# Total Synthesis of the Bridged Indole Alkaloid Apparicine 

M.-Lluïsa Bennasar,* Ester Zulaica, Daniel Solé, Tomàs Roca, Davinia García-Díaz, and Sandra Alonso<br>Laboratory of Organic Chemistry, Faculty of Pharmacy, and Institut de Biomedicina (IBUB), University of Barcelona, Barcelona 08028, Spain<br>bennasar@ub.edu

Received September 15, 2009

An indole-templated ring-closing metathesis or a 2-indolylacyl radical cyclization constitute the central steps of two alternative approaches developed to assemble the tricyclic ABC substructure of the indole alkaloid apparicine. From this key intermediate, an intramolecular vinyl halide Heck reaction accomplished the closure of the strained 1-azabicyclo[4.2.2]decane framework of the alkaloid with concomitant incorporation of the exocyclic alkylidene substituents.

## Introduction

Apparicine (Figure 1) is a fairly widespread monoterpenoid indole alkaloid, first isolated from Aspidosperma dasycarpon more than 40 years ago. ${ }^{1,2}$ Its structural elucidation, ${ }^{2}$ carried out by chemical degradation and early spectroscopic techniques, revealed a particular skeleton with a bridged 1-azabicyclo[4.2.2]decane framework fused to the indole ring and two exocyclic alkylidene (16-methylene and $20 E$-ethylidene) substituents. ${ }^{3}$ The same arrangement was also found in vallesamine $^{4}$ and later in a small number of alkaloids, including $16(S)$ -hydroxy-16,22-dihydroapparicine ${ }^{5}$ or ervaticine, ${ }^{6}$ which differ from apparicine in the substitution at C-16. ${ }^{7}$

The apparicine alkaloids are biogenetically defined by the presence of only one carbon ( $\mathrm{C}-6$ ) connecting the indole 3position and the aliphatic nitrogen, which is the result of the C-5

excision from the original two-carbon tryptamine bridge of the alkaloid stemmadenine. ${ }^{8}$ The fragmentation-iminium hydro-lysis-recyclization route depicted in Scheme 1, which involves the operation of a stemmadenine $N$-oxide equivalent, ${ }^{9}$ has been proposed to rationalize this biogenetic relationship. Such a route appears to be likely since stemmadenine itself ${ }^{10}$ and, more

[^1]recently, pericine (subincanadine E ) ${ }^{11}$ have been transformed in vitro into the respective C-5 nor-alkaloids (vallesamine and apparicine) by treatment of the N -oxides with trifluoroacetic anhydride (modified Polonovski reaction). ${ }^{12}$

## SCHEME 1. Biosynthesis of Apparicine Alkaloids

Their synthetically challenging structures make apparicine alkaloids attractive targets for synthesis. However, progress in this area has been limited to the approach developed by Joule's group in the late 1970s, which allowed the construction of the ring skeleton of apparicine (i.e., 20-deethylideneervaticine) but proved unsuitable for the total synthesis of the alkaloid. ${ }^{13}$

We envisaged apparicine to be accessible via tricyclic ABC substructures containing the central eight-membered ring (e.g., azocinoindoles A, Scheme 2), from which the carbon skeleton would be completed by inserting an ethylideneethano unit between the aliphatic nitrogen and C -5. In particular, it was planned that after $N$-alkylation with the appropriate haloalkenyl halide, an intramolecular Heck reaction ${ }^{14}$ upon a 2 -vinylindole moiety would serve to close the piperidine ring and at the same time install the requisite $20 E$-ethylidene and (when $\mathrm{R}^{2}=$ Me) 16-methylene appendages. It should be noted that similar Heck couplings of vinyl halides and elaborated cycloalkenes have proved to be useful for the assembly of the bridged core of several indole alkaloids, including pentacyclic Strychnos alkaloids, ${ }^{15}$ strychnine, ${ }^{15 c, 16}$ minfiensine, ${ }^{17}$ apogeissoschizine, ${ }^{18}$ and ervitsine. ${ }^{19}$ However, to the best of our knowledge, there are no

[^2]reported vinyl halide Heck reactions involving (aza)cyclooctene rings to produce strained bridged systems. ${ }^{20}$

## SCHEME 2. Synthetic Strategy

The power of ring-closing metathesis $(\mathrm{RCM})^{21}$ to synthesize medium-sized rings ${ }^{22}$ and our own work on RCM of indole-containing dienes ${ }^{23}$ made it our method of choice to assemble the indolo fused eight-membered ring of the key intermediates $\mathbf{A}$ and also to install the double bond required for the Heck reaction, either directly or after an isomerization step. In the course of our work, an alternative approach to $\mathbf{A}$ based on 2-indolylacyl radical cyclization ${ }^{24}$ and manipulation of the resulting ketone was also investigated. ${ }^{25}$ This Article deals with the development of the above indole annulation chemistry and its application to complete the first total synthesis of ( $\pm$ )-apparicine. ${ }^{26}$

## Resuts and Discussion

Initial Studies. We set out to study the indole-templated RCM en route to apparicine, directly targeting 6-methylazo-cino[4,3-b]indoles ( $\mathbf{A}, \mathrm{R}^{2}=\mathrm{Me}$, Scheme 2 ) with the trisubstituted 5,6-double bond functionality required for the Heck coupling. To this end, 2-isopropenylindoles 3 , which are equipped with Boc or Ts groups at the aliphatic nitrogen

[^3]and a robust MOM group at the indole nitrogen, were selected as the starting dienes (Scheme 3). These compounds were efficiently prepared from the known 2-chloroindole-3-carbaldehyde $\mathbf{1}^{27}$ by a Stille coupling with (isopropenyl)tributylstannane, followed by reductive amination of aldehyde $\mathbf{2}$ with 3-butenylamine and subsequent acylation or sulfonylation of the resulting secondary amine with di-tert-butyl dicarbonate or tosyl chloride, respectively. Unfortunately, exposure of dienes 3 to the second-generation Grubbs catalyst $\mathbf{B}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ or toluene did not deliver the expected eight-membered ring. Instead, carbamate 3a mainly underwent an intermolecular metathesis reaction leading to dimer $\mathbf{4 a}$, even when working under high dilution conditions ( 0.007 M ). Sulfonamide 3b, in turn, led to the respective dimer $\mathbf{4 b}$ along with variable amounts of the ring-contracted product 5 , coming from the competitive isomerization of the terminal double bond followed by RCM with liberation of propene. Azepinoindole 5 was the only isolated product ( $75 \%$ ) when cyclization of $\mathbf{3 b}$ was performed in refluxing toluene. In both cases, the use of other metathesis catalysts, either based on ruthenium (first-generation Grubbs or second-generation Hoveyda-Grubbs catalysts) or molybdenum (Schrock's catalyst) did not lead to any improvement.

