26  
27 **Word count of text:** 11,442 words

28  
29 **Short version of title:** Food and Sports Nutrition Trends

30  
31 **Choice of journal:** Comprehensive Reviews in Food Science and Food Safety

32  
33 **Author disclosures**

34 M. Arenas-Jal works as R&D manager for Vitae Natural Nutrition, S.L (Industrial Doctorate).

36 **ABSTRACT:** This revision intends to provide an overview on the major and emerging trends in food and  
37 nutrition. Food scientists and dietitians should keep an eye on the trends shaping the food industry in order  
38 to understand consumer changes in preferences, expectations and dietary patterns; and to identify those  
39 areas that should be added to the research agenda. In addition, to comprehend the major drivers of change  
40 in the food industry, global consumer trends are also reviewed in this article. Global concerns are shaping  
41 consumer attitudes, and with an easier access to information and an unprecedented consumer power  
42 through social media, the food industry should quickly adapt to meet consumer needs. In order to meet  
43 these objectives, this review is organized in three different but interrelated sections: global consumer trends,  
44 food and nutrition trends, and trends in sports foods and nutrition. This last one is also included due to its  
45 influence over food trends, and its significant relevance as a category and food trend.

46  
47 **Keywords:** food trends, food industry, nutrition, sports nutrition, consumer.  
48

49 **Table of contents:**

50 Abstract

51 Introduction

52 Global consumer trends

- 53 Clean-living and activist consumers
- 54 Personalization, a trend across all industries
- 55 Informed and connected consumers are shaping changes
- 56 Global consumer trends in brief

57 Food and nutrition trends

- 58 Older population growth – increased focus on health care
- 59 Connected consumers, informed decisions: going greener and healthier
  - 60 - Vegetarian and vegan diets on the rise
  - 61 - Organic food growth
  - 62 - “Free-from” and digestive wellness
  - 63 - Naturally healthy vs. fortified and functional food
- 64 Clean label, no longer a trend but the new norm
- 65 Protein is king, fat is back, and what about carbohydrates?
- 66 Beverages, snacks and indulgence foods redefined
- 67 Activist consumers against food waste
- 68 Personalization, a global trend impacting nutrition
- 69 Internet of Things shaping interaction with food
- 70 Sports nutrition is rocketing
- 71 Nutrition trends in brief

72 Trends in sports foods and nutrition

- 73 Sports nutrition, not just a recent trend
- 74 Sports nutrition market analysis
- 75 Sports nutrition is becoming mainstream
- 76 Proteins will not abdicate – and continue leading
  - 77 - Whey protein – a sales king that is being challenged

78	- Rising demand for plant-based proteins
79	- Hydrolysates are the next big thing – life is too short for slow proteins
80	What about non-protein products?
81	An overview of sports nutrition products' global sales
82	Other trends to look out for in 2020
83	Innovation is driving the market – microencapsulation as an example
84	Considerations on regulation
85	- US regulation
86	- EU regulation
87	- Worldwide anti-doping regulation
88	Sports nutrition trends in brief
89	<u>Conclusion</u>
90	<u>Acknowledgments</u>
91	<u>Author contributions</u>
92	<u>Abbreviations</u>
93	<u>References</u>

For Peer Review

## 94 **Introduction**

95 The development of new food products is influenced by numerous factors, but among them, global  
96 dynamics stand out. Demographics, socioeconomics, culture, politics and environment have a great impact  
97 on consumer lifestyles and dietary patterns. In fact, global issues such as climate change, global population  
98 aging, child exploitation, food waste, unfair trade or animal abuse, among others, are shaping consumer  
99 attitudes towards healthy, plant-based, sustainable and socially conscious food purchases (The Nielsen  
100 Company, 2018a). It has to be noted that, thanks to the irruption of new technologies, consumers not only  
101 have an easier access to information, but also an unprecedented power to lobby for change (Euromonitor  
102 International's Head of Lifestyles Research, 2017).

103  
104 In this context, and in order to adapt formulas and technologies to consumer needs, food scientists should  
105 keep an eye on the major and emerging trends shaping the food industry. Understanding consumer  
106 changes in preferences and expectations is vital when developing new products (PriceWaterhouseCoopers  
107 [PwC], 2013). Moreover, global dynamics have an influence on nutrition trends, thereby impacting dietary  
108 patterns and being potentially disruptive for the correct balancing of the diet. For this reason, not only food  
109 scientists, but also dietitians should be aware of the emerging trends that will influence food and nutrition  
110 in the coming decades.

111  
112 The aim of this review is to provide an overview of the current food trends, identifying the areas that are  
113 more prone to development, and thus, that should be added to the research agenda. In addition, due to its  
114 influence over food trends, and its relevance as a category and food trend, sports foods and nutrition are  
115 also reviewed in detail (European Specialist Sports Nutrition Alliance [ESSNA], 2018), (Euromonitor,  
116 2015b). Global consumer trends are also addressed in this review in order to understand the major drivers  
117 of change in the food industry. Finally, this review is organized in three different but interrelated sections:  
118 global consumer trends, food and nutrition trends, and trends in sports foods and nutrition.

119

## 120 **Global Consumer Trends**

121 In 2018, with a stronger global economy, consumer expenditure is expected to grow as its strongest rate  
122 since 2011 (Euromonitor International's Head of Lifestyles Research, 2017). However, shifting consumer  
123 attitudes will continue shaping changes in business.

124

### 125 Clean-living and activist consumers

126 Consumers are becoming activists due to an increased awareness of global issues through Internet and  
127 social media; which at the same time give consumers an unprecedented power to lobby for change  
128 (Labrecque, vor dem Esche, Mathwick, & Novak, 2013). Consumer opinions are far-reaching, and they feel  
129 that their spending choices can make a difference (Labrecque et al., 2013). Concerns about climate change  
130 and health are widespread among consumers, especially the younger who are adopting a clean-living  
131 lifestyle. Clean lifers have strong beliefs and ideals, and they are embracing a minimalist, balanced and  
132 healthier lifestyle to reduce harm to themselves, others and the environment (Euromonitor International's  
133 Head of Lifestyles Research, 2017). Furthermore, they are demanding companies a greater transparency,  
134 sustainability and social responsibility (Kearney, 2010), (Kang & Hustvedt, 2014).

135

### 136 Personalization, a trend across all industries

137 Besides going greener, consumers are seeking uniqueness, demanding to be involved in the production  
138 process and product personalization (Wind & Rangaswamy, 2001). Although customization is demanded  
139 in all industries, from sneakers and furniture, to services and experiences; there is a rising interest in  
140 personalized health and beauty (Euromonitor International's Head of Lifestyles Research, 2017). Genetic  
141 findings related to health, fitness and nutrition, as well as a rising interest in health, and a growing consumer  
142 curiosity about their genetics, are fueling demand for DNA testing (Subbiah, 2007), (Ferguson, 2013).

143

### 144 Informed and connected consumers are shaping changes

145 Millennials, also known as "the connected generation", are driving the consumer revolution. Mobile devices  
146 are nowadays vital for everything, including shopping, sharing experiences, or health and sport tracking  
147 among others (Deloitte, 2013). Health technologies, including wearables and fitness apps, have made

148 people more aware of their state of health, powering the growth of health and wellness market (L. G.  
149 Euromonitor International's Consumer Health Analyst, 2016). In fact, people tend to exercise more, with  
150 gym memberships in the United States of America (US) increasing by more than 20% for the period  
151 comprised between 2011 and 2016 (Business Development Bank of Canada [BDC], 2016).

152  
153 Thanks to new technologies, consumers are more informed about their choices and reject unmeasured or  
154 uninformed spending. Ownership is under question and sharing is gaining popularity (Hamari, Sjöklint, &  
155 Ukkonen, 2016). A new wave of apps aims to provide consumers with the opportunity to share everything,  
156 from cars to living spaces (The Economist, 2013). Consumers prefer spending their money on experiences  
157 like travels, festivals and restaurants, rather than on products (Euromonitor International's Head of  
158 Lifestyles Research, 2017). Buying time, such as adopting online shopping and ordering food for delivery,  
159 is also a trend on the rise (L. G. Euromonitor International's Consumer Health Analyst, 2016). For this  
160 reason, an increased growth rate in apps and mobile optimized websites is forecasted.

161  
162 Global consumer trends in brief  
163 Thanks to the irruption of new technologies, consumers' opinion is more powerful than it has ever been.  
164 For this reason, concerns about climate change, health and social responsibility, which are widespread  
165 among consumers, may shape changes in business. Other important trends are personalization and shared  
166 economy; as well as seeking for experiences or saving time rather than buying products. Finally, millennials  
167 will lead the mobile-driven market transformation, as they expect to do everything by using their mobile  
168 phone.

169  
170 **Food and Nutrition Trends**  
171 Global trends have the power to transform and disrupt entire categories, such as nutrition. One of the  
172 aforementioned global trends, clean/healthy living, stands out as the most relevant trend impacting the food  
173 industry. Connected and informed consumers are going back to nature and unprocessed foods, to preserve  
174 most of the natural vitamins and minerals. For this reason, there's a growth in plant-based, organic, naturally  
175 healthy and "free-from" foods. Clean label is also a trend on the rise, and while healthy snacks and fats are

176 coming back, sugar and certain carbohydrates are becoming the main enemies. Protein, instead, is the  
177 preferred food component. Other trends such as personalization, redefinition of indulgence foods, activist  
178 consumers, and Internet of Things (IoT), are shaping changes in consumer behaviors and therefore, in the  
179 food industry. However, the most relevant nutrition trend is the rise of sports nutrition category.

180

#### 181 Older population growth – increased focus on health care

182 As both the proportion of older people and the average life expectancy increase throughout the world, the  
183 older population is growing dramatically worldwide; and therefore, the incidence of chronic diseases (Global  
184 Burden of Disease Study 2013 collaborators, 2015). In fact, in about five years' time, the number of people  
185 aged 65 or older, will outnumber children under age 5; representing a forecasted 16% of world's population  
186 by 2050 (World Health Organization [WHO], 2015b). Population aging is placing pressure on overall health  
187 care spending in developed countries, and for this reason, governments are interested in promoting healthy  
188 habits to reduce morbidity and cut off its associated health-care costs. In this spirit, the World Health  
189 Organization (WHO) released "Active ageing: a policy framework" in 2002 to prevent and delay chronic  
190 diseases and premature mortality, as well as their risk factors (WHO, 2015a).

191

192 In line with WHO's health action plan, and thanks to consumer connectivity and access to information, there  
193 is an increased attention on health care (Kearney, 2010). For this reason, by 2020, a double-digit growth  
194 has been predicted for health and wellness market in the US. In addition, an increasingly number of  
195 consumers are seeing food as a medicine, and as a consequence, dietary supplements and sports nutrition  
196 stand out as one of the fastest growing healthcare categories, with an expected growth of 14% over the  
197 next few years in the US (BDC, 2016).

198

#### 199 Connected consumers, informed decisions: going greener and healthier

200 With an easier access to information, consumers are becoming more aware than ever of ingredients in their  
201 food and their properties. In order to make informed decisions, consumers seek transparency throughout  
202 the production process to understand what is in their food and how it was produced (Bjørndal, Fernandez-  
203 Polanco, Lappo, & Lem, 2013), (Kang & Hustvedt, 2014). Clean lifers are turning their backs on unhealthy

204 habits, food waste and animal-based products. They want to feel good about their consumption choices by  
205 eating healthily, sustainably and ethically (Radnitz, Beezhold, & DiMatteo, 2015). Nowadays, eating often  
206 carries an ideological charge similar to belonging to a political party or football club (Euromonitor, 2015a).  
207 In fact, in 2018, 67% of US consumers said that they will be prioritizing healthy or socially conscious food  
208 purchases (The Nielsen Company, 2018a). Even fast food is getting greener, and there is a decrease in  
209 reliance on animal-based nutrition. The vegetarian and vegan movement are already in full-swing, and on  
210 the next years we will see a further push to eradicate or reduce animal-based products (Hancox, 2018),  
211 (Radnitz et al., 2015).

212

### 213 - *Vegetarian and vegan diets on the rise*

214 The proportion of individuals choosing to follow a vegan diet has increased in the recent years, with ethics  
215 and health being the main reason for such choice (Radnitz et al., 2015). As a result of consumer interest,  
216 vegan sales growth is outpacing total food and beverage sales (The Nielsen Company, 2018b). When it  
217 comes to health benefits of vegetarian eating, current scientific evidence reinforces benefits of a plant-  
218 based diet that is low in fat, added sugars, added salt, and processed foods. A healthy and well-planned  
219 vegan diet, with a high content of fruits, vegetables and whole grains, can provide sufficient energy and  
220 an appropriate range of carbohydrate, fat and protein intakes to support performance and health (Venderley  
221 & Campbell, 2006). In fact, many top athletes, including world champions like Venus Williams and Lewis  
222 Hamilton, are vegan, thereby contributing to a vegan consumer base expansion (Edsor, 2017).

223

224 In line with this growing consumer interest, global market for vegetarian and vegan products was worth  
225 US\$51bn in 2016, but it is still expanding, with a 987% increase in demand for vegetarian products (The  
226 Vegan Society, 2018). In the same year, a 3% of the US population ate a strictly vegetarian diet, and about  
227 half of those were vegan. But the biggest revelation was that 36% of consumers opted for at least some  
228 vegetarian meal on a regular basis (Vegetarian Resource Group, 2016). In the United Kingdom (UK), the  
229 number of vegans quadrupled in the years between 2014 and 2018, reaching a 1,16% of the population  
230 (The Vegan Society, 2018). Indeed, as shown in Figure 1, vegan trend tripled in the years between 2012  
231 and 2018 (Google Trends, 2018). In line with this rapidly growing consumer demand for vegetarian and

232 vegan products, big companies such as Danone, McDonald's or Ben&Jerry's have invested in vegan  
233 alternatives to their products (The Vegan Society, 2018).

234

235 To sum up, consumers are keener on more plant-based, natural, minimally processed, local and seasonal  
236 food. According to Euromonitor International Global consumer trends survey 2017, "all natural" is the  
237 preferred food attribute, followed by "no artificial sweeteners", "limited or no added sugar" and "does not  
238 contain Genetically Modified Organisms (GMO) ingredients". In line with these findings, the following  
239 categories are on the rise (Euromonitor, 2017a).

240

241 - *Organic food growth*

242 Consumers are moving towards products perceived as more natural and healthier, resulting in a global  
243 demand for organic products (Asioli et al., 2017). Global sales of organic food and drink expanded by about  
244 10% to US\$81,6bn in 2015. The highest growth was observed in North America, which has the largest  
245 market for organic food and drink in the world. Valued at US\$43,4bn and accounting for over half of  
246 international sales, it is followed by the European market, which is valued at US\$31,1bn in 2015. Asia,  
247 Australasia and other regions, account for just US\$7,2bn in 2015. Despite having had an enormous growth,  
248 from US\$18 to 82bn over 15 years, organic food drink and sales growth is expected to continue (Sahota,  
249 2012), (FIBL and IFOAM, 2017). In fact, by 2019, 30% growth is forecasted for organic beverages in  
250 Canada (BDC, 2016).

251

252 When it comes to the organic packaged food and beverages, in 2016 they had a global retail value RSP of  
253 US\$32,153mn and US\$3,972.7mn, respectively (Euromonitor, 2015a). And in 2018, in Latin America,  
254 organic and "free-from" packaged food, are worth US\$35bn and US\$36bn; and will have annual growth  
255 rates of about 6% and 3,5%, respectively, thereby standing out as one of the food categories with a global  
256 strongest growth (Daniells, 2018).

257

258 - *“Free-from” and digestive wellness*

259 Specific ingredients and even entire categories or food groups, such as dairy, lactose, sugar, sodium,  
260 gluten, meat, fats and carbohydrates, are being avoided or limited by an increasing number of consumers  
261 (International Food Information Council Foundation, 2018). 68% of US consumers are concerned with what  
262 is not in their food (The Nielsen Company, 2018a), and those who avoided at least five separate ingredients  
263 increased from 35% in 2015, to 53% in 2016 (L. G. Euromonitor International's Consumer Health Analyst,  
264 2016).

265  
266 In the same year, global free-from foods were valued at US\$33bn, and have consolidated as the category  
267 with the most dynamic growth in the health and wellness market (Euromonitor, 2017b). Consumers perceive  
268 “free-from” offering as healthier, and they associate it to digestive wellness and gut health. For this reason,  
269 free-from trend has gone beyond intolerance and allergies, as consumers increasingly focus on foods that  
270 may help them to reduce feelings of gas, bloating or more severe gastrointestinal symptoms related to  
271 suspected allergies or intolerances (Mintel, 2016), (Kerry Health And Nutrition Institute [KHNI], 2018). As a  
272 consequence, “free-from” products, as well as added-benefit ingredients such as probiotics and prebiotics  
273 are on the rise. When it comes to the largest subcategory, free-from dairy is leading, due to an increased  
274 demand for dairy milk alternatives. It is followed by free-from gluten, which had the largest absolute growth  
275 over the period between 2012 and 2017 (Euromonitor, 2017b). In fact, in 2015, 12% of new food products  
276 launched in the UK carried a gluten-free claim (Mintel, 2016).

