, whereas $\mathbf{1 0}$ and $\mathbf{1 4}$ were obtained as yellow oils, but
crystallized after treatment with $\mathrm{Et}_{2} \mathrm{O}$ /petroleum ether and $\mathrm{Et}_{2} \mathrm{O}$, respectively. The pure peptide amides were isolated in $85-100 \%$ yield. The selective hydrolysis of $\mathbf{8 a}$ and $\mathbf{1 0}$ occurred smoothly at room temperature to give the peptide acids $\mathbf{9}$ and $\mathbf{1 1}$ in 85 and $\mathbf{9 8 \%}$ yield, respectively. In the case of the rather insoluble 12, the hydrolysis was carried out at $60^{\circ}$ and gave $\mathbf{1 3}$ in $\mathbf{9 8 \%}$ yield.
2.2. Synthesis of the Heptapeptide Z-(Aib) $)_{3}$-Pro-(Aib $)_{3}-N(M e) P h$ (21). The protected heptapeptide amide 21 was synthesized via a combination of the azirine coupling/hydrolysis described above and the segment condensation via a 1,3-oxazol-5(4H)-one (Scheme 3), i.e. with the 'azirine/oxazolone method'. The first segment $\mathrm{Z}-(\mathrm{Aib})_{3}-\mathrm{OH}$ (9) was prepared analogously to Scheme 2 , but by using $2,2, N, N$, tetramethyl- $2 H$-azirin- 3 -amine ( $\mathbf{( 1 b}$ ) as the Aib synthon. The azirine coupling gave $\mathbf{6 b}$ and $\mathbf{8 b}$ in 87 and $92 \%$ yield, respectively, and the selective hydrolysis to $\mathbf{7}$ and $\mathbf{9}$ was almost quantitative. The second segment, Z-L-Pro-(Aib) $3^{-}$ $\mathrm{N}(\mathrm{Me}) \mathrm{Ph}(\mathbf{1 9})$ was obtained in a total yield of $51 \%$ by repeated coupling of Z-L-Pro-OH with 1a, followed by the selective hydrolysis. The reason for the choice of $\mathbf{1 a}$ was the faster hydrolysis of the $N$-methyl- $N$-phenylamides in $6 \mathrm{~N} \mathrm{HCl} /$ THF in comparison with that of the corresponding $N, N$-dimethylamides. Therefore, the racemization of Pro as well as the acidcatalyzed cleavage of Pro-Aib [5b][17] was minimized. The hydrolysis of $\mathbf{1 5}$ and $\mathbf{1 7}$ were complete already after 3 and 3.5 h , respectively, and afforded the products in 80 and $94 \%$ yield.

Scheme 3

Finally, the Z-protecting group of the tetrapeptide 19 was removed by hydrogenolysis with $\mathrm{Pd} / \mathrm{C}$ yielding 20, and the segments 9 and 20 were condensed by using the coupling reagent $\mathrm{DCC} / \mathrm{ZnCl}_{2}$ [5a] to give $\mathbf{2 1}$ in $75 \%$ yield.
2.3. Crystal Structures of the Poly-Aib-Oligopeptide Amides. Nowadays it is well known that the preferred conformation of peptides containing Aib (and some other $\alpha, \alpha$ dialkylated glycines) is the $3_{10}$-helix, which is a sequence of $\beta$-turns of type III or III', in which the ideal values for all torsion angles $\phi\left(\mathrm{CO}-\mathrm{N}-\mathrm{C}_{\alpha}-\mathrm{CO}\right)$ and $\psi\left(\mathrm{N}-\mathrm{C}_{\alpha}-\mathrm{CO}-\mathrm{N}\right)$ are $\pm$ $60^{\circ}$ and $\pm 30^{\circ}$, respectively. The negative values stand for the right-handed helix ( $\beta$-turns of type III) and the positive ones for the left-handed helix ( $\beta$-turns of type III'). An additional characteristic feature consists of the intramolecular H -bonds between CO of amino acid $i$ and NH of amino acid $i+4$, which form 10 -membered rings, and thereby stabilize the helical structure.

A rather large series of poly-Aib-oligopeptide derivatives have been prepared and their structures analyzed (see e.g. [16][18]). In most cases, peptide esters were investigated. The crystal structures of the present set of $\left.\mathrm{Z}-(\mathrm{Aib})_{n}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}(n=3-6)^{3}\right)$, i.e. poly-Aib amides, are in good agreement with the $3_{10}$-helical structures of analogous derivatives: the average magnitudes of $\phi_{i}$ and $\psi_{i}$ are $55.3^{\circ}$ and $31.5^{\circ}$, i.e. they correspond well with the typical values of $\pm 60^{\circ}$ and $\pm 30^{\circ}$ (see, e.g. [16b][18b,e,f]).
$Z-(A i b)_{2}-N(M e) P h(\mathbf{6 a})$. The molecular structure of $\mathbf{6 a}$ in the crystal is shown in Fig. 1. The torsion angles $\omega$ of the amide groups are in the allowed region for trans-amide bonds (Table 1). The values of the torsion angle-pair $\phi / \psi$ for $\operatorname{Aib}(2)$ are $+55.2(3)^{\circ}$ and $+41.9(3)^{\circ}$, i.e., compatible with a left-handed $3_{10}$-helix, but the corresponding $\psi$-value for $\operatorname{Aib}(1)$ is far from the allowed values. Note that since the space group is centrosymmetric, the crystal also contains the equal number of molecules existing in a right-handed helix.

[^2]Fig. 1. ORTEP Plots [19] of the molecular structures of a) $\mathbf{6 a}$ and b) one of the two symmetry-independent molecules of $\mathbf{8 a}$ (50\% probability ellipsoids, arbitrary numbering of the atoms)

The molecule 6a does not form intramolecular H-bonds. Each N-H group of the molecule acts as a donor for intermolecular H-bonds: $\mathrm{N}(2)-\mathrm{H}$ forms an intermolecular H bond with the amide $\mathrm{O}(1)$-atom at the $\mathrm{Ph}(\mathrm{Me}) \mathrm{N}$ end of a neighboring peptide molecule and thereby links the molecules into extended chains which run parallel to the [010] direction and which can be described by a graph set motif [20] of $\mathrm{C}(5)$. $\mathrm{N}(3)-\mathrm{H}$ forms an intermolecular $\mathrm{H}-$ bond with the amide $\mathrm{O}(2)$-atom in the middle of a different neighboring peptide molecule and thereby links the molecules into centrosymmetric dimers, in which the interactions can be described by a graph set motif of $\mathrm{R}^{2}, 2(10)$. The combination of these interactions links the molecules into two-dimensional networks which lie parallel to the (10-1) plane.

Table 1. Torsion Angles $\omega, \phi$, and $\psi$ of the Backbone of Compounds 6a, 8a, 10, 12, and $\mathbf{1 4}$ in the Crystal (atom numbering refers to Figs. 1-3)
$Z-(A i b)_{3}-N(M e) P h(\mathbf{8 a})$. There are two molecules with almost identical conformations but with opposite helicity in the asymmetric unit. As the space group is centrosymmetric, both of the independent molecules exist in the crystal in their left- and right-handed forms. A view of molecule A is shown in Fig. 1. Both molecules form a $\beta$-turn, stabilized by an intramolecular H -bond between $\mathrm{N}(2)-\mathrm{H}$ of $\mathrm{Aib}(2)$ and $\mathrm{C}=\mathrm{O}(4)$ of the Z-protecting group (Table 2). This corresponds with the observation of Toniolo et al. that polypeptides with a Zprotected N -terminal Aib form a $\beta$-turn of type III with a $4 \rightarrow 1 \mathrm{H}$-bond between NH of the third amino acid and $\mathrm{C}=\mathrm{O}$ of the Z -group [21]. All torsion angles $\omega$ of the amide groups show
characteristic values for trans-amide bonds (Table 1). The average magnitudes of the torsion angle-pairs $\phi_{1-3} / \psi_{1-2}$ are $57.3^{\circ}$ and $33.8^{\circ}$, typical for a $3_{10}$-helix. The torsion angles $\psi_{3 \mathrm{~A}}$ and $\psi_{3 \mathrm{~B}}$ of the C-terminal Aib differ significantly from the ideal value of $\pm 30^{\circ}$, a fact that has also been described earlier [21a].

