The Tensor Product of Triples as Multilinear Product*

JOSE L. FREIRE NISTAL AND MIGUEL A. LOPEZ LOPEZ

ABSTRACT. In this paper we introduce a notion of multilinear product for triples in Set, which if it is given by a distributive law then coincides with the one given by Bunge. We also demonstrate that the tensor product of two triples, if there exist, is an initial object in a suitable category of multilinear products.

INTRODUCTION

In "Producto de triples" ([8]) the definition that is given of the product of triples generalizes the notion of distributive law, according to Beck ([2]). The tensor product is studied by E. Manes in various articles ([10], [11], [12]), for triples in the category Set, of sets and maps.

M. Bunge, in ([3]), studies the relationship between composition triple and tensor product of triples, for triples in Set. In this paper, it is given the definition of distributive multilinear law, which is the

distributive law in which each algebra over the composition triple is also a bialgebra.

The aim of the present paper is to introduce a notion of multilinear product for triples in Set, which if it is given by a distributive law then coincides with the one given by Bunge, and to demonstrate that the tensor product of two triples T and S, if there exist, is an initial object in the category whose objects are multilinear products $\mathbf{R} = (\mathbf{TS})_r$, and whose morphisms $\alpha: \mathbf{R} \rightarrow \mathbf{R}'$ are morphisms of triples that make the following diagram commutative

 ϕ_T and ϕ_S being the morphisms of triples associated to every product ([8]).

1. PRODUCT OF TRIPLES AND DISTRIBUTIVE LAWS

1.1 If $\mathbf{T} = (\mathbf{T}, \eta_{\mathsf{T}}, \mu_{\mathsf{T}})$ and $\mathbf{S} = (\mathbf{S}, \eta_{\mathsf{S}}, \mu_{\mathsf{S}})$ are triples in a category A, a *product* $\mathbf{R} = (\mathbf{TS})_{\mathsf{r}}$ is a triple $\mathbf{R} = (\mathbf{R}, \eta, \mathbf{m})$, where $\eta = \mathbf{r} \circ (\eta_{\mathsf{T}} \star \eta_{\mathsf{S}})$ and where the natural transformation r: TS \implies R verifies the following axioms:

i.e.: $\mathbf{r} \circ (\mu_T \star \mathbf{S}) = \mathbf{m} \circ (\mathbf{r} \star \mathbf{r}) \circ (\mathbf{T} \star \eta_S \star \mathbf{TS})$

i.e.: $\mathbf{r} \circ (\mathbf{T}_{\star} \mu_{s}) = \mathbf{m} \circ (\mathbf{r}_{\star} \mathbf{r}) \circ (\mathbf{TS}_{\star} \eta_{\mathsf{T}} \mathbf{s})$ ([8], 1.1).

1.2 If $\mathbf{R} = (\mathbf{TS})_r$ is a product, then $\phi_T := r \circ (T * \eta_S)$: $\mathbf{T} \implies \mathbf{R}$ and $\phi_S := r \circ (\eta_T * S)$: $\mathbf{S} \implies \mathbf{R}$ are morphisms of triples.

Conversely, if ϕ_T : $T \implies R$ and ϕ_S : $S \implies R$ are morphisms of triples, with $\mathbf{R} = (\mathbf{R}, \eta_R, \mathbf{m})$ then $\mathbf{R} = (TS)_r$ with r:= $\mathbf{m} \circ (\phi_T \star \phi_S)$: $TS \implies R$.

Moreover, if $\mathbf{R} = (\mathbf{TS})_r$ is a product, then $\mathbf{R} = (\mathbf{ST})_r$, is also a product, where $\mathbf{r}' = \mathbf{m} \circ (\phi_{\mathbf{S} \star} \phi_{\mathbf{T}})$ ([8], 1.2, 1.3, 1.5).

