21	ABSTRACT
22	Amphipods belonging to the crangonyctoid genus <i>Pseudocrangonyx</i> Akatsuka &
23	Komai, 1922 constitute a major component of the subterranean environments in east
24	Asia. The true species diversity of this group has been unsettled due to the lack of
25	molecular data for <i>P. shikokunis</i> Akatsuka & Komai, 1922 and <i>P. kyotonis</i> Akatsuka &
26	Komai, 1922 and the taxonomic status of the misidentified populations of these two
27	species. The status of the misidentified populations is herein clarified. Morphological
28	comparisons among the specimens of these populations and the name-bearing types of
29	P. shikokunis and P. kyotonis demonstrate the two are distinctive species. Phylogenetic
30	analyses using partial sequences of nuclear 28S rRNA and histone H3, mitochondrial
31	cytochrome $c$ oxidase subunit I, and 16S rRNA genes also confirm that each of the two
32	populations represents a unique clade within the species of <i>Pseudocrangonyx</i> .
33	Accordingly, the population indigenous to the limestone caves in western Japan, which
34	was previously identified as P. shikokunis, is described as P. akatsukai n. sp., and that
35	reported as P. kyotonis from central Japan is described as P. komaii n. sp. The
36	phylogenetic relationships within P. akatsukai n. sp. and an unidentified
37	Pseudocrangonyx species elucidate the complex stygofaunal relationships in western
38	Japan (western Honshu, Shikoku, and Kyushu). A key to <i>Pseudocrangonyx</i> species is
39	also provided.
40	

41 **Key Words:** molecular phylogeny, systematics, stygobitic fauna

# INTRODUCTION

43	Crangonyctoid amphipods constitute an important component of Holarctic subterranean
44	habitats (Holsinger, 1993, 1994), with western Eurasian Niphargus Schiödte, 1849 and
45	North American <i>Crangonyx</i> Bate, 1859 being highly diversified. In eastern Asia,
46	amphipods that belong to <i>Pseudocrangonyx</i> Akatsuka & Komai, 1922 are one of the
47	stygobitic groups indigenous to groundwater environments in this region (Holsinger,
48	1994). In contrast to Niphargus and Crangonyx, which comprise approximately 300 and
49	50 species, respectively (Zhang & Holsinger, 2003; Hekmatara et al., 2013),
50	Pseudocrangonyx so far contains only 23 species, six of them recorded from the
51	Japanese Archipelago (Uéno, 1966; Narahara et al., 2009; Tomikawa et al., 2016).
52	A molecular phylogenetic study by Tomikawa et al. (2016) revealed that the true
53	species diversity of <i>Pseudocrangonyx</i> from Japan remains elusive, recognizing at least
54	six unidentified species. Tomikawa et al. (2016) also showed that the several records of
55	species of <i>Pseudocrangonyx</i> from non-type localities in Japan (e.g., Uéno, 1927;
56	Nunomura, 1975) were based on misidentified specimens and highlighted that the
57	systematic status of the unidentified species of <i>Pseudocrangonyx</i> should be clarified by
58	using both morphological and molecular data.
59	Our understanding of the taxonomy of <i>Pseudocrangonyx</i> has been hampered by a
60	lack of the molecular data of the true <i>P. shikokunis</i> Akatsuka & Komai, 1922 and <i>P.</i>
61	kyotonis Akatsuka & Komai, 1922, which were originally described along with the
62	genus. Topotypic specimens of P. shikokunis and P. kyotonis have not yet been
63	collected. Although Tomikawa et al. (2016) speculated that the unidentified
64	Pseudocrangonyx spp. 4 and 5 might comprise P. shikokunis and/or P. kyotonis, the
65	phylogroup consisted of deeply diverged clades, which were discordant with the

morphological characters defined by the type specimens of *P. shikokunis* and *P.* kyotonis. Moreover, the group identified as Pseudocrangonyx sp. 5 contained a specimen of P. coreanus Uéno, 1966 (Narahara et al., 2009). The taxonomies of *P. shikokunis* and *P. kyotonis* have also complicated by misidentified records. Tomikawa et al. (2016) revealed that the population inhabiting Akiyoshi limestone caves identified as P. shikokunis (Uéno, 1927) and from Gifu reported as P. kyotonis (Nunomura, 1975) clearly represent Pseudocrangonyx spp. 2 and 6, respectively. We therefore establish the taxonomic status of these two unidentified lineages. The molecular phylogenies in Tomikawa et al. (2016) also revealed that the species of *Pseudocrangonyx* that inhabit the Japanese Archipelago do not form a monophyletic group. Pseudocrangonyx elegantulus Hou in Zhao & Hou (2017) from Henan, China, P. daejeoensis Lee, Tomikawa, Nakano & Min, 2018 from the Korean Peninsula support a complex biogeographical history of *Pseudocrangonyx* in continental Asia and the Japanese Archipelago. The present molecular phylogenetic trees based on an updated dataset, which includes newly collected specimens, elucidates the biogeographical relationships of the species of *Pseudocrangonyx* from western Japan. MATERIALS AND METHODS Sampling and morphological observation Specimens of species of *Pseudocrangonyx* were collected from a cave each in Gifu, Okayama, and Kumamoto prefectures and two caves in Yamaguchi Prefecture, Japan. The geographical coordinates for all cave entrances were obtained using a Garmin