Each N-H group of each independent molecule acts as a donor for H -bonds. In molecule $\mathrm{A}, \mathrm{N}(2)-\mathrm{H}$ forms an intramolecular H -bond with the urethane $\mathrm{O}(4)$-atom that is seven atoms along the peptide backbone. This interaction has a graph set motif [20] of $\mathrm{S}(10)$ and serves to maintain a fairly rigid helical conformation of the peptide. $\mathrm{N}(3)-\mathrm{H}$ and $\mathrm{N}(4)-\mathrm{H}$, which are unable to form an intramolecular interaction because of their positions in the backbone, form intermolecular H-bonds with the amide $\mathrm{O}\left(31^{\prime}\right)$ and $\mathrm{O}\left(32^{\prime}\right)$-atoms closest to the $\mathrm{Ph}(\mathrm{Me}) \mathrm{N}$ end of the same neighboring B molecule. Molecule B exhibits an identical pattern of H-bonds. Each of these specific donors links molecules A and B alternately into extended chains which run parallel to the [101] direction, and which can be described by a graph set motif of $\mathrm{C}^{2}{ }_{2}(16)$. The double-bridge between adjacent molecules resulting from both the interactions forms a ring with a graph set motif of $\mathrm{R}^{2}{ }_{2}(12)$.

Table 2. Intramolecular H-bonds in 8a, 10, 12, and $\mathbf{1 4}$ in the Crystal (atom numbering refers to Figs. 1-3)
$Z-(A i b)_{4}-N(M e) P h(10)$. The asymmetric unit of the centrosymmetric structure contains one molecule of the peptide $\mathbf{1 0}$ and one molecule of $\mathrm{H}_{2} \mathrm{O}$. A view of the molecule is shown in Fig. 2. The right-handed $3_{10}$-helical conformation of the reference molecule is stabilized by two intramolecular $4 \rightarrow 1 \mathrm{H}$-bonds, which form $\beta$-turns of type III’ (N(2)$\left.\mathrm{H}^{\cdots} \mathrm{O}(4), \mathrm{N}(3)-\mathrm{H}^{\cdots} \mathrm{O}(5)\right)$. As in the previous case, $\mathrm{N}(3)-\mathrm{H}$ forms a H -bond with the $\mathrm{C}=\mathrm{O}(5)$ group of the urethane. All torsion angles $\omega$ are in the region of trans amide bonds, and the
magnitudes of the torsion angles $\phi_{1-4}$ and $\psi_{1-3}$ are those of a $3_{10}$-helical conformation (Table 1 ; average values $-55.3^{\circ}$ and $-29.0^{\circ}$, resp.). Again, the value of $\psi_{4}$ deviates significantly from $\pm 30^{\circ}$. It is worth mentioning that $\phi_{4}$ and $\psi_{4}$ are positive whereas $\phi_{1-3}$ and $\psi_{1-3}$ are all negative, i.e. the helicity of the last Aib is inverted.

Fig. 2. ORTEP Plots [19] of the molecular structures of a) $\mathbf{1 0}$ and b) $\mathbf{1 2}$ (50\% probability ellipsoids, arbitrary numbering of the atoms, $\mathrm{H}_{2} \mathrm{O}$ molecule in $\mathbf{1 0}$ omitted)

Each $\mathrm{N}-\mathrm{H}$ group of the molecule $\mathbf{1 0}$ acts as a donor for H -bonds. $\mathrm{N}(2)-\mathrm{H}$ and $\mathrm{N}(3)-\mathrm{H}$ form intramolecular H -bonds with the amide $\mathrm{O}(4)$ and $\mathrm{O}(5)$-atoms that are seven atoms along the peptide backbone. Each of these interactions has a graph set motif [20] of $\mathrm{S}(10)$. N(5)-H, which is unable to form an intramolecular interaction because of its position in the backbone, forms an intermolecular H -bond with the amide $\mathrm{O}\left(1^{\prime}\right)$-atom at the $\mathrm{Ph}(\mathrm{Me}) \mathrm{N}$ end of a neighboring peptide molecule. These interactions link the molecules into extended chains which run parallel to the [010] direction and which can be described by a graph set motif of $\mathrm{C}(14)$. $\mathrm{N}(4)-\mathrm{H}$ forms an intermolecular H -bond with the O -atom of the $\mathrm{H}_{2} \mathrm{O}$ molecule, which, in turn, donates a H -bond to the amide $\mathrm{O}\left(1^{\prime}\right)$-atom at the $\mathrm{Ph}(\mathrm{Me}) \mathrm{N}$ end of the next peptide molecule in the chain. These interactions can be described by a binary graph set motif of $C^{2}{ }_{2}(13)$.
$Z-(A i b)_{5}-N(M e) P h(12)$. The molecular structure is shown in Fig. 2. The reference molecule in the asymmetric unit of the centrosymmetric structure forms a left-handed $3_{10^{-}}$ helix, stabilized by three intramolecular H-bonds of type $4 \rightarrow 1$, i.e. three $\beta$-turns of type III: $\mathrm{N}(2)-\mathrm{H}^{+\cdots} \mathrm{O}(4), \mathrm{N}(3)-\mathrm{H}^{\cdots} \mathrm{O}(5)$, and $\mathrm{N}(4)-\mathrm{H}^{\cdots} \mathrm{O}(6)$, the last one including the $\mathrm{C}=\mathrm{O}$ of the urethane (Table 2). The torsion angles $\omega$ are typical for trans amide bonds, and the magnitudes of the torsion angles $\phi_{1-4}$ and $\psi_{1-4}$ are characteristic for a $3_{10}$-helical conformation
(Table 1; average values $+56.3^{\circ}$ and $+28.5^{\circ}$, resp.). The values of the last pair $\phi_{5}$ and $\psi_{5}$ are quite different and have the opposite sign $\left(-47.6(6)^{\circ}\right.$ and $\left.-54.1(5)^{\circ}\right)$ compared with $\phi_{1-4}$ and $\psi_{1-4}$.

Each N-H group of the molecule acts as a donor for H-bonds. $\mathrm{N}(2)-\mathrm{H}, \mathrm{N}(3)-\mathrm{H}$, and $\mathrm{N}(4)-\mathrm{H}$ form intramolecular H -bonds with the amide $\mathrm{O}(4), \mathrm{O}(5)$, and $\mathrm{O}(6)$-atoms that are seven atoms along the peptide backbone. Each of these interactions has a graph set motif [20] of $\mathrm{S}(10)$. These H -bonds stabilize the peptide in a fairly rigid helical conformation. $\mathrm{N}(5)-\mathrm{H}$ and $\mathrm{N}(6)-\mathrm{H}$, which are unable to form an intramolecular interaction because of their positions in the backbone, form intermolecular H -bonds with the amide $\mathrm{O}\left(1^{\prime}\right)$ and $\mathrm{O}\left(2^{\prime}\right)$-atoms closest to the $\mathrm{Ph}(\mathrm{Me}) \mathrm{N}$ end of the same neighboring molecule. Each of these specific donors links the molecules into extended chains which run parallel to the [100] direction and which can be described by a graph set motif of $\mathrm{C}(14)$. The double-bridge between adjacent molecules resulting from both the interactions forms a ring with a graph set motif of $\mathrm{R}^{2},_{2}(12)$.
$Z-(A i b)_{6}-N(M e) P h(14)$. The molecular structure is shown in Fig. 3. The asymmetric unit contains one molecule of $\mathbf{1 4}$ plus a site, which is approximately $25 \%$ occupied by a $\mathrm{H}_{2} \mathrm{O}$ molecule. Four intramolecular H-bonds of type $4 \rightarrow 1$, i.e. four $\beta$-turns of type III’ (N(2)$\mathrm{H}^{\cdots} \mathrm{O}(4), \mathrm{N}(3)-\mathrm{H}^{\cdots} \mathrm{O}(5), \mathrm{N}(4)-\mathrm{H}^{\cdots} \mathrm{O}(6)$, and $\mathrm{N}(5)-\mathrm{H} \ldots \mathrm{O}(7)$, Table 2), stabilize a righthanded $3_{10}$-helix. The compound crystallizes in a chiral space group, so all molecules exclusively posses a right-handed helix. As in the cases of $\mathbf{8 a}, \mathbf{1 0}$, and $\mathbf{1 2}$, the acceptor of the last H -bond is the $\mathrm{C}=\mathrm{O}$ group of the urethane. All torsion angles $\omega$ are compatible with trans amide bonds, and the values of the torsion angles $\phi_{1-5}$ and $\psi_{1-5}$ are characteristic for a $3_{10^{-}}$ helical conformation (Table 1; average values $-54.6^{\circ}$ and $-35.1^{\circ}$, resp.). Again, the values of the last pair $\phi_{6}$ and $\psi_{6}$ differ and have the opposite sign $\left(+49.3(4)^{\circ}\right.$ and $\left.+52.7(4)^{\circ}\right)$.

