## Supporting Information

## 1 Synthesis of bi- and triradicals

## General information

All reactions were performed under argon. In case of alkynyl-aryl cross-coupling reactions, the solutions containing both coupling components, the solvent and the amine were degassed through several freeze-pump-thaw-cycles prior to addition of the catalysts. THF was distilled from sodium/benzophenone. Piperidine was distilled from $\mathrm{CaH}_{2}$. Diethylamine and triethylamine were used as received. 1-Oxyl-2,2,5,5-tetramethylpyrroline-3-carboxylic acid was purchased from Acros. Triiodobenzene $\mathbf{1}[1]$ and the alkynes $\mathbf{7}[1,2]$ were prepared as described in the literature.
For flash chromatography, Merck silica gel ( $40-63 \mu \mathrm{~m}$ ) and Acros silica gel ( $35-70 \mu \mathrm{~m}$ ) was used. For the preparation of the chromatotron plates (centrifugal preparative thin layer chromatography) Merck silica gel $60 \mathrm{PF}_{254}$ was used. Thin layer chromatography (TLC) was carried out on silica gel coated aluminum foils (Merck, $60 \mathrm{~F}_{254}$ ). Ratios of solvents in mixtures are given as volume to volume.
The melting points were determined in open capillaries. Elemental analyses were made at the analytical laboratory of Bielefeld University or at an external analytical laboratory. MALDI

TOF mass spectra were recorded with a Voyager DE Instrument mounted with a 1.2 m flight tube. Ionisation was achieved using an LSI nitrogen laser ( 337 nm beam wavelength, 3 ns pulse width, 3 Hz repetition rate). The ions were accelerated with 15 to 20 kV . 1,8,9trihydroxyanthracene was used as the matrix and THF or $\mathrm{CHCl}_{3}$ as the solvent to prepare the samples.
Unless specified otherwise, NMR spectra were recorded at $27-30^{\circ} \mathrm{C}$ on a Bruker 250 or a Bruker 500 instrument. The solvent was used as an internal standard. The coupling constants are given in Hz . For ${ }^{13} \mathrm{C}$ NMR signal assignment the carbon multiplicity (quaternary carbon (C), tertiary carbon $(\mathrm{CH})$, secondary carbon $\left(\mathrm{CH}_{2}\right)$, primary carbon $\left(\mathrm{CH}_{3}\right)$ ) was determined by a DEPT-135 experiment. The detailed assignment is based on reported shift increments[3] and on our own data obtained from related compounds.[1, 2, 4, 5]