277

278 - *Naturally healthy vs. fortified and functional food*

279 Functional foods are those containing added biologically active ingredients that may improve health or lower  
280 the risk of disease. Besides supplying macronutrients, vitamins and minerals, they may include other active  
281 ingredients like antioxidants, prebiotics, probiotics, enzymes and/or phytonutrients to deliver a specific  
282 health benefit above their basic nutritional value (Bigliardi & Galati, 2013).

283

284 Functional food term encompasses a wide variety of products, like those enriched or fortified. Enrichment  
285 involves replacing those nutrients lost during processing. An example is bread, often enriched with iron and

286 folic acid, which are removed during milling of wheat to make flour (WHO, 2018), (Overview of Food  
287 Fortification, 2003). Fortification, instead, involves adding nutrients irrespective of whether they were  
288 originally present to any great extent in the food. Fortification is mostly used to improve nutritional status of  
289 a population or to differentiate products providing a competitive advantage. For example, bread may be  
290 fortified with omega-3 fatty acids (Gökmen et al., 2011). Nutrients are also usually added to substitute  
291 products in order to achieve a similar nutritive value to that in the original product. An example is the addition  
292 of calcium to soya-based drinks, which are sold as cow's milk substitute, in an amount equal to milk's  
293 natural content (Yazici, Alvarez, Mangino, & Hansen, 1997).

294  
295 On the other hand, naturally healthy products are those that naturally contain active ingredients. An  
296 example is oatmeal, which contains a soluble fiber that can help lower cholesterol levels and heart disease  
297 risk (Othman, Moghadasian, & Jones, 2011), (Bernstein et al., 2013). In line with the clean-living trend,  
298 more consumers like the idea of whole plant-based foods with intrinsic nutritional value, and thus, without  
299 the need for fortification. This is leading to a decrease in demand for functional foods. In fact, naturally  
300 healthy, valued at US\$253bn, has already outpaced global fortified and functional food and beverage  
301 market, which is valued at US\$247bn (M. M. Euromonitor International's Consumer Health Analyst, 2018).  
302 Despite functional food category growth slowing down, this category is still expanding and important,  
303 especially in emerging markets, where consumers are seeking functional ingredients linked to a health  
304 positioning (Kearney, 2010).

305  
306 Clean label, no longer a trend but the new norm  
307 "Clean label" concept doesn't have any commonly accepted definition, and it is more based on consumer  
308 perception rather than on scientific evidence. Clean label products are those made with ingredients that  
309 consumers recognize and trust, and that do not contain undesirable ingredients (Asioli et al., 2017),  
310 (Bizozzero, 2017). Clean labeling usually involves reducing the number of ingredients, particularly those  
311 perceived to be artificial, and those lacking any nutritional benefit. Mainly focused on removing food  
312 additives, such as synthetic colors, preservatives, stabilizers, emulsifiers and texturizers; clean labelling in  
313 its purest form also involves reducing certain food components such as fat, sugar and salt among others.

314 Claims such as “all natural”, “no artificial sweeteners”, “limited or no added sugar”, “non-GMO” and  
315 “minimally processed” are often included in clean label products (Asioli et al., 2017).

316

317 In line with the aforementioned global trends, consumers are increasingly mindful of their food and beverage  
318 choices. 69% and 52% of worldwide consumers believe, respectively, that products without artificial  
319 ingredients, and products with fewer ingredients, are healthier (The Nielsen Company, 2016). For this  
320 reason, consumers are willing to pay more for clean label products, whose global sales hit US\$165bn in  
321 2015 and are projected to reach US\$180bn by 2020 (Bizzozzero, 2017).

322 Clean label products are no longer a trend but the new norm (Bizzozzero, 2017). Ingredient names, and  
323 especially consumer familiarity and acceptance of them, play a central role in clean-label. Long, chemical-  
324 sounding, difficult-to-pronounce or unfamiliar names lead to perceptions of higher risk and raise questions  
325 about the reason for their use in foods (Asioli et al., 2017). Therefore, clean labeling often includes swapping  
326 chemical-sounding names for consumer-friendly ones. By way of example “tocopherol”, a synonym of  
327 vitamin E, might be perceived as chemical or artificial, so it would be better to list it as vitamin E. However,  
328 going clean label is not always such an easy task (Gallagher, Gormley, & Arendt, 2004). For this reason,  
329 the replacement of ingredients regarded as redundant, unacceptable or even harmful without any scientific  
330 justification sets up costly and sometimes unnecessary challenges. In addition, as previously mentioned,  
331 clean labeling is more about consumer perception than scientific evidence. With a constantly changing  
332 consumers' wish-list, so does the target for formulators, whom at the same time have to face functionality,  
333 quality and safety issues derived from the replacement of certain ingredients (Lamacchia et al., 2014).

334 Protein is king, fat is back, and what about carbohydrates?

335 While consumers try to avoid specific ingredients, others are on the rise. Consumers are increasingly  
336 looking for high-protein foods, since an optimal protein intake is usually associated with satiety and lean  
337 body mass gain or maintenance (Euromonitor, 2016). Protein also serves as a great replacement for sugar  
338 and fat, which are usually linked to an unhealthy diet (Lucca & Tepper, 1994). With 55% of US consumers  
339 considering high protein content a remarkable attribute when buying food products, protein demand is

340 increasing (The Nielsen Company, 2017). However, it still has room to grow, especially in emergent  
341 markets.

342  
343 When it comes to the reasons for this protein surge, media praise and sports nutrition have a lot to do with  
344 it. Protein dominates sports nutrition global sales, as it is an accessible and understandable ingredient,  
345 which gives multiple health benefits (C. S. Euromonitor International's Consumer Health Analyst, 2014). It  
346 appeals mainly to younger consumers aligned with fitness trends, but with an increasing evidence of  
347 benefits on aging, bone and heart health, it will potentially appeal to millions more in the near future  
348 (Euromonitor, 2016).

349  
350 As for the sources of protein, skinless chicken, fish, egg white and lean beef are the best dietary sources  
351 of low fat and high-quality protein (Hoffman & Falvo, 2004). While traditional sources like meat, eggs and  
352 dairy are consumer's primary sources of protein and still dominate sales (as illustrated in Figure 2), plant-  
353 based alternatives are experiencing a strong growth, in demand for health, sustainability and animal rights  
354 (The Nielsen Company, 2017).

355  
356 It should be pointed out that fat, which is usually associated to an unhealthy diet, is an essential component  
357 of all cells, and along with carbohydrates, provides the majority of energy to individuals who exercise at a  
358 low-to-moderate intensity (Melzer, 2011). "Fat is back" is a trend in agreement with the dietary  
359 recommendation that the type is more important than the amount of fat (KHNI, 2018). Certain fats such as  
360 polyunsaturated omega-3 fatty acids found in fish and other foods, have a number of reported positive  
361 health effects, like mitigating inflammation (Calder, 2010). Other examples of healthy fat's sources would  
362 be olive and avocado, which are rich in monounsaturated fatty acids (Owen et al., 2000), (Dreher &  
363 Davenport, 2013). Finally, fats also have a technological function, serving as texturizers or as a way to add  
364 flavor. The last one is gaining relevance as a result of an increased focus on sugar reduction (KHNI, 2018).

365  
366 Last but not least, there is a growing concern about the source and content of carbohydrates. They have  
367 been targeted by many weight-loss diets as a strategy to reduce overall calorie intake, resulting in a rising

368 popularity of carb-free foods (International Food Information Council Foundation, 2018). When it comes to  
369 its source, minimally refined grains and faux grains like quinoa, amaranth or wild rice, are gaining popularity  
370 due to their nutritional profile with increased protein content and a low glycemic index (Peters, 2018). In  
371 contrast, consumers try to avoid sugars or starches, which are often referred to as “bad carbs” due to their  
372 minimal nutritional value. This is strongly linked with the plant-based food trend, as carbs derived from fruits  
373 or vegetables are considered as “good carbs”, and are used instead of refined starches (KHNI, 2018).

374

#### 375 Beverages, snacks and indulgence foods redefined

376 Due to the aforementioned scientific evidence against added sugars and energy drinks, beverages are in  
377 a redefinition phase. Functional beverages like kombucha and protein shakes are gaining popularity among  
378 consumers, who are keener on beverages that incorporate protein, fiber and vegetable servings, while  
379 maintaining an acceptable flavor (KHNI, 2018). In functional beverages, stevia is usually the sweetener of  
380 choice for people who want to cut down sugar or calories (Lemus-Mondaca, Vega-Gálvez, Zura-Bravo, &  
381 Ah-Hen, 2012).

382

383 When it comes to snacks and indulgence foods, they are being reformulated so that they contain more  
384 plant-based and/or perceived as healthy ingredients. In addition, due to busier lifestyles, an increasing  
385 number of consumers prefer a snackable meal format, which is more convenient than sit-down meals. This  
386 is a growing food trend, known as “snackification” (KHNI, 2018).

387

#### 388 Activist consumers against food waste

389 With half of the world’s food being thrown away, there is an increased concern about food waste (McCarthy  
390 & Liu, 2017). For this reason, consumer acceptance of “non-perfect” products will grow, and consumers will  
391 begin to consider cheap food past its best before date. A revival in use of leftovers, right-size portioning  
392 and grow-it-yourself, is also forecasted (Euromonitor, 2015a). Finally, as consumers are keener on new  
393 initiatives encouraging more sustainable production and targeting food waste, governments are also  
394 making a move. In fact, in France, a law was approved to make supermarkets give food waste to charity or  
395 as animal feed (Sénate Français, 2016).

396

#### 397 Personalization, a global trend impacting nutrition

398 As discussed above, personalization is one of the main global trends, which is also influencing nutrition  
399 trends. A new wave of companies provides consumers with genetic and metabolomic findings related to  
400 their health, fitness and nutrition (Subbiah, 2007). Additional information can be collected through wearable  
401 fitness trackers, among other methods; giving an overall picture of health. Personalized training and  
402 nutrition plans are offered based on findings of individual parameters such as fat burning ability or capacity  
403 to metabolize caffeine, lactose or gluten, among others (Mutch, Wahli, & Williamson, 2005), (Ferguson,  
404 2013). In this context, one of the main challenges of personalization is not just customizing mass-produced  
405 products, but also shaping them to individual preferences before production, in order to shift from product  
406 to experience or service (Wind & Rangaswamy, 2001), (Euromonitor International's Head of Lifestyles  
407 Research, 2017).

408

#### 409 Internet of Things shaping interaction with food

410 By the year 2020, about 24 billion internet-connected devices will be installed globally, which is the  
411 equivalent of about 3 devices/person (Gubbi, Buyya, Marusic, & Palaniswami, 2013). IoT may continue  
412 shaping the way we purchase, receive and interact with our food. In fact, there is a continued expansion of  
413 online or online/offline hybrid subscription services, such as click and collect grocery shopping and delivery  
414 of restaurant meals. Due to strong growth of these alternative businesses, it is expected that by 2021,  
415 supermarkets and hypermarkets will account for less than a half of the total consumer goods trade  
416 (Euromonitor, 2018).

417

#### 418 Sports nutrition is rocketing

419 In line with the aforementioned healthy living trend, more people are adopting an active lifestyle, which is  
420 translating into a rise of sport and endurance activities (C. S. Euromonitor International's Consumer Health  
421 Analyst, 2014). As scientific evidence confirms that certain ingredients can enhance athletic performance,  
422 more people recognize the benefits of sports nutrition products, and therefore, are increasingly  
423 complementing their work-out sessions with these products (American Dietetic Association et al., 2009),

424 (Ronald J. Maughan & Shirreffs, 2012). For a long time, sports nutrition products were primarily meant and  
425 used by the so-called core users, that is, elite athletes and bodybuilders. However, the growing health  
426 consciousness and desire for fast results has helped sports nutrition to become more appealing to  
427 mainstream consumers and thereby, to expand its consumer base over the last decade. The so-called  
428 casual users have pushed the category into the mass market (Euromonitor, 2015b). For this reason,  
429 products that were once only available in fitness shops, can now be found in pharmacies and even  
430 supermarkets, achieving greater total sales for the sports nutrition category (Spano & Antonio, 2008).

431  
432 Sports nutrition was valued at US\$8,8bn in 2013; and sports foods comprising protein supplements, sports  
433 nutrition, and soft drinks including energy and sports drinks, were valued at US\$60bn in the same year (C.  
434 S. Euromonitor International's Consumer Health Analyst, 2014). Despite having experienced a steady rate  
435 growth in the last decade, several market researches continue forecasting a sustained global growth for  
436 sports nutrition category in the following years (Euromonitor, 2015b). Last but not least, although it has  
437 been reviewed as a nutrition trend, sports nutrition is also a category itself, with its own wide range of  
438 specific trends, and for this reason it will be reviewed in detail in the corresponding section below.

439

#### 440 Nutrition trends in brief

441 To sum up, global trends and concerns about climate change, health and social responsibility, which are  
442 widespread among consumers, are shaping changes in nutrition. As a consequence of the clean-living  
443 trend and the older population growth, there is an increased focus on healthy nutrition and physical exercise  
444 to prevent and delay aging, chronic diseases and premature mortality, as well as their risk factors.

445

446 Consumers seek transparency, and with an easier access to information, they are becoming more aware  
447 than ever of ingredients in their food. Consumption choices are influenced by the will of eating healthy, but  
448 also ethically and socially conscious. For this reason, consumers are keener on more natural, animal-free,  
449 plant-based, minimally processed, local, and seasonal food. Besides going back to nature, with a growth in  
450 demand for organic and naturally healthy products, other categories such as "free-from" and  
451 fortified/functional foods are also on the rise.

452

453 In line with the clean labelling trend, certain ingredients or categories, such as dairy, sodium, sugar or  
454 carbohydrates, are being avoided or limited by an increasing number of consumers. Instead, other  
455 ingredients such as proteins or healthy fats, are becoming more popular. With health as the main priority,  
456 even beverages, snacks and indulgence foods, are being redefined to incorporate ingredients with  
457 demonstrated health benefits.

458

459 Other global trends such as personalization, activist consumers against food waste, and IoT, are shaping  
460 interaction with food and impacting nutrition. Sports nutrition is rocketing and influencing nutrition trends,  
461 possibly being the main responsible for the protein surge. For this reason, and because it is not only a  
462 nutrition trend, but also a category itself, it will be reviewed in detail in the section below.

463

464 Finally, by way of a summary, Figure 3 shows the global sales of the selected health categories in 2017,  
465 reflecting their relevance among the different health categories.

466

#### 467 **Trends in Sports Foods and Nutrition**

468 Global trends and consumer concerns are shaping changes in nutrition, and thereby influencing the sports  
469 nutrition category as well. "Healthy living" stands out as the most relevant global trend impacting the food  
470 industry, and it is responsible for the enormous growth that sports nutrition category is experimenting. In  
471 line with this increased health awareness, consumers are keener on more natural, animal-free, plant-based,  
472 minimally processed, local, and seasonal food, what is also shaping sports nutrition products.

473

474 As more consumers become aware of the importance of a well-designed diet for a good training, the use  
475 of sports nutrition products is becoming mainstream. Besides being a nutrition trend, it is an important  
476 category influencing nutrition trends, possibly being the main responsible for the protein surge. Sports  
477 nutrition is a large and quickly growing consumer health category that promotes the achievement of an  
478 optimum nutrient intake, which is having positive implications in health care costs and well-being, and for  
479 this reason it will be reviewed in detail below.

480

481 Sports nutrition, not just a recent trend

482 Sports foods are those specialized products designed for athletes and active people to improve their  
483 nutritional intake, health, wellbeing, performance, muscle growth and/or recovery from exercise. In addition,  
484 they can also provide a convenient source of nutrients when it is impractical to consume everyday foods.  
485 Whey protein, sports gel or electrolyte replacement drinks are examples of sports foods. Among sports  
486 foods, sports nutrition encompasses food/dietary supplements aimed to contribute to an optimal  
487 performance (ESSNA, 2018). By law, sports nutrition products can only contain vitamins, minerals, food  
488 ingredients, macronutrients, herbal ingredients with a substantial history of use, and other ingredients that  
489 are generally regarded as safe (European Parliament, 2002), (United States Congress, 1994). Despite the  
490 distinction between sports foods category and sports nutrition subcategory, the two terms are often used  
491 interchangeably, also in the following text.

