CLARENDON PRESS • OXFORD

2007

CONTENTS

1 Introduction 1
- 1.1 The subject 1
  - 1.1.1 The porous medium equation 1
  - 1.1.2 The PME as a nonlinear parabolic equation 2
- 1.2 Peculiar features of the PME 4
  - 1.2.1 Finite propagation and free boundaries 4
  - 1.2.2 The role of special solutions 6
- 1.3 Nonlinear diffusion. Related equations 7
- 1.4 Contents 9
  - 1.4.1 The main problems and the classes of solutions 9
  - 1.4.2 Chapter overview 10
  - 1.4.3 What is not covered 12
- 1.5 Reading the book 13

Notes 14

PART ONE

2 Main applications 19
- 2.1 Gas flow through a porous medium 19
  - 2.1.1 Extensions 21
- 2.2 Nonlinear heat transfer 21
- 2.3 Groundwater flow. Boussinesq's equation 23
- 2.4 Population dynamics 25
- 2.5 Other applications and equations 26
- 2.6 Images, concepts and names taken from the applications 26

Notes 27

Problems 28

3 Preliminaries and basic estimates 30
- 3.1 Quasilinear equations and the PME 30
  - 3.1.1 Existence of classical solutions 30
  - 3.1.2 Weak theories and the PME 31
- 3.2 The GPME with good Φ. Main estimates 33
  - 3.2.1 Maximum principle and comparison 34
  - 3.2.2 Other boundedness estimates 35
  - 3.2.3 The stability estimate. L^1 contraction 36

3.2.4 The energy identity 38
3.2.5 Estimate of a time derivative 40
3.2.6 The BV estimates 42
3.3 Properties of the PME 43
3.3.1 Elementary invariance 43
3.3.2 Scaling 44
3.3.3 Conservation and dissipation 45
3.4 Alternative formulations of the PME and associated equations 46
3.4.1 Formulations 46
3.4.2 Dual equation 47
3.4.3 The p-Laplacian equation in $d = 1$ 48
Notes 49
Problems 49

4 Basic examples 52
4.1 Some very simple solutions 52
4.2 Separation of variables 53
4.2.1 Positive λ. Nonlinear eigenvalue problem 53
4.2.2 Negative $\lambda = -l < 0$. Blow-up 54
4.3 Planar travelling waves 55
4.3.1 Limit solutions 57
4.3.2 Finite propagation and Darcy's law 58
4.4 Source-type solutions. Self-similarity 59
4.4.1 Comparison of ZKB profiles with Gaussian profiles. 61
4.4.2 Self-similarity. Derivation of the ZKB solution 62
4.4.3 Extension to $m < 1$ 65
4.5 Blow-up. Limits for the existence theory 66
4.5.1 Optimal existence versus blow-up 67
4.5.2 Non-contractivity in uniform norm 67
4.6 Two solutions in groundwater infiltration 68
4.6.1 The Polubarinova-Kochina solution 68
4.6.2 The dipole solution 69
4.6.3 Signed self-similar solutions 71
4.7 General planar front solutions 72
4.7.1 Solutions with a blow-up interface 73
Notes 75
Problems 77

5 The Dirichlet problem I. Weak solutions 81
5.1 Introducing generalized solutions 81
5.2 Weak solutions for the complete GPME 84
5.2.1 Concepts of weak and very weak solution 85
5.2.2 Definition of weak solutions for the HDP 86

5.2.3 About the initial data 87
5.2.4 Examples of weak solutions for the PME 89
5.3 Uniqueness of weak solutions 90
5.3.1 Non-existence of classical solutions 91
5.3.2 The subclass of energy solutions 92
5.4 Existence of weak energy solutions for general Φ. Case of non-negative data 92
5.4.1 Improvement of the assumption on f 96
5.4.2 Non-positive solutions 96
5.5 Existence of weak signed solutions 97
5.5.1 Constant boundary data 101
5.6 Some properties of weak solutions 101
5.7 Weak solutions with non-zero boundary data 103
5.7.1 Properties of radial solutions 107
5.8 Universal bound in sup norm 108
5.9 Construction of the Friendly Giant 111
5.10 Properties of fast diffusion 114
5.10.1 Extinction in finite time 114
5.10.2 Singular fast diffusion 116
5.11 Equations of inhomogeneous media. A short review 116
Notes 119
Problems 122