## Diiodo compound 2

$\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}(4 \mathrm{mg}, 0.006 \mathrm{mmol})$ and $\mathrm{CuI}(3 \mathrm{mg}, 0.02 \mathrm{mmol})$ were added to a degassed solution of alkyne $\boldsymbol{7}_{\mathbf{0}}(81 \mathrm{mg}, 0.40 \mathrm{mmol})$ and triiodobenzene $\mathbf{1}(609 \mathrm{mg}, 1.34 \mathrm{mmol})$ in diethylamine $(10 \mathrm{~mL})$. After stirring the reaction mixture at room temperature for $16 \mathrm{~h}, \mathrm{Et}_{2} \mathrm{NH}$ was distilled
off at room temperature and slightly reduced pressure. The residue was dissolved in $\mathrm{Et}_{2} \mathrm{O}$, THF and water, the aqueous phase was extracted with a mixture of $\mathrm{Et}_{2} \mathrm{O}$ and THF, and the combined organic extracts were washed with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated at reduced pressure giving a colorless solid. This crude product was adsorbed onto a small quantity of silica gel through dissolving it in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, adding silica gel to this solution, and removing the solvent $\left(40^{\circ} \mathrm{C}\right.$, reduced pressure). The resulting freely flowing powder was applied to a silica gel column by pouring it into a small amount of solvent overlaying the silica gel column. Column chromatography ( $n$-pentane/ $\mathrm{Et}_{2} \mathrm{O}$ 12:1) yielded triiodobenzene 1 (347 $\left.\mathrm{mg}, 57 \% ; R_{\mathrm{f}}=0.72\right)$ as a colorless solid and diiodo compound $\mathbf{2}\left(121 \mathrm{mg}, 57 \% ; R_{\mathrm{f}}=0.52\right)$ as a colorless solid (mp $122{ }^{\circ} \mathrm{C}$; Found C, 43.15; H, 3.06. Calc. for $\mathrm{C}_{19} \mathrm{H}_{16} \mathrm{O}_{2} \mathrm{I}_{2}$ (530.145): C, 43.04; $\mathrm{H}, 3.04 \%$ ) containing a trace (about $1 \%$ as judged from ${ }^{1} \mathrm{H}$ NMR spectrum) of disubstitution product 3. Analytical data of diiodo compound 2: $\delta_{\mathrm{H}}\left(250 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 7.97(1 \mathrm{H}, \mathrm{t}, J 1.5$, $\mathrm{H}_{\alpha}$ ortho to both I), $7.80\left(2 \mathrm{H}, \mathrm{d}, J 1.5, \mathrm{H}_{\alpha}\right.$ ortho to one I and to $\left.\mathrm{C} \equiv \mathrm{C}\right), 7.41$ and $7.02(2 \mathrm{H}$ each, AA'XX' spinsystem, $\mathrm{H}_{\beta}$ meta to OTHP and $\mathrm{H}_{\beta}$ ortho to OTHP, respectively), 5.44 (1 H, t-shaped, $J 3, \mathrm{O}_{2} \mathrm{CH}$ ), 3.87 and $3.61\left(1 \mathrm{H}\right.$ each, $\left.2 \mathrm{~m}, \mathrm{OCH}_{2}\right)$, 2.1-1.5 $\left(6 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right) ; \delta_{\mathrm{C}}(62.8$ $\left.\mathrm{MHz} ; \mathrm{CD}_{2} \mathrm{Cl}_{2}\right) 158.2\left(\mathrm{C}, C_{\beta} \mathrm{O}\right), 144.9$ and $139.6\left(\mathrm{CH}, \mathrm{C}_{\alpha} \mathrm{H}\right), 133.5\left(\mathrm{CH}, \mathrm{C}_{\beta} \mathrm{H}\right.$ meta to OTHP), $127.6\left(\mathrm{C}, C_{\alpha} \mathrm{C} \equiv \mathrm{C}\right), 117.0\left(\mathrm{CH}, \mathrm{C}_{\beta} \mathrm{H}\right.$ ortho to OTHP), $115.4\left(\mathrm{C}, C_{\beta} \mathrm{C} \equiv \mathrm{C}\right), 96.8\left(\mathrm{CH}, \mathrm{O}_{2} \mathrm{CH}\right)$, 94.3 and $92.4(\mathrm{C}, \mathrm{C} \equiv \mathrm{C}), 85.2\left(\mathrm{C}, \mathrm{C}_{\alpha} \mathrm{I}\right), 62.5\left(\mathrm{CH}_{2}, \mathrm{OCH}_{2}\right), 30.6,25.5$, and $19.1\left(\mathrm{CH}_{2}, \mathrm{CH}_{2}\right.$ of THP).

## Protected triol 5a

To a degassed solution of alkyne $\mathbf{7}_{\mathbf{1}}(136 \mathrm{mg}, 0.29 \mathrm{mmol})$ and diiodo compound $\mathbf{2}(60 \mathrm{mg}, 0.11$ $\mathrm{mmol})$ in diethylamine $(5 \mathrm{~mL}), \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}(3 \mathrm{mg}, 0.004 \mathrm{mmol})$ and $\mathrm{CuI}(2 \mathrm{mg}, 0.01 \mathrm{mmol})$ were added. The reaction mixture was stirred at room temperature for 15 h . Then $\mathrm{Et}_{2} \mathrm{NH}$ was distilled off at slightly reduced pressure/room temperature, the residue was dissolved in $\mathrm{Et}_{2} \mathrm{O}$ and water, the aqueous phase was extracted with $\mathrm{Et}_{2} \mathrm{O}$, the combined organic extracts were washed with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated under reduced pressure giving a yellow oil. This was diluted with a very small amount of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and applied as such to a chromatotron plate. Chromatography ( $n$-pentane $/ \mathrm{CH}_{2} \mathrm{Cl}_{2} 5: 1 \rightarrow 1: 1$ ) yielded 5 a ( $126 \mathrm{mg}, 92 \% ; R_{\mathrm{f}}\left(n\right.$-pentane $\left./ \mathrm{CH}_{2} \mathrm{Cl}_{2} 1: 1\right)=0.08$ ) as a yellowish fluorescent oil (Found C , 83.97; H, 8.26. ## Triol 5b