492

493 Although sports nutrition is one of the latest trends, it is a much older phenomenon. In the ancient Olympic  
494 Games, athletes used to eat massive quantities of meat, bread, dried fruits and honey, along with various  
495 fungi and herbs in an attempt to increase their athletic performance. But it was not until the last century  
496 when scientists found that certain substances were effective in improving athletic performance, and thereby,  
497 the first scientific-based sports nutrition products were created (ESSNA, 2018). A well-designed diet, with  
498 nutrient-dense foods, that meets energy intake requirements and incorporates proper timing of nutrients, is  
499 the foundation of a good training (Kerksick et al., 2008). However, athletes' dietary needs might be difficult  
500 to achieve through food intake alone, and for this reason, dietary supplements and sports nutrition products  
501 are often needed. When races are won by mere fractions of a second, and games may be lost due to  
502 fatigue, nutrition can make the difference between an athlete and a champion (Spano & Antonio, 2008).

503

504 Until recently, only bodybuilders and strength athletes were pushing for nutrient-dense, high-quality, and  
505 more convenient sources of nutrition, that could help them satisfy their unique nutritional requirements.  
506 However, as a consequence of an increasing scientific evidence on sports nutrition health and performance  
507 benefits, more athletes and coaches from other disciplines, embraced the use of these products. In the last

508 decade, sports nutrition has expanded its consumer base to amateur athletes and active people who not  
509 only care about their muscle growth, athletic performance and recovery, but also about their health and  
510 wellbeing (Euromonitor, 2015b), (C. S. Euromonitor International's Consumer Health Analyst, 2014).

511

#### 512 Sports nutrition market analysis

513 Consumers worldwide are adopting a healthy living lifestyle and gaining awareness of their needs and  
514 proactive steps that can be taken to achieve a higher wellbeing and prevent chronic diseases (Euromonitor  
515 International's Head of Lifestyles Research, 2017). Along with this trend, different categories are growing,  
516 like the Canadian wearable device market, which includes fitness trackers, and is expected to grow by  
517 150% in 2019. Another example would be that in 2014, more than 41% of Canadians were interested in  
518 buying a health monitor (BDC, 2016). So, with health in focus and with the rising mantra "strong is the new  
519 skinny", sports nutrition is the fastest growing consumer health category for several years in a row, and it  
520 is expected to continue growing at a steady pace in the next years (Mitchell, 2016).

521

522 Since more people recognize the benefits of sports nutrition products, the category has seen an enormous  
523 growth, from US\$6,7bn and US\$8,9bn in 2010 and 2013, respectively, to US\$10,8bn in 2015. Moreover,  
524 forecasts point out that it will continue growing. Sports foods, including not only sports nutrition products,  
525 but also sports and energy drinks and bars, were worth US\$60bn in 2013 (C. S. Euromonitor International's  
526 Consumer Health Analyst, 2014).

527

528 Although US is dominating the global market, accounting for over 60% of global sales, the growth is truly  
529 global. However, in terms of consumption, developed markets are leading. By way of example, Australia  
530 followed by US were leading in consumption in 2013, with an expenditure of US\$ 55 and 45 per household  
531 respectively; while world average consumption was around US\$5 per household. As for low-income  
532 markets, despite the barrier of relatively high prices, the global healthy living trend together with the rising  
533 disposable incomes, are supporting the increased demand and consumption of sports nutrition products.  
534 For this reason, less developed markets such as China, India and Brazil, are evolving and fast growing (C.

535 S. Euromonitor International's Consumer Health Analyst, 2014), (C. O. Euromonitor International's  
536 Consumer Health Analyst, 2017).

537

#### 538 Sports nutrition is becoming mainstream

539 The main reason for the sports nutrition market steady growth is the expansion of its consumer base over  
540 the last 10 years (Euromonitor, 2015b). Consumers have an increased health awareness and are  
541 increasingly opting for sports nutrition products to complement their work-out sessions (Mordor Intelligence,  
542 2018). As a result, the demand for sports nutrition category and its sales are rocketing.

543

544 Sports nutrition products, which are aimed to improve performance, post workout recovery and muscle  
545 maintenance and building, were originally designed for elite athletes and body builders in order to keep up  
546 with their unique nutritional demands. However, as a result of the healthy living trend, sports nutrition  
547 products have become mainstream over the past decade (C. S. Euromonitor International's Consumer  
548 Health Analyst, 2014). Besides the constantly increasing fitness clubs, which are exposing more and more  
549 recreational sports enthusiasts to sports nutrition products, other key features to support market growth  
550 have been innovation, with a growth rate of 10'4% of global product launches between 2011 and 2016, and  
551 consumer loyalty. In contrast to what happens to other categories, when users detect a positive difference  
552 in performance, they generally stick to it. Thereby, sports nutrition products enjoy a high degree of loyalty  
553 (Mordor Intelligence, 2018).

554

555 When it comes to consumers, they are not only increasing in number, but also in diversity. As a  
556 consequence, knowledgeable and high-volume users who purchase frequently, also known as "core users",  
557 no longer dominate sports nutrition sales. In the last decade, sports nutrition products have become more  
558 appealing to a greater number of mainstream consumers, often referred to as "casual users", who are  
559 recreationally active. They prefer convenient formats and recognizable ingredients (Euromonitor, 2015b).  
560 Another group has recently emerged in developed markets, they are the "lifestyle users" who are not  
561 particularly athletic but put a greater focus on increasing their fitness levels by trying to do more exercise.  
562 Lifestyle users are mainly young and invest in fitness as a fundament aspect of a healthy lifestyle. They are

563 keen on trying new products, formats and ingredients (C. S. Euromonitor International's Consumer Health  
564 Analyst, 2014), (Mordor Intelligence, 2018).

565

566 Despite the different characteristics defining each consumer type, what all of them have in common is that  
567 they seek transparency, as well as clean and open label formulations (Kang & Hustvedt, 2014). Responding  
568 to these demands, third-party banned-substance-free certification has become a standard for major brands  
569 and producers. In addition, an increasing number of brands are opening up their proprietary blends with  
570 complete ingredient break-outs (C. S. Euromonitor International's Consumer Health Analyst, 2014). In  
571 general, a greater focus is put on the presentation of products, including appealing and interactive labelling  
572 to make it easier for the consumer to understand the ingredients, and to ensure product safety (Mordor  
573 Intelligence, 2018).

574

575 Finally, as a consequence of the consumer base expansion and segmentation, sports nutrition products  
576 are consumed for different purposes. For this reason, companies are discussing whether a better name for  
577 the industry would be lifestyle nutrition or active nutrition, which would appeal to more consumers, helping  
578 to continue broadening the consumer base (C. O. Euromonitor International's Consumer Health Analyst,  
579 2017). In line with this last objective, major brands are penetrating mainstream distribution channels, such  
580 as gyms, pharmacies and supermarkets. For this reason, products that were once only available in  
581 dedicated fitness shops, have made their way to other retailers. In addition, sports nutrition products are  
582 also distributed by online sellers, accounting for 41,3% of sales in the US in 2017 (Mordor Intelligence,  
583 2018).

584

585 Proteins will not abdicate – and continue leading

586 Proteins dominate global sales, in no small part as a consequence of being the most accessible and  
587 understandable sports nutrition ingredient. While non-protein products were worth US\$1,6bn in 2013, this  
588 is 17% of the total sports nutrition market; protein products, including powder, bars, ready-to-drink  
589 beverages and others, have been growing at a steady pace, reaching US\$7,3bn in 2013 and US\$9,2bn in  
590 2015, accounting for more than 83% of the total sports nutrition market. In addition, 6,5% compound annual

591 growth is forecasted for protein products during the time frame between 2015 and 2020. In fact, protein  
592 market is expected to reach US\$13,5bn in 2020 (C. S. Euromonitor International's Consumer Health  
593 Analyst, 2014), (Euromonitor, 2015b).

594

595 Protein claims related to muscle mass growth, lean muscle maintenance and recovery from resistance  
596 exercise, makes protein the most demanded product on sports nutrition category. Protein is especially  
597 appealing for younger consumers, aged 15-34. Its popularity benefits from media praise and still has room  
598 to grow, particularly in emergent markets such as China, Latin America and India. Other lesser known  
599 protein benefits are satiety, bone and heart health, and antiaging, which are perfectly aligned with global  
600 concerns about overweight, obesity, cardiovascular health and aging. Provided that these claims become  
601 mainstream, proteins will potentially appeal to millions more in the near future (Euromonitor, 2016). As a  
602 result of its reputation as a health-promoting ingredient, natural-containing protein products and protein  
603 fortified foods, are also gaining popularity among mainstream consumers.

604

605 In the sports nutrition category, protein products remain the most demanded, as they offer a convenient  
606 way of meeting increased protein requirements without excess calories, fats or sugars. When it comes to  
607 the format, protein powder accounted for 70-80% of total protein products and reached US\$5,6bn in 2013.  
608 However, convenience formats, like ready-to-drink beverages, or protein bars, are growing quickly and  
609 reached US\$ 766mn and 837mn, respectively, in 2013 (Euromonitor, 2016).

610

611 - *Whey protein – a sales king that is being challenged*

612 Among protein powder products, which usually need to be mixed with water or milk, whey is the king of  
613 sales. Casein, egg and soy proteins are also fairly common (Euromonitor, 2015b), (Euromonitor, 2016).  
614 However, in nutritional terms, whey is one of the best quality protein sources, and it delivers a greater taste  
615 than the offered by other sources. Besides its content in essential amino acids and BCAA, whey proteins  
616 are also well-known for its easy digestion and quick absorption, which ensure a fast delivery of the building  
617 blocks required for lean muscle mass growth and recovery (Hoffman & Falvo, 2004), (Patel, 2015). In fact,

618 published scientific research has demonstrated that in relation to other protein sources, whey protein  
619 promotes greater muscle-building activity and muscle mass gains (Hoffman & Falvo, 2004).

620  
621 For a long time, whey protein isolate was only popular among core users, but due to a trickle-down effect,  
622 its consumer appeal is widening (C. S. Euromonitor International's Consumer Health Analyst, 2014). In  
623 addition, whey protein is versatile and easy to use in product applications, so it is also popular among  
624 manufacturers (Agarwal, Beausire, Patel, & Patel, 2015). However, as casual and less-sophisticated users  
625 increasingly opt for whey protein products, core users are shifting to sustained-release protein blends,  
626 which could also gain mass acceptance in the near future (C. S. Euromonitor International's Consumer  
627 Health Analyst, 2014). These new formulations, including mixtures of different protein sources and protein  
628 treatments (concentrate, isolate and hydrolysate), are challenging whey protein isolate as king of protein  
629 sales (Euromonitor, 2016). Other factors, such as sustainability and animal welfare, are increasing the  
630 demand for plant-based proteins and therefore, increasing the challenge for whey protein (Radnitz et al.,  
631 2015), (Hancox, 2018).

632  
633 Last but not least, in line with the healthy nutrition trend, high-protein and added-protein foods, which are  
634 already in full-swing, could pose a long-term threat to specialized sports protein products; especially among  
635 casual and lifestyle users (Chittock, 2013). In addition, although scientific evidence confirms protein  
636 supplementation safety, some dietitians are questioning the need and safety of protein supplementation,  
637 posing another threat to sports protein products (Antonio et al., 2016).

638  
639 - *Rising demand for plant-based proteins*  
640 With over 80% of sports nutrition sales coming from protein-based products, and a global high-protein diet  
641 trend, sports protein products will continue to lead the industry (C. O. Euromonitor International's Consumer  
642 Health Analyst, 2017). However, consumers are increasingly asking for free-from, non-allergenic and plant-  
643 based products; and proteins are not the exception. With 3% of US population eating a strictly vegetarian  
644 diet, and 36% opting for at least vegetarian meals on a regular basis in 2016, there is a growing demand  
645 for plant-based proteins (Vegetarian Resource Group, 2016). Sustainability, animal welfare and a decrease

646 in reliance on animal-based nutrition are driving the demand for alternatives to milk proteins (C. S.  
647 Euromonitor International's Consumer Health Analyst, 2014), (Radnitz et al., 2015), (Hancox, 2018).

648  
649 Plant-based proteins from soy, pea or rice are less common than whey protein, but they are growing quickly  
650 and will continue to do so (Euromonitor, 2016). In fact, scientific evidence shows that plant-based proteins  
651 can be as effective as animal proteins for muscle maintenance, as long as the selected source, delivers all  
652 the essential amino acids needed (Mangano et al., 2017). In addition, a well-designed vegetarian or vegan  
653 diet provides sufficient energy and appropriate range of carbohydrate, fat and protein intakes to support  
654 performance and health (Venderley & Campbell, 2006), (Lynch et al., 2016). For this reason, certain elite  
655 athletes are going vegan and beginning to consume plant-based proteins, thereby contributing to plant-  
656 based proteins consumer base expansion (Edsor, 2017).

657  
658 - *Hydrolysates are the next big thing – life is too short for slow proteins*  
659 Differences in protein source, amino acid profile, and processing methods, can have an influence on amino  
660 acids bioavailability. Hydrolysates are high-quality proteins that have been finely chopped or predigested  
661 so that they can be absorbed faster than conventional proteins, helping to cut muscle recovery times from  
662 days to hours (Manninen, 2009). For this reason, they play a greater role in those athletes who place higher  
663 pressure on their body due to exercise frequency and intensity, and those who have a small window for  
664 recovery. Although hydrolysates future is promising, its bitterness and astringency hinders its incorporation  
665 into beverages, bars and gels (FitzGerald & O'Cuinn, 2006), (Liu, Jiang, & Peterson, 2014). This is not a  
666 drawback for core users, but since casual users prefer convenience products with good taste, until now  
667 hydrolysates have had a slow expansion. However, recent advances in hydrolysates processing technology  
668 have allowed taste-masking, enabling its incorporation into various formats such as clear drinks (FitzGerald  
669 & O'Cuinn, 2006). As a consequence, a fast growth for hydrolysates is forecasted (Euromonitor, 2015b).

670  
671 What about non-protein products?  
672 Casual users' adoption of non-protein products is growing. However, since these products are more difficult  
673 to understand by the mainstream and uninformed consumers, they mostly appeal to core users. With sales

674 reaching US\$160mn in 2013, UK has a leading position in the global non-protein products market. Global  
675 sales were worth 1,6bn in 2013 and are expected to grow by nearly US\$500mn, achieving US\$2bn in 2018  
676 (C. S. Euromonitor International's Consumer Health Analyst, 2014).

677  
678 In general, fitness-focused lifestyle, a desire for fast results, and a high demand for portable and convenient  
679 products, are the main drivers of the sports nutrition category. When it comes to convenience formats, non-  
680 protein products have been ahead, leading the experimentation. Gels, chews, bars, sachets and shots are  
681 examples of convenience formats. With the rise of endurance sports, gels have become the most popular  
682 convenience format (Euromonitor, 2015b), (C. S. Euromonitor International's Consumer Health Analyst,  
683 2014).

684  
685 As for sports drinks, they are expected to record the highest growth rate in the following years. Sports  
686 drinks, including products sold in powder to be rehydrated in water, are highly demanded as consumers  
687 become aware of the uses and benefits of drinks rich in carbohydrates, minerals and electrolytes (Zimberoff,  
688 2017). Active and sports people have higher carbohydrate requirements, and without an adequate intake  
689 of them, exercise performance decreases (Williams & Rollo, 2015). Electrolyte-replacement, glucose-  
690 containing solutions help to maintain blood glucose levels and prevent dehydration and therefore, may  
691 delay fatigue and attenuate muscle damage during endurance exercise (American Dietetic Association et  
692 al., 2009). However, the growing sugar-averse consumer base is contributing to an increased demand for  
693 low-calorie and low-carbohydrate sports drinks, especially in North America, which is the leader in sales  
694 (International Food Information Council Foundation, 2018). New sports drinks are mainly focused on  
695 optimizing hydration before, during and after physical activity. Maintaining hydration status is one of the  
696 most effective ways to maintain exercise performance, which can be significantly impaired when 2% or  
697 more of body weight, is lost through sweating (American Dietetic Association et al., 2009),(Ronald J.  
698 Maughan & Shirreffs, 2012).

699  
700 In 2013, sports drinks and energy drinks accounted for US\$18,7bn and US\$27,6bn, respectively. However,  
701 there is a blurring line between energy/sports drinks, and non-protein products category (C. S. Euromonitor

702 International's Consumer Health Analyst, 2014). The main reason for this, is that energy/sports drinks are  
703 shifting from the so-called bad carbs to the good ones. This is translating into products with lesser amounts  
704 of ingredients with minimal other nutritional value, like sugar or starches; and with higher amounts of  
705 naturally-containing-carbohydrates fruits, vegetables and whole grains (International Food Information  
706 Council Foundation, 2018). Strongly aligned with plant-based trend, this new wave of products is blurring  
707 the line between energy/sports drinks, and other drinks or beverages in the non-protein products category.