eTrex<sup>®</sup> GPS unit (Garmin, Olathe, KS, USA). Specimens for molecular analyses were 90 also newly collected from two locations, a well in Takarazuka, Hyogo Prefecture 91 92 (~34.8861°N, ~135.3067°E) and Hakiai-syonyudo Cave in Kumamoto Prefecture (32.41456°N, 130.86549°E). Amphipods inhabiting caves were collected by scooping 93 groundwater environments with a fine-mesh hand net and fixed in 99% ethanol on-site. 94 All appendages of the specimens of the undescribed species were dissected in 70% 95 ethanol and mounted in gum-chloral medium on glass slides under an Olympus SZX7 96 97 stereomicroscope (Olympus, Tokyo, Japan). Specimens were examined using a Nikon Eclipse Ni light microscope (Nikon, Tokyo, Japan) and illustrated with the aid of a 98 99 camera lucida. The body length from the tip of the rostrum to the base of the telson was 100 measured along the dorsal curvature to the nearest 0.1 mm. The nomenclature of the 101 setal patterns on the mandibular palp follows Stock (1974). The specimens examined 102 are deposited in the Zoological Collection of Kyoto University (KUZ). 103 The type specimens of P. coreanus, P. kyotonis, and P. shikokunis deposited at the National Museum of Nature and Science, Tsukuba (NSMT), were examined: paratypes 104 105 of P. coreanus, female 3.3 mm, NSMT-Cr 13521, and female 3.0 mm, NSMT-Cr 13522, Seongnam-dong, Chungju, South Korea; holotype of *P. kyotonis*, female 11.0 mm, 106 NSMT-Cr 13500, Kyoto, Kyoto Prefecture, Honshu, Japan; and syntypes of P 107 108 shikokunis, male 7.0 mm, NSMT-Cr 13501, and female 8.2 mm, NSMT-Cr 13502, both 109 from Tomioka, Tokushima Prefecture, Shikoku, Japan. 110 111 PCR, DNA sequencing, and molecular phylogenetic analyses Genomic DNA was extracted from appendage muscles following Tomikawa et al. 112 (2014). Primer sets for the polymerase chain reaction (PCR) and cycle sequencing 113

114 reaction (CS) for the nuclear 28S rDNA (28S), histone H3 (H3), and the mitochondrial cytochrome c oxidase subunit I (COI) and 16S rDNA (16S) follow Tomikawa et al. 115 116 (2016). The PCR and CS reactions and DNA sequencing were performed using a modified version of a method described by Tomikawa et al. (2016) using a T-100 117 Thermal Cycler (Bio-Rad, Hercules, CA, USA). The obtained sequences were 118 119 assembled using DNA BASER (Heracle Biosoft, Pitesti, Romania). In total, 12 120 sequences from the three *Pseudocrangonyx* specimens were obtained and deposited 121 with the International Nucleotide Sequence Database Collaboration (INSDC) through 122 DNA Data Bank of Japan (Supplementary material Table S1). 123 The phylogenetic relationships of the species studied were estimated based on 28S, 124 H3, COI, and 16S sequences. The dataset was identical to that used by Tomikawa et al. (2016) with the addition of the two sequences obtained from the type material of P. 125 126 elegantulus (Zhao & Hou, 2017), four sequences from the holotype of *P. daejeoensis* 127 (Lee et al., 2018), and the newly obtained 12 sequences (Supplementary material Table S1). The alignments of H3 and COI were trivial, as no indels were observed. The 128 129 sequences of 28S and 16S were aligned using MAFFT v7.312 (Katoh & Standley, 2013). The lengths of the 28S, H3, COI, and 16S sequences were 1360, 328, 658, and 130 432 bp, respectively. The concatenated sequences yielded 2778 bp of aligned positions. 131 132 Phylogenetic trees were constructed using maximum likelihood (ML) and Bayesian inference (BI). The ML phylogeny was reconstructed using RAxML v8.2.8 (Stamatakis, 133 134 2014) with the substitution model set as GTRCAT, immediately after nonparametric 135 bootstrapping (BS) was conducted with 1000 replicates. The best-fit partition scheme was identified with the Akaike information criterion using PartitionFinder v2.1.2 136 (Lanfear et al., 2017) with the "greedy" algorithm (Lanfear et al., 2012): 28S/ H3 1st 137