Fig. 3. ORTEP Plot [19] of the molecular structure of $\mathbf{1 4}$ (50\% probability ellipsoids, arbitrary numbering of the atoms, the $\mathrm{H}_{2} \mathrm{O}$ molecule has been omitted)

Each $\mathrm{N}-\mathrm{H}$ group of the molecule acts as a donor for H -bonds. The four interactions involving $\mathrm{N}(2)-\mathrm{H}, \mathrm{N}(3)-\mathrm{H}, \mathrm{N}(4)-\mathrm{H}$, and $\mathrm{N}(5)-\mathrm{H}$ are intramolecular H -bonds with the amide $\mathrm{O}(4), \mathrm{O}(5), \mathrm{O}(6)$, and $\mathrm{O}(7)$-atoms that are seven atoms along the peptide backbone. Each of these interactions has a graph set motif [20] of $S(10)$. This serves to maintain a fairly rigid helical conformation of the peptide. $\mathrm{N}(7)-\mathrm{H}$, which is unable to form an intramolecular interaction because of its position in the backbone, forms an intermolecular H -bond with the amide O -atom at the $\mathrm{Ph}(\mathrm{Me}) \mathrm{N}$ end of a neighboring peptide molecule. These interactions link the molecules into extended chains which run parallel to the [001] direction and which can be described by a graph set motif of $\mathrm{C}(20)$. $\mathrm{N}(6)-\mathrm{H}$ forms an intermolecular H -bond with the O atom of the $\mathrm{H}_{2} \mathrm{O}$ molecule, which, in turn, donates a H -bond to the first amide O -atom in the next peptide molecule in the chain. These interactions can be described by a binary graph set motif of $\mathrm{C}^{2}{ }_{2}(19)$.
3. Conclusions. - With the presented syntheses of poly-AIB-oligopeptides and an Aib-containing heptapeptide, the usefulness of 2,2-dimethyl- 2 H -azirin-3-amines as Aib synthons in peptide synthesis was proved. Repeated azirine coupling with Z-protected $\alpha$ aminoisobutyric acid (Aib) allowed the smooth and efficient preparation of the Aib-oligomers (Z-(Aib) $\left.)_{2-6}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}\right)$ with a C-terminal amide function. The X-ray crystal-structure analyses of these oligomers confirmed the high preference of $\beta$-turns and the $3_{10}$-helical conformation. It is worth mentioning that the dimer Z-Aib-Aib-N(Me)Ph is not able to form a $\beta$-turn with the corresponding $4 \rightarrow 1 \mathrm{H}$-bond because it is to short, but the values of the torsion angles of $\operatorname{Aib}(2)$ are close to those of an Aib involved in a $\beta$-turn. As expected, in all oligomers the
terminal amide group is not involved in intramolecular H -bonding and, therefore, does not influence the structure of the peptide backbone significantly (cf. [18]). Furthermore, the conformation of the Z-protecting group, which is involved in a $4 \rightarrow 1 \mathrm{H}$-bond stabilizing the first $\beta$-turn, is similar for all investigated oligopeptides and shows the trans,transconformation (cf. [21b]). The torsion angles $\omega$ of the peptide bonds of the studied Aiboligomers are typically in the range of $171-180^{\circ}$ (trans amide bonds), and only in the two crystallographically independent molecules of Z-(Aib) $)_{3}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}$ were values of $c a .164^{\circ}$ observed for $\omega_{2}$.

With the synthesis of $\mathrm{Z}-(\mathrm{Aib})_{3}-\mathrm{Pro}-(\mathrm{Aib})_{3}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}$ it was demonstrated once more that the combination of azirine coupling, selective hydrolysis, and coupling of a peptide segment via an $5(4 H)$-oxazolone, i.e. the 'azirine/oxazolone method', is very suitable for the synthesis of Aib-rich oligopeptides.

We thank the analytical units of our institute for spectra and analyses. Financial support of the work by the Stipendienfonds der Basler Chemischen Industrie (I. D.-D.), the Swiss National Science Foundation, and F. Hoffmann-La Roche AG, Basel, is gratefully acknowledged. Dr. B. R. Vincent is thanked for the crystallographic data collection and the initial solution and refinement of the structures.

## Experimental Part

1. General. Solvents were purified by standard procedures; THF was distilled from Na /benzophenone, $\mathrm{Et}_{2} \mathrm{O}$ from Na , and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ from $\mathrm{CaCl}_{2}$; DMF, puriss. was dried over molecular sieves. All commercially available chemicals were of analytical grade and were
used without purification. The 2 H -azirin- 3 -amines $\mathbf{1 a}$ and $\mathbf{1 b}$ were prepared according to the references cited in [4]. TLC: aluminium sheets, silica gel $60 \mathrm{~F}_{254}$ (Merck). Prep. TLC: glass plates, silica gel $60 \mathrm{~F}_{254}$ ( 2 mm ; Merck). Column chromatography (CC, flash chromatography [22]): silica gel Merck 60 ( $0.040-0.063 \mathrm{~mm}$ ). High performance liquid chromatography (HPLC) with a Varian 2510 instrument and Varian 2550 UV detector ( 254 nm ) or Waters 600 E instrument with Waters 484 UV detector ( 254 nm ); Lichrosorb RP 18 or LichroCast RP 18 (reversed phase) columns. M.p.: Mettler-FP-5 apparatus; uncorrected. IR Spectra: Perkin-Elmer-297 or 781 spectrophotometer; in KBr , in $\mathrm{cm}^{-1} .{ }^{1} \mathrm{H}-$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ Spectra: Varian XL-200 or Bruker-AM-400 instrument (200 and 50.4 MHz, or 400 and 100.7 MHz , resp.); $\delta$ in ppm, coupling constants $J$ in Hz ; multiplicity of C-atoms from DEPT spectra. MS: Finnigan MAT-90 (EI) or Finnigan SSQ-700 (CI with $\mathrm{NH}_{3}$ ) instrument. Elemental analyses were performed at the Institute of Organic Chemistry of the University of Zürich.

Abbreviations: AcOEt $=$ ethyl acetate, $\mathrm{Aib}=2$-aminoisobutyric acid, $\mathrm{Bn}=$ benzyl, $\mathrm{DCC}=N, N$ '-dicyclohexyl carbodiimide, $\mathrm{Z}=$ benzyloxycarbonyl.

General Procedure 1 (GP 1, azirine coupling). To a 0.5 M soln. of the peptide acid in $\mathrm{Et}_{2} \mathrm{O}$, THF, or DMF at $0^{\circ}$ was added azirine $\mathbf{1 a}$ or $\mathbf{1 b}$ (1.1 equiv.) dropwise, and the mixture was stirred at $0^{\circ}$ for 10 min and at r.t. for several h . The precipitated product was filtered and washed with $\mathrm{Et}_{2} \mathrm{O}$ and petroleum ether. The solvent of the mother liquor was evaporated and the oily residue crystallized by treatment with petroleum ether at $0^{\circ}$. The combined crystals were dried in h.v.