708

#### 709 An overview of sports nutrition products' global sales

710 Before moving forward with other trends to look out for in 2020, Figure 4 shows the global sales of the  
711 selected sports foods subcategories in 2013, thus reflecting their relative relevance.

712

#### 713 Other trends to look out for in 2020

714 Nutrient timing is a well-known concept for elite athletes, and casual users' awareness of its importance is  
715 increasing. Meal times and snacks should be planned in concert with training, to make sure that athletes  
716 have sufficient availability of nutrient-dense foods throughout the day. Research has shown that meal timing  
717 and composition may play a role in optimizing performance, training adaptations and preventing  
718 overtraining (Kerksick et al., 2008). By way of example, within 30 minutes of a workout, consuming high-  
719 quality carbohydrate and protein is key to replenish those nutrients depleted during the workout. While  
720 carbohydrates replenish glycogen stores and therefore, support muscle recovery, protein helps in muscle  
721 building and repairing (American Dietetic Association et al., 2009).

722

723 Global trends such as transparency, clean labeling and personalization are also impacting sports nutrition.  
724 Besides those that have already been discussed before, customized workouts and meals, tailored to  
725 preferences and goals, will help optimizing physical activity. "One size fits all" will no longer exist, and  
726 appeal for personalized fitness plans and nutrition, will broaden from elite athletes to include casual users  
727 as well (German, Zivkovic, Dallas, & Smilowitz, 2011), (Nutraingredients, 2016), (Gardiner, 2016).

728

729 Recovery is gaining importance over rest. While resting is just the absence of training, recovery involves all  
730 techniques and activities to maximize repair: hydration, compression, nutrition, heat or cold, stretching and  
731 massaging (Menzies et al., 2010). For a long time, a lot of these techniques were only reserved for elite  
732 athletes, but casual users' adoption is increasing as they are becoming aware that a balance between rest  
733 and recovery, together with a proper nutrition is essential for anyone who exercises (Meltzer, 2018), (Mateo,  
734 2018).

735

736 Finally, flavor is one of the most important areas for innovation in the sports nutrition industry, and it has a  
737 long way to go in terms of customers acquisition and retention (Cash, 2017). Another main driver of sports  
738 nutrition industry is convenience packaging, since consumers prefer small and portable products  
739 (Euromonitor, 2015b), (Euromonitor International's Head of Lifestyles Research, 2017).

740

#### 741 Innovation is driving the market – microencapsulation as an example

742 Besides demand-driven innovation, offering technological and professional solutions to mass market  
743 consumers is a powerful driver for growth and competitive positioning of a company (PwC, 2013). In this  
744 line, technologies such as microencapsulation would allow a broader use of certain ingredients with  
745 organoleptic or stability issues, among others. Microencapsulation is a technique that involves the  
746 entrapment of a substance within a microscopic shell of encapsulating polymeric material to give  
747 microcapsules different useful properties: preventing interactions among ingredients of a formula, flavor  
748 masking, increased stability and bioavailability, improved dissolution and flowability, and sustained-release  
749 among others (Gaonkar, Vasisht, Khare, & Sobel, 2014).

750

751 By way of example, taste-masking microcapsules allow the incorporation of caffeine into gels or chews  
752 without its characteristic bitter taste (Pimparade et al., 2015), (Mohammadi, Ehsani, & Bakhoda, 2018).  
753 Other examples of microencapsulation applications are increased water-dispersibility and bioavailability of  
754 hydrophobic ingredients, such as coenzyme Q10 or medium chain triglycerides (Gaonkar et al., 2014).  
755 Microcapsules are also capable to increase the stability of certain sensitive ingredients, such as probiotics,  
756 when they are exposed to different environmental conditions like heat, humidity, light and oxygen (Anal &

757 Singh, 2007). Furthermore, microcapsules can act as delivery systems. Depending on the  
758 microencapsulation technique and wall material selected, the release mechanism can be triggered by  
759 different factors such as dissolution, temperature, pressure, pH and enzymes among others; and the  
760 release profile can also be modified to be immediate, delayed or sustained (Gaonkar et al., 2014). Finally,  
761 microcapsules are also capable to protect acid-sensitive ingredients, like probiotics or enzymes, during their  
762 pass through the highly acidic environment of the stomach, and to release them in the intestine, which has  
763 an alkaline pH (Anal & Singh, 2007), (Cook, Tzortzis, Charalampopoulos, & Khutoryanskiy, 2012).

764  
765 Finally, as has just been reviewed, the implementation of professional solutions for mass market products,  
766 can help overcome different challenges, from technical issues like shelf-life, to consumer acceptance  
767 problems, like unpleasant taste or poor dissolution. Until now, technological advances were a business-to-  
768 business tool due to a lack of consumer understanding. However, consumers access to information is  
769 greater than ever, and soon they will become aware of the benefits of these techniques (Hamari et al.,  
770 2016). For this reason, technological solutions are going to be crucial to differentiate products from their  
771 competitors (PwC, 2013).

772

### 773 Considerations on regulation

774 Last but not least, the sports nutrition category is not only shaped by dietary recommendations and  
775 research, but also by regulations. Each country has its own regulation, which has an impact on the direction  
776 and growth of the sports nutrition industry. While some countries can select from a wide range of ingredients  
777 and claims, other countries may restrict or ban the same ones (R. J. Maughan, Greenhaff, & Hespel, 2011).

778

779 The US and the European Union (EU), by their respective competent bodies, Food and Drug Administration  
780 (FDA) and European Food Safety Authority (EFSA), have its own composition and labelling requirements,  
781 which will be briefly reviewed below. It is important to remark that besides the benefits provided by  
782 supplements and sports food, safety remains the main priority (US Congress, 2011). When it comes to  
783 professional athletes competing under anti-doping codes, not only evidence and safety are important  
784 factors to consider, but also the absence of prohibited substances. For this reason, it is important to highlight

785 a valuable information resource developed by the Australian Institute of Sport. It consists of an ABCD  
786 classification system that ranks those ingredients found in sports foods and supplements, into four groups.  
787 It is based on scientific evidence and other practical considerations to establish product safety, legality and  
788 efficacy in improving sports performance (Australian Institute of Sport, 2018).

789

790 - *US regulation*

791 In US, according to the Dietary Supplement Health and Education Act, dietary supplements are defined as  
792 products taken by mouth, which are typically sold in the form of capsules, soft gels, liquids, powders and  
793 bars, and that contain one or more dietary ingredients intended to supplement the diet. Vitamins, minerals,  
794 herbs, botanical extracts, amino acids and other substances may be considered dietary ingredients.  
795 Products sold as dietary supplements must be clearly labeled as such. FDA monitors its manufacturing  
796 processes, quality and labelling, but it grants a greater control over supplements containing new dietary  
797 ingredients. A new dietary ingredient is a dietary ingredient that was not sold in the US before 1994. FDA  
798 requires specific safety information from manufacturers intending to market food supplements containing  
799 new dietary ingredients. Safety evidence, which may include in vitro and long-term toxicity studies, and  
800 clinical studies in humans, must be provided to FDA. When it comes to health and nutrient content claims,  
801 efficacy evidence must be submitted to FDA for approval. Authorities can act against companies who make  
802 false or misleading claims; and can also remove supplements from the market if they lack sufficient scientific  
803 evidence to demonstrate product safety. In addition, companies are now required to record all adverse  
804 event complaints about their products; and must report to FDA all those serious adverse events (United  
805 States Congress, 1994), (US Food and Drug Administration, 2018).

806

807 - *EU regulation*

808 As for the regulation in Europe, according to European Parliament Directive (2002/46/EC), food  
809 supplements are defined as products intended to supplement the normal diet, consisting of concentrated  
810 sources of nutrients, like minerals and vitamins, or other substances with a nutritional or physiological effect  
811 that are marketed in a "dosage" form (e.g. pills, tablets, capsules or liquids in measured doses). Food  
812 supplements are regulated as foods, and thereby may contain vitamins, minerals, amino acids, essential

813 fatty acids, fiber and various plants and herbal extracts, among others. It has to be noted that the addition  
814 of nutrients or other substances to fortify foods, does not fall within the definition of a food supplement, and  
815 is addressed by a different regulation. Food supplements are intended to correct nutritional deficiencies,  
816 maintain an adequate intake of certain nutrients, or support specific physiological functions. The  
817 responsibility for the safety of these products lies with the food business operator placing the product on  
818 the market (European Parliament, 2002).

819  
820 In order to protect consumers against potential health risks, EFSA carried out a comprehensive assessment  
821 of substances that could be intended for food supplements manufacture in the EU. Based on EFSA's work,  
822 the European Commission established a harmonized list of substances that may be used in the  
823 manufacture of food supplements, their tolerable upper intake levels, labelling requirements and approved  
824 health claims (European Parliament, 2006b), (European Food Safety Authority, 2006), (European  
825 Parliament, 2011), (European Parliament, 2006a). There is also a list of those substances that are known  
826 or suspected to have adverse effects on health, and the use of which is therefore controlled. As for those  
827 substances intended to be used in food supplements, and that do not have a history of safe use in the EU  
828 before 1997, which are known as "novel foods", EFSA is requested to provide a scientific opinion on its  
829 safety (European Parliament, 2015).

830  
831 Finally, the EU register provides information on the permitted nutrition and health claims made on foods,  
832 and their conditions of use and applicable restrictions, as well as non-authorized health claims and the  
833 reason for their non-authorization (European Commission, 2018).

834

#### 835 - *Worldwide anti-doping regulation*

836 The World Anti-Doping Agency (WADA) is an international independent agency with scientific research,  
837 education, development of anti-doping capacities, and monitoring of the world anti-doping code, as key  
838 activities. Its mission is to lead a collaborative worldwide movement for doping-free sport, bringing  
839 consistency to anti-doping policies and regulations within sport organizations and governments across the  
840 world (World Anti-Doping Agency [WADA], 2018a). The list of prohibited substances and methods, which

841 is updated annually, is a cornerstone of the WADA. It lists substances prohibited at all times, just in-  
842 competition or in particular sports. Some examples of prohibited substances are non-approved  
843 pharmacological substances, anabolic agents, beta-2 agonists and diuretics, as well as masking agents.  
844 Examples of prohibited methods are manipulation of blood, chemical manipulation of samples collected  
845 during doping control and gene doping (WADA, 2018b).

846  
847 According to world anti-doping code, athletes are responsible for all products ingested and any subsequent  
848 legal, health or safety consequence (WADA, 2015). For this reason, they should pay special attention when  
849 choosing a supplement, since some of them have been reported to have an accidental or deliberate content  
850 of banned substances (R. Maughan, 2005). A research of stimulants and anabolic steroids in dietary  
851 supplements revealed that the number of mislabeled supplements represented 18% of the 103 products  
852 analyzed (Baume, Mahler, Kamber, Mangin, & Saugy, 2006). For this reason, some manufacturers order  
853 commercial third-party auditing programs, as an independent screening for banned and restricted  
854 substances that could be accidentally found in their dietary supplements. These certifications provide a  
855 greater assurance of supplement purity for those athletes competing under antidoping codes (Bishop,  
856 2010). Non-intentional doping poses a threat to athlete's career, since anti-doping rule violation, regardless  
857 it was intentional or unintentional, may result in bans of up to four years (WADA, 2015).

858

#### 859 Sports nutrition trends in brief

860 In line with the healthy living global trend, as consumers are increasingly focusing on health and fitness  
861 goals, different categories, like wearable devices, are growing. Sports nutrition is the fastest growing  
862 consumer health category for several years in a row, and it is expected to continue growing at a steady  
863 pace in the following years. An expanding and more diverse consumer base is boosting the demand for  
864 sports nutrition, which has become a mainstream category. For this reason, products that were once only  
865 available in dedicated fitness shops, have made their way to other retailers.

866

867 As for the sports nutrition king ingredient, proteins dominate global sales accounting for more than 83% of  
868 total sports nutrition market. Since proteins are the most accessible and understandable sports nutrition

869 category, further growth is forecasted for the next five years. Among protein powders, whey isolate is the  
870 preferred source, due to its taste, amino acid composition and quick absorption. However, new formulations  
871 including different sources and treatments of proteins, are challenging whey protein isolate as king of sales.  
872 The main threats for whey protein isolate are a rising demand for plant-based proteins, and hydrolysates  
873 of different protein sources.

874

875 On contrast, non-protein products are more difficult to understand by the mainstream and uninformed  
876 consumers, and account for just 17% of total sports nutrition market. Despite not leading in sales, non-  
877 protein products are way ahead of convenience formats experimentation. As for sports drinks, they are  
878 expected to record the highest growth rate in the following years. Electrolyte-replacement, glucose-  
879 containing solutions help to maintain blood glucose levels and prevent dehydration, and therefore, may  
880 delay fatigue and attenuate muscle damage during endurance exercise. However, since there is an  
881 increasing demand for low-calorie and low-carbohydrate sports drinks, new products are mainly focused  
882 on optimizing hydration.

883

884 Besides global trends like clean labeling and personalization, which are impacting sports nutrition, other  
885 emerging trends to look out for in 2020 are nutrient timing, recovery gaining importance over rest,  
886 convenience packaging, and flavor as one of the main areas for innovation. Finally, offering professional  
887 solutions to mass market is key for disruptive innovation. Application of technologies such as  
888 microencapsulation in the sports nutrition field, would allow a broader use of certain ingredients with  
889 organoleptic or stability issues. In addition, preventing interactions, improving dissolution and achieving a  
890 sustained-release profile by means of microencapsulation, could also drive the sports nutrition category.

891

892 Last but not least, when it comes to the direction and growth of the sports nutrition industry, it is shaped by  
893 different factors. One of the most relevant but frequently forgotten factors is regulation, which can be  
894 different in each country. Competent authorities can restrict or ban ingredients to ensure safety and can  
895 also regulate to avoid false or misleading claims. Professional athletes who compete under anti-doping

896 codes, may only consider certain manufacturers which provide a third-party certificate ensuring that no  
897 banned or restricted substance is present.

898

## 899 **Conclusion**

900 Global dynamics are shaping consumer attitudes and thereby, promoting changes across industries. Clean  
901 and healthy living stands out as the most relevant trend impacting the food industry. Consumers are making  
902 informed decisions to prioritize healthy, plant-based, sustainable and socially-conscious food purchases, a  
903 trend which is also affecting beverages, snacks, indulgence foods and even fast food. Aligned with this  
904 trend, governments are promoting healthy habits to reduce morbidity and cut off its associated costs. In this  
905 context, not only vegetarian and vegan product sales are growing quickly, but also organic and free-from  
906 products. In addition, since consumers prefer foods with an intrinsic nutritional value, functional foods have  
907 been outpaced by naturally healthy products.

908

909 Due to media praise and sports nutrition, a category where protein is the king of sales, consumers are  
910 increasingly looking for high-protein products. Carbohydrates, instead, have been targeted as a strategy to  
911 reduce overall calorie intake, resulting in a decreased popularity. However, the source matters, and “good  
912 carbs” are used instead of “bad carbs”. In this line, as consumers increasingly avoid certain food  
913 ingredients, clean label products are no longer a trend, but the new norm. Nonetheless, the replacement of  
914 certain ingredients may set up costly and sometimes unnecessary challenges for food scientists. Other  
915 relevant trends shaping interaction with foods are personalization, IoT, and food waste reduction. However,  
916 one of the main trends is sports nutrition, which is a large and quickly growing consumer health category.

917

918 Sports nutrition sales are no longer dominated by core users, instead, they have become more appealing  
919 to mainstream consumers, and as a result, sports foods have made their way to mainstream distribution  
920 channels. Proteins are leading the sports nutrition category, but whey protein isolate, which is the king of  
921 sales among protein powder products, is being challenged by the rise of high-protein foods and the rising  
922 demand for plant-based proteins. When it comes to protein processing methods, isolates are being replaced  
923 by hydrolysates, which are expected to be the next big trend among protein powders. As for non-protein

924 products, despite experiencing a slower growth, they are leading the experimentation in convenience  
925 formats. Regarding new sports drinks products, they are mainly focused on optimizing hydration, and  
926 shifting from the so-called bad carbs to the good ones. As a consequence, there is a blurring line between  
927 energy/sports drinks, and other non-protein drinks or beverages.

928  
929 Other trends to look out for in 2020 in the sports food industry are nutrient timing, personalization, recovery  
930 gaining importance over rest, and flavor as one of the most important areas for innovation. Different  
931 professional technologies can be applied to mass market products, as a driver for growth and competitive  
932 positioning. In this context, microencapsulation stands out as one of these technologies with a wide variety  
933 of applications and a promising future. Finally, besides innovation, dietary recommendations and research,  
934 the sports nutrition category is shaped by regulations; among which stand US and EU regulation, and World  
935 Anti-Doping Code.