To a solution of protected triol $\mathbf{5 a}(110 \mathrm{mg}, 0.09 \mathrm{mmol})$ in THF $(10 \mathrm{~mL})$ and methanol $(7 \mathrm{~mL})$ toluenesulphonic acid monohydrate ( $47 \mathrm{mg}, 0.25 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at room temperature for 5 h (TLC monitoring; $n$-pentane/ $\mathrm{Et}_{2} \mathrm{O}$ 1:3). Then $\mathrm{Et}_{2} \mathrm{O}$ and water were added, the phases were separated, the aqueous phase was extracted with $\mathrm{Et}_{2} \mathrm{O}$, and the combined organic extracts were washed with saturated aqueous $\mathrm{K}_{2} \mathrm{CO}_{3}$, then 2 N HCl , and finally brine. After drying over $\mathrm{MgSO}_{4}$, the solvents were removed under reduced pressure and the residue was freeze-dried from benzene giving triol $5 \mathbf{b}(86 \mathrm{mg}, 99 \%)$ as a slightly yellow solid (mp $138{ }^{\circ} \mathrm{C}$ ). The elemental analysis of this material deviated largely from the expected values. The ${ }^{1} \mathrm{H}$ NMR spectrum showed an intense peak for silicon grease which may account for the elemental analysis result. However other experiments in which THP was removed from similar compounds indicate that in general the material obtained in the way that is described above is impure. A satisfying elemental analysis (Found C, 87.08; H, 87.86. Calc. for $\mathrm{C}_{70} \mathrm{H}_{74} \mathrm{O}_{3}$ (963.359): C 87.27, H 7.74\%) was obtained from material which had been chromatographed ( $n$-pentane $/ \mathrm{Et}_{2} \mathrm{O}$ 1:1). ## Triradical T011

N,N'-Dicyclohexylcarbodiimide ( $45.0 \mathrm{mg}, 0.22 \mathrm{mmol}$ ) was added to a solution of triol $\mathbf{5 b}$ ( 35 $\mathrm{mg}, 0.036 \mathrm{mmol}$ ), 1-oxyl-2,2,5,5-tetramethylpyrroline-3-carboxylic acid ( $40.5 \mathrm{mg}, 0.220 \mathrm{mmol}$ ), and DMAP ( $26.8 \mathrm{mg}, 0.22 \mathrm{mmol}$ ) in THF ( 5 mL ). After stirring of the reaction mixture at room temperature for 3 days, the precipitate was filtered off and washed with THF until the
solid was colorless. The solvent of the filtrate, which contained the triradical, was removed. In order to get rid of trapped THF, the crude product was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the solvent was removed. The crude product was suspended in a small amount of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (the colorless insoluble material is most probably the urea compound) and applied to a chromatotron plate. Elution with $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(R_{\mathrm{f}}=0.12\right)$ gave triradical $\mathbf{T 0 1 1}(25 \mathrm{mg}, 47 \%)$ as a yellow oil which soldified upon freeze-drying from benzene (mp $54-56{ }^{\circ} \mathrm{C}$; Found C, 78.95; H, 7.80; N, 3.09. ## Triradical T111 ${ }_{\text {inv }}$