General Procedure 2 (GP 2, selective hydrolysis). A 0.1 M soln. of the peptide amide in $\mathrm{THF} / 6 \mathrm{~N} \mathrm{HCl}$ (1:1) was stirred at r.t. or at $60^{\circ}$ and the progress of the reaction followed by TLC. When the reaction was complete, the same volume of 2 N HCl was added, the product was extracted with $\mathrm{Et}_{2} \mathrm{O}$, and the combined org. phase was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. After evaporation of the solvent, the product was dried in h.v.
2. Synthesis of Poly-Aib-Oligopeptides. 2.1. N-Benzyloxycarbonyl-2-methylalanine (Z-Aib-OH) [16]. To a vigorously stirred soln. of Aib ( $20 \mathrm{~g}, 194 \mathrm{mmol}$ ) in $2 \mathrm{~N} \mathrm{HCl} /$ dioxane ( $2: 1$, 145.5 ml ) at $0^{\circ}$ were added simultaneously a soln. of benzyl chloroformate ( $79.4 \mathrm{~g}, 466$ mmol ) in toluene and $4 \mathrm{~N} \mathrm{NaOH}(37 \mathrm{ml})$ to keep the pH basic. Then, the mixture was warmed to r.t., and stirring was continued overnight. After addition of $\mathrm{Et}_{2} \mathrm{O}$, the org. phase was separated, and 6 N HCl was added to the cooled aq. phase, which was then extracted with $\mathrm{Et}_{2} \mathrm{O}$ $(3 \times)$. The combined org. phase was evaporated, and the oily residue was crystallized by addition of petroleum ether at reflux temperature and subsequent cooling to r.t. The crystalline solid was washed with petroleum ether and dried in h.v. Yield of Z-Aib-OH: 44.5 g (95\%). M.p. $75.5^{\circ} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(90 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ): $10.65-10.35$ (br. $s, \mathrm{COOH}$ ); 7.35 ( $s, 5$ arom. H ); $5.65-5.25$ (br. $s, \mathrm{NH}$ ); 1.60 ( $s, \mathrm{Me}_{2} \mathrm{C}$ ).
2.2. N -Benzyloxycarbonyl-2-methylalanyl-2-methyalanine-N-methyl-N-phenylamide (Z-(Aib) $\left.)_{2}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}, 6 \mathbf{6}\right)$. According to GP 1 , to a soln. of Z-Aib-OH ( $1.30 \mathrm{~g}, 5.5 \mathrm{mmol}$ ) in $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{ml})$, azirine $\mathbf{1 a}(1.0 \mathrm{~g}, 6.0 \mathrm{mmol})$ was added. After 5 min , a precipitate formed. The mixture was kept at $4^{\circ}$ overnight and then filtered. Yield of 6a: 2.28 g (quant.). Colorless solid. M.p. $152-154^{\circ}$. $\mathrm{IR}\left(\mathrm{CHCl}_{3}\right): 3430 w, 3370 w, 2940 w, 1725 m, 1670 m, 1630 m, 1595 w$, 1495s, 1455m, 1390w, 1365w, 1170w, 1120w, 1090w, 1075w, 705w. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 200 MHz , $\mathrm{CDCl}_{3}$ ): 7.48 (br. $s, \mathrm{NH}$ ); $7.42-7.30,7.30-7.20$ ( $2 m, 10$ arom. H); 5.36 (br. $s, \mathrm{NH}$ urethane); $5.07\left(s, \mathrm{PhCH}_{2} \mathrm{O}\right) ; 3.28(s, \mathrm{MeN}) ; 1.47,1.42\left(2 s, 2 \mathrm{Me}_{2} \mathrm{C}\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}(50 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ): 173.6, 172.7 ( $2 s, 2 \mathrm{CO}$ (amide)); 154.9 ( $s, \mathrm{CO}$ (urethane)); 144.3, 136.5 ( $2 s, 2$ arom. C); 129.3, 128.4, 128.3, 128.03, 128.0, 127.9 ( $6 d, 10$ arom. CH ); $66.4\left(t, \mathrm{PhCH}_{2} \mathrm{O}\right) ; 58.4,57.0$ ( $2 s, 2 \mathrm{Me}_{2} C$ ); $41.5(q, \mathrm{MeN}) ; 25.2,25.1\left(2 q, 2 \mathrm{Me}_{2} \mathrm{C}\right)$. Anal. calc. for $\mathrm{C}_{23} \mathrm{H}_{29} \mathrm{~N}_{3} \mathrm{O}_{4}(411.51): \mathrm{C}$ 67.13, H 7.10, N 10.21; found: C 67.25, H 7.03, N 10.30 .

Suitable crystals for the X-ray crystal-structure determination were grown from $\mathrm{DMSO} / \mathrm{H}_{2} \mathrm{O}$ by slow evaporation of the solvent.
2.3. N-Benzyloxycarbonyl-2-methylalanyl-2-methyalanine (Z-(Aib) $\left.)_{2}-\mathrm{OH}, \quad 7\right)$. According to GP 2, 6a ( $3.74 \mathrm{~g}, 9.1 \mathrm{mmol}$ ) was hydrolysed. After evaporation of $\mathrm{Et}_{2} \mathrm{O}, 7$ was obtained as a colorless, crystalline solid. Yield: 2.75 g (94\%). M.p. $154-158^{\circ}$. IR (KBr): $3430 m, 3300 m, 3040 w, 2990 w, 2950 w, 1725 s, 1705 s, 1655 s, 1535 s, 1510 m, 1470 w, 1460 w$, $1445 w, 1420 w, 1380 w, 1360 w, 1300 w, 1255 m, 1230 m, 1210 w, 1185 w, 1170 w, 1080 m, 970 w$, $855 w, 785 w, 750 w, 700 w .{ }^{1}$ H-NMR (200 MHz, ( $\mathrm{D}_{6}$ )DMSO): 12.27 - 12.20 (br. $s, \mathrm{COOH}$ ); $7.48(s, \mathrm{NH}) ; 7.37-7.26$ ( $m, 5$ arom. $\mathrm{H}, \mathrm{NH}$ ); $5.02\left(s, \mathrm{PhCH}_{2} \mathrm{O}\right)$; $1.33\left(s, 2 \mathrm{Me}_{2} \mathrm{C}\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}$ (50 MHz, ( $\mathrm{D}_{6}$ )DMSO): 175.8 ( $s, \mathrm{COOH}$ ); 173.4 ( $s, \mathrm{CO}$ (amide)); 154.7 ( $s, \mathrm{CO}$ (urethane)); 137.2 ( $s$, arom. C); 128.3, 127.7, 127.5 ( $3 d, 5$ arom. CH ); $65.0\left(t, \mathrm{PhCH}_{2} \mathrm{O}\right)$; 56.0, 55.1 ( $2 s, 2$ $\mathrm{Me}_{2} C$ ); 25.0, 24.4 ( $2 q, 2 M e_{2} \mathrm{C}$ ). CI-MS: 323 (100, $[M+1]^{+}$). Anal. calc. for $\mathrm{C}_{16} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{5}$ (322.36): C 59.62, H 6.88, N 8.69; found: C 59.54, H 6.82, N 8.49.
2.4. N-Benzyloxycarbonyl-2-methylalanyl-2-methylalanyl-2-methyalanine-N-methylN -phenylamide (Z-(Aib) $\left.)_{3}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}, \mathbf{8 a}\right)$. According to GP 1 , to a soln. of $7(2.0 \mathrm{~g}, 6.2 \mathrm{mmol})$ in THF ( 14 ml ) was added $\mathbf{1 a}(1.14 \mathrm{~g}, 6.5 \mathrm{mmol})$. After warming to r.t., a precipitate formed. The mixture was stirred at r.t. for 4 h and kept at $4^{\circ}$ overnight. Yield of 8a: $2.95 \mathrm{~g}(95 \%)$. Colorless solid. M.p. $177-178^{\circ}$. IR (KBr): 3340m, 3290m, 3040w, 2990w, 2940w, 1710m, $1690 m, 1660 s, 1635 s, 1595 w, 1540 m, 1515 m, 1495 m, 1465 m, 1270 m, 1225 w, 1205 w, 1170 w$, $1100 m, 1090 m, 915 w, 740 w, 710 w .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(200 \mathrm{MHz},\left(\mathrm{D}_{6}\right) \mathrm{DMSO}\right): ~ 7.75,7.66$ (2s, 2 NH ); $7.40-7.15$ ( $m, 10$ arom. H, NH); 5.11 ( $s, \mathrm{PhCH}_{2} \mathrm{O}$ ); 3.16 ( $s, \mathrm{MeN}$ ); 1.31, 1.30, 1.29 ( $3 s, 3$ $\mathrm{Me}_{2} \mathrm{C}$ ) ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(50 \mathrm{MHz},\left(\mathrm{D}_{6}\right) \mathrm{DMSO}\right): 173.7,173.1,172.4$ (3s, 3 CO (amide)); 155.5 ( $s$, CO (urethane)); 146.0, 137.2 ( $2 s, 2$ arom. C); 128.6, 128.3, 127.6, 126.9, 126.8, 125.9 ( $6 d, 10$ arom. CH); 65.1 ( $t, \mathrm{PhCH}_{2} \mathrm{O}$ ); 56.2, 56.1, 55.9 ( $3 \mathrm{~s}, 3 \mathrm{Me}_{2} C$ ); 39.1 ( $q$, MeN); 25.4, 24.8, 24.7 (3q, $3 \mathrm{Me}_{2} \mathrm{C}$ ). Anal. calc. for $\mathrm{C}_{27} \mathrm{H}_{36} \mathrm{~N}_{4} \mathrm{O}_{5}$ (496.61): $\mathrm{C} 65.30, \mathrm{H} 7.31, \mathrm{~N} 11.28$; found: C 65.52 , H 7.54, N 11.05.