936  
937 To conclude, global dynamics have an influence on nutrition trends, being potentially disruptive for the  
938 correct balancing of the diet. However, as it has been reviewed, along with the healthy living trend, more  
939 people are adopting an active lifestyle, embracing a healthier dietary pattern and recognizing the benefits  
940 of sports foods, which is having positive implications in health, well-being and healthcare-associated costs.  
941 This review has also provided an overview of the areas that are more prone to development, and that should  
942 be added to the research agenda to adapt formulas and technologies to consumer needs.

35

36 **ABSTRACT:** This revision intends to provide an overview on the major and emerging trends in food and  
37 nutrition. Food scientists and dietitians should keep an eye on the trends shaping the food industry in order  
38 to understand consumer changes in preferences, expectations and dietary patterns; and to identify those  
39 areas that should be added to the research agenda. In addition, to comprehend the major drivers of change  
40 in the food industry, global consumer trends are also reviewed in this article. Global concerns are shaping  
41 consumer attitudes, and with an easier access to information and an unprecedented consumer power  
42 through social media, the food industry should quickly adapt to meet consumer needs. In order to meet  
43 these objectives, this review is organized in three different but interrelated sections: global consumer trends,  
44 food and nutrition trends, and trends in sports foods and nutrition. This last one is also included due to its  
45 influence over food trends, and its significant relevance as a category and food trend.

46  
47 **Keywords:** food trends, food industry, nutrition, sports nutrition, consumer.  
48

49 **Table of contents:**

50 Abstract

51 Introduction

52 Global consumer trends

- 53 Clean-living and activist consumers
- 54 Personalization, a trend across all industries
- 55 Informed and connected consumers are shaping changes
- 56 Global consumer trends in brief

57 Food and nutrition trends

- 58 Older population growth – increased focus on health care
- 59 Connected consumers, informed decisions: going greener and healthier
  - 60 - Vegetarian and vegan diets on the rise
  - 61 - Organic food growth
  - 62 - “Free-from” and digestive wellness
  - 63 - Naturally healthy vs. fortified and functional food
- 64 Clean label, no longer a trend but the new norm
- 65 Protein is king, fat is back, and what about carbohydrates?
- 66 Beverages, snacks and indulgence foods redefined
- 67 Activist consumers against food waste
- 68 Personalization, a global trend impacting nutrition
- 69 Internet of Things shaping interaction with food
- 70 Sports nutrition is rocketing
- 71 Nutrition trends in brief

72 Trends in sports foods and nutrition

- 73 Sports nutrition, not just a recent trend
- 74 Sports nutrition market analysis
- 75 Sports nutrition is becoming mainstream
- 76 Proteins will not abdicate – and continue leading
  - 77 - Whey protein – a sales king that is being challenged

78	- Rising demand for plant-based proteins
79	- Hydrolysates are the next big thing – life is too short for slow proteins
80	What about non-protein products?
81	An overview of sports nutrition products' global sales
82	Other trends to look out for in 2020
83	Innovation is driving the market – microencapsulation as an example
84	Considerations on regulation

## 94 **Introduction**

95 The development of new food products is influenced by numerous factors, but among them, global  
96 dynamics stand out. Demographics, socioeconomics, culture, politics and environment have a great impact  
97 on consumer lifestyles and dietary patterns. In fact, global issues such as climate change, global population  
98 aging, child exploitation, food waste, unfair trade or animal abuse, among others, are shaping consumer  
99 attitudes towards healthy, plant-based, sustainable and socially conscious food purchases (The Nielsen  
100 Company, 2018a). It has to be noted that, thanks to the irruption of new technologies, consumers not only  
101 have an easier access to information, but also an unprecedented power to lobby for change (Euromonitor  
102 International's Head of Lifestyles Research, 2017).

103  
104 In this context, and in order to adapt formulas and technologies to consumer needs, food scientists should  
105 keep an eye on the major and emerging trends shaping the food industry. Understanding consumer  
106 changes in preferences and expectations is vital when developing new products (PriceWaterhouseCoopers  
107 [PwC], 2013). Moreover, global dynamics have an influence on nutrition trends, thereby impacting dietary  
108 patterns and being potentially disruptive for the correct balancing of the diet. For this reason, not only food  
109 scientists, but also dietitians should be aware of the emerging trends that will influence food and nutrition  
110 in the coming decades.

111  
112 The aim of this review is to provide an overview of the current food trends, identifying the areas that are  
113 more prone to development, and thus, that should be added to the research agenda. In addition, due to its  
114 influence over food trends, and its relevance as a category and food trend, sports foods and nutrition are  
115 also reviewed in detail (European Specialist Sports Nutrition Alliance [ESSNA], 2018), (Euromonitor,  
116 2015b). Global consumer trends are also addressed in this review in order to understand the major drivers  
117 of change in the food industry. Finally, this review is organized in three different but interrelated sections:  
118 global consumer trends, food and nutrition trends, and trends in sports foods and nutrition.

119

## 120 **Global Consumer Trends**

121 In 2018, with a stronger global economy, consumer expenditure is expected to grow as its strongest rate  
122 since 2011 (Euromonitor International's Head of Lifestyles Research, 2017). However, shifting consumer  
123 attitudes will continue shaping changes in business.

124

### 125 Clean-living and activist consumers

126 Consumers are becoming activists due to an increased awareness of global issues through Internet and  
127 social media; which at the same time give consumers an unprecedented power to lobby for change  
128 (Labrecque, vor dem Esche, Mathwick, & Novak, 2013). Consumer opinions are far-reaching, and they feel  
129 that their spending choices can make a difference (Labrecque et al., 2013). Concerns about climate change  
130 and health are widespread among consumers, especially the younger who are adopting a clean-living  
131 lifestyle. Clean lifers have strong beliefs and ideals, and they are embracing a minimalist, balanced and  
132 healthier lifestyle to reduce harm to themselves, others and the environment (Euromonitor International's  
133 Head of Lifestyles Research, 2017). Furthermore, they are demanding companies a greater transparency,  
134 sustainability and social responsibility (Kearney, 2010), (Kang & Hustvedt, 2014).

135

### 136 Personalization, a trend across all industries

137 Besides going greener, consumers are seeking uniqueness, demanding to be involved in the production  
138 process and product personalization (Wind & Rangaswamy, 2001). Although customization is demanded  
139 in all industries, from sneakers and furniture, to services and experiences; there is a rising interest in  
140 personalized health and beauty (Euromonitor International's Head of Lifestyles Research, 2017). Genetic  
141 findings related to health, fitness and nutrition, as well as a rising interest in health, and a growing consumer  
142 curiosity about their genetics, are fueling demand for DNA testing (Subbiah, 2007), (Ferguson, 2013).

143

### 144 Informed and connected consumers are shaping changes

145 Millennials, also known as "the connected generation", are driving the consumer revolution. Mobile devices  
146 are nowadays vital for everything, including shopping, sharing experiences, or health and sport tracking  
147 among others (Deloitte, 2013). Health technologies, including wearables and fitness apps, have made

148 people more aware of their state of health, powering the growth of health and wellness market (L. G.  
149 Euromonitor International's Consumer Health Analyst, 2016). In fact, people tend to exercise more, with  
150 gym memberships in the United States of America (US) increasing by more than 20% for the period  
151 comprised between 2011 and 2016 (Business Development Bank of Canada [BDC], 2016).

152  
153 Thanks to new technologies, consumers are more informed about their choices and reject unmeasured or  
154 uninformed spending. Ownership is under question and sharing is gaining popularity (Hamari, Sjöklint, &  
155 Ukkonen, 2016). A new wave of apps aims to provide consumers with the opportunity to share everything,  
156 from cars to living spaces (The Economist, 2013). Consumers prefer spending their money on experiences  
157 like travels, festivals and restaurants, rather than on products (Euromonitor International's Head of  
158 Lifestyles Research, 2017). Buying time, such as adopting online shopping and ordering food for delivery,  
159 is also a trend on the rise (L. G. Euromonitor International's Consumer Health Analyst, 2016). For this  
160 reason, an increased growth rate in apps and mobile optimized websites is forecasted.

161

#### 162 Global consumer trends in brief

163 Thanks to the irruption of new technologies, consumers' opinion is more powerful than it has ever been.  
164 For this reason, concerns about climate change, health and social responsibility, which are widespread  
165 among consumers, may shape changes in business. Other important trends are personalization and shared  
166 economy; as well as seeking for experiences or saving time rather than buying products. Finally, millennials  
167 will lead the mobile-driven market transformation, as they expect to do everything by using their mobile  
168 phone.

169

#### 170 **Food and Nutrition Trends**

171 Global trends have the power to transform and disrupt entire categories, such as nutrition. One of the  
172 aforementioned global trends, clean/healthy living, stands out as the most relevant trend impacting the food  
173 industry. Connected and informed consumers are going back to nature and unprocessed foods, to preserve  
174 most of the natural vitamins and minerals. For this reason, there's a growth in plant-based, organic, naturally  
175 healthy and "free-from" foods. Clean label is also a trend on the rise, and while healthy snacks and fats are

176 coming back, sugar and certain carbohydrates are becoming the main enemies. Protein, instead, is the  
177 preferred food component. Other trends such as personalization, redefinition of indulgence foods, activist  
178 consumers, and Internet of Things (IoT), are shaping changes in consumer behaviors and therefore, in the  
179 food industry. However, the most relevant nutrition trend is the rise of sports nutrition category.

180

#### 181 Older population growth – increased focus on health care

182 As both the proportion of older people and the average life expectancy increase throughout the world, the  
183 older population is growing dramatically worldwide; and therefore, the incidence of chronic diseases (Global  
184 Burden of Disease Study 2013 collaborators, 2015). In fact, in about five years' time, the number of people  
185 aged 65 or older, will outnumber children under age 5; representing a forecasted 16% of world's population  
186 by 2050 (World Health Organization [WHO], 2015b). Population aging is placing pressure on overall health  
187 care spending in developed countries, and for this reason, governments are interested in promoting healthy  
188 habits to reduce morbidity and cut off its associated health-care costs. In this spirit, the World Health  
189 Organization (WHO) released "Active ageing: a policy framework" in 2002 to prevent and delay chronic  
190 diseases and premature mortality, as well as their risk factors (WHO, 2015a).

191

192 In line with WHO's health action plan, and thanks to consumer connectivity and access to information, there  
193 is an increased attention on health care (Kearney, 2010). For this reason, by 2020, a double-digit growth  
194 has been predicted for health and wellness market in the US. In addition, an increasingly number of  
195 consumers are seeing food as a medicine, and as a consequence, dietary supplements and sports nutrition  
196 stand out as one of the fastest growing healthcare categories, with an expected growth of 14% over the  
197 next few years in the US (BDC, 2016).

198

#### 199 Connected consumers, informed decisions: going greener and healthier

200 With an easier access to information, consumers are becoming more aware than ever of ingredients in their  
201 food and their properties. In order to make informed decisions, consumers seek transparency throughout  
202 the production process to understand what is in their food and how it was produced (Bjørndal, Fernandez-  
203 Polanco, Lappo, & Lem, 2013), (Kang & Hustvedt, 2014). Clean lifers are turning their backs on unhealthy

204 habits, food waste and animal-based products. They want to feel good about their consumption choices by  
205 eating healthily, sustainably and ethically (Radnitz, Beezhold, & DiMatteo, 2015). Nowadays, eating often  
206 carries an ideological charge similar to belonging to a political party or football club (Euromonitor, 2015a).  
207 In fact, in 2018, 67% of US consumers said that they will be prioritizing healthy or socially conscious food  
208 purchases (The Nielsen Company, 2018a). Even fast food is getting greener, and there is a decrease in  
209 reliance on animal-based nutrition. The vegetarian and vegan movement are already in full-swing, and on  
210 the next years we will see a further push to eradicate or reduce animal-based products (Hancox, 2018),  
211 (Radnitz et al., 2015).

212

### 213 - *Vegetarian and vegan diets on the rise*

214 The proportion of individuals choosing to follow a vegan diet has increased in the recent years, with ethics  
215 and health being the main reason for such choice (Radnitz et al., 2015). As a result of consumer interest,  
216 vegan sales growth is outpacing total food and beverage sales (The Nielsen Company, 2018b). When it  
217 comes to health benefits of vegetarian eating, current scientific evidence reinforces benefits of a plant-  
218 based diet that is low in fat, added sugars, added salt, and processed foods. A healthy and well-planned  
219 vegan diet, with a high content of fruits, vegetables and whole grains, can provide sufficient energy and  
220 an appropriate range of carbohydrate, fat and protein intakes to support performance and health (Venderley  
221 & Campbell, 2006). In fact, many top athletes, including world champions like Venus Williams and Lewis  
222 Hamilton, are vegan, thereby contributing to a vegan consumer base expansion (Edsor, 2017).

223

224 In line with this growing consumer interest, global market for vegetarian and vegan products was worth  
225 US\$51bn in 2016, but it is still expanding, with a 987% increase in demand for vegetarian products (The  
226 Vegan Society, 2018). In the same year, a 3% of the US population ate a strictly vegetarian diet, and about  
227 half of those were vegan. But the biggest revelation was that 36% of consumers opted for at least some  
228 vegetarian meal on a regular basis (Vegetarian Resource Group, 2016). In the United Kingdom (UK), the  
229 number of vegans quadrupled in the years between 2014 and 2018, reaching a 1,16% of the population  
230 (The Vegan Society, 2018). Indeed, as shown in Figure 1, vegan trend tripled in the years between 2012  
231 and 2018 (Google Trends, 2018). In line with this rapidly growing consumer demand for vegetarian and

232 vegan products, big companies such as Danone, McDonald's or Ben&Jerry's have invested in vegan  
233 alternatives to their products (The Vegan Society, 2018).

234

235 To sum up, consumers are keener on more plant-based, natural, minimally processed, local and seasonal  
236 food. According to Euromonitor International Global consumer trends survey 2017, "all natural" is the  
237 preferred food attribute, followed by "no artificial sweeteners", "limited or no added sugar" and "does not  
238 contain Genetically Modified Organisms (GMO) ingredients". In line with these findings, the following  
239 categories are on the rise (Euromonitor, 2017a).

240

241 - *Organic food growth*

242 Consumers are moving towards products perceived as more natural and healthier, resulting in a global  
243 demand for organic products (Asioli et al., 2017). Global sales of organic food and drink expanded by about  
244 10% to US\$81,6bn in 2015. The highest growth was observed in North America, which has the largest  
245 market for organic food and drink in the world. Valued at US\$43,4bn and accounting for over half of  
246 international sales, it is followed by the European market, which is valued at US\$31,1bn in 2015. Asia,  
247 Australasia and other regions, account for just US\$7,2bn in 2015. Despite having had an enormous growth,  
248 from US\$18 to 82bn over 15 years, organic food drink and sales growth is expected to continue (Sahota,  
249 2012), (FIBL and IFOAM, 2017). In fact, by 2019, 30% growth is forecasted for organic beverages in  
250 Canada (BDC, 2016).

251

252 When it comes to the organic packaged food and beverages, in 2016 they had a global retail value RSP of  
253 US\$32,153mn and US\$3,972.7mn, respectively (Euromonitor, 2015a). And in 2018, in Latin America,  
254 organic and "free-from" packaged food, are worth US\$35bn and US\$36bn; and will have annual growth  
255 rates of about 6% and 3,5%, respectively, thereby standing out as one of the food categories with a global  
256 strongest growth (Daniells, 2018).

257

258 - *“Free-from” and digestive wellness*

259 Specific ingredients and even entire categories or food groups, such as dairy, lactose, sugar, sodium,  
260 gluten, meat, fats and carbohydrates, are being avoided or limited by an increasing number of consumers  
261 (International Food Information Council Foundation, 2018). 68% of US consumers are concerned with what  
262 is not in their food (The Nielsen Company, 2018a), and those who avoided at least five separate ingredients  
263 increased from 35% in 2015, to 53% in 2016 (L. G. Euromonitor International’s Consumer Health Analyst,  
264 2016).

265  
266 In the same year, global free-from foods were valued at US\$33bn, and have consolidated as the category  
267 with the most dynamic growth in the health and wellness market (Euromonitor, 2017b). Consumers perceive  
268 “free-from” offering as healthier, and they associate it to digestive wellness and gut health. For this reason,  
269 free-from trend has gone beyond intolerance and allergies, as consumers increasingly focus on foods that  
270 may help them to reduce feelings of gas, bloating or more severe gastrointestinal symptoms related to  
271 suspected allergies or intolerances (Mintel, 2016), (Kerry Health And Nutrition Institute [KHNI], 2018). As a  
272 consequence, “free-from” products, as well as added-benefit ingredients such as probiotics and prebiotics  
273 are on the rise. When it comes to the largest subcategory, free-from dairy is leading, due to an increased  
274 demand for dairy milk alternatives. It is followed by free-from gluten, which had the largest absolute growth  
275 over the period between 2012 and 2017 (Euromonitor, 2017b). In fact, in 2015, 12% of new food products  
276 launched in the UK carried a gluten-free claim (Mintel, 2016).