138 and 2nd positions/H3 3rd position/COI 1st position/COI 2nd position/COI 3rd 139 position/16S. 140 BI and Bayesian posterior probabilities (PPs) were estimated using MrBayes v3.2.6 (Ronquist et al., 2012). The best-fit partition scheme and models for each partition were 141 selected with the Bayesian information criterion using PartitionFinder with the "greedy" 142 143 algorithm: for 28S GTR+I+G; for H3 1st and 2nd positions and COI 2nd position, K80+I; for H3 3rd position, SYM+G; for COI 1st position, SYM+I+G; for COI 3rd 144 145 position, GTR+I+G; and for 16S, GTR+I+G. Two independent runs for four Markov chains were conducted for 20 million generations, and the tree was sampled every 100 146 147 generations. The parameter estimates and convergence were checked using Tracer 148 v1.6.0 (http://tree.bio.ed.ac.uk/software/tracer/), and the first 50001 trees were discarded 149 based on the results. 150 **SYSTEMATICS** 151 Family Pseudocrangonyctidae Holsinger, 1989 152 153 Genus Pseudocrangonyx Akatsuka & Komai, 1922 154 Pseudocrangonyx akatsukai n. sp. Description: Female (KUZ Z1980, 10.2 mm). Head (Fig. 1A) with short dorsal setae; rostrum reduced; lateral cephalic lobe rounded; antennal sinus with rounded angle; eyes absent. Pereonites 1–7 with short dorsal setae (Fig. 1A); posterolateral margin of pereonites 5–7 with 1, 1, 4 setae, respectively (Fig. 1A). Dorsal margin of pleonites 1–3 with 14, 14, 19 setae, respectively (Fig. 2A–C). Posterior margin of epimeral plate 1 with 7 setae, posteroventral corner not produced with seta (Fig. 2D); ventral, posterior margins of plate 2 with 4 robust setae, 6 setae, respectively, posteroventral corner not produced, with 2 setae (Fig. 2E); ventral, posterior margins of plate 3 with 4 robust setae, 3 setae, respectively, posteroventral corner rounded, with seta (Fig. 2F). Ventral margin of urosomites 1 with robust seta (Fig. 1); dorsal margin of urosomites 1, 2 with 9, 8 setae, respectively (Fig. 2G, H), dorsal margin of urosomite 3 lacking setae (Fig. 2I). Antenna 1 (Fig. 2J) 0.66× body length, length ratio of peduncular articles 1–3 1.0:0.9:0.5; accessory flagellum (Fig. 2K) 2-articulate, terminal article with 3 setae, 1 aesthetasc; primary flagellum 21-articulate, aesthetasc on some articles (Fig. 2L). Antenna 2 (Fig. 2M) 0.55× antenna 1 length; peduncular article 5 with 3 calceoli (Fig. 2N); flagellum 0.50× length peduncular articles 4, 5 combined, consisting of 7 articles, first 5 with calceolus. Upper lip (labrum) (Fig. 2O) with rounded anterior margin, with fine setae. Mandibles (Fig. 2P–R) with left, right incisors 5-dentate; left lacinia mobilis 5-dentate, right lacinia bifid, with many teeth; molar process triturative, molar of right mandible with accessory seta; accessory setal rows of left, right mandibles with 8, 4 weakly pectinate setae, respectively; palp 3-articulate, article 3 longer than article 2 with 3 Asetae, about 17 D-setae, about 8 E-setae. Lower lip (Fig. 2S) with broad outer lobes,

mandibular process of outer lobe rounded apically; inner lobes indistinct. Maxilla 1 (Fig. 3A, B) with inner, outer plates, palp; inner plate subquadrate, medial margin with 6 plumose setae; outer plate subrectangular with 7 serrate teeth apically (Fig. 3B); palp 2-articulate, longer than outer plate, article 1 lacking marginal setae, article 2 with 5 apical robust setae, 6 subapical slender setae. Maxilla 2 (Fig. 3C) with oblique inner row of 5 plumose setae plus simple seta on inner plate. Maxilliped (Fig. 3D) with inner, outer plates, palp; inner plate (Fig. 3E) with 5 apical, 2 subapical robust setae; outer plate with 4 apical plumose setae, 8 robust, some slender setae on medial margin; palp 4-articulate, medial margin of article 2 lined with setae, article 4 with nail. Gnathopod 1 (Fig. 3F, G) with subquadrate coxa bearing setae on anterior to ventral margins of coxa, width 1.6× long as depth; anterior margin of basis bare, posterior margin of basis with many setae; posterodistal corner of carpus with 5 serrate setae (Fig. 3H); propodus stout, subtriangular, palmar margin with 11 robust setae in 2 rows, some distally notched (Fig. 3G); posterior margin of dactylus dentate (Fig. 3G). Gnathopod 2 (Fig. 3I, J) with rounded coxa bearing setae on its anterior margin, posterodistal corner, width 1.3× depth; basis with setae on anterodistal submargin, posterior margin; posterodistal corner of carpus with 4 serrate setae (Fig. 3K); propodus slender than that of gnathopod 1, with 9 robust setae along palmar margin in 2 rows, some distally notched (Fig. 3J); posterior margin of dactylus dentate (Fig. 3J). Pereopod 3 (Fig. 4A, B) with subquadrate coxa bearing setae on anterodistal, posteroventral corners, width 1.2× depth; anterior, posterior margins of basis with setae; length ratio of merus, carpus, propodus 1.0:0.9:0.9; posterior margin of dactylus with 2 setae (Fig. 4B). Pereopod 4 (Fig. 4C, D) with coxa bearing setae on anterodistal, posteroventral corners, width 1.5x depth; anterior, posterior margins of basis with setae; length ratio of merus, carpus,