Suitable crystals for the X-ray crystal-structure determination were grown from
$\mathrm{DMSO} / \mathrm{H}_{2} \mathrm{O}$ by slow evaporation of the solvent.
2.5. N -Benzyloxycarbonyl-2-methylalanyl-2-methylalanyl-2-methyalanine (Z-(Aib) $3_{3}$ $\mathrm{OH}, \mathbf{9})$. According to $G P 2,8 \mathbf{a}(4.95 \mathrm{~g}, 10.0 \mathrm{mmol})$ was hydrolyzed. After 2 h , the precipitate was filtered. The aq. phase was extracted with $\mathrm{Et}_{2} \mathrm{O}$, the org. phase was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, then $\mathrm{Et}_{2} \mathrm{O}$ was evaporated, the combined solid material was washed wit $\mathrm{Et}_{2} \mathrm{O}$ and dried in h.v. Yield of 9: 3.43 g ( $85 \%$ ). Colorless solid. M.p. 195 - $196^{\circ}$. IR (KBr): $3470 \mathrm{~m}, 3410 \mathrm{~m}, 3320 \mathrm{~m}$, $3300 s, 3080 w, 3020 w, 2990 w, 2930 w, 1730 s, 1700 s, 1660 s, 1635 s, 1550 m, 1535 s, 1470 w$, $1455 m, 1390 m, 1345 m, 1310 m, 1275 s, 1225 w, 1210 w, 1180 m, 1100 s, 1080 w, 740 m .{ }^{1} \mathrm{H}-\mathrm{NMR}$ ( $200 \mathrm{MHz},\left(\mathrm{D}_{6}\right) \mathrm{DMSO}$ ): 7.62 (br. $s, 2 \mathrm{NH}$ ); $7.39-7.31$ ( $m, 5$ arom. H, NH); 5.07 ( $s$, $\mathrm{PhCH}_{2} \mathrm{O}$ ); 1.30 (br. $s, 3 \mathrm{Me}_{2} \mathrm{C}$ ). ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(50 \mathrm{MHz},\left(\mathrm{D}_{6}\right) \mathrm{DMSO}\right): 175.5$ ( $s, \mathrm{COOH}$ ); 173.4, 173.2 ( $2 s, 2 \mathrm{CO}$ (amide)); 155.4 ( $s$, CO(urethane)); 137.0 ( $s$, arom. C); 128.3, 127.8, 127.6 (3d, 5 arom. CH ); $65.3\left(t, \mathrm{PhCH}_{2} \mathrm{O}\right)$; 56.2, 55.7, 54.8 ( $3 \mathrm{~s}, 3 \mathrm{Me}_{2} \mathrm{C}$ ); 24.9, 24.5 ( $2 q, 3 \mathrm{Me}_{2} \mathrm{C}$ ). CIMS: 408 (100, $\left.[M+1]^{+}\right)$. Anal. calc. for $\mathrm{C}_{20} \mathrm{H}_{29} \mathrm{~N}_{3} \mathrm{O}_{6}$ (407.47): C 58.95, H 7.17, N 10.31; found: C 58.87, H 7.33, N 10.55.
2.6. N-Benzyloxycarbonyl-2-methylalanyl-2-methylalanyl-2-methylalanyl-2-methyalanine- N -methyl- N -phenylamide ( $\left.\mathrm{Z}-(\mathrm{Aib})_{4}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}, 10\right)$. At ca. $40^{\circ}, 9(3.20 \mathrm{~g}, 7.85$ $\mathrm{mmol})$ was dissolved in DMF ( 17 ml ). After cooling to $0^{\circ}$, according to GP $1, \mathbf{1 a}(1.55 \mathrm{~g}, 8.2$ mmol ) was added and the mixture stirred at r.t. for 4 h . The solvent was evaporated and the yellow oily residue was treated with $\mathrm{Et}_{2} \mathrm{O}$. The formed solid was filtered, dissolved in DMF, precipitated by addition of $\mathrm{Et}_{2} \mathrm{O}(3 \times)$, and dried in h.v. Yield of $\mathbf{1 0}: 4.24 \mathrm{~g}(93 \%)$. Colorless solid. M.p. $194-195^{\circ}$. IR (KBr): $3420 w, 3330 m, 3300 m, 3030 w, 2990 w, 2940 w, 1705 s, 1680$ $-1650 s(\mathrm{br}), 1630 \mathrm{~m}, 1595 m, 1530 s, 1495 m, 1470 m, 1455 m, 1395 m, 1380 m, 1365 m, 1270 m$, $1220 w, 1170 w, 1090 m, 710 m .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(200 \mathrm{MHz},\left(\mathrm{D}_{6}\right) \mathrm{DMSO}\right.$ ): 8.21, 7.84, 7.55 (3 br. $s, 3$ NH ); 7.38 - 7.16 ( $m, 10$ arom. Anal. calc. for $\mathrm{C}_{35} \mathrm{H}_{50} \mathrm{~N}_{6} \mathrm{O}_{7}$ (666.82): C 63.04, H 7.56, N 12.60; found: C 63.08, H 7.48, N 12.44.