A solution of $m$-chloroperbenzoic acid ( $28 \mathrm{mg}, 0.16 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.5 \mathrm{~mL})$ was added to an ice bath cooled solution of triradical precursor $9(29.0 \mathrm{mg}, 0.015 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3.0 \mathrm{~mL})$. The reaction mixture was stirred at room temperature for 2 h . The solvent was evaporated at $40^{\circ} \mathrm{C}$ and reduced pressure. Methanol $(5.0 \mathrm{~mL})$ was added to the yellow residue, the precipitate was isolated through filtration and washed with methanol ( 10 mL ). Surprisingly, the material was only partially soluble in solvents such as THF, $\mathrm{CHCl}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{Et}_{2} \mathrm{O}$, and toluene, despite the fact that the reaction mixture had been a clear solution $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ before work-up. The isolated solid was suspended in $\mathrm{CHCl}_{3}$. The suspension was stirred at room temperature for overnight, then stirred at $80^{\circ} \mathrm{C}$ for 1 h , cooled to room temperature and filtered. The filtrate was concentrated (to about 5 mL ) at room temperature and reduced pressure. The residual solution was diluted with THF $(2.0 \mathrm{~mL})$. This solution was applied to a silica gel column. Chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{Et}_{2} \mathrm{O} 10: 1\right)$ yielded triradical $\mathrm{T} 111^{\mathrm{inv}}$ ( $9.3 \mathrm{mg}, 31 \%$; mp $132{ }^{\circ} \mathrm{C}$; $\left.R_{\mathrm{F}}=0.54\right)$ as a yellow solid. $\delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right)$ All signals are broad and structureless. 8.0 (ca 4 H , extremely broad, $\mathrm{H}_{\varepsilon}$ ), $7.67\left(6 \mathrm{H}\right.$, very broad, $\mathrm{H}_{\delta}$ ortho to N$)$, $7.63\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}_{\alpha}\right)$, 7.48 ( 6 H , very broad, $\mathrm{H}_{\delta}$ meta to N ), 7.41 and $7.39\left(3 \mathrm{H}\right.$ each, $\left.2 \mathrm{~s}, \mathrm{H}_{\gamma}\right), 2.82\left(12 \mathrm{H}, \mathrm{ArCH}_{2}\right), 1.72$ (ca. $12 \mathrm{H}, \mathrm{ArCH}_{2} \mathrm{CH}_{2}$ ), 1.53 (ca. $27 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}$ of isoindoline), 1.43 and 1.34 (ca. $36 \mathrm{H}, \mathrm{CH}_{2}$ ), 1.25 (ca. 4 H , sharp s, probably water), $0.89\left(18 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{3}\right.$ of Hex$) ; \mathrm{m} / z$ (MALDI-TOF) 1984.5 (50), 1968.8 (70), 1955.3 ( $100 \%, \mathrm{M}^{+} . \mathrm{C}_{132} \mathrm{H}_{141} \mathrm{~N}_{6} \mathrm{O}_{9}$ requires 1955.6), 1941.3 (90), 1924.1 (75); All signals are of very low absolute intensity.

