## Conclusion

- **Test case:** testing particular functionality
- **Test suite:** a set of tests
- **Test:** outputs are stimuli for IUT, inputs are observations of IUT's outputs
- **Fail verdict:** IUT is rejected
- **Pass verdict:** IUT is accepted
- **Inconclusive verdict:** correct behaviour is observed but test purpose can't be reached
- **Soundness:** test cases only reject non-conformant IUT's
- **Exhaustiveness:** all non-conformant IUT's are rejected

The Tool

Conclusion

- Extracting test case by selection of accepted behaviours
- $A_O^{CTG} \subseteq A_I^{VIS}$
- $A_I^{CTG} = A_O^{VIS}$
- **L2A**: all states that lead to accept
- **Pass**:  $Accept^{VIS}$
- **Inconc**: direct successors of states in L2A by output in  $SP^{VIS}$
- **Fail**: else
- **Result**: CTG (Complete Test Graph)
- **TGVLoop**, based on Tarjan's algo ( $O(n), S(n)$ )

Conclusion

- Several software layers
- Communicate through APIs
- Each one is simulation of IOLTS (allows graph traversal)
- Each level implements one of the algorithms
- Output: test cases in TTCN or graph formats (.aut, .bcg)
- Can be used to verify manually created test cases
- SunOS 5, Windows XP, Linux

Conclusion

- TGV can synthesize tests from industrial size specs
- Drawback: manual creation of test purpose
- Still better than manual test case creation
- Future: distributed tests, improvements of algorithms