SCHEME 3. Attempted Direct RCM Synthesis of 6-Methyl-1,2,3,4-tetrahydroazocino[4,3-b]indoles

Because this unsuccessful result was probably due to the presence of a geminal disubstituted terminal alkene moiety in dienes 3 , we turned our attention to more easily available 6-demethyl tricyclic substructures $\left(\mathbf{A}, \mathrm{R}^{2}=\mathrm{H}\right.$, Scheme 2$)$. These model azocinoindoles would also serve as precursors for closing the piperidine ring of apparicine by a reductive Heck cyclization or a tandem Heck cyclization-capture, which could also allow the introduction of the remaining carbon atom at $\mathrm{C}-16$. The implementation of this new synthetic plan is depicted in Scheme 4.

[^4]Thus, the required RCM substrates $7 \mathbf{a}$ and $7 \mathbf{b}$ were uneventfully prepared from 2-vinylindole-3-carbaldehyde $\mathbf{6}^{27}$ by reductive amination with 3-butenylamine followed by N -acylation or sulfonylation, as in the above isopropenyl series. As anticipated, RCM of dienes 7a or $\mathbf{7 b}$, involving two terminal monosubstituted alkene units, took place with the use of ruthenium complex $\mathbf{B}$ under standard conditions $\left(0.01 \mathrm{M}\right.$, toluene, $60^{\circ} \mathrm{C}$ or $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, reflux) to give azocinoindoles $\mathbf{8 a}$ or $\mathbf{8 b}$ in acceptable yields. At this point, access to the more advanced synthetic intermediate 9 required the manipulation of the aliphatic nitrogen of $\mathbf{8 a}$ or $\mathbf{8 b}$ to install the iodoalkenyl chain for eventual cyclization. As our first attempts to induce $N$-desulfonylation of 8b under reductive conditions $\left(\mathrm{Mg}, \mathrm{NH}_{4} \mathrm{Cl}, \mathrm{MeOH}\right.$ or $\mathrm{Na} /$ naphthalenide, THF) proved problematic, affording the unchanged starting product or complex reaction mixtures, we focused on the more labile carbamate function of 8a. Removal of the Boc group under standard acidic conditions (TFA, $\mathrm{Me}_{3} \mathrm{SiI}$, $\mathrm{ZnBr}_{2}$ ) was also troublesome, leading to partial decomposition, but the deprotection took place cleanly upon exposure of $\mathbf{8 a}$ to a mild acidic protocol ( 1.2 M HCl in MeOH at rt ). The resulting secondary amine was directly subjected to alkylation with $(Z)$-2-iodo-2-butenyl tosylate in hot acetonitrile in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ to give $\mathbf{9}$ in $60 \%$ isolated yield over the two steps.

## SCHEME 4. Studies in the 6-Demethyl Series

We next studied the key formation of the piperidine ring by Pd-catalyzed cyclization of the vinyl iodide upon the 2vinylindole moiety. Our expectation was that the initially formed alkylpalladium intermediate $\mathbf{C}$ (Scheme 5), in which no $\beta$-hydrogen is available for elimination, would be stable enough to be reduced or trapped with a suitable quencher. However, when 9 was subjected to a number of standard conditions for reductive Heck reactions, the desired tetracyclic system $\mathbf{D}(\mathrm{Q}=\mathrm{H})$ was never detected. The only observed process under the phosphine-free conditions ${ }^{28}\left[\mathrm{Pd}(\mathrm{OAc})_{2}\right.$,

[^5]$\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{TBACl}, \mathrm{HCO}_{2} \mathrm{Na}$, DMF, $\left.80^{\circ} \mathrm{C}\right]$ previously used by Overman ${ }^{17 \mathrm{a}}$ on a related substrate was N -dealkylation. After this unsuccessful result, a variety of palladium precatalysts $\left[\mathrm{Pd}(\mathrm{OAc})_{2}, \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}, \mathrm{Pd}_{2}(\mathrm{dba})_{3}\right]$, ligands $\left(\mathrm{PPh}_{3}\right.$, dppe $)$, and cosolvents (toluene, $\mathrm{CH}_{3} \mathrm{CN}$, THF) were examined in the presence of $\mathrm{Et}_{3} \mathrm{~N}$ or diisopropylethylamine as the potential reductants. ${ }^{16 b, 29}$ Whereas short reaction times left the starting product unchanged, prolonged heating gave low yields ( $5-10 \%$ ) of the unexpected tetracycle $\mathbf{1 0}$, coming from an apparent 7 -endo cyclization with inversion of the ethylidene configuration. ${ }^{30}$ The yield of $\mathbf{1 0}$ was raised to $30 \%$ on exposure of 9 to $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ in 1:1 THF- $\mathrm{Et}_{3} \mathrm{~N}$ in a sealed tube at $90^{\circ} \mathrm{C}$ for 24 h . On the other hand, under cationic conditions $\left[\mathrm{Pd}(\mathrm{OAc})_{2}, \mathrm{PPh}_{3}, \mathrm{Ag}_{2} \mathrm{CO}_{3}, 1: 1\right.$ toluene $\left.-\mathrm{Et}_{3} \mathrm{~N}, 90^{\circ} \mathrm{C}\right]$ the cyclization proceeded readily to give tetracycle 10 in $46 \%$ isolated yield. Significantly, this result was not substantially altered when the reaction was carried out in the presence of $\mathrm{HCO}_{2} \mathrm{Na}$ as the reductant or $\mathrm{KCN}, \mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$, TMSCN, or tributylvinylstannane as trapping agents.

## SCHEME 5

The formation of unusual Heck cyclization products like $\mathbf{1 0}$ has been previously observed ${ }^{31}$ and rationalized ${ }^{32}$ by considering that the initial 6-exo cyclization is followed by an intramolecular carbopalladation on the exocyclic alkene. The resulting cyclopropane intermediate would undergo rearrangement, with concomitant inversion of the alkene geometry, and final $\beta$-hydride elimination. In our case, the cy-clopropanation-rearrangement route depicted in Scheme 5 would be fast enough to prevent the quenchers from intercepting the initially formed alkylpalladium intermediate $\mathbf{C}$.

It now became apparent that the presence of a 6-methyl group in the Heck cyclization substrate was crucial to assemble the bridged framework of apparicine, as it would

[^6]guarantee the $\beta$-elimination of the alkylpalladium intermediate arising from cyclization, thus hampering the above undesired route. Hence, we renewed our efforts to synthesize 6-methylazocino[4,3-b]indoles ( $\mathbf{A}, \mathrm{R}^{2}=\mathrm{Me}$, Scheme 2), once again tackling the problem of RCM and ready to explore new routes.

