Contents

1 The evolutionary record and methods of reconstruction

1.1 Introduction 1
1.2 The geological timescale 3
1.3 Methods of reconstruction 6
1.4 Dating methods 14

2 Earliest forms of plant life

2.1 The earliest environments 18
2.2 Accumulation of organic material and formation of the first cell 20
2.3 The first prokaryotes: the geological evidence 23
2.4 Evolution of the eukaryotes 29
2.5 Possible triggering mechanisms of eukaryotic evolution 37

3 The colonization of land

3.1 Environmental changes during the Cambrian and Ordovician (543–443 Ma) 42
3.2 Fossil evidence for plant terrestrialization 48
3.3 Examples of earliest land plants in the fossil record 59
3.4 Evolutionary trends: green algae to land plants? 67
3.5 Evolutionary trends: non-vascular to vascular plants? 74
3.6 Biogeographical distribution of the earliest land plants in the late Silurian and early Devonian (~430–390 Ma) 77

4 The first forests

4.1 Environmental changes spanning the mid-Devonian to late Carboniferous (~395–290 Ma) 81

4.2 Major changes and innovations in the plant fossil record during the mid-Devonian to late Carboniferous (~395–290 Ma) 85

4.3 Evidence of further plant adaptations to land dwelling between early Devonian and late Carboniferous (395–290 Ma) 87

4.4 Further adaptations to the plant life cycle 92

4.5 Earliest trees in the fossil record 99

4.6 Evolutionary trends: earliest vascular plants to trees 116

4.7 Biogeographical distribution of global vegetation during the early and late Carboniferous (354–290 Ma) 118

5 Major emergence of the seed plants

5.1 Environmental changes during the Permian (290–248 Ma) 130

5.2 Evolution of cycads, bennettites, ginkgos, and glossopterids 132

5.3 Biogeographical distribution of global vegetation during the middle Permian (267–264 Ma) 144

5.4 Major radiation of the conifers 148

5.5 Biogeographical distribution of global vegetation during the early Jurassic (206–180 Ma) 152

6 Flowering plant origins

6.1 Evidence for the first angiosperms 156

6.2 Nature and distribution of the earliest angiosperms 167

6.3 Why so late? 173

6.4 Evolutionary trends: gymnosperms to angiosperms? 181

6.5 Biogeographical distribution of global vegetation during the late Cretaceous (~84–65 Ma) 187

7 The past 65 million years

7.1 Environmental changes over the past 65 million years (Tertiary and Quarternary) 194
7.2 Biogeographical distribution of global vegetation between ~60 and 50 Ma (late Palaeocene to early Eocene) 201
7.3 The evolution of grasses 207
7.4 Decline of the forests and spread of aridland vegetation 210
7.5 Biogeographical distribution of global vegetation between 34–25 Ma (Oligocene) 214
7.6 The evolution of plants using C_4 and CAM photosynthetic pathways 218
7.7 Biogeographical distribution of global vegetation by 11.2–5.3 Ma (late Miocene) 222

8 Mass extinctions and persistent populations

8.1 Definition of mass extinction 232
8.2 Evidence in the geological record: plants versus animals 233
8.3 Why no mass extinction in the plant fossil record? 249
8.4 Evidence for persistence in the plant fossil record 250
8.5 Adaptations of plants for persistence 252

9 Ancient DNA and the biomolecular record

9.1 Potential of ancient DNA in evolutionary research 260
9.2 Deposition, preservation, and extraction of DNA 264
9.3 Examples of current research 266
9.4 Limitations of the technique 269
9.5 In defence of ancient DNA 272
9.6 Other fossil plant biomolecules, biomacromolecules, and chemical constituents 274
9.7 Stable carbon isotopes ($\delta^{13}C$) and the fossil plant record 279

10 Evolutionary theories and the plant fossil record

10.1 Evolutionary theories 283

10.2 Patterns of evolutionary change in the plant fossil record 286

10.3 The mechanisms driving evolutionary change 288

10.4 Why should plant evolution be related to periods of increased continental plate movement? 303

10.5 Conclusions 314