Suitable crystals for the X-ray crystal-structure determination were grown from DMSO by slow evaporation of the solvent.
2.9. N-Benzyloxycarbonyl-2-methylalanyl-2-methylalanyl-2-methylalanlyl-2-methylalanyl-2-methyalanine (Z-(Aib) $)_{5}-\mathrm{OH}, 13$ ). According to GP 2, a suspension of $\mathbf{1 2}$ (200 $\mathrm{mg}, 0.3 \mathrm{mmol})$ in $\mathrm{THF} / 6 \mathrm{~N} \mathrm{HCl}(3 \mathrm{ml})$ was stirred at $c a .60^{\circ}$ for 1.5 h . After usual workup, the product was dried in h.v. Yield of 13: 169 mg (98\%). Colorless solid. M.p. $234-235^{\circ}$. IR (KBr): $3300 \mathrm{~m}, 3080 w, 3030 w, 299 w, 2940 w, 1730 m, 1710 m, 1660 s, 1530 s, 1455 w, 1385 w$, $1365 w, 1300 w, 1260 m, 1230 w, 1170 w, 1080 m, 750 w, 700 w .{ }^{1} \mathrm{H}-\mathrm{NMR}(200 \mathrm{MHz}$, $\left.\left(\mathrm{D}_{6}\right) \mathrm{DMSO}, 50^{\circ}\right): 11.83$ (br. $\left.s, \mathrm{COOH}\right) ; 8.24,7.85,7.48(3 s, 3 \mathrm{NH}) ; 7.34-7.30(m, 5$ arom. $\mathrm{H}, \mathrm{NH}$ ); 7.29 (br. $s, \mathrm{NH}$ ); 5.10 ( $s, \mathrm{PhCH}_{2} \mathrm{O}$ ); 1.33, 1.27, 1.22 ( $3 s, 5 \mathrm{Me}_{2} \mathrm{C}$ ). ${ }^{13} \mathrm{C}-\mathrm{NMR}(50$ $\left.\mathrm{MHz},\left(\mathrm{D}_{6}\right) \mathrm{DMSO}, 80^{\circ}\right): 174.8,174.4,174.0,173.1,173.0$ ( $5 \mathrm{~s}, \mathrm{COOH}, 4 \mathrm{CO}$ (amide)); 155.4 ( $s, \mathrm{CO}$ (urethane)); 136.7 ( $s$, arom. C); 127.8, 127.3, 126.9 ( $3 d, 5$ arom. CH ); 65.3 ( $t$, $\mathrm{PhCH}_{2} \mathrm{O}$ ); 55.8, 55.60, 55.59, 55.5, 54.5 ( $5 s, 5 \mathrm{Me}_{2} \mathrm{C}$ ); 24.6, 24.3, 24.25, 24.1 ( $4 q, 5 \mathrm{Me}_{2} \mathrm{C}$ ). Anal. calc. for $\mathrm{C}_{28} \mathrm{H}_{43} \mathrm{~N}_{5} \mathrm{O}_{8}$ (577.68): C 58.12, H 7.50, N 12.12; found: C $58.35, \mathrm{H} 7.57, \mathrm{~N}$ 11.95.
2.10. N-Benzyloxycarbonyl-2-methylalanyl-2-methylalanyl-2-methylalanyl-2-
methylalanyl-2-methylalanlyl-2-methyalanine-N-methyl-N-phenylamide (Z-(Aib) $)_{6}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}$, 14). At $c a .70^{\circ}, \mathbf{1 3}(3.0 \mathrm{~g}, 5.2 \mathrm{mmol})$ was dissolved in DMF ( 11 ml ). After cooling to $0^{\circ}$, according to GP l, was added $\mathbf{1 a}(950 \mathrm{mg}, 5.45 \mathrm{mmol})$ and the mixture stirred at r.t. for 20 h . The obtained oil was treated with $\mathrm{Et}_{2} \mathrm{O}$, and the formed solid was dried in h.v. Yield of 14: $3.58 \mathrm{~g}(92 \%)$. Colorless solid. M.p. $222-223^{\circ}$. IR (KBr): $3320 \mathrm{~m}, 3040 w, 2990 w, 2940 w$, $1745 w, 1700 m, 1670 s, 1595 w, 1525 s, 1455 w, 1385 w, 1365 w, 1270 m, 1230 w, 1170 w, 1090 m$, $\left.1100 w, 740 w, 715 w, 700 w .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(200 \mathrm{MHz},\left(\mathrm{D}_{6}\right) \mathrm{DMSO}+5 \% \mathrm{H}_{2} \mathrm{O}, 85^{\circ}\right)^{4}\right): 7.89,7.61$, 7.50, 7.48 ( 4 br. $s, 4 \mathrm{NH}$ ); $7.44-7.12$ ( $m, 10$ arom. H, 2 NH ); $5.10\left(s, \mathrm{PhCH}_{2} \mathrm{O}\right) ; 3.31(s$, MeN ); 1.45, 1.42, 1.40, 1.37, 1.36, 1.35, 1.32, 1.31, $1.28\left(9 s, 6 \mathrm{Me}_{2} \mathrm{C}\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}(50 \mathrm{MHz}$, $\left.\left.\left(\mathrm{D}_{6}\right) \mathrm{DMSO}, 70^{\circ}\right)^{4}\right): 174.9,174.7,174.5,174.45,174.1,173.5,173.14,173.1,172.3(9 s, 6$ $\mathrm{C}=\mathrm{O}$ (amide)); 155.5, 155.4 (2s, $\mathrm{C}=\mathrm{O}$ (urethan)); 146.0, 136.7 (2s, 2 arom. C ); 128.1, 127.9, 127.4, 127.0, 126.5, 125.4 ( $6 d, 10$ arom. CH); $65.3\left(t, \mathrm{PhCH}_{2} \mathrm{O}\right.$ ); 56.0, 55.9, 55.8, 55.7, 55.6, 55.5 ( $6 s, 6 \mathrm{Me}_{2} C$ ); 38.8 ( $q, \mathrm{MeN}$ ); 25.3, 25.0, 24.5, 24.4, 24.3, 24.1 ( $6 q, 6 \mathrm{Me}_{2} \mathrm{C}$ ). Anal. calc. for $\mathrm{C}_{39} \mathrm{H}_{57} \mathrm{~N}_{7} \mathrm{O}_{8}$ (751.93): C 62.30, H 7.64, N 13.04; found: C 62.08, H 7.62, N 12.82.

Suitable crystals for the X-ray crystal-structure determination were grown from DMSO/ $\mathrm{H}_{2} \mathrm{O}$ by slow evaporation of the solvent.
3. Synthesis of $Z$-(Aib) $)_{3}$-L-Pro-(Aib $)_{3}-N(M e) P h(21)$. 3.1. N-Benzyloxycarbonyl-2-methylalanyl-2-methyalanine-N,N-dimethylamide (Z-(Aib) $\left.)_{2}-\mathrm{NMe}_{2}, \mathbf{6 b}\right)$. According to GP 1 , to a soln. of Z-Aib-OH $(4.0 \mathrm{~g}, 16.9 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(36 \mathrm{ml})$ at $0^{\circ}$, azirine $\mathbf{1 b}(2.1 \mathrm{~g}, 18.6 \mathrm{mmol})$ was added, and the mixture was stirred at r.t. After 1 h , a precipitate formed, and after 24 h , the reaction was complete. The solid was filtered, washed with $\mathrm{Et}_{2} \mathrm{O}$, and dried in h.v. Yield of $\mathbf{6 b}$ : $5.13 \mathrm{~g}(87 \%)$. Colorless solid. M.p. $159-161^{\circ} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(200 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): 7.56$ (br. $s, \mathrm{NH}$ ); $7.40-7.30$ ( $m, 5$ arom. H); 5.44 (br. $s$, NH urethane); 5.09 ( $s, \mathrm{PhCH}_{2} \mathrm{O}$ ); 3.03 ( $s$, $\left.\mathrm{Me}_{2} \mathrm{~N}\right) ; 1.58,1.53\left(2 s, 2 \mathrm{Me}_{2} \mathrm{C}\right)$. CI-MS: $350\left(45,[M+1]^{+}\right), 305(100)$.