RCM-Isomerization Route to Azocinoindole 15. Given that we were unable to directly form the trisubstituted double bond included in the azocine ring by RCM, we decided to change the cyclization site from the 5,6-position to the less crowded 4,5-position by using a 3-(allylaminomethyl)-2allylindole such as $\mathbf{1 3}$ (Scheme 6) as the diene. Consequently, the synthesis of the Heck precursor would now require an additional isomerization step of the resulting double bond.

It was planned to install the $\alpha$-methyl-substituted allyltype chain at the indole 2-position taking advantage of an allylic nucleophilic substitution reaction using a suitable organometallic derivative of indole. Thus, 1-(phenylsulfonyl)indole was allowed to react with $n$ - BuLi and CuCN , and the intermediate organocopper derivative was treated with ( $E$ )-4-chloro-2-pentene. The resulting indole $\mathbf{1 1}$ was then converted into the RCM precursor $\mathbf{1 3}$ by Friedel-Crafts formylation, reductive amination of aldehyde $\mathbf{1 2}$ with allylamine, and the subsequent protection of the aliphatic nitrogen with a Boc group. The overall yield of the four steps was $58 \%$. Satisfactorily, ring closure of diene $\mathbf{1 3}$ took place with the second-generation Grubbs catalyst $\mathbf{B}$ under standard conditions ( $0.07 \mathrm{M}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, reflux) to give the desired 6methylazocinoindole 14 in $80 \%$ yield.

## SCHEME 6. RCM-Isomerization Route to 6-Methylazocinoindole 15

Attention was then focused on the isomerization step. Considering recent reports on alkene isomerizations mediated
by suitably modified ruthenium-metathesis catalysts, ${ }^{33-36}$ we sought to examine if such a protocol could be synthetically useful for our purpose (Scheme 7). Unfortunately, when azocinoindole $\mathbf{1 4}$ was treated with catalyst $\mathbf{B}$ in refluxing toluene, ${ }^{35}$ a slow isomerization of the double bond took place to its N -conjugated counterpart (3,4-position), providing the enecarbamate 16 in 50\% yield (not optimized). The directing effect of the carbamate nitrogen was also decisive, although to a lesser extent, in the ruthenium-catalyzed isomerization of the 6-demethyl analogue $17 \mathrm{a},{ }^{23 \mathrm{c}}$ which led to the enamide 18a as the major product along with minor amounts of vinylindole 19a. Significantly, the influence of the heteroatom was suppressed in the $N$-tosyl analogue $\mathbf{1 7 b},{ }^{23 c}$ which underwent isomerization to afford vinylindole $\mathbf{1 9 b}$ as the only product. Finally, no isomerization was observed upon exposure of azocinoindoles $\mathbf{1 4}$ or $\mathbf{1 7}$ to catalyst $\mathbf{B}$ in hot methanol. ${ }^{36}$

## SCHEME 7. Isomerization Studies

Satisfactorily, we fortuitously discovered that the double bond of azocinoindole $\mathbf{1 4}$ moved into conjugation with the aromatic ring under the basic conditions used to remove the phenylsulfonyl group. Thus, long exposure of $\mathbf{1 4}$ to $t$-BuOK in refluxing THF brought about the anticipated indole deprotection along with alkene isomerization, affording 15 in $90 \%$ yield (Scheme 6). By using shorter reaction times and using NMR spectroscopy, we found that the migration of the double bond took place after the initial indole $N$-deprotection step, which suggests that the base-induced isomerization is only compatible with the presence of a free indole NH group.

Alternative Synthesis of $\mathbf{1 5}$. Although the RCM-isomerization route depicted in Scheme 6 allowed an efficient synthesis of the key apparicine intermediate $\mathbf{1 5}$ [41\% overall yield from 2-(phenylsulfonyl)indole by way of four isolated intermediates], we explored the possibility of installing the trisubstituted double bond required for the Heck reaction from a ketone carbonyl group. To this end, the first substrate

[^7]examined was the $N$-MOM tricyclic ketone 20 (Scheme 8), since it had already been prepared by RCM followed by removal of the resulting double bond by hydrogenation. ${ }^{23 c}$ Reaction of $\mathbf{2 0}$ with MeLi smoothly provided tertiary alcohol 21, which was subjected to several dehydration protocols without success. Thus, the acid-catalyzed dehydration using $3 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$ in acetone or TsOH in benzene was complicated by the competitive indole deprotection, affording low yields of the endocyclic alkene (15). On the other hand, the use of Martin sulfurane resulted in a cleaner dehydration to the exocyclic alkene 22, in which the N -MOM group remained unaffected.

## SCHEME 8

In search of a more efficient approach, we decided to extend the above organometallic addition-dehydration sequence to an analogous indole unprotected ketone (i.e., 26, Scheme 9). After unsuccessful attempts to remove the $N$ MOM group of $\mathbf{2 0}$, the substrate was efficiently prepared by a more direct route free of indole protecting groups, based on an 8 -endo cyclization of a 2 -indolylacyl radical upon an amino tethered alkene. ${ }^{24,37}$ The synthesis began with the preparation of selenoester $\mathbf{2 5}$ as the radical precursor, equipped with a bromovinyl chain to increase both the efficiency and the endo regioselectivity of the ring closure. ${ }^{37}$ Thus, reductive amination of aldehyde 23 with 2-bromo-2propenylamine followed by standard protection of the resulting secondary amine with a Boc group led to ester 24, which was converted into 25 by phenylselenation through the corresponding carboxylic acid. ${ }^{38}$ Treatment of selenoester $\mathbf{2 5}$ with $n-\mathrm{Bu}_{3} \mathrm{SnH}$ as the radical mediator and $\mathrm{Et}_{3} \mathrm{~B}$ as the initiator achieved the desired ring closure affording ketone 26 in moderate yield (54\%). Finally, to our satisfaction, reaction of $\mathbf{2 6}$ with methyllithium followed by dehydration of the resulting tertiary alcohol under mild acid conditions ( $\mathrm{TsOH}, \mathrm{CH}_{3} \mathrm{CN}$, rt ) smoothly provided the target alkene 15. Using this alternative route, the synthesis of $\mathbf{1 5}$ was accomplished from aldehyde 23 in $26 \%$ overall yield by way of only three isolated intermediates.