1.3 If $\mathbf{T} = (T, \eta_T, \mu_T)$ and $\mathbf{S} = (S, \eta_S, \mu_S)$ are triples in A, a *distributive* law of T over S is a natural transformation τ : TS \implies ST which verifies:

 $\begin{array}{l} D.L. \ 1) \ \tau \circ (\eta_{T} \ \star \ S) = S \ \star \ \eta_{T} \\ D.L. \ 2) \ \tau \circ (T \ \star \ \eta_{S}) = \eta_{S} \ \star \ T \\ D.L. \ 3) \ (S \ \star \ \mu_{T}) \circ (\tau \ \star \ T) \circ (T \ \star \ \tau) = \tau \circ (\mu_{T} \ \star \ S) \\ D.L. \ 4) \ (\mu_{S} \ \star \ T) \circ (S \ \star \ \tau) \circ (\tau \ \star \ S) = \tau \circ (T \ \star \ \mu_{S}) \end{array}$ ([2], 1).

1.4 A distributive law τ of **T** over **S** makes a product $\mathbf{R} = (\mathbf{TS})_r$ with $r = \tau$, $\mathbf{R} = (ST, \eta_S \star \eta_T, (\mu_S \star \mu_T) \circ (S \star \tau \star T)$ and $r' = 1_{ST}$ ("half unitary law") ([8], 2.2).

.

1.5 Conversely if $\mathbf{R} = (\mathbf{TS})_r$ is a product with $\mathbf{R} = \mathbf{ST}$ and verifies the half unitary law, $\mathbf{r}' = \mathbf{1}_{ST}$, then r is a distributive law of T over S ([8], 2.3).

1.6 Taking one of the examples given in [2], we obtain a product $(TS)_r$, in which r is not a distributive law. In fact, if T and S are graduated rings, $R = S \otimes T$ is a ring with the product operation:

$$(s_1 \otimes t_1)(s_2 \otimes t_2) = (-1)^{cs_1 ct_2} s_1 s_2 \otimes t_1 t_2$$

(∂ indicates the degree), being 1 \otimes 1 the unity element. Moreover, the maps

$$\phi_{T}: T \longrightarrow T \otimes S, \ \phi_{T}(t) = 1 \otimes t$$

$$\phi_{S}: S \longrightarrow S \otimes T, \ \phi_{S}(s) = s \otimes 1$$

are homomorphisms of rings.

The rings T, S and R give the triples $T = (-\otimes T, \eta_T, \mu_T)$, $S = (-\otimes S, \eta_S, \mu_S)$ and $\mathbf{R} = (-\otimes R, \eta_R, \mu_R)$ in the category A of abelians groups (the natural transformations η and μ are the ones induced by the unities and the multiplications of the rings). The homomorphisms ϕ_T and ϕ_S induce morphisms of triples

$$\phi_T$$
: $T \Longrightarrow R$ and ϕ_S : $S \Longrightarrow R$

 $\mathbf{R} = (\mathbf{TS})_r$, being $r = \mu_R \circ (\phi_T \star \phi_S)$ (1.2). However, in this case r is not a distributive law, because the half unitary law is not verified, that is, $r' \neq 1$.

2. TENSOR PRODUCT OF TRIPLES

2.1 Let $n \in |\text{Set}|$ and $(-)^n$: Set \rightarrow Set be the functor Hom(n,-). If $T = (T, \eta_T, \mu_T)$ is a triple in Set, a *n*-ary operation over T is a natural transformation $(-)^n \Longrightarrow T$.

If (X,ξ) is a T-algebra, each n-ary operation g over T induces an operation, $\xi^g = \xi \circ (g X)$: $X^n \longrightarrow X$, over the set X

Moreover, a T-morphism f: $(X,\xi) \rightarrow (Y,\theta)$ is a map f: $X \rightarrow Y$ which is a morphism in the classic sense, commuting with each operation, that is, for each g: $(-)^n \Rightarrow T$

i.e.: $f \circ \xi^g = f \circ \xi \circ (g X) = \theta \circ (g \star f) = \theta \circ (g Y) \circ f^n = \theta^g \circ f^n$ ([3], 1).

2.2 If **T** and **S** are triples in Set, a S-T-*bialgebra* is a 3-triple (X,σ,ξ) , with (X,σ) and S-algebra and (X,ξ) a T-algebra such that for all $n,m \in$ [Set], g: $(-)^n \Longrightarrow$ T and h: $(-)^m \Longrightarrow$ S the following holds true:

i.e.: $\sigma \circ (S_{\star}\xi) \circ ((h_{\star}g) X) \circ (\gamma_{m}^{n} X) = \xi \circ (T_{\star}\sigma) \circ ((g_{\star}h) X)$, where

$$\gamma_m^n$$
: $(-)^n (-)^m \Longrightarrow (-)^m (-)^n$

is the canonical isomorphism.