[^3]3.2. N-Benzyloxycarbonyl-2-methylalanyl-2-methylalanyl-2-methyalanine-N,Ndimethylamide (Z-(Aib) $)_{3}-\mathrm{NMe}_{2}, \mathbf{8 b}$ ). According to $G P 2, \mathbf{6 b}(5.0 \mathrm{~g}, 14.0 \mathrm{mmol}$ ) was hydrolyzed to give $7(4.40 \mathrm{~g}, 13.65 \mathrm{mmol}$; see section 2.3$)$. The crude material was dissolved in a mixture of $\mathrm{Et}_{2} \mathrm{O}(28 \mathrm{ml})$ and THF $(10 \mathrm{ml})$, and azirine $\mathbf{1 b}(1.77 \mathrm{~g}, 15.7 \mathrm{mmol})$ was added. After 42 h , the precipitate was filtered, the product washed with $\mathrm{Et}_{2} \mathrm{O}$, and dried in h.v. Yield of $\mathbf{8 b}$ : $5.46 \mathrm{~g}(92 \%)$. Colorless solid. M.p. $185-186^{\circ} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(200 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): 7.43$ (br. $s, \mathrm{NH}$ ); $7.36-7.32$ ( $m, 5$ arom. H, NH); 6.72 (br. $s, \mathrm{NH}$ ); 5.13 ( $s, \mathrm{PhCH}_{2} \mathrm{O}$ ); 2.97 (br. $s$, $\left.\mathrm{Me}_{2} \mathrm{~N}\right) ; 1.43,1.42,1.38$ ( $3 \mathrm{~s}, 3 \mathrm{Me}_{2} \mathrm{C}$ ). CI-MS: 435 (17, $\left.[M+1]^{+}\right), 390$ (100).
3.3. N-Benzyloxycarbonyl-2-methylalanyl-2-methylalanyl-2-methyalanine (Z-(Aib) $3^{-}$ $\mathrm{OH}, \mathbf{9})$. The hydrolysis of $\mathbf{8 b}(5.32 \mathrm{~g}, 12.2 \mathrm{mmol})$ according to $G P 2$ gave $\mathbf{9}(4.10 \mathrm{~g}, 96 \%$; see section 2.5).
3.4. N -Benzyloxycarbonyl-L-prolyl-2-methyalanine-N-methyl-N-phenylamide (Z-Pro-Aib-N(Me)Ph, 15). According to GP 1, to a soln. of Z-Pro-OH ( $5.0 \mathrm{~g}, 20.06 \mathrm{mmol}$ ) in abs. THF ( 50 ml ) at $0^{\circ}$, azirine $1 \mathrm{a}(3.7 \mathrm{~g}, 21.06 \mathrm{mmol})$ was added and the mixture was stirred under Ar at r.t. for 5 d . The solvent was evaporated and the residue was crystallized by treatment with $\mathrm{Et}_{2} \mathrm{O}$ and hexane. The product was washed with $\mathrm{Et}_{2} \mathrm{O}$ and dried in h.v. Yield of 15: $7.90 \mathrm{~g}(93 \%)$. Colorless solid. M.p. $119-120^{\circ} .[\alpha]_{\mathrm{D}}{ }^{20}=-51.0(\mathrm{EtOH}, \mathrm{c}=0.97)$. IR (KBr): $3420 w, 3280 m$, $3040 w .3000 w, 2970 w, 2880 w, 1710 s, 1675 s, 1625 s, 1590 m, 1535 m$, $1495 m, 1470 w, 1455 w, 1420 s, 1390 m, 1375 w, 1355 m, 1250 m, 1215 w, 1170 w, 1120 m$, $1090 m, 1070 w, 1030 w, 1020 w, 995 w, 960 w, 915 w, 870 w, 775 w, 710 m, 700 w .{ }^{1} \mathrm{H}-\mathrm{NMR}(200$ $\mathrm{MHz},\left(\mathrm{D}_{6}\right) \mathrm{DMSO}$ ): 8.12 (br. $s, \mathrm{NH}$ ); $7.40-7.10$ ( $m, 10$ arom. H ); $5.20-4.85$ ( $m, \mathrm{PhCH}_{2} \mathrm{O}$ ); $4.30-4.10(m, \mathrm{CH}(2) \mathrm{Pro}) ; 3.45-3.30\left(m, \mathrm{CH}_{2}(5) \mathrm{Pro}\right) ; 3.32(s, \mathrm{MeN}) ; 2.30-1.70(m$, $\mathrm{CH}_{2}(3), \mathrm{CH}_{2}(4)$ Pro $)$; 1.35, 1.31 (2s, $\mathrm{Me}_{2} \mathrm{C}$ ). CI-MS: 424 (43, $\left.[M+1]^{+}\right), 317$ (100). Anal. calc. for $\mathrm{C}_{24} \mathrm{H}_{29} \mathrm{~N}_{3} \mathrm{O}_{4}$ (423.52): C 68.00, H 6.90, N 9.92; found: C 67.33, H 6.89, N 10.03 .
3.5. N-Benzyloxycarbonyl-L-prolyl-2-methyalanine (Z-Pro-Aib-OH, 16). The
hydrolysis of $\mathbf{1 5}(6.63 \mathrm{~g}, 15.65 \mathrm{mmol})$ according to $G P 2$ for 2.75 h gave $\mathbf{1 6}(4.19 \mathrm{~g}, 80 \%)$ as a colorless foam. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(90 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ : 9.30 (br. $s, \mathrm{COOH}$ ); $7.50-7.10$ ( $m, 5$ arom. H , NH); 5.10 (br. $s, \mathrm{PhCH}_{2} \mathrm{O}$ ); $4.50-4.10$ ( $m, \mathrm{CH}$ (2) Pro); $3.85-3.30\left(m, \mathrm{CH}_{2}(5) \mathrm{Pro}\right) ; 2.30-$ 1.80 ( $m, \mathrm{CH}_{2}(3), \mathrm{CH}_{2}(4)$ Pro); 1.50 (br. $s, \mathrm{Me}_{2} \mathrm{C}$ ).
3.6. N-Benzyloxycarbonyl-L-prolyl-2-methylalanyl-2-methyalanine-N-methyl-Nphenylamide (Z-Pro-(Aib) $\left.)_{2}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}, \mathbf{1 7}\right)$. According to GP 1 , to a soln. of $16(4.20 \mathrm{~g}, 12.56$ $\mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(130 \mathrm{ml})$ at $0^{\circ}, \mathbf{1 a}(2.53 \mathrm{~g}, 14.45 \mathrm{mmol})$ was added and the mixture was stirred under Ar at $0^{\circ}$ overnight. The precipitate was filtered, washed with $\mathrm{Et}_{2} \mathrm{O}$, and dried in h.v. Yield of 17: $5.69 \mathrm{~g}(89 \%)$. Colorless solid. M.p. $147-148^{\circ} .[\alpha]_{\mathrm{D}}^{22}=-23.1(\mathrm{EtOH}, \mathrm{c}=$ 0.943 ). IR (KBr): $3400 \mathrm{~m}, 3310 \mathrm{~m}, 2990 w, 2940 w, 2870 w, 1695 s, 1685 s, 1625 s, 1595 w$, $1530 w, 1495 w, 1440 w, 1425 m, 1395 w, 1365 w, 1335 m, 1280 w, 1240 w, 1225 w, 1205 w$, $1110 w, 1090 w, 1000 w, 995 w, 980 w, 770 w, 730 w, 705 w .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz},\left(\mathrm{D}_{6}\right) \mathrm{DMSO}\right):$ 8.17, $7.86(2 s, 2 \mathrm{NH}) ; 7.50-7.10\left(m, 10\right.$ arom. H); $5.09\left(s, \mathrm{PhCH}_{2} \mathrm{O}\right) ; 4.20-4.10(m, \mathrm{CH}(2)$ Pro); 3.60 - 3.30 ( $m, \mathrm{CH}_{2}(5)$ Pro); $3.32(s, \mathrm{MeN}) ; 2.20-1.70\left(m, \mathrm{CH}_{2}(3), \mathrm{CH}_{2}(4) \mathrm{Pro}\right) ; 1.36$, $1.35,1.29,1.27\left(4 s, 2 \mathrm{Me}_{2} \mathrm{C}\right)$. CI-MS: $509\left(2,[M+1]^{+}\right), 402(100)$. Anal. calc. for $\mathrm{C}_{28} \mathrm{H}_{36} \mathrm{~N}_{4} \mathrm{O}_{5}$ (508.62): C 66.12, H 7.13, N 11.02; found: C 65.89, H 7.22, N 11.19.
3.7. N -Benzyloxycarbonyl-L-prolyl-2methylalanyl-2-methyalanine (Z-Pro-(Aib) $)_{2}-\mathrm{OH}$, 18). The hydrolysis of $\mathbf{1 7}(5.45 \mathrm{~g}, 10.72 \mathrm{mmol})$ according to $G P 2$ for 3.5 h gave $\mathbf{1 8}(4.49 \mathrm{~g}$, $94 \%$ ) as a colorless foam. $[\alpha]_{\mathrm{D}}^{22}=-36.0(\mathrm{EtOH}, \mathrm{c}=1.197)$. IR (KBr): 3330m, 3300m, $3030 w, 2990 w, 2980 w, 2940 w, 2880 w, 1730 m, 1685 s, 1650 s, 1530 m, 1500 w, 1470 m, 1440 m$, $1395 w, 1385 w, 1360 m, 1315 w, 1280 w, 1260 w, 1240 w, 1170 m, 1130 w, 1090 w, 1040 w, 990 w$, $975 w, 770 w, 750 w, 700 w .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz},\left(\mathrm{D}_{6}\right) \mathrm{DMSO}\right): 8.21(\mathrm{~s}, \mathrm{NH}) ; 7.50-7.20(m, 5$ arom. CH); 60.7 (d, C(2) Pro); 57.9, 57.1, 56.7 (3s, 3 $\mathrm{Me}_{2} C$ ); 47.2 ( $\left.t, \mathrm{CH}_{2}(5) \mathrm{Pro}\right) ; 40.8$ ( $q, \mathrm{MeN}$ ); 30.6, 26.2 ( $\left.2 t, \mathrm{CH}_{2}(3), \mathrm{CH}_{2}(4) \mathrm{Pro}\right) ; 25.7,25.5$, 25.4, 25.0, 24.9 (5q, $\left.3 M e_{2} \mathrm{C}\right)$. FAB-MS: $460\left(20,[M+1]^{+}\right), 353$ (92).