277

278 - *Naturally healthy vs. fortified and functional food*

279 Functional foods are those containing added biologically active ingredients that may improve health or lower  
280 the risk of disease. Besides supplying macronutrients, vitamins and minerals, they may include other active  
281 ingredients like antioxidants, prebiotics, probiotics, enzymes and/or phytonutrients to deliver a specific  
282 health benefit above their basic nutritional value (Bigliardi & Galati, 2013).

283

284 Functional food term encompasses a wide variety of products, like those enriched or fortified. Enrichment  
285 involves replacing those nutrients lost during processing. An example is bread, often enriched with iron and

286 folic acid, which are removed during milling of wheat to make flour (WHO, 2018), (Overview of Food  
287 Fortification, 2003). Fortification, instead, involves adding nutrients irrespective of whether they were  
288 originally present to any great extent in the food. Fortification is mostly used to improve nutritional status of  
289 a population or to differentiate products providing a competitive advantage. For example, bread may be  
290 fortified with omega-3 fatty acids (Gökmen et al., 2011). Nutrients are also usually added to substitute  
291 products in order to achieve a similar nutritive value to that in the original product. An example is the addition  
292 of calcium to soya-based drinks, which are sold as cow's milk substitute, in an amount equal to milk's  
293 natural content (Yazici, Alvarez, Mangino, & Hansen, 1997).

294  
295 On the other hand, naturally healthy products are those that naturally contain active ingredients. An  
296 example is oatmeal, which contains a soluble fiber that can help lower cholesterol levels and heart disease  
297 risk (Othman, Moghadasian, & Jones, 2011), (Bernstein et al., 2013). In line with the clean-living trend,  
298 more consumers like the idea of whole plant-based foods with intrinsic nutritional value, and thus, without  
299 the need for fortification. This is leading to a decrease in demand for functional foods. In fact, naturally  
300 healthy, valued at US\$253bn, has already outpaced global fortified and functional food and beverage  
301 market, which is valued at US\$247bn (M. M. Euromonitor International's Consumer Health Analyst, 2018).  
302 Despite functional food category growth slowing down, this category is still expanding and important,  
303 especially in emerging markets, where consumers are seeking functional ingredients linked to a health  
304 positioning (Kearney, 2010).

305

#### 306 Clean label, no longer a trend but the new norm

307 "Clean label" concept doesn't have any commonly accepted definition, and it is more based on consumer  
308 perception rather than on scientific evidence. Clean label products are those made with ingredients that  
309 consumers recognize and trust, and that do not contain undesirable ingredients (Asioli et al., 2017),  
310 (Bizzozzero, 2017). Clean labeling usually involves reducing the number of ingredients, particularly those  
311 perceived to be artificial, and those lacking any nutritional benefit. Mainly focused on removing food  
312 additives, such as synthetic colors, preservatives, stabilizers, emulsifiers and texturizers; clean labelling in  
313 its purest form also involves reducing certain food components such as fat, sugar and salt among others.

314 Claims such as “all natural”, “no artificial sweeteners”, “limited or no added sugar”, “non-GMO” and  
315 “minimally processed” are often included in clean label products (Asioli et al., 2017).

316

317 In line with the aforementioned global trends, consumers are increasingly mindful of their food and beverage  
318 choices. 69% and 52% of worldwide consumers believe, respectively, that products without artificial  
319 ingredients, and products with fewer ingredients, are healthier (The Nielsen Company, 2016). For this  
320 reason, consumers are willing to pay more for clean label products, whose global sales hit US\$165bn in  
321 2015 and are projected to reach US\$180bn by 2020 (Bizzozzero, 2017).

322 Clean label products are no longer a trend but the new norm (Bizzozzero, 2017). Ingredient names, and  
323 especially consumer familiarity and acceptance of them, play a central role in clean-label. Long, chemical-  
324 sounding, difficult-to-pronounce or unfamiliar names lead to perceptions of higher risk and raise questions  
325 about the reason for their use in foods (Asioli et al., 2017). Therefore, clean labeling often includes swapping  
326 chemical-sounding names for consumer-friendly ones. By way of example “tocopherol”, a synonym of  
327 vitamin E, might be perceived as chemical or artificial, so it would be better to list it as vitamin E. However,  
328 going clean label is not always such an easy task (Gallagher, Gormley, & Arendt, 2004). For this reason,  
329 the replacement of ingredients regarded as redundant, unacceptable or even harmful without any scientific  
330 justification sets up costly and sometimes unnecessary challenges. In addition, as previously mentioned,  
331 clean labeling is more about consumer perception than scientific evidence. With a constantly changing  
332 consumers' wish-list, so does the target for formulators, whom at the same time have to face functionality,  
333 quality and safety issues derived from the replacement of certain ingredients (Lamacchia et al., 2014).

334 Protein is king, fat is back, and what about carbohydrates?

335 While consumers try to avoid specific ingredients, others are on the rise. Consumers are increasingly  
336 looking for high-protein foods, since an optimal protein intake is usually associated with satiety and lean  
337 body mass gain or maintenance (Euromonitor, 2016). Protein also serves as a great replacement for sugar  
338 and fat, which are usually linked to an unhealthy diet (Lucca & Tepper, 1994). With 55% of US consumers  
339 considering high protein content a remarkable attribute when buying food products, protein demand is

340 increasing (The Nielsen Company, 2017). However, it still has room to grow, especially in emergent  
341 markets.

342  
343 When it comes to the reasons for this protein surge, media praise and sports nutrition have a lot to do with  
344 it. Protein dominates sports nutrition global sales, as it is an accessible and understandable ingredient,  
345 which gives multiple health benefits (C. S. Euromonitor International's Consumer Health Analyst, 2014). It  
346 appeals mainly to younger consumers aligned with fitness trends, but with an increasing evidence of  
347 benefits on aging, bone and heart health, it will potentially appeal to millions more in the near future  
348 (Euromonitor, 2016).

349  
350 As for the sources of protein, skinless chicken, fish, egg white and lean beef are the best dietary sources  
351 of low fat and high-quality protein (Hoffman & Falvo, 2004). While traditional sources like meat, eggs and  
352 dairy are consumer's primary sources of protein and still dominate sales (as illustrated in Figure 2), plant-  
353 based alternatives are experiencing a strong growth, in demand for health, sustainability and animal rights  
354 (The Nielsen Company, 2017).

355  
356 It should be pointed out that fat, which is usually associated to an unhealthy diet, is an essential component  
357 of all cells, and along with carbohydrates, provides the majority of energy to individuals who exercise at a  
358 low-to-moderate intensity (Melzer, 2011). "Fat is back" is a trend in agreement with the dietary  
359 recommendation that the type is more important than the amount of fat (KHNI, 2018). Certain fats such as  
360 polyunsaturated omega-3 fatty acids found in fish and other foods, have a number of reported positive  
361 health effects, like mitigating inflammation (Calder, 2010). Other examples of healthy fat's sources would  
362 be olive and avocado, which are rich in monounsaturated fatty acids (Owen et al., 2000), (Dreher &  
363 Davenport, 2013). Finally, fats also have a technological function, serving as texturizers or as a way to add  
364 flavor. The last one is gaining relevance as a result of an increased focus on sugar reduction (KHNI, 2018).

365  
366 Last but not least, there is a growing concern about the source and content of carbohydrates. They have  
367 been targeted by many weight-loss diets as a strategy to reduce overall calorie intake, resulting in a rising

368 popularity of carb-free foods (International Food Information Council Foundation, 2018). When it comes to  
369 its source, minimally refined grains and faux grains like quinoa, amaranth or wild rice, are gaining popularity  
370 due to their nutritional profile with increased protein content and a low glycemic index (Peters, 2018). In  
371 contrast, consumers try to avoid sugars or starches, which are often referred to as “bad carbs” due to their  
372 minimal nutritional value. This is strongly linked with the plant-based food trend, as carbs derived from fruits  
373 or vegetables are considered as “good carbs”, and are used instead of refined starches (KHNI, 2018).

374

#### 375 Beverages, snacks and indulgence foods redefined

376 Due to the aforementioned scientific evidence against added sugars and energy drinks, beverages are in  
377 a redefinition phase. Functional beverages like kombucha and protein shakes are gaining popularity among  
378 consumers, who are keener on beverages that incorporate protein, fiber and vegetable servings, while  
379 maintaining an acceptable flavor (KHNI, 2018). In functional beverages, stevia is usually the sweetener of  
380 choice for people who want to cut down sugar or calories (Lemus-Mondaca, Vega-Gálvez, Zura-Bravo, &  
381 Ah-Hen, 2012).

382

383 When it comes to snacks and indulgence foods, they are being reformulated so that they contain more  
384 plant-based and/or perceived as healthy ingredients. In addition, due to busier lifestyles, an increasing  
385 number of consumers prefer a snackable meal format, which is more convenient than sit-down meals. This  
386 is a growing food trend, known as “snackification” (KHNI, 2018).

387

#### 388 Activist consumers against food waste

389 With half of the world’s food being thrown away, there is an increased concern about food waste (McCarthy  
390 & Liu, 2017). For this reason, consumer acceptance of “non-perfect” products will grow, and consumers will  
391 begin to consider cheap food past its best before date. A revival in use of leftovers, right-size portioning  
392 and grow-it-yourself, is also forecasted (Euromonitor, 2015a). Finally, as consumers are keener on new  
393 initiatives encouraging more sustainable production and targeting food waste, governments are also  
394 making a move. In fact, in France, a law was approved to make supermarkets give food waste to charity or  
395 as animal feed (Sénate Français, 2016).

396

#### 397 Personalization, a global trend impacting nutrition

398 As discussed above, personalization is one of the main global trends, which is also influencing nutrition  
399 trends. A new wave of companies provides consumers with genetic and metabolomic findings related to  
400 their health, fitness and nutrition (Subbiah, 2007). Additional information can be collected through wearable  
401 fitness trackers, among other methods; giving an overall picture of health. Personalized training and  
402 nutrition plans are offered based on findings of individual parameters such as fat burning ability or capacity  
403 to metabolize caffeine, lactose or gluten, among others (Mutch, Wahli, & Williamson, 2005), (Ferguson,  
404 2013). In this context, one of the main challenges of personalization is not just customizing mass-produced  
405 products, but also shaping them to individual preferences before production, in order to shift from product  
406 to experience or service (Wind & Rangaswamy, 2001), (Euromonitor International's Head of Lifestyles  
407 Research, 2017).

408

#### 409 Internet of Things shaping interaction with food

410 By the year 2020, about 24 billion internet-connected devices will be installed globally, which is the  
411 equivalent of about 3 devices/person (Gubbi, Buyya, Marusic, & Palaniswami, 2013). IoT may continue  
412 shaping the way we purchase, receive and interact with our food. In fact, there is a continued expansion of  
413 online or online/offline hybrid subscription services, such as click and collect grocery shopping and delivery  
414 of restaurant meals. Due to strong growth of these alternative businesses, it is expected that by 2021,  
415 supermarkets and hypermarkets will account for less than a half of the total consumer goods trade  
416 (Euromonitor, 2018).

417

#### 418 Sports nutrition is rocketing

419 In line with the aforementioned healthy living trend, more people are adopting an active lifestyle, which is  
420 translating into a rise of sport and endurance activities (C. S. Euromonitor International's Consumer Health  
421 Analyst, 2014). As scientific evidence confirms that certain ingredients can enhance athletic performance,  
422 more people recognize the benefits of sports nutrition products, and therefore, are increasingly  
423 complementing their work-out sessions with these products (American Dietetic Association et al., 2009),

424 (Ronald J. Maughan & Shirreffs, 2012). For a long time, sports nutrition products were primarily meant and  
425 used by the so-called core users, that is, elite athletes and bodybuilders. However, the growing health  
426 consciousness and desire for fast results has helped sports nutrition to become more appealing to  
427 mainstream consumers and thereby, to expand its consumer base over the last decade. The so-called  
428 casual users have pushed the category into the mass market (Euromonitor, 2015b). For this reason,  
429 products that were once only available in fitness shops, can now be found in pharmacies and even  
430 supermarkets, achieving greater total sales for the sports nutrition category (Spano & Antonio, 2008).

431  
432 Sports nutrition was valued at US\$8,8bn in 2013; and sports foods comprising protein supplements, sports  
433 nutrition, and soft drinks including energy and sports drinks, were valued at US\$60bn in the same year (C.  
434 S. Euromonitor International's Consumer Health Analyst, 2014). Despite having experienced a steady rate  
435 growth in the last decade, several market researches continue forecasting a sustained global growth for  
436 sports nutrition category in the following years (Euromonitor, 2015b). Last but not least, although it has  
437 been reviewed as a nutrition trend, sports nutrition is also a category itself, with its own wide range of  
438 specific trends, and for this reason it will be reviewed in detail in the corresponding section below.

439

#### 440 Nutrition trends in brief

441 To sum up, global trends and concerns about climate change, health and social responsibility, which are  
442 widespread among consumers, are shaping changes in nutrition. As a consequence of the clean-living  
443 trend and the older population growth, there is an increased focus on healthy nutrition and physical exercise  
444 to prevent and delay aging, chronic diseases and premature mortality, as well as their risk factors.

445

446 Consumers seek transparency, and with an easier access to information, they are becoming more aware  
447 than ever of ingredients in their food. Consumption choices are influenced by the will of eating healthy, but  
448 also ethically and socially conscious. For this reason, consumers are keener on more natural, animal-free,  
449 plant-based, minimally processed, local, and seasonal food. Besides going back to nature, with a growth in  
450 demand for organic and naturally healthy products, other categories such as "free-from" and  
451 fortified/functional foods are also on the rise.

452

453 In line with the clean labelling trend, certain ingredients or categories, such as dairy, sodium, sugar or  
454 carbohydrates, are being avoided or limited by an increasing number of consumers. Instead, other  
455 ingredients such as proteins or healthy fats, are becoming more popular. With health as the main priority,  
456 even beverages, snacks and indulgence foods, are being redefined to incorporate ingredients with  
457 demonstrated health benefits.

458

459 Other global trends such as personalization, activist consumers against food waste, and IoT, are shaping  
460 interaction with food and impacting nutrition. Sports nutrition is rocketing and influencing nutrition trends,  
461 possibly being the main responsible for the protein surge. For this reason, and because it is not only a  
462 nutrition trend, but also a category itself, it will be reviewed in detail in the section below.

463

464 Finally, by way of a summary, Figure 3 shows the global sales of the selected health categories in 2017,  
465 reflecting their relevance among the different health categories.

466

### 467 **Trends in Sports Foods and Nutrition**

468 Global trends and consumer concerns are shaping changes in nutrition, and thereby influencing the sports  
469 nutrition category as well. “Healthy living” stands out as the most relevant global trend impacting the food  
470 industry, and it is responsible for the enormous growth that sports nutrition category is experimenting. In  
471 line with this increased health awareness, consumers are keener on more natural, animal-free, plant-based,  
472 minimally processed, local, and seasonal food, what is also shaping sports nutrition products.

473

474 As more consumers become aware of the importance of a well-designed diet for a good training, the use  
475 of sports nutrition products is becoming mainstream. Besides being a nutrition trend, it is an important  
476 category influencing nutrition trends, possibly being the main responsible for the protein surge. Sports  
477 nutrition is a large and quickly growing consumer health category that promotes the achievement of an  
478 optimum nutrient intake, which is having positive implications in health care costs and well-being, and for  
479 this reason it will be reviewed in detail below.

480

481 Sports nutrition, not just a recent trend

482 Sports foods are those specialized products designed for athletes and active people to improve their  
483 nutritional intake, health, wellbeing, performance, muscle growth and/or recovery from exercise. In addition,  
484 they can also provide a convenient source of nutrients when it is impractical to consume everyday foods.  
485 Whey protein, sports gel or electrolyte replacement drinks are examples of sports foods. Among sports  
486 foods, sports nutrition encompasses food/dietary supplements aimed to contribute to an optimal  
487 performance (ESSNA, 2018). By law, sports nutrition products can only contain vitamins, minerals, food  
488 ingredients, macronutrients, herbal ingredients with a substantial history of use, and other ingredients that  
489 are generally regarded as safe (European Parliament, 2002), (United States Congress, 1994). Despite the  
490 distinction between sports foods category and sports nutrition subcategory, the two terms are often used  
491 interchangeably, also in the following text.

492

493 Although sports nutrition is one of the latest trends, it is a much older phenomenon. In the ancient Olympic  
494 Games, athletes used to eat massive quantities of meat, bread, dried fruits and honey, along with various  
495 fungi and herbs in an attempt to increase their athletic performance. But it was not until the last century  
496 when scientists found that certain substances were effective in improving athletic performance, and thereby,  
497 the first scientific-based sports nutrition products were created (ESSNA, 2018). A well-designed diet, with  
498 nutrient-dense foods, that meets energy intake requirements and incorporates proper timing of nutrients, is  
499 the foundation of a good training (Kerksick et al., 2008). However, athletes' dietary needs might be difficult  
500 to achieve through food intake alone, and for this reason, dietary supplements and sports nutrition products  
501 are often needed. When races are won by mere fractions of a second, and games may be lost due to  
502 fatigue, nutrition can make the difference between an athlete and a champion (Spano & Antonio, 2008).