This is equivalent to, for every g: $(-)^n \Longrightarrow T, \xi^g$ is an S-morphism, or equivalently, for every h: $(-)^m \Longrightarrow S$, σ^h is a T-morphism ([3], 1).

This defines the category $\text{Set}^{(S,T)}$ of S-T-bialgebras as a full subcategory of the category $\text{Set}^{(S,T)}$ whose objects are triples (X,σ,ξ) with (X,σ) an S-algebra and (X,ξ) a T-algebra, and whose morphisms f: $(X, \sigma, \xi) \rightarrow (Y, \tau, \theta)$ are maps f: $X \rightarrow Y$, being f an S-morphism and T-morphism.

If the forgetful functor $U^{(S,T)}$: Set^(S,T) \rightarrow Set is tripleable, it makes a triple S \otimes T that is called tensor product (symmetrically, T \otimes S) ([3], [10], [11], [12]).

The existence of tensor product of triples is, in general, an open question.

3. MULTILINEAR PRODUCTS

3.1 Let $T = (T, \eta_T, \mu_T)$ and $S = (T, \eta_S, \mu_S)$ be triples in Set and $R = (TS)_r$ a product, $R = (R, r \circ (\eta_T * \eta_S), m)$.

18

We will say that **R** is a *multilinear product* if for whatever $g:(-)^n \Longrightarrow$ T and $h:(-)^m \Longrightarrow$ S it are verified

i.e.: $\mathbf{r}' \circ (\mathbf{h}_{\star} \mathbf{g}) = \mathbf{r} \circ (\mathbf{g}_{\star} \mathbf{h}) \circ \gamma_{\mathbf{n}}^{\mathbf{m}}$.

3.2 If $\mathbf{R} = (\mathbf{TS})_r$ is a product, the morphisms of triples $\phi_S \colon S \implies \mathbf{R}$ and $\phi_T \colon \mathbf{T} \implies \mathbf{R}$ (1.2) give functors (change of triple) Set^{ϕ_T}: Set^{\mathbf{R}} \longrightarrow Set^{\mathbf{S}} and Set^{ϕ_T}: Set^{\mathbf{R}} \longrightarrow Set^{\mathbf{T}}, respectively, that commute with the forgetful functors to Set. As a result, each **R**-algebra (X,τ) gives an S-algebra $(X,\sigma_\tau) = (X,\tau \circ (\phi_S X))$ and a **T**-algebra $(X,\xi_\tau) = (X,\tau \circ (\phi_T X))$. Moreover, it is verified

i.e.: $\xi_{\tau} \circ (T_*\sigma_{\tau}) = \tau_* (r X)$, and

. .

i.e.: $\sigma_{\tau} \circ (S_{\star}\xi_{\tau}) = \tau \circ (r' X)$ [12], proposition 2.9, page 210).

20 José L. Freire Nistal and Miguel A. López López

We will say that an R-algebra (X,τ) is a *bialgebra* if the S-algebra (X,σ_{τ}) and the T-algebra (X,ξ_{τ}) make an S-T-bialgebra $(X, \sigma_{\tau}, \xi_{\tau})$, i.e.:

i.e.: $\sigma_{\tau} \circ (S_{\star}\xi_{\tau}) \circ ((h_{\star}g)X) \circ (\gamma_{m}^{n}X) = \xi_{\tau} \circ (T_{\star}\sigma_{\tau}) \circ ((g_{\star}h)X)$, for all operations g: $(-)^{n} \Longrightarrow T$ and h: $(-)^{m} \Longrightarrow S$.