Two further freeze-pump-thaw cycles were pursued. The reaction mixture was stirred at room temperature for 5 days. The solvent was evaporated at $45^{\circ} \mathrm{C}$ and reduced pressure. The lightly yellow colored solid residue was dissolved in $\mathrm{CHCl}_{3}$ $(5.0 \mathrm{~mL})$ and applied as such to a silica gel column. Elution $\left(\mathrm{CHCl}_{3} / \mathrm{EtOH} 97: 3\right)$ gave two fractions of a faintly yellow solid $\left(64 \mathrm{mg}, 19 \mathrm{mg} ; R_{\mathrm{F}}=0.32\right)$ containing the coupling product 10a and the oxidative dimer (Glaser coupling product) of the alkyne 8 in a ratio of $3: 1$ and 20:1 ( ${ }^{1} \mathrm{H}$ NMR spectroscopically determined), respectively. A solution of metachloroperbenzoic acid ( $25.3 \mathrm{mg}, 0.147 \mathrm{mmol}$ ) in dichloromethane ( 1.5 mL ) was added to an ice-bath cooled solution of the $3: 1$ mixture ( 27.2 mg ) of compound 10a and the Glaser coupling product of the alkyne $\mathbf{8}$ dissolved in dichloromethane ( 2.0 mL ). The reaction mixture was stirred at room temperature for 1.5 h . The solvent was evaporated at $40{ }^{\circ} \mathrm{C}$ and reduced pressure. The residual solution was diluted with $\mathrm{CHCl}_{3}(5 \mathrm{~mL})$. This solution was applied to a silica gel column. Chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{Et}_{2} \mathrm{O} 12: 1\right)$ gave the oxidised Glaser coupling product of the alkyne $8\left(R_{\mathrm{F}}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{Et}_{2} \mathrm{O} 10: 1\right)=0.73\right)$ and biradical $\mathrm{B} 11_{\mathrm{inv}}$ as a yellowish solid ( $13 \mathrm{mg}, 63 \%$ over two steps; $R_{\mathrm{F}}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{Et}_{2} \mathrm{O} 10: 1\right)=0.34 ; \mathrm{mp} 125{ }^{\circ} \mathrm{C}$ ). Analytical data of biradical $\mathbf{B 1 1} 1_{\mathrm{inv}}$ : $\delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right)$ All signals are broad and structureless. 8.0-10 (extremely broad, $\mathrm{H}_{\varepsilon}$ ), 8.5-6.5 (extremely broad, $\mathrm{H}_{\beta}$ ortho to OH$), 7.69\left(4 \mathrm{H}\right.$, very broad, $\mathrm{H}_{\delta}$ meta to N), 7.63 and $7.62\left(3 \mathrm{H}, 2 \mathrm{~s}, \mathrm{H}_{\alpha}\right), 7.49\left(6 \mathrm{H}\right.$, very broad, $\mathrm{H}_{\delta}$ ortho to N and $\mathrm{H}_{\beta}$ meta to OH$), 7.42$ and $7.40\left(2 \mathrm{H}\right.$ each, $\left.2 \mathrm{~s}, \mathrm{H}_{\gamma}\right), 2.84\left(8 \mathrm{H}, \mathrm{ArCH}_{2}\right), 1.73\left(8 \mathrm{H}, \mathrm{ArCH}_{2} \mathrm{CH}_{2}\right), 1.44$ and 1.36 (allover ca. $28 \mathrm{H}, \mathrm{CH}_{2}, \mathrm{CH}_{3}$ of isoindoline), $1.26(2 \mathrm{H}$, sharp s, probably water), 0.92 and $0.91\left(12 \mathrm{H}, \mathrm{CH}_{3}\right.$ of Hex); $m / z$ (MALDI-TOF) $1445.9\left(55 \%, \mathrm{M}^{+} . \mathrm{C}_{98} \mathrm{H}_{100} \mathrm{~N}_{4} \mathrm{O}_{7}\right.$ requires 1445.9), 1430.7 (75), 1415.8 (100), 1400.2 (75).

## 2 Supporting figures

Figure S 2: Total modulation depth $\Delta$ as a function of nominal inversion efficiency $\lambda_{\text {nominal }}$ for compounds T011 (A), T012 (B), T111 (C), and 2a from [1]. The data were fitted for models with up to two spins (blue lines) and up to three spins (red lines) by varying the polynomial coefficients and $\lambda_{\text {max }}$.

Figure S 3: Distance distributions for triradicals T011 (A) and T111 (B). Red lines correspond to distributions obtained from original DEER data and solid lines to distributions obtained from the extracted pair contribution. Vertical arrows correspond to side lengths found in model fits. (A) $a=2.90 \mathrm{~nm}, b=3.07 \mathrm{~nm}, c=3.69 \mathrm{~nm}$. (B) $a=3.52 \mathrm{~nm}, b=3.54$ $\mathrm{nm}, c=3.60 \mathrm{~nm}$.

Figure S 4: Fit of dipolar spectra by scalene triangle models with uniform normal distribution of all side lengths. Experimental spectra are shown as black lines and fits as red lines. Dotted red lines correspond to a range that was excluded from the fits. (A) Pair contribution of T011. (B) Three-spin contribution of T011. (C) Pair contribution of T111. (D) Three-spin contribution of T111. (E) Pair contribution of T012. (F) Three-spin contribution of T012.

[6] When recording the spectra on the 250 MHz instrument the decoupling power was insufficient which resulted in signal broadening or splitting in the case of aromatic CH groups.
