ABSTRACT

The standard-state thermodynamic properties of 14 Å Fe-amesite [$\text{Fe}_4\text{Al}_4\text{Si}_2\text{O}_{10}(\text{OH})_8$] were calculated from the reequilibration experiments of Parra et al. (2005) and natural data bearing on the Fe-Mg partitioning between chlorite and chloritoid over a wide range of pressure (P), temperature (T), and rock composition. The combination of these data with the three-site mixing model and thermodynamic properties of daphnite proposed by Vidal et al. (2001) led us to reappraise the evolution of the Margules parameter W_{AlFe}^G with pressure and temperature. The new data [$H_{\text{Fe-Am}}^0 = -7\,607\,460$ J/mol, $S_{\text{Fe-Am}}^0 = 514.8$ J/(mol·K), $V_{\text{Fe-Am}}^0 = 20.90$ J/bar, $W_{\text{AlFe}}^G = 1200 - 31T + 0.7(P - 1)$] are compatible with all the natural data and reequilibration experiments, and in fair agreement with the results of synthesis. They are used to calculate the compositional evolution of chlorite with T , P , or a_{O_2} at different bulk-system compositions. The calculated phase relations and chlorite compositions are compared with previous experiments conducted in the FeO-Al₂O₃-SiO₂-H₂O system. The addition of the Fe-amesite end-member increases the number of equilibria that can be calculated for any natural assemblage involving chlorite. Two independent equilibria are obtained for natural (Fe-Mg)-chlorite-quartz or diaspore assemblages. It is therefore possible to estimate metamorphic conditions for high-variance assemblages from the composition of chlorite. We discuss the reliability of such P - T estimates using natural chlorites occurring in low-pressure and low-temperature or medium- to high-pressure and temperature samples. Assuming that the proposed model and thermodynamic parameters are correct, these various natural data suggest that $X_{\text{Fe}^{3+}} = [\text{Fe}^{3+}/(\text{Fe}^{2+} + \text{Fe}^{3+})]$ in metamorphic chlorites is low (<0.1), whereas it can be as high as 0.3 in Si- and Mg-rich chlorites formed at low- P - T conditions.