It is immediately proved that the last equality is equivalent to:

i.e.: $\tau \circ (r, X) \circ ((h_*g) X) \circ (\gamma_m^n X) = \tau \circ (r X) \circ ((g_*h) X).$

3.3 From former definitions we can conclude, trivially, that for a multilinear product \mathbf{R} , every \mathbf{R} -algebra is a bialgebra. Its reciprocal result is also true. If \mathbf{R} is a product and every \mathbf{R} -algebra is a bialgebra, then \mathbf{R} is multilinear as a consequence of the following result:

If **T** is a triple in Set and α,β : $(-)^k \implies T$ are k-ary operations over **T**, then $\alpha = \beta$ if and only if $\tau^{\alpha} = \tau^{\beta}$ for every **T**-algebra (X,τ) ([3], lemma 2.5, page 145).

To obtain our result, it is enough to take

i.e.: $\alpha = r' \circ (h_{\star}g) \circ \gamma_m^n$ and $\beta = r \circ (g_{\star}h)$.

4. THE TENSOR PRODUCT AS MULTILINEAR PRODUCT

4.1 Let $T = (T, \eta_T, \mu_T)$ and $S = (T, \eta_S, \mu_S)$ be triples in Set. Let us suppose that the tensor product $S \otimes T = R = (R, \eta_R, m)$ exist, i.e., the following diagram

is commutative, ϕ being an isomorphism. For the inclusion functor i: Set^[S,T] \rightarrow Set^S,

 $i(f: (X, \varepsilon, \delta) \rightarrow (X', \varepsilon', \delta')) = f: (X, \varepsilon) \rightarrow (X', \varepsilon'))$ the following diagram of functors is commutative:

Since $i \circ \phi^{-1}$ commutes with the forgetful functors, a natural transformation exists σ : SR \Longrightarrow R such that $\phi_s = \sigma \circ (S_*\eta_R)$: S \Longrightarrow R is a morphism of triples ($i \circ \phi^{-1} = \text{Set}^{\phi_s}$ is the change of triple functor). For $X \in |\text{Set}|$, and (RX,mX) being the free **R**-algebra over X, ($i \circ \phi^{-1}$) (RX,mX) = (RX,\sigmaX). For any **R**-algebra (X, τ), ($i \circ \phi^{-1}$) (X, τ) = (X, $\tau \circ (\phi_s X)$).

In the same way, for the triple T, a natural transformation exists ξ : TR \implies R, such that $\phi_T = \xi \circ (T_*\eta_R)$: T \implies R is a morphism of triples.

If (X,τ) is an **R**-algebra, $\phi^{-1}(X,\tau) = (X,\tau \circ (\phi_S X), \tau \circ (\phi_T X))$. In particular, $\phi^{-1}(RX, mX) = (RX, \sigma X, \xi X)$.

4.2 From all this and from (1.2) it follows that **R** is a product, $\mathbf{R}=(\mathbf{TS})_r$ with $r = m \circ (\phi_{T*}\phi_s) = \xi \circ (T_*\sigma) \circ (TS_*\eta_R)$ (this last equality is true since mX: (RRX, σ RX, ξ RX) \rightarrow (RX, σ X, ξ X) is a morphism of S-algebras and of T-algebras).

If (X,τ) is an **R**-algebra, $\phi^{-1}(X,\tau) = (X,\tau \circ (\phi_S X), \tau \circ (\phi_T X)) = (X, \sigma_{\tau}, \xi_{\tau})$ is an **S**-**T**-algebra and, by (3.2) and (3.3), **R** is a multilinear product.

5. THE CATEGORY OF MULTILINEAR PRODUCTS

5.1 Let T and S be triples in Set. Taking as objects the multilinear products $\mathbf{R} = (\mathbf{TS})_r$ and as morphisms, α : $\mathbf{R} = (\mathbf{TS})_r \longrightarrow \mathbf{R'} = (\mathbf{TS})_{r'}$, those morphisms of triples α : $\mathbf{R} \longrightarrow \mathbf{R'}$ that make the diagram commutative

we obtain the category of multilinear products of T and S.

5.2 In the category of multilinear products of T and S, S \otimes T is an initial object. Let us write S \otimes T = R = (R, η_R , m) = (TS)_r.