[^8]
## SCHEME 9. Radical Route to 6-Methylazocinoindole 15

Completion of the Synthesis of Apparicine. With azocinoindole $\mathbf{1 5}$ in hand, we next sought to manipulate the aliphatic nitrogen to install the haloalkenyl chain for the subsequent Heck reaction. As occurred with the C-6 demethyl analogue $\mathbf{8 a}$ (Scheme 4), removal of the $N$-Boc group of $\mathbf{1 5}$ required a mild acid protocol to avoid decomposition. The resulting secondary amine proved to be highly unstable and was directly subjected to alkylation with ( $Z$ )-2-iodo-2-butenyl tosylate to give 27 in $30 \%$ isolated yield over the two steps (Scheme 10). Attempts to place a phenylsulfonyl group at the indole nitrogen of $\mathbf{1 5}$ in order to improve the yield were unsucccessful.

## SCHEME 10. Completion of the Synthesis of Apparicine

The stage was now set for the completion of the synthesis by intramolecular coupling of the vinyl iodide and the trisubstituted alkene. A variety of experimental conditions were screened, including different solvents, palladium precatalysts, and additives, resulting only in the recovery of the starting material or decomposition products. However, the critical closure of the strained 1-azabicyclo[4.2.2]decane framework with concomitant incorporation of the exocyclic alkylidene substituents took place under cationic conditions, although loss of material was still extensive. Thus, when
vinyl iodide 27 was subjected to a specific protocol, using $\mathrm{Pd}(\mathrm{OAc})_{2} / \mathrm{PPh}_{3}$ (0.2:0.6 equiv) and $\mathrm{Ag}_{2} \mathrm{CO}_{3}$ (2 equiv) in $1: 1$ toluene $-\mathrm{Et}_{3} \mathrm{~N}$ at $80^{\circ} \mathrm{C}$ for a short reaction time ( 1.5 h ), apparicine was obtained in a consistent, reproducible $15 \%$ isolated yield. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopic data of synthetic apparicine essentially matched those described in the literature for the natural product. ${ }^{2,7,39}$ Additionally, the chromatographic (TLC) behavior of synthetic apparicine was identical to an authentic sample.

## Conclusion

In summary, the first total synthesis of ( $\pm$ )-apparicine has been accomplished by a concise route employing a vinyl halide Heck cyclization to close the bridged piperidine ring in the last synthetic step. The key azocinoindole intermediate 15 has been successfully assembled by developing two alternative procedures, namely, an indole-templated RCM followed by base-induced isomerization and an acyl radical cyclization followed by ketone-alkene functional group interconversion.

## Experimental Section

2-Isopropenyl-1-(methoxymethyl)indole-3-carbaldehyde (2). Tetraethylammonium bromide $(0.42 \mathrm{~g}, 2.01 \mathrm{mmol}), \mathrm{Bu}_{3} \mathrm{Sn}-$ $\left(\mathrm{CH}_{3}\right) \mathrm{C}=\mathrm{CH}_{2}(1.33 \mathrm{~g}, 4.02 \mathrm{mmol})$, and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}(42 \mathrm{mg}$, 0.06 mmol ) were successively added to a solution of aldehyde $\mathbf{1}^{27}$ ( $0.45 \mathrm{~g}, 2.01 \mathrm{mmol}$ ) in DMF ( 30 mL ), and the mixture was stirred at $85^{\circ} \mathrm{C}$ overnight. The reaction mixture was diluted with AcOEt and washed with brine. The organic solution was dried and concentrated, and the resulting residue was chromatographed ( $9: 1$ hexanes-AcOEt) to give 2 as an oil: 0.37 g ( $80 \%$ ); IR (film) 3057, 2934, $1663 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( 400 MHz ) $\delta 2.25(\mathrm{~s}, 3 \mathrm{H}), 3.31(\mathrm{~s}, 3 \mathrm{H}), 5.35(\mathrm{~s}, 1 \mathrm{H}), 5.44(\mathrm{~s}, 2 \mathrm{H}), 5.76(\mathrm{~s}, 1 \mathrm{H})$, $7.33(\mathrm{~m}, 2 \mathrm{H}), 7.49(\mathrm{dm}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.35(\mathrm{dm}, J=7.5 \mathrm{~Hz}$, $1 \mathrm{H}), 10.0(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100.6 \mathrm{MHz}\right) \delta 25.0\left(\mathrm{CH}_{3}\right)$, $56.3\left(\mathrm{CH}_{3}\right), 75.2\left(\mathrm{CH}_{2}\right), 110.4(\mathrm{CH}), 115.2(\mathrm{C}), 122.1(\mathrm{CH}), 123.4$ $(\mathrm{CH}), 123.9\left(\mathrm{CH}_{2}\right), 124.3(\mathrm{CH}), 125.2(\mathrm{C}), 133.4(\mathrm{C}), 136.8(\mathrm{C})$, 153.3 (C), 186.8 (CH); ESI-HRMS $[M+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{14} \mathrm{H}_{16^{-}}$ $\mathrm{NO}_{2} 230.1175$, found 230.1183 .

3-[ N -(3-Butenyl)- N -(tert-butoxycarbonyl)aminomethyl]-2-iso-propenyl-1-(methoxymethyl)indole (3a). 3-Butenylamine ( 0.24 $\mathrm{mL}, 2.60 \mathrm{mmol}), \mathrm{NaBH}(\mathrm{OAc})_{3}(0.82 \mathrm{~g}, 3.90 \mathrm{mmol})$, and AcOH $(0.08 \mathrm{~mL}, 1.36 \mathrm{mmol})$ were successively added to aldehyde $\mathbf{2}$ ( $0.30 \mathrm{~g}, 1.30 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$, and the resulting mixture was stirred at rt overnight. The reaction mixture was partitioned between $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $10 \%$ aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic extracts were dried and concentrated to give the crude secondary amine ( 0.30 g ). This compound was dissolved in $\mathrm{MeOH}(10 \mathrm{~mL})$ and treated with $(t-\mathrm{BuOCO})_{2} \mathrm{O}$ ( $0.45 \mathrm{~g}, 2.06 \mathrm{mmol}$ ) and $\mathrm{Et}_{3} \mathrm{~N}(0.58 \mathrm{~mL}, 4.12 \mathrm{mmol})$. After the mixture was heated at reflux for 4 h , the solvent was removed, and the residue was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and washed with 1 N HCl and brine. The organic solution was dried and concentrated, and the residue was chromatographed (8:2 hexanesAcOEt) to give carbamate 3a as a pale yellow oil: $0.33 \mathrm{~g}(65 \%)$; IR (film) $1689,1462,1415 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( 400 MHz ) $\delta 1.53$ (br $\mathrm{s}, 9 \mathrm{H}), 2.12(\mathrm{~s}, 3 \mathrm{H}), 2.13(\mathrm{~m}, 2 \mathrm{H}), 3.10(\mathrm{~m}, 2 \mathrm{H}) 3.26(\mathrm{~s}, 3 \mathrm{H}), 4.66$ $(\mathrm{s}, 2 \mathrm{H}), 4.96(\mathrm{~m}, 2 \mathrm{H}), 5.15(\mathrm{~s}, 1 \mathrm{H}), 5.38(\mathrm{~s}, 2 \mathrm{H}), 5.60(\mathrm{~s}, 1 \mathrm{H}), 5.65$ $(\mathrm{m}, 1 \mathrm{H}), 7.15(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.24(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.40(\mathrm{~d}$,