6 The Dirichlet problem II. Limit solutions, very weak solutions and some other variants 126
6.1 L^1 theory. Stability. Limit solutions 127
6.1.1 Stability of weak solutions 127
6.1.2 Limit solutions in the L^1 setting 128
6.2 Theory of very weak solutions 130
6.2.1 Uniqueness of very weak solutions 132
6.2.2 Traces of very weak solutions 135
6.3 Problems in different domains 137
6.4 Limit solutions build a semigroup 138
6.5 Weak solutions with bounded forcing 140
6.5.1 Relating the concepts of solution 142
6.6 More general initial data. The case L^1_δ 143
6.7 More general initial data. The case H^{-1} 145
6.7.1 Review of functional analysis 145
6.7.2 Basic identities 146
6.7.3 General setting. Existence of H^{-1} solutions 147
Notes 148
Problems 149

7 Continuity of local solutions 152
7.1 Continuity in several space dimensions 152
7.2 Problem, assumptions and result 155
7.3 Lemmas controlling the size of v 157
7.4 Proof of the continuity theorem 164
7.4.1 Behaviour near a vanishing point 164
7.4.2 Behaviour near a non-vanishing point 165
7.4.3 End of proof 166
7.5 Continuity of weak solutions of the Dirichlet problem 167
7.5.1 Initial regularity 167
7.5.2 Boundary regularity 169
7.6 Hölder continuity for porous media equations 170
7.7 Continuity of weak solutions in 1D 175
7.8 Existence of classical solutions 177
7.9 Extensions 178
7.9.1 Fast diffusions 178
7.9.2 When continuity fails 178
7.9.3 Equations with measurable coefficients 178
7.9.4 Other 179
Notes 179
Problems 180

8 The Dirichlet problem III. Strong solutions 181
8.1 Regularity for the PME. Bounds for u_t 181
8.1.1 Bounds for u_t if $u \geq 0$ 182
8.1.2 Bound for u_t for signed solutions 184
8.2 Strong solutions 185
8.2.1 The energy identity. Dissipation 187
8.2.2 Super- and subsolutions. Barriers 188
Notes 191
Problems 191

9 The Cauchy problem. L^1-theory 194
9.1 Definition of strong solution. Uniqueness 195
9.2 Existence of non-negative solutions 197
9.3 The fundamental estimate for the CP 199
9.4 Boundedness of the solutions 202
9.5 Existence with general L^1 data 204
9.5.1 Mass conservation 206
9.5.2 More properties of L^1 solutions 206
9.5.3 Sub- and supersolutions. More on comparison 207
9.6 Solutions with special properties 208
9.6.1 Invariance and symmetry 208
9.6.2 Aleksandrov's reflection principle 209

9.6.3 Solutions with compactly supported data 210
9.6.4 Solutions with finite moments 211
9.6.5 Centre of mass and mean deviation 215
9.7 The Cauchy-Dirichlet problem in unbounded domains 216
9.8 The Cauchy problem for the GPME 217
9.8.1 Weak theory 217
9.8.2 Limit L^1 theory 220
9.8.3 Relating the Cauchy-Dirichlet and Cauchy problems 221
Notes 221
Problems 222

10 The PME as an abstract evolution equation. Semigroup approach 229
10.1 Maximal monotone operators and semigroups 230
10.1.1 Generalities on maximal monotone operators 230
10.1.2 Evolution problem associated to an m.m.o. Semigroup 233
10.1.3 Complete evolution equation 234
10.1.4 Application to the GPME 235
10.2 Discretizations, mild solutions and accretive operators 236
10.2.1 The ITD method 237
10.2.2 Problem of convergence. Mild solutions 238
10.2.3 Accretive operators 240
10.2.4 The Crandall–Liggett theorem 242
10.3 Mild solutions of the filtration equation 244
10.3.1 Problems in bounded domains 245
10.3.2 Problem in the whole space 246
10.3.3 Cauchy problem with a peculiar nonlinearity 248
10.4 Time discretization and mass transfer problems 250
10.5 Other concepts of solution 252
Notes 254
Problems 255