503

504 Until recently, only bodybuilders and strength athletes were pushing for nutrient-dense, high-quality, and  
505 more convenient sources of nutrition, that could help them satisfy their unique nutritional requirements.  
506 However, as a consequence of an increasing scientific evidence on sports nutrition health and performance  
507 benefits, more athletes and coaches from other disciplines, embraced the use of these products. In the last

508 decade, sports nutrition has expanded its consumer base to amateur athletes and active people who not  
509 only care about their muscle growth, athletic performance and recovery, but also about their health and  
510 wellbeing (Euromonitor, 2015b), (C. S. Euromonitor International's Consumer Health Analyst, 2014).

511

#### 512 Sports nutrition market analysis

513 Consumers worldwide are adopting a healthy living lifestyle and gaining awareness of their needs and  
514 proactive steps that can be taken to achieve a higher wellbeing and prevent chronic diseases (Euromonitor  
515 International's Head of Lifestyles Research, 2017). Along with this trend, different categories are growing,  
516 like the Canadian wearable device market, which includes fitness trackers, and is expected to grow by  
517 150% in 2019. Another example would be that in 2014, more than 41% of Canadians were interested in  
518 buying a health monitor (BDC, 2016). So, with health in focus and with the rising mantra "strong is the new  
519 skinny", sports nutrition is the fastest growing consumer health category for several years in a row, and it  
520 is expected to continue growing at a steady pace in the next years (Mitchell, 2016).

521

522 Since more people recognize the benefits of sports nutrition products, the category has seen an enormous  
523 growth, from US\$6,7bn and US\$8,9bn in 2010 and 2013, respectively, to US\$10,8bn in 2015. Moreover,  
524 forecasts point out that it will continue growing. Sports foods, including not only sports nutrition products,  
525 but also sports and energy drinks and bars, were worth US\$60bn in 2013 (C. S. Euromonitor International's  
526 Consumer Health Analyst, 2014).

527

528 Although US is dominating the global market, accounting for over 60% of global sales, the growth is truly  
529 global. However, in terms of consumption, developed markets are leading. By way of example, Australia  
530 followed by US were leading in consumption in 2013, with an expenditure of US\$ 55 and 45 per household  
531 respectively; while world average consumption was around US\$5 per household. As for low-income  
532 markets, despite the barrier of relatively high prices, the global healthy living trend together with the rising  
533 disposable incomes, are supporting the increased demand and consumption of sports nutrition products.  
534 For this reason, less developed markets such as China, India and Brazil, are evolving and fast growing (C.

535 S. Euromonitor International's Consumer Health Analyst, 2014), (C. O. Euromonitor International's  
536 Consumer Health Analyst, 2017).

537

#### 538 Sports nutrition is becoming mainstream

539 The main reason for the sports nutrition market steady growth is the expansion of its consumer base over  
540 the last 10 years (Euromonitor, 2015b). Consumers have an increased health awareness and are  
541 increasingly opting for sports nutrition products to complement their work-out sessions (Mordor Intelligence,  
542 2018). As a result, the demand for sports nutrition category and its sales are rocketing.

543

544 Sports nutrition products, which are aimed to improve performance, post workout recovery and muscle  
545 maintenance and building, were originally designed for elite athletes and body builders in order to keep up  
546 with their unique nutritional demands. However, as a result of the healthy living trend, sports nutrition  
547 products have become mainstream over the past decade (C. S. Euromonitor International's Consumer  
548 Health Analyst, 2014). Besides the constantly increasing fitness clubs, which are exposing more and more  
549 recreational sports enthusiasts to sports nutrition products, other key features to support market growth  
550 have been innovation, with a growth rate of 10'4% of global product launches between 2011 and 2016, and  
551 consumer loyalty. In contrast to what happens to other categories, when users detect a positive difference  
552 in performance, they generally stick to it. Thereby, sports nutrition products enjoy a high degree of loyalty  
553 (Mordor Intelligence, 2018).

554

555 When it comes to consumers, they are not only increasing in number, but also in diversity. As a  
556 consequence, knowledgeable and high-volume users who purchase frequently, also known as "core users",  
557 no longer dominate sports nutrition sales. In the last decade, sports nutrition products have become more  
558 appealing to a greater number of mainstream consumers, often referred to as "casual users", who are  
559 recreationally active. They prefer convenient formats and recognizable ingredients (Euromonitor, 2015b).  
560 Another group has recently emerged in developed markets, they are the "lifestyle users" who are not  
561 particularly athletic but put a greater focus on increasing their fitness levels by trying to do more exercise.  
562 Lifestyle users are mainly young and invest in fitness as a fundament aspect of a healthy lifestyle. They are

563 keen on trying new products, formats and ingredients (C. S. Euromonitor International's Consumer Health  
564 Analyst, 2014), (Mordor Intelligence, 2018).

565  
566 Despite the different characteristics defining each consumer type, what all of them have in common is that  
567 they seek transparency, as well as clean and open label formulations (Kang & Hustvedt, 2014). Responding  
568 to these demands, third-party banned-substance-free certification has become a standard for major brands  
569 and producers. In addition, an increasing number of brands are opening up their proprietary blends with  
570 complete ingredient break-outs (C. S. Euromonitor International's Consumer Health Analyst, 2014). In  
571 general, a greater focus is put on the presentation of products, including appealing and interactive labelling  
572 to make it easier for the consumer to understand the ingredients, and to ensure product safety (Mordor  
573 Intelligence, 2018).

574  
575 Finally, as a consequence of the consumer base expansion and segmentation, sports nutrition products  
576 are consumed for different purposes. For this reason, companies are discussing whether a better name for  
577 the industry would be lifestyle nutrition or active nutrition, which would appeal to more consumers, helping  
578 to continue broadening the consumer base (C. O. Euromonitor International's Consumer Health Analyst,  
579 2017). In line with this last objective, major brands are penetrating mainstream distribution channels, such  
580 as gyms, pharmacies and supermarkets. For this reason, products that were once only available in  
581 dedicated fitness shops, have made their way to other retailers. In addition, sports nutrition products are  
582 also distributed by online sellers, accounting for 41,3% of sales in the US in 2017 (Mordor Intelligence,  
583 2018).

584  
585 Proteins will not abdicate – and continue leading  
586 Proteins dominate global sales, in no small part as a consequence of being the most accessible and  
587 understandable sports nutrition ingredient. While non-protein products were worth US\$1,6bn in 2013, this  
588 is 17% of the total sports nutrition market; protein products, including powder, bars, ready-to-drink  
589 beverages and others, have been growing at a steady pace, reaching US\$7,3bn in 2013 and US\$9,2bn in  
590 2015, accounting for more than 83% of the total sports nutrition market. In addition, 6,5% compound annual

591 growth is forecasted for protein products during the time frame between 2015 and 2020. In fact, protein  
592 market is expected to reach US\$13,5bn in 2020 (C. S. Euromonitor International's Consumer Health  
593 Analyst, 2014), (Euromonitor, 2015b).

594

595 Protein claims related to muscle mass growth, lean muscle maintenance and recovery from resistance  
596 exercise, makes protein the most demanded product on sports nutrition category. Protein is especially  
597 appealing for younger consumers, aged 15-34. Its popularity benefits from media praise and still has room  
598 to grow, particularly in emergent markets such as China, Latin America and India. Other lesser known  
599 protein benefits are satiety, bone and heart health, and antiaging, which are perfectly aligned with global  
600 concerns about overweight, obesity, cardiovascular health and aging. Provided that these claims become  
601 mainstream, proteins will potentially appeal to millions more in the near future (Euromonitor, 2016). As a  
602 result of its reputation as a health-promoting ingredient, natural-containing protein products and protein  
603 fortified foods, are also gaining popularity among mainstream consumers.

604

605 In the sports nutrition category, protein products remain the most demanded, as they offer a convenient  
606 way of meeting increased protein requirements without excess calories, fats or sugars. When it comes to  
607 the format, protein powder accounted for 70-80% of total protein products and reached US\$5,6bn in 2013.  
608 However, convenience formats, like ready-to-drink beverages, or protein bars, are growing quickly and  
609 reached US\$ 766mn and 837mn, respectively, in 2013 (Euromonitor, 2016).

610

611 - *Whey protein – a sales king that is being challenged*

612 Among protein powder products, which usually need to be mixed with water or milk, whey is the king of  
613 sales. Casein, egg and soy proteins are also fairly common (Euromonitor, 2015b), (Euromonitor, 2016).  
614 However, in nutritional terms, whey is one of the best quality protein sources, and it delivers a greater taste  
615 than the offered by other sources. Besides its content in essential amino acids and BCAA, whey proteins  
616 are also well-known for its easy digestion and quick absorption, which ensure a fast delivery of the building  
617 blocks required for lean muscle mass growth and recovery (Hoffman & Falvo, 2004), (Patel, 2015). In fact,

618 published scientific research has demonstrated that in relation to other protein sources, whey protein  
619 promotes greater muscle-building activity and muscle mass gains (Hoffman & Falvo, 2004).

620

621 For a long time, whey protein isolate was only popular among core users, but due to a trickle-down effect,  
622 its consumer appeal is widening (C. S. Euromonitor International's Consumer Health Analyst, 2014). In  
623 addition, whey protein is versatile and easy to use in product applications, so it is also popular among  
624 manufacturers (Agarwal, Beausire, Patel, & Patel, 2015). However, as casual and less-sophisticated users  
625 increasingly opt for whey protein products, core users are shifting to sustained-release protein blends,  
626 which could also gain mass acceptance in the near future (C. S. Euromonitor International's Consumer  
627 Health Analyst, 2014). These new formulations, including mixtures of different protein sources and protein  
628 treatments (concentrate, isolate and hydrolysate), are challenging whey protein isolate as king of protein  
629 sales (Euromonitor, 2016). Other factors, such as sustainability and animal welfare, are increasing the  
630 demand for plant-based proteins and therefore, increasing the challenge for whey protein (Radnitz et al.,  
631 2015), (Hancox, 2018).

632

633 Last but not least, in line with the healthy nutrition trend, high-protein and added-protein foods, which are  
634 already in full-swing, could pose a long-term threat to specialized sports protein products; especially among  
635 casual and lifestyle users (Chittock, 2013). In addition, although scientific evidence confirms protein  
636 supplementation safety, some dietitians are questioning the need and safety of protein supplementation,  
637 posing another threat to sports protein products (Antonio et al., 2016).

638

639 - *Rising demand for plant-based proteins*

640 With over 80% of sports nutrition sales coming from protein-based products, and a global high-protein diet  
641 trend, sports protein products will continue to lead the industry (C. O. Euromonitor International's Consumer  
642 Health Analyst, 2017). However, consumers are increasingly asking for free-from, non-allergenic and plant-  
643 based products; and proteins are not the exception. With 3% of US population eating a strictly vegetarian  
644 diet, and 36% opting for at least vegetarian meals on a regular basis in 2016, there is a growing demand  
645 for plant-based proteins (Vegetarian Resource Group, 2016). Sustainability, animal welfare and a decrease

646 in reliance on animal-based nutrition are driving the demand for alternatives to milk proteins (C. S.  
647 Euromonitor International's Consumer Health Analyst, 2014), (Radnitz et al., 2015), (Hancox, 2018).

648  
649 Plant-based proteins from soy, pea or rice are less common than whey protein, but they are growing quickly  
650 and will continue to do so (Euromonitor, 2016). In fact, scientific evidence shows that plant-based proteins  
651 can be as effective as animal proteins for muscle maintenance, as long as the selected source, delivers all  
652 the essential amino acids needed (Mangano et al., 2017). In addition, a well-designed vegetarian or vegan  
653 diet provides sufficient energy and appropriate range of carbohydrate, fat and protein intakes to support  
654 performance and health (Venderley & Campbell, 2006), (Lynch et al., 2016). For this reason, certain elite  
655 athletes are going vegan and beginning to consume plant-based proteins, thereby contributing to plant-  
656 based proteins consumer base expansion (Edsor, 2017).

657  
658 - *Hydrolysates are the next big thing – life is too short for slow proteins*  
659 Differences in protein source, amino acid profile, and processing methods, can have an influence on amino  
660 acids bioavailability. Hydrolysates are high-quality proteins that have been finely chopped or predigested  
661 so that they can be absorbed faster than conventional proteins, helping to cut muscle recovery times from  
662 days to hours (Manninen, 2009). For this reason, they play a greater role in those athletes who place higher  
663 pressure on their body due to exercise frequency and intensity, and those who have a small window for  
664 recovery. Although hydrolysates future is promising, its bitterness and astringency hinders its incorporation  
665 into beverages, bars and gels (FitzGerald & O'Cuinn, 2006), (Liu, Jiang, & Peterson, 2014). This is not a  
666 drawback for core users, but since casual users prefer convenience products with good taste, until now  
667 hydrolysates have had a slow expansion. However, recent advances in hydrolysates processing technology  
668 have allowed taste-masking, enabling its incorporation into various formats such as clear drinks (FitzGerald  
669 & O'Cuinn, 2006). As a consequence, a fast growth for hydrolysates is forecasted (Euromonitor, 2015b).

670  
671 What about non-protein products?  
672 Casual users' adoption of non-protein products is growing. However, since these products are more difficult  
673 to understand by the mainstream and uninformed consumers, they mostly appeal to core users. With sales

674 reaching US\$160mn in 2013, UK has a leading position in the global non-protein products market. Global  
675 sales were worth 1,6bn in 2013 and are expected to grow by nearly US\$500mn, achieving US\$2bn in 2018  
676 (C. S. Euromonitor International's Consumer Health Analyst, 2014).

677  
678 In general, fitness-focused lifestyle, a desire for fast results, and a high demand for portable and convenient  
679 products, are the main drivers of the sports nutrition category. When it comes to convenience formats, non-  
680 protein products have been ahead, leading the experimentation. Gels, chews, bars, sachets and shots are  
681 examples of convenience formats. With the rise of endurance sports, gels have become the most popular  
682 convenience format (Euromonitor, 2015b), (C. S. Euromonitor International's Consumer Health Analyst,  
683 2014).

684  
685 As for sports drinks, they are expected to record the highest growth rate in the following years. Sports  
686 drinks, including products sold in powder to be rehydrated in water, are highly demanded as consumers  
687 become aware of the uses and benefits of drinks rich in carbohydrates, minerals and electrolytes (Zimberoff,  
688 2017). Active and sports people have higher carbohydrate requirements, and without an adequate intake  
689 of them, exercise performance decreases (Williams & Rollo, 2015). Electrolyte-replacement, glucose-  
690 containing solutions help to maintain blood glucose levels and prevent dehydration and therefore, may  
691 delay fatigue and attenuate muscle damage during endurance exercise (American Dietetic Association et  
692 al., 2009). However, the growing sugar-averse consumer base is contributing to an increased demand for  
693 low-calorie and low-carbohydrate sports drinks, especially in North America, which is the leader in sales  
694 (International Food Information Council Foundation, 2018). New sports drinks are mainly focused on  
695 optimizing hydration before, during and after physical activity. Maintaining hydration status is one of the  
696 most effective ways to maintain exercise performance, which can be significantly impaired when 2% or  
697 more of body weight, is lost through sweating (American Dietetic Association et al., 2009),(Ronald J.  
698 Maughan & Shirreffs, 2012).

699  
700 In 2013, sports drinks and energy drinks accounted for US\$18,7bn and US\$27,6bn, respectively. However,  
701 there is a blurring line between energy/sports drinks, and non-protein products category (C. S. Euromonitor

702 International's Consumer Health Analyst, 2014). The main reason for this, is that energy/sports drinks are  
703 shifting from the so-called bad carbs to the good ones. This is translating into products with lesser amounts  
704 of ingredients with minimal other nutritional value, like sugar or starches; and with higher amounts of  
705 naturally-containing-carbohydrates fruits, vegetables and whole grains (International Food Information  
706 Council Foundation, 2018). Strongly aligned with plant-based trend, this new wave of products is blurring  
707 the line between energy/sports drinks, and other drinks or beverages in the non-protein products category.

708

#### 709 An overview of sports nutrition products' global sales

710 Before moving forward with other trends to look out for in 2020, Figure 4 shows the global sales of the  
711 selected sports foods subcategories in 2013, thus reflecting their relative relevance.