[^9]$J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.75(\mathrm{~m}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100.6 MHz$) \delta 24.5$ $\left(\mathrm{CH}_{3}\right), 28.5\left(3 \mathrm{CH}_{3}\right), 32.6\left(\mathrm{CH}_{2}\right), 39.7\left(\mathrm{CH}_{2}\right), 44.2\left(\mathrm{CH}_{2}\right), 55.7$ $\left(\mathrm{CH}_{3}\right), 74.7\left(\mathrm{CH}_{2}\right), 79.2(\mathrm{C}), 109.8(\mathrm{CH}), 116.1\left(\mathrm{CH}_{2}\right), 120.1(\mathrm{C})$, $120.4(\mathrm{CH}), 121.5\left(\mathrm{CH}_{2}\right), 122.4(\mathrm{CH}), 122.5(\mathrm{CH}), 127.9(\mathrm{C})$, 135.5 (CH), 135.6 (C), 136.9 (C), 141.3 (C), 155.7 (C); ESI-HRMS $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{23} \mathrm{H}_{33} \mathrm{~N}_{2} \mathrm{O}_{3} 385.2485$, found 385.2477 .

3-[ $N$-(3-Butenyl)- $N$-(tosyl)aminomethyl]-2-isopropenyl-1-(methoxymethyl)indole (3b). Aldehyde $2(0.25 \mathrm{~g}, 1.09 \mathrm{mmol})$ was allowed to react as above with 3-butenylamine and NaBH $(\mathrm{OAc})_{3}$. The resulting secondary amine $(0.25 \mathrm{~g})$ was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(12 \mathrm{~mL})$ and treated with $\mathrm{TsCl}(0.20 \mathrm{~g}, 1.05 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(0.15 \mathrm{~mL}, 1.05 \mathrm{mmol})$ at rt overnight. The reaction mixture was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and washed with 1 N HCl and brine. The organic solution was dried and concentrated, and the resulting residue was chromatographed (9:1 hexanes-AcOEt) to give sulfonamide $\mathbf{3 b}$ as a pale yellow solid: $0.29 \mathrm{~g}(60 \%)$; mp $88^{\circ} \mathrm{C}\left(\mathrm{Et}_{2} \mathrm{O}\right)$; IR (KBr) 1463, 1332, $1158 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR (400 $\mathrm{MHz}) \delta 1.92(\mathrm{~m}, 2 \mathrm{H}), 2.06(\mathrm{~s}, 3 \mathrm{H}), 2.44(\mathrm{~s}, 3 \mathrm{H}), 3.04(\mathrm{~m}, 2 \mathrm{H})$, $3.28(\mathrm{~s}, 3 \mathrm{H}), 4.48(\mathrm{~s}, 2 \mathrm{H}), 4.70(\mathrm{dm}, J=17 \mathrm{~Hz}, 1 \mathrm{H}), 4.78(\mathrm{dm}$, $J=10 \mathrm{~Hz}, 1 \mathrm{H}), 5.09(\mathrm{~s}, 1 \mathrm{H}), 5.36(\mathrm{~s}, 2 \mathrm{H}), 5.40(\mathrm{~m}, 1 \mathrm{H}), 5.53(\mathrm{br} \mathrm{s}$, $1 \mathrm{H}), 7.14(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.24(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.33$ (m, $2 \mathrm{H}), 7.43(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}), 7.78(\mathrm{~m}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C} \mathrm{NMR}(100.6 \mathrm{MHz})$ $\delta 21.5\left(\mathrm{CH}_{3}\right), 24.5\left(\mathrm{CH}_{3}\right), 32.9\left(\mathrm{CH}_{2}\right), 43.4\left(\mathrm{CH}_{2}\right), 46.7\left(\mathrm{CH}_{2}\right)$, $55.7\left(\mathrm{CH}_{3}\right), 74.7\left(\mathrm{CH}_{2}\right), 107.1(\mathrm{C}), 109.8(\mathrm{CH}), 116.3\left(\mathrm{CH}_{2}\right)$, $120.1(\mathrm{CH}), 120.7(\mathrm{CH}), 121.9\left(\mathrm{CH}_{2}\right), 122.7(\mathrm{CH}), 127.3(2 \mathrm{CH})$, 127.7 (C), 129.2 ( 2 CH ), 134.8 (CH), 135.2 (C), 136.9 (2C), 141.4 (C), 143.0 (C); ESI-HRMS $[M+H]^{+}$calcd for $\mathrm{C}_{25} \mathrm{H}_{31} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{~S}$ 439.2049, found 439.2039; $[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{25} \mathrm{H}_{30} \mathrm{Na}-$ $\mathrm{N}_{2} \mathrm{O}_{3} \mathrm{~S} 461.1869$, found 461.1866. Se-Phenyl 3-[ $N$-(2-Bromo-2-propenyl)- $N$-(tert-butoxycarbo-nyl)aminomethyl]-indole-2-carboselenoate (25). A solution of carboxylic ester $24(2.30 \mathrm{~g}, 5.44 \mathrm{mmol})$ and $\mathrm{LiOH} \cdot \mathrm{H}_{2} \mathrm{O}(0.27 \mathrm{~g}$, $6.43 \mathrm{mmol})$ in a $3: 1$ mixture of $\mathrm{THF}-\mathrm{H}_{2} \mathrm{O}(45 \mathrm{~mL})$ was stirred at $65{ }^{\circ} \mathrm{C}$ overnight. The reaction mixture was concentrated, acidified with 1 N HCl , and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were dried and concentrated to give the crude carboxylic acid ( 2.20 g ). A suspension of this material in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(40 \mathrm{~mL})$ was treated with $\mathrm{Et}_{3} \mathrm{~N}(1.50 \mathrm{~mL}$, $10.88 \mathrm{mmol})$. After 15 min at rt , the mixture was concentrated to give the corresponding triethylammonium salt. In another flask, tributylphosphine ( $6.70 \mathrm{~mL}, 27.16 \mathrm{mmol}$ ) was added under Ar to a solution of $\mathrm{PhSeCl}(5.20 \mathrm{~g}, 27.16 \mathrm{mmol})$ in anhydrous THF $(40 \mathrm{~mL})$ and the mixture was stirred at rt for 10 min (yellow solution). The above triethylammonium salt in THF ( 40 mL ) was added to this solution, and the resulting mixture was stirred overnight. The reaction mixture was partitioned between $\mathrm{Et}_{2} \mathrm{O}$ and $\mathrm{H}_{2} \mathrm{O}$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The organic extracts were dried and concentrated and the crude product was chromatographed (hexanes and 9:1 hexanes-AcOEt) to give $\mathbf{2 5}$ as a yellow solid: $2.68 \mathrm{~g}(90 \%)$; ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , major rotamer) $\delta 1.51$ (s, 9H), $3.93(\mathrm{~s}, 2 \mathrm{H}), 5.13(\mathrm{~s}, 2 \mathrm{H}), 5.44(\mathrm{~s}, 1 \mathrm{H}), 5.54(\mathrm{~s}, 1 \mathrm{H}), 7.18$ $(\mathrm{m}, 1 \mathrm{H}), 7.39(\mathrm{~m}, 2 \mathrm{H}), 7.46(\mathrm{~m}, 3 \mathrm{H}), 7.62(\mathrm{~m}, 2 \mathrm{H}), 7.94(\mathrm{~d}$, $J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.83(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75.4 MHz, major rotamer) $\delta 28.3\left(\mathrm{CH}_{3}\right), 39.8\left(\mathrm{CH}_{2}\right), 53.0\left(\mathrm{CH}_{2}\right), 80.5(\mathrm{C}), 112.1$ $(\mathrm{CH}), 115.8\left(\mathrm{CH}_{2}\right), 118.4(\mathrm{C}), 121.3(\mathrm{CH}), 122.4(\mathrm{CH}), 125.0(\mathrm{C})$, $126.8(\mathrm{CH}), 127.8(\mathrm{C}), 129.4(\mathrm{CH}), 129.5(\mathrm{CH}), 132.8(\mathrm{C}), 136.3$ (CH), 136.4 (C), 155.2 (C), 184.1 (C), (one missing quaternary carbon); HRMS $[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{24} \mathrm{H}_{25} \mathrm{BrN}_{2} \mathrm{NaO}_{3} \mathrm{Se}$ 571.0105, found 571.0102. Anal. Calcd for $\mathrm{C}_{24} \mathrm{H}_{25} \mathrm{BrN}_{2} \mathrm{O}_{3} \mathrm{Se}$ : C, 52.57 ; H, 4.60; N, 5.11. Found: C, 52.57; H, 4.52; N, 5.11.