11 The Neumann problem and problems on manifolds 257
11.1 Problem and weak solutions 257
11.1.1 Concept of weak solution 258
11.1.2 Examples of solutions of the HNP 260
11.2 Existence and uniqueness for the HNP 260
11.2.1 Uniqueness and energy solutions 260
11.2.2 Existence and properties for good data 261
11.2.3 Existence for L^1 data 262
11.2.4 Neumann problem and abstract ODE theory 262
11.2.5 Convergence to the Cauchy problem 263
11.3 Results for the HNP with a power equation 263

11.4 Other boundary value problems 266
11.4.1 Exterior problems 266
11.4.2 Mixed problems 267
11.4.3 Nonlinear boundary conditions 267
11.4.4 Dynamic boundary conditions 268
11.4.5 Boundary conditions of combustion type 268
11.5 The porous medium flow on a Riemannian manifold 268
11.5.1 Initial value problem 269
11.5.2 Initial value problem for the PME 271
11.5.3 Homogeneous Dirichlet, Neumann and other problem 272
Notes 273
Problems 273

PART TWO

12 The Cauchy problem with growing initial data 279
12.1 The Cauchy problem with large initial data 280
12.2 The Aronson–Caffarelli estimate 281
12.2.1 Precise a priori control on the initial data 283
12.3 Existence under optimal growth conditions 284
12.3.1 Functional preliminaries 284
12.3.2 Growth estimates for good solutions 284
12.3.3 Estimates in the spaces $L^1(\rho_\alpha)$ 289
12.3.4 Existence results 290
12.4 Uniqueness of growing solutions 293
12.5 Further properties of the solutions 297
12.6 Special solutions 299
12.6.1 Bounded solutions 299
12.6.2 Periodic solutions 300
12.6.3 Problems in a half space 300
12.6.4 Problems in intervals 301
12.7 Boundedness of local solutions 301
12.8 The PME in cones and tubes. Higher growth rates 302
12.8.1 Solutions in conical domains 302
12.8.2 Solutions in tubes 303
Notes 305
Problems 306

13 Optimal existence theory for non-negative solutions 309
13.1 Measures as initial data. Initial trace 310
13.2 Existence of initial traces in the CP 312
13.3 Pierre's uniqueness theorem 315
13.4 Uniqueness without growth restrictions 321

13.5 Dirichlet problem with optimal data 325
13.5.1 The special solution 326
13.5.2 The double trace results 326
13.6 Weak implies continuous 328
13.7 Complements 328
13.7.1 Signed solutions 328
Notes 330
Problems 331

14 Propagation properties 332
14.1 Basic definitions. The free boundary 333
14.2 Evolution properties of the positivity set 334
14.2.1 Persistence 334
14.2.2 Expansion and penetration of the support 335
14.2.3 Finite propagation 337
14.3 Initial behaviour. Waiting times 340
14.3.1 Waiting times for general solutions of the Cauchy problem 342
14.3.2 Addendum for comparison. Positivity for the heat equation 343
14.3.3 Examples of infinite waiting time near a corner 344
14.4 Hölder continuity and vertical lines 345
14.5 Describing the free boundary by the time function 347
14.6 Properties of solutions in the whole space 348
14.6.1 Finite propagation for L^1 data 348
14.6.2 Monotonicity properties for solutions with compact support 349
14.6.3 Free boundary behaviour 351
14.7 Propagation of signed solutions 352
Notes 353
Problems 354

15 One-dimensional theory. Regularity and interfaces 357
15.1 Cauchy problem. Regularity of the pressure 358
15.2 New comparison theorems 363
15.2.1 Shifting comparison 363
15.2.2 Counting intersections and lap number 365
15.3 The interface 368
15.3.1 Generalities 368
15.3.2 Left-hand interface and inner interfaces 371
15.3.3 Waiting time 372
15.4 Equation of the interface and Lipschitz continuity 376
15.4.1 Semiconvexity 378