3.10. N-Benzyloxycarbonyl-2-methylalanyl-2-methylalanyl-2-methylalanyl-L-prolyl-2-methylalanyl-2-methylalanyl-2-methyalanine-N-methyl-N-phenylamide (Z-(Aib) $3_{3}$-Pro-(Aib) $3^{-}$ $\mathrm{N}(\mathrm{Me}) \mathrm{Ph}, \mathbf{2 1})$. To a stirred soln. of $9(80.6 \mathrm{mg}, 0.20 \mathrm{mmol})$ in DMF ( 1 ml ) at $0^{\circ}$, dicyclohexyl carbodiimide (CCD, $41 \mathrm{mg}, 0.20 \mathrm{mmol}$ ) was added. After $3 \mathrm{~min}, \mathrm{ZnCl}_{2}$ ( $55 \mathrm{mg}, 0.40 \mathrm{~mol}$ ) and then $\mathbf{2 0}$ ( $100 \mathrm{mg}, 0.22 \mathrm{mmol}$ ) were added in small portions, and the mixture was stirred under Ar at r.t. for 40 h . Then, aq. $\mathrm{Na}_{2} \mathrm{CO}_{3}$ soln. (2.5\%) was added and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times)$. The combined org. phase was washed with $2 \mathrm{~N} \mathrm{HCl}(3 \times)$. The org. phase was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, the solvent evaporated, and the residue dried in h.v. Yield of 21: $125 \mathrm{mg}(75 \%)$. Colorless solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ): 7.77, 7.45, 7.40, 7.23, 6.35, $5.82(6 s, 6 \mathrm{NH}) ; 7.50-7.10\left(m, 10\right.$ arom. H); 5.19, $5.08\left(A B, J_{\mathrm{AB}}=12.6, \mathrm{PhCH}_{2} \mathrm{O}\right) ; 4.22(t, J$ $=8.1, \mathrm{CH}(2) \mathrm{Pro}) ; 3.75-3.55\left(m, \mathrm{CH}_{2}(5) \operatorname{Pro}\right) ; 3.45(s, \mathrm{MeN}) ; 2.40-2.25,2.10-1.70(2 m$, $\left.\mathrm{CH}_{2}(3), \mathrm{CH}_{2}(4) \mathrm{Pro}\right) ; 1.61,1.59,1.55,1.51,1.49,1.46,1.45,1.42,1.41,1.34,1.27,1.26$ (12s, $6 \mathrm{Me}_{2} \mathrm{C}$ ). ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(50 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ): 174.9, 174.8, 174.5, 174.1, 173.6, 173.2, 173.1 (7s, 7 $\mathrm{C}=\mathrm{O}$ (amide)); 156.2 ( $s, \mathrm{C}=\mathrm{O}$ (urethane)); 146.2, 136.7 ( $2 s, 2$ arom. C ); 128.9, 128.6, 128.1, 127.2, 127.1, 126.3 ( $6 d, 10$ arom. CH); 66.5 ( $t, \mathrm{PhCH}_{2} \mathrm{O}$ ); 64.0 ( $d, \mathrm{C}(2)$ Pro); 57.1, 57.0, 56.8, 56.6 ( $4 s, 6 \mathrm{Me}_{2} C$ ); 48.4 ( $\left.t, \mathrm{CH}_{2}(5) \mathrm{Pro}\right) ; 40.1$ ( $q, \mathrm{MeN}$ ); 28.8, 26.2 ( $\left.2 t, \mathrm{CH}_{2}(3), \mathrm{CH}_{2}(4) \mathrm{Pro}\right)$; 27.8, 27.1, 26.7, 26.1, 25.8, 25.7, 25.5, 24.2, 23.9, 23.4, 23.2 ( $11 q, 6 \mathrm{Me}_{2} \mathrm{C}$ ). FAB-MS: 871 (15, [M+Na] $\left.{ }^{+}\right), 742$ (100, $[M+1-\mathrm{Ph}(\mathrm{Me}) \mathrm{NH}), 390$ (100), 305 (100).
4. X-Ray Crystal-Structure Determination of 6a, 8a, 10, 12, and 14 (Table 3 and Figs. $1-3)^{5}$ ). All measurements were performed on a Nicolet $R 3$ diffractometer using graphitemonochromated $\operatorname{Mo} K_{\alpha}$ radiation ( $\lambda 0.71073 \AA$ ). The data collection and refinement parameters are given in Table 3, and views of the molecules are shown in Figs. 1 - 3. The intensities were corrected for Lorentz and polarization effects, but not for absorption. The structures were solved by direct methods using SHELXS86 [23], which revealed the positions of all non- H -atoms. In the case of $\mathbf{8 a}$, there are two symmetry-independent molecules in the asymmetric unit. The atomic coordinates of the two molecules were tested carefully for a relationship from a higher symmetry space group using the program PLATON [24], but none could be found. In the case of $\mathbf{1 0}$, the asymmetric unit contains one molecule of the peptide plus one molecule of $\mathrm{H}_{2} \mathrm{O}$. In the case of $\mathbf{1 4}$, one significant electron density peak (ca. 0.5 $e / A^{3}$ ) remained after all other atoms were accounted for. This peak was assigned as a partially occupied site for a $\mathrm{H}_{2} \mathrm{O}$ molecule $[\mathrm{O}(9)$ ], with a site occupation factor of 0.25 . The non- $\mathrm{H}-$ atoms were refined anisotropically. The amide H -atoms were placed in the positions indicated by a difference electron density map and their positions were allowed to refine together with individual isotropic displacement parameters. The H -atoms of the $\mathrm{H}_{2} \mathrm{O}$ molecule in $\mathbf{1 4}$ could not be located. Bond lengths restraints were applied to the $\mathrm{N}(5)-\mathrm{H}$ and $\mathrm{N}(6)-\mathrm{H}$ bonds in compound 12. All remaining H -atoms were fixed in geometrically calculated positions and refined by using a rigid model where each H -atom was assigned a fixed isotropic displacement parameter with a value equal to $1.2 \mathrm{U}_{\text {eq }}$ of its parent C -atom $\left(1.5 \mathrm{U}_{\text {eq }}\right.$ for Me groups). The refinements of the structures were carried out on $F^{2}$ by using full-matrix leastsquares procedures, which minimized the function $\Sigma w\left(F_{\mathrm{o}}{ }^{2}-F_{\mathrm{c}}{ }^{2}\right)^{2}$. A correction for secondary
${ }^{5}$ ) CCDC-817459-817463 contains the supplementary crystallographic data for this paper. These data can be obtained free of charge from the Cambridge Crystallographic Data Centre via http://www.ccdc.cam.ac.uk/data_request/cif.
extinction was applied in the cases of $\mathbf{6 a}, \mathbf{8 a}$, and $\mathbf{1 0}$. Neutral atom scattering factors for nonH -atoms were taken from [25a], and the scattering factors for H -atoms were taken from [26]. Anomalous dispersion effects were included in $F_{\mathrm{c}}$ [27]; the values for $f^{\prime}$ and $f^{\prime \prime}$ were those of [25b]. The values of the mass attenuation coefficients are those of [25c]. All calculations were performed using the SHELXL97 [28] program.

Table 3. Crystallographic Data for Compounds 6a, 8a, 10, 12, and 14

Graphical Abstract

[^0]:    ${ }^{1}$ ) Part of the PhD thesis of I.D.-D., University of Zürich, 1995.

[^1]:    ${ }^{2}$ ) The term 'peptaibol' is used for amphiphilic, membrane-active Aib-containing peptides with an acylated N-terminus and a C-terminal amino alcohol, which show antibiotic properties [6][7].

[^2]:    ${ }^{3}$ ) The dipeptide derivative Z -( Aib$)_{2}-\mathrm{N}(\mathrm{Me}) \mathrm{Ph}(\mathbf{6 a})$ is not able to form a $\beta$-turn and, therefore, is not included in this comparison.

[^3]:    ${ }^{4}$ ) Some of the signals were doubled, most likely because of the presence of conformers.

[^4]:    ${ }^{\text {a }}$ ) Two symmetry-independent molecules