712

#### 713 Other trends to look out for in 2020

714 Nutrient timing is a well-known concept for elite athletes, and casual users' awareness of its importance is  
715 increasing. Meal times and snacks should be planned in concert with training, to make sure that athletes  
716 have sufficient availability of nutrient-dense foods throughout the day. Research has shown that meal timing  
717 and composition may play a role in optimizing performance, training adaptations and preventing  
718 overtraining (Kerksick et al., 2008). By way of example, within 30 minutes of a workout, consuming high-  
719 quality carbohydrate and protein is key to replenish those nutrients depleted during the workout. While  
720 carbohydrates replenish glycogen stores and therefore, support muscle recovery, protein helps in muscle  
721 building and repairing (American Dietetic Association et al., 2009).

722

723 Global trends such as transparency, clean labeling and personalization are also impacting sports nutrition.  
724 Besides those that have already been discussed before, customized workouts and meals, tailored to  
725 preferences and goals, will help optimizing physical activity. "One size fits all" will no longer exist, and  
726 appeal for personalized fitness plans and nutrition, will broaden from elite athletes to include casual users  
727 as well (German, Zivkovic, Dallas, & Smilowitz, 2011), (Nutraingredients, 2016), (Gardiner, 2016).

728

729 Recovery is gaining importance over rest. While resting is just the absence of training, recovery involves all  
730 techniques and activities to maximize repair: hydration, compression, nutrition, heat or cold, stretching and  
731 massaging (Menzies et al., 2010). For a long time, a lot of these techniques were only reserved for elite  
732 athletes, but casual users' adoption is increasing as they are becoming aware that a balance between rest  
733 and recovery, together with a proper nutrition is essential for anyone who exercises (Meltzer, 2018), (Mateo,  
734 2018).

735  
736 Finally, flavor is one of the most important areas for innovation in the sports nutrition industry, and it has a  
737 long way to go in terms of customers acquisition and retention (Cash, 2017). Another main driver of sports  
738 nutrition industry is convenience packaging, since consumers prefer small and portable products  
739 (Euromonitor, 2015b), (Euromonitor International's Head of Lifestyles Research, 2017).

740

#### 741 Innovation is driving the market – microencapsulation as an example

742 Besides demand-driven innovation, offering technological and professional solutions to mass market  
743 consumers is a powerful driver for growth and competitive positioning of a company (PwC, 2013). In this  
744 line, technologies such as microencapsulation would allow a broader use of certain ingredients with  
745 organoleptic or stability issues, among others. Microencapsulation is a technique that involves the  
746 entrapment of a substance within a microscopic shell of encapsulating polymeric material to give  
747 microcapsules different useful properties: preventing interactions among ingredients of a formula, flavor  
748 masking, increased stability and bioavailability, improved dissolution and flowability, and sustained-release  
749 among others (Gaonkar, Vasisht, Khare, & Sobel, 2014).

750

751 By way of example, taste-masking microcapsules allow the incorporation of caffeine into gels or chews  
752 without its characteristic bitter taste (Pimparade et al., 2015), (Mohammadi, Ehsani, & Bakhoda, 2018).  
753 Other examples of microencapsulation applications are increased water-dispersibility and bioavailability of  
754 hydrophobic ingredients, such as coenzyme Q10 or medium chain triglycerides (Gaonkar et al., 2014).  
755 Microcapsules are also capable to increase the stability of certain sensitive ingredients, such as probiotics,  
756 when they are exposed to different environmental conditions like heat, humidity, light and oxygen (Anal &

757 Singh, 2007). Furthermore, microcapsules can act as delivery systems. Depending on the  
758 microencapsulation technique and wall material selected, the release mechanism can be triggered by  
759 different factors such as dissolution, temperature, pressure, pH and enzymes among others; and the  
760 release profile can also be modified to be immediate, delayed or sustained (Gaonkar et al., 2014). Finally,  
761 microcapsules are also capable to protect acid-sensitive ingredients, like probiotics or enzymes, during their  
762 pass through the highly acidic environment of the stomach, and to release them in the intestine, which has  
763 an alkaline pH (Anal & Singh, 2007), (Cook, Tzortzis, Charalampopoulos, & Khutoryanskiy, 2012).

764  
765 Finally, as has just been reviewed, the implementation of professional solutions for mass market products,  
766 can help overcome different challenges, from technical issues like shelf-life, to consumer acceptance  
767 problems, like unpleasant taste or poor dissolution. Until now, technological advances were a business-to-  
768 business tool due to a lack of consumer understanding. However, consumers access to information is  
769 greater than ever, and soon they will become aware of the benefits of these techniques (Hamari et al.,  
770 2016). For this reason, technological solutions are going to be crucial to differentiate products from their  
771 competitors (PwC, 2013).

772

### 773 Considerations on regulation

774 Last but not least, the sports nutrition category is not only shaped by dietary recommendations and  
775 research, but also by regulations. Each country has its own regulation, which has an impact on the direction  
776 and growth of the sports nutrition industry. While some countries can select from a wide range of ingredients  
777 and claims, other countries may restrict or ban the same ones (R. J. Maughan, Greenhaff, & Hespel, 2011).

778

779 The US and the European Union (EU), by their respective competent bodies, Food and Drug Administration  
780 (FDA) and European Food Safety Authority (EFSA), have its own composition and labelling requirements,  
781 which will be briefly reviewed below. It is important to remark that besides the benefits provided by  
782 supplements and sports food, safety remains the main priority (US Congress, 2011). When it comes to  
783 professional athletes competing under anti-doping codes, not only evidence and safety are important  
784 factors to consider, but also the absence of prohibited substances. For this reason, it is important to highlight

785 a valuable information resource developed by the Australian Institute of Sport. It consists of an ABCD  
786 classification system that ranks those ingredients found in sports foods and supplements, into four groups.  
787 It is based on scientific evidence and other practical considerations to establish product safety, legality and  
788 efficacy in improving sports performance (Australian Institute of Sport, 2018).

789

790 - *US regulation*

791 In US, according to the Dietary Supplement Health and Education Act, dietary supplements are defined as  
792 products taken by mouth, which are typically sold in the form of capsules, soft gels, liquids, powders and  
793 bars, and that contain one or more dietary ingredients intended to supplement the diet. Vitamins, minerals,  
794 herbs, botanical extracts, amino acids and other substances may be considered dietary ingredients.  
795 Products sold as dietary supplements must be clearly labeled as such. FDA monitors its manufacturing  
796 processes, quality and labelling, but it grants a greater control over supplements containing new dietary  
797 ingredients. A new dietary ingredient is a dietary ingredient that was not sold in the US before 1994. FDA  
798 requires specific safety information from manufacturers intending to market food supplements containing  
799 new dietary ingredients. Safety evidence, which may include in vitro and long-term toxicity studies, and  
800 clinical studies in humans, must be provided to FDA. When it comes to health and nutrient content claims,  
801 efficacy evidence must be submitted to FDA for approval. Authorities can act against companies who make  
802 false or misleading claims; and can also remove supplements from the market if they lack sufficient scientific  
803 evidence to demonstrate product safety. In addition, companies are now required to record all adverse  
804 event complaints about their products; and must report to FDA all those serious adverse events (United  
805 States Congress, 1994), (US Food and Drug Administration, 2018).

806

807 - *EU regulation*

808 As for the regulation in Europe, according to European Parliament Directive (2002/46/EC), food  
809 supplements are defined as products intended to supplement the normal diet, consisting of concentrated  
810 sources of nutrients, like minerals and vitamins, or other substances with a nutritional or physiological effect  
811 that are marketed in a "dosage" form (e.g. pills, tablets, capsules or liquids in measured doses). Food  
812 supplements are regulated as foods, and thereby may contain vitamins, minerals, amino acids, essential

813 fatty acids, fiber and various plants and herbal extracts, among others. It has to be noted that the addition  
814 of nutrients or other substances to fortify foods, does not fall within the definition of a food supplement, and  
815 is addressed by a different regulation. Food supplements are intended to correct nutritional deficiencies,  
816 maintain an adequate intake of certain nutrients, or support specific physiological functions. The  
817 responsibility for the safety of these products lies with the food business operator placing the product on  
818 the market (European Parliament, 2002).

819  
820 In order to protect consumers against potential health risks, EFSA carried out a comprehensive assessment  
821 of substances that could be intended for food supplements manufacture in the EU. Based on EFSA's work,  
822 the European Commission established a harmonized list of substances that may be used in the  
823 manufacture of food supplements, their tolerable upper intake levels, labelling requirements and approved  
824 health claims (European Parliament, 2006b), (European Food Safety Authority, 2006), (European  
825 Parliament, 2011), (European Parliament, 2006a). There is also a list of those substances that are known  
826 or suspected to have adverse effects on health, and the use of which is therefore controlled. As for those  
827 substances intended to be used in food supplements, and that do not have a history of safe use in the EU  
828 before 1997, which are known as "novel foods", EFSA is requested to provide a scientific opinion on its  
829 safety (European Parliament, 2015).

830  
831 Finally, the EU register provides information on the permitted nutrition and health claims made on foods,  
832 and their conditions of use and applicable restrictions, as well as non-authorized health claims and the  
833 reason for their non-authorization (European Commission, 2018).

834  
835 - *Worldwide anti-doping regulation*

836 The World Anti-Doping Agency (WADA) is an international independent agency with scientific research,  
837 education, development of anti-doping capacities, and monitoring of the world anti-doping code, as key  
838 activities. Its mission is to lead a collaborative worldwide movement for doping-free sport, bringing  
839 consistency to anti-doping policies and regulations within sport organizations and governments across the  
840 world (World Anti-Doping Agency [WADA], 2018a). The list of prohibited substances and methods, which

841 is updated annually, is a cornerstone of the WADA. It lists substances prohibited at all times, just in-  
842 competition or in particular sports. Some examples of prohibited substances are non-approved  
843 pharmacological substances, anabolic agents, beta-2 agonists and diuretics, as well as masking agents.  
844 Examples of prohibited methods are manipulation of blood, chemical manipulation of samples collected  
845 during doping control and gene doping (WADA, 2018b).

846  
847 According to world anti-doping code, athletes are responsible for all products ingested and any subsequent  
848 legal, health or safety consequence (WADA, 2015). For this reason, they should pay special attention when  
849 choosing a supplement, since some of them have been reported to have an accidental or deliberate content  
850 of banned substances (R. Maughan, 2005). A research of stimulants and anabolic steroids in dietary  
851 supplements revealed that the number of mislabeled supplements represented 18% of the 103 products  
852 analyzed (Baume, Mahler, Kamber, Mangin, & Saugy, 2006). For this reason, some manufacturers order  
853 commercial third-party auditing programs, as an independent screening for banned and restricted  
854 substances that could be accidentally found in their dietary supplements. These certifications provide a  
855 greater assurance of supplement purity for those athletes competing under antidoping codes (Bishop,  
856 2010). Non-intentional doping poses a threat to athlete's career, since anti-doping rule violation, regardless  
857 it was intentional or unintentional, may result in bans of up to four years (WADA, 2015).

858  
859 Sports nutrition trends in brief

860 In line with the healthy living global trend, as consumers are increasingly focusing on health and fitness  
861 goals, different categories, like wearable devices, are growing. Sports nutrition is the fastest growing  
862 consumer health category for several years in a row, and it is expected to continue growing at a steady  
863 pace in the following years. An expanding and more diverse consumer base is boosting the demand for  
864 sports nutrition, which has become a mainstream category. For this reason, products that were once only  
865 available in dedicated fitness shops, have made their way to other retailers.

866  
867 As for the sports nutrition king ingredient, proteins dominate global sales accounting for more than 83% of  
868 total sports nutrition market. Since proteins are the most accessible and understandable sports nutrition

869 category, further growth is forecasted for the next five years. Among protein powders, whey isolate is the  
870 preferred source, due to its taste, amino acid composition and quick absorption. However, new formulations  
871 including different sources and treatments of proteins, are challenging whey protein isolate as king of sales.  
872 The main threats for whey protein isolate are a rising demand for plant-based proteins, and hydrolysates  
873 of different protein sources.

874

875 On contrast, non-protein products are more difficult to understand by the mainstream and uninformed  
876 consumers, and account for just 17% of total sports nutrition market. Despite not leading in sales, non-  
877 protein products are way ahead of convenience formats experimentation. As for sports drinks, they are  
878 expected to record the highest growth rate in the following years. Electrolyte-replacement, glucose-  
879 containing solutions help to maintain blood glucose levels and prevent dehydration, and therefore, may  
880 delay fatigue and attenuate muscle damage during endurance exercise. However, since there is an  
881 increasing demand for low-calorie and low-carbohydrate sports drinks, new products are mainly focused  
882 on optimizing hydration.

883

884 Besides global trends like clean labeling and personalization, which are impacting sports nutrition, other  
885 emerging trends to look out for in 2020 are nutrient timing, recovery gaining importance over rest,  
886 convenience packaging, and flavor as one of the main areas for innovation. Finally, offering professional  
887 solutions to mass market is key for disruptive innovation. Application of technologies such as  
888 microencapsulation in the sports nutrition field, would allow a broader use of certain ingredients with  
889 organoleptic or stability issues. In addition, preventing interactions, improving dissolution and achieving a  
890 sustained-release profile by means of microencapsulation, could also drive the sports nutrition category.

891

892 Last but not least, when it comes to the direction and growth of the sports nutrition industry, it is shaped by  
893 different factors. One of the most relevant but frequently forgotten factors is regulation, which can be  
894 different in each country. Competent authorities can restrict or ban ingredients to ensure safety and can  
895 also regulate to avoid false or misleading claims. Professional athletes who compete under anti-doping

896 codes, may only consider certain manufacturers which provide a third-party certificate ensuring that no  
897 banned or restricted substance is present.

898

### 899 **Conclusion**

900 Global dynamics are shaping consumer attitudes and thereby, promoting changes across industries. Clean  
901 and healthy living stands out as the most relevant trend impacting the food industry. Consumers are making  
902 informed decisions to prioritize healthy, plant-based, sustainable and socially-conscious food purchases, a  
903 trend which is also affecting beverages, snacks, indulgence foods and even fast food. Aligned with this  
904 trend, governments are promoting healthy habits to reduce morbidity and cut off its associated costs. In this  
905 context, not only vegetarian and vegan product sales are growing quickly, but also organic and free-from  
906 products. In addition, since consumers prefer foods with an intrinsic nutritional value, functional foods have  
907 been outpaced by naturally healthy products.

908

909 Due to media praise and sports nutrition, a category where protein is the king of sales, consumers are  
910 increasingly looking for high-protein products. Carbohydrates, instead, have been targeted as a strategy to  
911 reduce overall calorie intake, resulting in a decreased popularity. However, the source matters, and “good  
912 carbs” are used instead of “bad carbs”. In this line, as consumers increasingly avoid certain food  
913 ingredients, clean label products are no longer a trend, but the new norm. Nonetheless, the replacement of  
914 certain ingredients may set up costly and sometimes unnecessary challenges for food scientists. Other  
915 relevant trends shaping interaction with foods are personalization, IoT, and food waste reduction. However,  
916 one of the main trends is sports nutrition, which is a large and quickly growing consumer health category.

917

918 Sports nutrition sales are no longer dominated by core users, instead, they have become more appealing  
919 to mainstream consumers, and as a result, sports foods have made their way to mainstream distribution  
920 channels. Proteins are leading the sports nutrition category, but whey protein isolate, which is the king of  
921 sales among protein powder products, is being challenged by the rise of high-protein foods and the rising  
922 demand for plant-based proteins. When it comes to protein processing methods, isolates are being replaced  
923 by hydrolysates, which are expected to be the next big trend among protein powders. As for non-protein

924 products, despite experiencing a slower growth, they are leading the experimentation in convenience  
925 formats. Regarding new sports drinks products, they are mainly focused on optimizing hydration, and  
926 shifting from the so-called bad carbs to the good ones. As a consequence, there is a blurring line between  
927 energy/sports drinks, and other non-protein drinks or beverages.

928  
929 Other trends to look out for in 2020 in the sports food industry are nutrient timing, personalization, recovery  
930 gaining importance over rest, and flavor as one of the most important areas for innovation. Different  
931 professional technologies can be applied to mass market products, as a driver for growth and competitive  
932 positioning. In this context, microencapsulation stands out as one of these technologies with a wide variety  
933 of applications and a promising future. Finally, besides innovation, dietary recommendations and research,  
934 the sports nutrition category is shaped by regulations; among which stand US and EU regulation, and World  
935 Anti-Doping Code.

936  
937 To conclude, global dynamics have an influence on nutrition trends, being potentially disruptive for the  
938 correct balancing of the diet. However, as it has been reviewed, along with the healthy living trend, more  
939 people are adopting an active lifestyle, embracing a healthier dietary pattern and recognizing the benefits  
940 of sports foods, which is having positive implications in health, well-being and healthcare-associated costs.  
941 This review has also provided an overview of the areas that are more prone to development, and that  
942 should be added to the research agenda to adapt formulas and technologies to consumer needs.