15.5 C^1 regularity 379
15.5.1 Local linear behaviour and C^1 regularity near moving points 379
15.5.2 Limited regularity. Interfaces with a corner point * 383
15.5.3 Initial behaviour 385
15.6 Local solutions. Basic estimates 385
15.6.1 The local estimate for v_x 385
15.6.2 The local lower estimate for v_{xx} 386
15.6.3 Boundary behaviour 387
15.7 Interfaces of local solutions 387
15.7.1 Review of the regularity in the local case 388
15.8 Higher regularity 389
15.8.1 Second derivative estimate 389
15.8.2 C^∞ regularity of v and $s(t)$* 391
15.8.3 Higher interface equations and convexity properties 392
15.8.4 Concavity results 393
15.8.5 Analyticity* 393
15.9 Solutions and interfaces for changing-sign solutions* 394
Notes 394
Problems 396

16 Full analysis of self-similarity 401
16.1 Scale invariance and self-similarity 401
16.1.1 Subfamilies 403
16.1.2 Invariance implies self-similarity 404
16.2 Three types of time self-similarity 405
16.3 Self-similarity and existence theory 407
16.4 Phase-plane analysis 408
16.4.1 The autonomous ODE system 409
16.4.2 Analysis of system (S1) 410
16.4.3 Some special solutions. Straight lines in phase plane 413
16.4.4 The special dimensions 414
16.5 An alternative phase plane 414
16.6 Sign-change trajectories. Complete inversion 418
16.6.1 Global analysis. Applications 420
16.7 Beyond blow-up growth. The oscillating signed solution 421
16.8 Phase plane for Type II 423
16.9 Other types of exact solutions 424
16.9.1 Ellipsoidal solutions of ZKB type 425
16.10 Self-similarity for GPME 426
Notes 427
Problems 428

17 Techniques of symmetrization and concentration 431
17.1 Functional preliminaries 431
17.1.1 Rearrangement 431
17.1.2 Schwarz symmetrization 432
17.1.3 Mass concentration 433
17.2 Concentration theory for elliptic equations 434
17.2.1 Solutions are less concentrated than their data 435
17.2.2 Integral super- and subsolutions 437
17.2.3 Comparison of solutions 438
17.3 Symmetrization and comparison. Elliptic case 439
17.3.1 Standard symmetrization result revisited 440
17.3.2 General symmetrization-concentration comparison 442
17.3.3 Problem in the whole space 444
17.4 Comparison theorems for the evolution 444
17.5 Smoothing effect and decay for the PME with L^1 functions or measures as data 446
17.5.1 The calculation of the best constant 447
17.5.2 Cases $m \leq 1$ 448
17.6 Smoothing exponents and scaling properties 449
17.7 Smoothing effect and time decay from L^p 450
Notes 452
Problems 453

18 Asymptotic behaviour I. The Cauchy problem 454
18.1 ZKB asymptotics for the PME 456
18.2 Proof of convergence for non-negative solutions 458
18.2.1 Completing the general case 464
18.3 Convergence of supports and interfaces 466
18.4 Continuous scaling version. Fokker–Planck equation 468
18.5 A Lyapunov method 469
18.6 The entropy approach. Convergence rates 473
18.6.1 Rates of convergence 475
18.7 Asymptotic behaviour in one space dimension 477
18.7.1 Adjusting the centre of mass. Improved convergence 477
18.7.2 Closer analysis of the velocity. N-waves 481
18.7.3 The quest for optimal rates 482
18.8 Asymptotic behaviour for signed solutions 483
18.8.1 Actual rates for $M = 0$ 486
18.8.2 Asymptotics for the PME with forcing 487
18.8.3 Asymptotic expansions 488