2-(tert-Butoxycarbonyl)-6-oxo-1,2,3,4,5,6-hexahydroazocino-[4,3-b]indole (26). $n$ - $\mathrm{Bu}_{3} \mathrm{SnH}(2.50 \mathrm{~mL}, 9.42 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~B}$ ( 1 M in hexanes, 9.50 mmol ) were added to a solution of phenyl selenoester $25(2.07 \mathrm{~g}, 3.78 \mathrm{mmol}$, previously dried azeotropically with anhydrous $\left.\mathrm{C}_{6} \mathrm{H}_{6}\right)$ in anhydrous $\mathrm{C}_{6} \mathrm{H}_{6}(135 \mathrm{~mL})$. The
reaction mixture was stirred at rt for 2 h with dry air constantly supplied by passing compressed air through a short tube of Drierite. Then, additional $n-\mathrm{Bu}_{3} \mathrm{SnH}(0.50 \mathrm{~mL}, 1.89 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~B}(1 \mathrm{M}$ in hexanes, 1.90 mmol$)$ were added, and the reaction mixture was stirred under dry air at rt for 2 h . The reaction mixture was concentrated, and the resulting residue was partitioned between hexanes and acetonitrile. The polar layer was washed with hexanes and concentrated to give the crude product. Flash chromatography ( $8: 2$ hexanes - AcOEt) gave ketone 26 as an orange solid: $0.64 \mathrm{~g}(54 \%)$; ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , assignment aided by gHSQC, mixture of rotamers) $\delta 1.30$ and $1.50(2 \mathrm{~s}, 9 \mathrm{H}, \mathrm{Me}), 1.96$ and $2.04(2 \mathrm{~m}, 2 \mathrm{H}, 4-\mathrm{H}), 2.97(\mathrm{~m}, 2 \mathrm{H}, 5-$ $\mathrm{H}), 3.48$ and $3.62(2 \mathrm{~m}, 2 \mathrm{H}, 3-\mathrm{H}), 4.88$ and $5.01(2 \mathrm{~s}, 2 \mathrm{H}, 1-\mathrm{H})$, $7.16(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}, 10-\mathrm{H}), 7.35(\mathrm{ddd}, J=8.4,7.2,0.9 \mathrm{~Hz}$, $1 \mathrm{H}, 9-\mathrm{H}), 7.41(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}, 8-\mathrm{H}),[7.72(\mathrm{~d}, J=8.4 \mathrm{~Hz})$, and $7.77(\mathrm{~d}, J=8 \mathrm{~Hz}), 1 \mathrm{H}, 11-\mathrm{H}], 9.42$ and $9.47(2 \mathrm{~s}, 1 \mathrm{H}, \mathrm{NH})$; ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100.6 \mathrm{MHz}\right.$, gHSQC, mixture of rotamers) $\delta$ 23.9 and $25.1\left(\mathrm{CH}_{2}, \mathrm{C}-4\right), 28.3\left(\mathrm{CH}_{3}\right), 38.7$ and $39.5\left(\mathrm{CH}_{2}, \mathrm{C}-5\right)$, 42.5 and $42.6\left(\mathrm{CH}_{2}, \mathrm{C}-1\right), 43.0$ and $46.1\left(\mathrm{CH}_{2}, \mathrm{C}-3\right), 80.3(\mathrm{C})$, 112.1 (CH, C-8), 117.3 and 119.3 (C), 120.3 and 120.7 (CH, C10), 120.9 (CH, C-11), 126.4 and $126.6(\mathrm{CH}, \mathrm{C}-9), 127.5$ and 127.8 (C), 132.7 and 133.9 (C), 135.8 and 136.0 (C), 155.1 and 155.2 (C), 192.7 and $193.4(\mathrm{C})$; ESI-HRMS $[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{NaO}_{3}$ 337.1522, found 337.1524. Anal. Calcd for $\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{3} .1 / 2 \mathrm{H}_{2} \mathrm{O}$ C, $66.85 ; \mathrm{H}, 7,17$; N, 8.66. Found: C, 67.24; H, 7.00; N, 8.33.