Let $\mathbf{R'} = (\mathbf{R'}, \eta_{\mathbf{R'}}, \mathbf{m'}) = (\mathbf{TS})_{\mathbf{r'}}$ be an arbitrary multilinear product and $\phi'_s: \mathbf{S} \Longrightarrow \mathbf{R'}, \phi'_T: \mathbf{T} \Longrightarrow \mathbf{R'}$ the corresponding morphisms of triples. If (X, τ') is an **R'**-algebra, $(X, \sigma_{\tau'}, \xi_{\tau'}) = (X, \tau' \circ (\phi'_s X), \tau' \circ (\phi'_T X))$ is an **S-T**-bialgebra.

If j is the functor j: Set^{R'} \rightarrow Set^[S,T] such that $j(X,\tau') = (X,\sigma_{\tau'},\xi_{\tau'})$, then the following diagram of functors is commutative:

Thus, a natural transformation exists λ : RR' \Rightarrow R', so that $\alpha = \lambda \circ (R_*\eta_R)$: $\mathbf{R} \Rightarrow \mathbf{R}'$ is a morphism of triples, being $\phi \circ \mathbf{j} = \operatorname{Set}^{\alpha}$ the change of triple functor. Moreover, $(\phi \circ \mathbf{j})(X,\tau') = (X,\tau' \circ (\alpha X))$ and, in particular, $(\phi \circ \mathbf{j})(\mathbf{R}'X, \mathbf{m}'X) = (\mathbf{R}'X, \lambda X) = (\mathbf{R}'X, (\mathbf{m}'X) \circ (\alpha \mathbf{R}'X))$. Then,

 $(R'X,(m'X) \circ (\phi'_S R'X),(m'X) \circ (\phi'_T R'X)) = \phi^{-1} ((\phi \circ j)(R'X,m'X) =$

= $\phi^{-1}(R'X,(m'X) \circ (\alpha R'X)) = (R'X, (m'X) \circ (\alpha R'X) \circ (\phi_S R'X), (m'X) \circ (\alpha R'X) \circ (\phi_T R'X))$ from which we can obtain

$$m' \circ (\phi'_{s*}R') = m' \circ ((\alpha \circ \phi_s)_*R') \iff \phi'_s = \alpha \circ \phi_s$$

$$m' \circ (\phi'_{\tau*}R') = m' \circ ((\alpha \circ \phi_{\tau})_*R') \iff \phi'_{\tau} = \alpha \circ \phi_{\tau}$$

that is, there is a morphism in the category of multilinear products $\alpha: \mathbf{R} \longrightarrow \mathbf{R}'$.

5.3 Let us see the uniqueness of α . Let $\beta: \mathbb{R} \longrightarrow \mathbb{R}'$ be a morphism of triples such that $\beta \circ \phi_T = \phi'_T$ and $\beta \circ \phi_S = \phi'_S$. Set^{β}: Set^{\mathbb{R}'} \longrightarrow Set^{\mathbb{R}} is the change of triple functor corresponding to β (note that $\phi \circ j = \text{Set}^{\alpha}$). Then

 $\alpha = \beta \iff \text{Set}^{\alpha} = \text{Set}^{\beta} \iff \text{Set}^{\alpha} (\text{R'X}, \text{m'X}) = \text{Set}^{\beta} (\text{R'X}, \text{m'X})$ for every free **R**'-algebra (R'X, m'X) ([12], prop. 2.9, page 210). Also

 $\beta \circ \phi_{T} = \phi'_{T} = \alpha \circ \phi_{T} \iff m' \circ (\beta_{\star} R') \circ (\phi_{T \star} R') = m' \circ (\alpha_{\star} R') \circ (\phi_{T \star} R')$ $\beta \circ \phi_{S} = \phi'_{S} = \alpha \circ \phi_{S} \iff m' \circ (\beta_{\star} R') \circ (\phi_{S \star} R') = m' \circ (\alpha_{\star} R') \circ (\phi_{S \star} R')$

But, $j(R'X, m'X) = (R'X, (m'X) \circ (\alpha R'X) \circ (\phi_s R'X), (m'X) \circ (\alpha R'X) \circ (\phi_T R'X)) = \phi^{-1} \operatorname{Set}^{\beta}(R'X, m'X)$, so $\operatorname{Set}^{\alpha}(R'X, m'X) = \operatorname{Set}^{\beta}(R'X, m'X)$,