18.9 Introduction to the fast diffusion case 488
18.9.1 Stabilization with convergence in relative pointwise error 489
18.9.2 Solutions of the FDE that remain two-signed 489
18.10 Various topics 491
18.10.1 Asymptotics of non-integrable solutions 491
18.10.2 Asymptotics of filtration equations 491
18.10.3 Asymptotics of superslow diffusion 492
18.10.4 Asymptotics of the PME in inhomogeneous media 493
18.10.5 Asymptotics for systems 494
18.10.6 Other 494
Notes 494
Problems 495

19 Regularity and finer asymptotics in several dimensions 498
19.1 Lipschitz and C^1 regularity for large times 499
19.1.1 Lipschitz continuity for the pressure 499
19.1.2 Lipschitz continuity of the free boundary 502
19.1.3 $C^{1,\alpha}$ regularity 505
19.2 Focusing solutions and limited regularity 505
19.2.1 Propagation and hole filling. Unbounded speed 508
19.2.2 Asymptotic convergence 509
19.2.3 Continuation after the singularity 510
19.2.4 Multiple holes 510
19.3 Lipschitz continuity from space to time 510
19.4 C^∞ regularity 513
19.4.1 Eliminating the admissibility condition 514
19.5 Further regularity results 514
19.5.1 Conservation of initial regularity 515
19.5.2 Concavity results 515
19.5.3 Eventual concavity 515
19.6 Various 516
19.6.1 Precise Hölder regularity 516
19.6.2 Fast diffusion flows 518
Notes 518
Problems 519

20 Asymptotic behaviour II. Dirichlet and Neumann problems 521
20.1 Large-time behaviour of the HDP. Non-negative solutions 521
20.1.1 Rate of convergence 526
20.1.2 Linear versus nonlinear 527
20.1.3 On general initial data 529

20.2 Asymptotic behaviour for signed solutions 529
20.2.1 Description of the ω-limit in $d = 1$ 533
20.3 Asymptotics of the PME in a tubular domain 535
20.3.1 Basic asymptotic result 536
20.3.2 Lateral propagation. Logarithmic speed 537
20.4 Other Dirichlet problems 540
20.5 Asymptotics of the Neumann problem 543
20.5.1 Case of zero mass 544
20.5.2 Case of non-zero mass 544
20.6 Asymptotics on compact manifolds 546
Notes 546
Problems 547

COMPLEMENTS

21 Further applications 551
21.1 Thin liquid film spreading under gravity 551
21.1.1 Higher order models for thin films 552
21.1.2 Related application 553
21.2 The equations of unsaturated filtration 553
21.3 Immiscible fluids. Oil equations 554
21.4 Boundary layer theory 555
21.5 Spread of magma in volcanos 556
21.6 Signed solutions in groundwater flow 557
21.7 Limits of kinetic and radiation models 557
21.7.1 Carleman's model 557
21.7.2 Rosseland model 558
21.7.3 Marshak waves 559
21.8 The PME as the limit of particle models 559
21.9 Diffusive coagulation-fragmentation models 560
21.10 Diffusion in semiconductors 561
21.11 Contrast enhancement in image processing 561
21.12 Stochastic models. PME with noise 563
21.13 General filtration equations 563
21.14 Other 564

A Basic facts 565
A.1 Notations and basic facts 565
A.1.1 Points and sets 565
A.1.2 Functions 566
A.1.3 Integrals and derivatives 567
A.1.4 Functional spaces 567

	A.1.5 Some integrals and constants	568
	A.1.6 Various	569
A.2	Nonlinear operators	569
A.3	Maximal monotone graphs	570
	A.3.1 Comparison of maximal monotone graphs	571
A.4	Measures	572
A.5	Marcinkiewicz spaces	573
A.6	Some ideas of potential theory	574
A.7	A lemma from measure theory	574
A.8	Results for semiharmonic functions	575
A.9	Three notes on the Giant and elliptic problems	577
	A.9.1 Nonlinear elliptic approach. Calculus of variations	578
	A.9.2 Another dynamical proof of existence	579
	A.9.3 Another construction of the Giant	580
A.10	Optimality of the asymptotic convergence for the PME	581
A.11	Non-contractivity of the PME flow in L^p spaces	583
	A.11.1 Other contractivity properties	586