2-(tert-Butoxycarbonyl)-6-methyl-1,2,3,4-tetrahydroazocino-[4,3-b]indole (15). From Azocinoindole 14. $t$-BuOK ( $0.55 \mathrm{~g}, 4.90$ $\mathrm{mmol})$ was added to a solution of $\mathbf{1 4}(0.22 \mathrm{~g}, 0.49 \mathrm{mmol})$ in THF $(14 \mathrm{~mL})$, and the resulting solution was heated at reflux for 48 h . The reaction mixture was partitioned between a saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution and $\mathrm{Et}_{2} \mathrm{O}$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The organic extracts were dried and concentrated to give azocinoindole $\mathbf{1 5}$ as a yellow foam: $138 \mathrm{mg}(90 \%)$. An analytical sample was obtained by chromatography (hexanes and 8:2 hexanes-AcOEt); IR (film) $3321,1670 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR (400 MHz , assignments aided by gHSQC, mixture of rotamers) $\delta$ 1.35 and 1.45 ( $2 \mathrm{~s}, 9 \mathrm{H}, \mathrm{Boc}$ ), 2.13 (s, $3 \mathrm{H}, \mathrm{CH}_{3}$ ), 2.37 (m, 2H, 4-H), $3.60(\mathrm{~m}, 2 \mathrm{H}, 3-\mathrm{H}), 4.64(\mathrm{br} \mathrm{s}, 2 \mathrm{H}, 1-\mathrm{H}), 5.69$ and $5.75(2 \mathrm{t}, \mathrm{J}=8$ $\mathrm{Hz}, 1 \mathrm{H}, 5-\mathrm{H}), 7.15(\mathrm{~m}, 2 \mathrm{H}, 9-\mathrm{H}, 10-\mathrm{H}), 7.28$ and $7.31(2 \mathrm{~d}, J=8$ $\mathrm{Hz}, 1 \mathrm{H}, 8-\mathrm{H}), 7.56$ and $7.62(2 \mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}, 11-\mathrm{H}), 7.85$ and 7.89 ( $2 \mathrm{br} \mathrm{s}, 1 \mathrm{H}, \mathrm{NH}$ ); ${ }^{13} \mathrm{C}$ NMR ( 100.6 MHz , assignments aided by gHSQC, $\delta 22.7$ and $22.8\left(\mathrm{CH}_{3}\right), 28.4$ and $28.5\left(3 \mathrm{CH}_{3}, \mathrm{Boc}\right)$, $28.7\left(\mathrm{CH}_{2}, \mathrm{C}-4\right), 43.4$ and $43.5\left(\mathrm{CH}_{2}, \mathrm{C}-1\right), 46.0$ and $46.7\left(\mathrm{CH}_{2}\right.$, $\mathrm{C}-3$ ), 79.1 and 79.3 (C), 110.3 and 110.4 (CH, C-8), 110.8 and $111.0(\mathrm{C}), 118.5$ and $119.0(\mathrm{CH}, \mathrm{C}-11), 119.3$ and $119.4(\mathrm{CH}, \mathrm{C}-$ 10), 122.1 and $122.2(\mathrm{CH}, \mathrm{C}-9), 126.5$ and $127.1(\mathrm{CH}, \mathrm{C}-5), 127.2$ and 127.3 (C), 128.9 and 129.5 (C), 132.8 and 133.4 (C), 135.7 and 135.9 (C), 156.1 and 156.5 (C); ESI-HRMS calcd for $\mathrm{C}_{19} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{2}$ 312.1837, found 312.1837.

From Ketone 26. Ketone $\mathbf{2 6}(0.52 \mathrm{~g}, 1.66 \mathrm{mmol})$ in anhydrous THF ( 35 mL ) was added under Ar to a cooled $\left(-10^{\circ} \mathrm{C}\right)$ solution of $\mathrm{MeLi}\left(1.6 \mathrm{M}\right.$ in $\left.\mathrm{Et}_{2} \mathrm{O}, 10.40 \mathrm{~mL}, 16.60 \mathrm{mmol}\right)$ in anhydrous THF ( 35 mL ). After stirring at rt for 2 h , the reaction mixture was quenched with ice-water and extracted with AcOEt. Concentration of the organic extracts gave the crude carbinol $(0.45 \mathrm{~g})$. $p$-Toluenesulfonic acid monohydrate $(25 \mathrm{mg}$, 0.13 mmol ) was added to a suspension of the above material in acetonitrile ( 25 mL ), and the mixture was stirred at rt for 1 h . The reaction mixture was concentrated, and the resulting residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and washed with a saturated aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$ solution. Concentration of the organic solution gave 15: $0.36 \mathrm{~g}(70 \%)$.

2-(2-Iodo-2-(Z)-butenyl)-6-methyl-1,2,3,4-tetrahydroazocino-[4,3-b]indole (27). A solution of carbamate 15 ( 224 mg , $0.72 \mathrm{mmol})$ in 1.2 M HCl in $\mathrm{MeOH}(3.2 \mathrm{~mL})$ was stirred at rt for $4.5 \mathrm{~h} .20 \% \mathrm{NH}_{4} \mathrm{OH}$ was added and the organic solvent was removed. The residue was partitioned between $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$
and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic extracts were dried and concentrated to give the secondary amine ( 127 mg ), which was directly used in the next step. Diisopropylethylamine ( 0.15 mL , $0.89 \mathrm{mmol})$ and ( $Z$ )-2-iodo-2-butenyl tosylate ${ }^{15 \mathrm{a}, 16 \mathrm{c}}(230 \mathrm{mg}$, 0.65 mmol ) were added to a solution of the above amine ( 127 $\mathrm{mg}, 0.59 \mathrm{mmol})$ in $1: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}-$ acetonitrile $(21 \mathrm{~mL})$. After the reaction mixture was stirred at rt for $2 \mathrm{~h}, \mathrm{MeNH}_{2}(2 \mathrm{M}$ in $\mathrm{MeOH}, 1.5 \mathrm{~mL}, 3 \mathrm{mmol}$ ) was added and the stirring was continued for 1 h . The reaction mixture was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and washed with a saturated aqueous $\mathrm{NaHCO}_{3}$ solution. The organic solution was dried and concentrated, and the residue was chromatographed (hexanes and 9:1 hexanes-EtOAc) to give pure tertiary amine $\mathbf{2 7}$ (yellow oil): 70 mg ( $30 \%$ ); IR (film) 3408, 2923, 1612, 1460, $742 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( 400 MHz ) $\delta 1.79$ (dd, $J=6.2$ and $1.2 \mathrm{~Hz}, 3 \mathrm{H}), 2.11(\mathrm{~s}, 3 \mathrm{H}), 2.14(\mathrm{br} \mathrm{s}, 2 \mathrm{H}), 2.77$ (br s, 2H), 3.35 (br s, 2H), 3.99 (br s, 2H), 5.81 (q, $J=6.2 \mathrm{~Hz}$, $1 \mathrm{H}), 5.85(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.15(\mathrm{~m}, 2 \mathrm{H}), 7.33(\mathrm{~d}, J=7.6 \mathrm{~Hz}$, $1 \mathrm{H}), 7.57(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.95(\mathrm{br} \mathrm{s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100.6 $\mathrm{MHz}) \delta 21.7\left(\mathrm{CH}_{3}\right), 22.5\left(\mathrm{CH}_{3}\right), 26.0\left(\mathrm{CH}_{2}\right), 48.0\left(\mathrm{CH}_{2}\right), 50.6$ $\left(\mathrm{CH}_{2}\right), 65.3\left(\mathrm{CH}_{2}\right), 110.1(\mathrm{C}), 110.5(\mathrm{CH}), 110.6(\mathrm{C}), 118.9(\mathrm{CH})$, $119.5(\mathrm{CH}), 121.9(\mathrm{CH}), 126.9(\mathrm{C}), 128.8(\mathrm{C}), 130.0(\mathrm{CH}), 131.3$ $(\mathrm{CH}), 135.8(\mathrm{C}), 136.1(\mathrm{C})$; ESI-HRMS $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{IN}_{2}$ 393.0822, found 393.0831.
$( \pm)$-Apparicine. $\mathrm{Pd}(\mathrm{OAc})_{2}(7.6 \mathrm{mg}, 0.034 \mathrm{mmol}), \mathrm{PPh}_{3}(26 \mathrm{mg}$, $0.10 \mathrm{mmol})$ and $\mathrm{Ag}_{2} \mathrm{CO}_{3}(93 \mathrm{mg}, 0.34 \mathrm{mmol})$ were added under Ar to a solution of amine $27(65 \mathrm{mg}, 0.17 \mathrm{mmol})$ in $1: 1$ toluene $-\mathrm{Et}_{3} \mathrm{~N}(17 \mathrm{~mL})$ and the mixture was heated at $80^{\circ} \mathrm{C}$ for 1.5 h . The solvent was removed, and the residue was partitioned between $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and a saturated aqueous $\mathrm{NaHCO}_{3}$ solution and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic extracts were dried and concentrated, and the resulting residue was chromatographed ( $\mathrm{SiO}_{2}$, flash, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to $9: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}$ ). An additional
chromatography $\left(\mathrm{SiO}_{2}, 0.5 \% \mathrm{Et}_{2} \mathrm{O}\right.$-diethylamine) gave pure ( $\pm$ )-apparicine as an amorphous solid: $6.6 \mathrm{mg}(15 \%) ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right.$, assignments aided by gHSQC$) \delta 1.46$ (dd, $J=6.8$ and $2.4 \mathrm{~Hz}, 3 \mathrm{H}, 18-\mathrm{H}), 1.89(\mathrm{ddt}, J=13.6,6.8$, and 2.4 Hz , $1 \mathrm{H}, 14-\mathrm{H}$ ), 2.16 (dddd, $J=13.6,11.2,8$, and $5.6 \mathrm{~Hz}, 1 \mathrm{H}, 14-\mathrm{H}$ ), 3.07 (dddd, $J=13.2,11.2,6.8$, and $1.2 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}), 3.20$ (d, $J=$ $16 \mathrm{~Hz}, 1 \mathrm{H}, 21-\mathrm{H}), 3.42(\mathrm{ddd}, J=13.2,8$, and $2 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H})$, $3.82(\mathrm{dt}, J=16$ and $2 \mathrm{~Hz}, 1 \mathrm{H}, 21-\mathrm{H}), 3.92$ (broad s, $1 \mathrm{H}, 15-\mathrm{H}$ ), $4.28(\mathrm{~d}, J=17.8 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{H}), 4.51(\mathrm{~d}, J=17.8 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{H})$, 5.25 (q, $J=6.8 \mathrm{~Hz}, 1 \mathrm{H}, 19-\mathrm{H}), 5.26(\mathrm{~s}, 1 \mathrm{H}, 17-\mathrm{H}), 5.39(\mathrm{~s}, 1 \mathrm{H}, 17-$ H), 7.06 (ddd, $J=7.6,7.2$, and $1.2 \mathrm{~Hz}, 1 \mathrm{H}, 10-\mathrm{H}), 7.18$ (ddd, $J=8,7.2$, and $1.2 \mathrm{~Hz}, 1 \mathrm{H}, 11-\mathrm{H}), 7.28(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}, 12-\mathrm{H})$, $7.42(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}, 9-\mathrm{H}), 7.84($ broad s, $1 \mathrm{H}, \mathrm{NH}) ;{ }^{13} \mathrm{C} \mathrm{NMR}$ $\left(\mathrm{CDCl}_{3}, 100.6 \mathrm{MHz}\right.$, assignment aided by gHSQC) $\delta 12.6\left(\mathrm{CH}_{3}\right.$, $\mathrm{C}-18), 29.6\left(\mathrm{CH}_{2}, \mathrm{C}-14\right), 41.2(\mathrm{CH}, \mathrm{C}-15), 45.3\left(\mathrm{CH}_{2}, \mathrm{C}-3\right), 54.2$ $\left(\mathrm{CH}_{2}, \mathrm{C}-6\right), 54.3\left(\mathrm{CH}_{2}, \mathrm{C}-21\right), 110.2(\mathrm{CH}, \mathrm{C}-12), 111.5(\mathrm{C}, \mathrm{C}-7)$, $112.2\left(\mathrm{CH}_{2}, \mathrm{C}-17\right), 118.6(\mathrm{CH}, \mathrm{C}-9), 119.3(\mathrm{CH}, \mathrm{C}-10), 120.1$ (CH, C-19), 123.0 (CH, C-11), 129.0 (C, C-8), 131.3 (C, C-20), 135.6 (C, C-16), 137.4 (C, C-13), 145.2 (C, C-2); ESI-HRMS $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{18} \mathrm{H}_{21} \mathrm{~N}_{2}$ 265.1699, found 265.1705.

Acknowledgment. We thank the Ministerio de Ciencia e Innovación, Spain, for financial support (project CTQ2006$00500 / \mathrm{BQU})$ and the University of Barcelona for a predoctoral grant to S.A. We are grateful to Professor John A. Joule for an authentic sample of apparicine.

Supporting Information Available: General protocols, additional experimental procedures and characterization data for all new compounds. This material is available free of charge via the Internet at http://pubs.acs.org.