234 propodus 1.0:0.9:0.9; posterior margin of dactylus with 2 setae (Fig. 4D). Pereopod 5 (Fig. 4E–G) with weakly bilobed coxa bearing setae on anterior, posterior lobes; 235 236 anterior, posterior margins of basis with setae; length ratio of merus, carpus, propodus 237 1.0:0.9:0.9; anterior margin of propodus with long setae (Fig. 4F); anterior margin of dactylus with 2 setae (Fig. 4G). Pereopod 6 (Fig. 4H, I) with coxa bearing concave 238 239 lower margin, anterodistal, posteroproximal corners with setae; anterior, posterior 240 margins of basis with setae; length ratio of merus, carpus, propodus 1.0:1.0:0.9; anterior 241margin of dactylus with 3 setae (Fig. 4I). Pereopod 7 (Fig. 4J, K) with coxa bearing 242 shallowly concave lower margin, posteroproximal corner of coxa with seta; anterior, 243 posterior margins of basis with setae; length ratio of merus, carpus, propodus 244 1.0:1.1:1.1; posterior margin of dactylus with 3 setae (Fig. 4K). Coxal gills (Figs. 2I, 3A, C, E, H) on gnathopod 2, pereopods 3–6; sternal gills 245 246 absent. Brood plates (Figs. 3I, 4A, C, E) slender on gnathopod 2, pereopods 3–5. 247 Peduncle of pleopod 1 (Fig. 5A) with seta on outer margins; peduncles of pleopods 2, 3 (Fig. 5D, E) lacking marginal setae. Pleopods 1–3 each with paired retinacula (Fig. 248 249 5B), bifid seta (clothes-pin seta; Fig. 5C) on inner basal margin of inner ramus. Uropod 1 (Fig. 5F) with basofacial robust seta on peduncle; peduncle 1.3× longer 250 than inner ramus; inner ramus 1.7× outer ramus length, inner, outer margins of inner 251 252 ramus with 3, robust setae, respectively, basal part with 2 slender setae; outer ramus with marginal robust seta. Uropod 2 (Fig. 5G) with peduncle 0.9× longer than inner 253 ramus; inner ramus 1.5× longer than outer ramus, inner, outer margins with 3, 2 robust 254 255 setae, respectively; outer ramus with 2 marginal robust setae. Uropod 3 (Fig. 5H, I) with peduncle 0.3× outer ramus length; inner ramus absent; outer ramus 2-articulate, 256 proximal article with robust setae, terminal article 0.1× proximal article length, with 3 257

KURENAI 🎞

258 distal setae (Fig. 5I). Telson (Fig. 5J) length 1.1× width, cleft for 9.2% of length, each telson lobe with 2 259 260 lateral, long penicillate setae, apical robust seta, subapical slender seta, apical short penicillate seta. 261Male (KUZ Z1981, 7.7 mm). Antenna 1 (Fig. 5K, L) 0.62× body length, primary 262 263 flagellum 19-articulate. Antenna 2 (Fig. 5M, N) 0.63× antenna 1 length, peduncular 264 article 5 with calceoli; flagellum 0.53× length of peduncular articles 4, 5 combined, 8-265 articulate, articles 2–5 each with calceolus. 266 Gnathopod 1 carpus with 3–5 serrate setae on posterodistal corner; palmar margin 267 of propodus with 9 robust setae in 2 rows, some distally notched (Fig. 50). Gnathopod 268 2 carpus bearing 3 or 4 serrate setae on posterodistal corner; palmar margin of propodus 269 with 8 robust setae in 2 rows, some distally notched (Fig. 5P). 270 Uropod 1 (Fig. 5Q) with peduncle 1.4× inner ramus length; inner, outer margins of inner ramus each with 2 robust setae, basal part with slender seta; outer ramus with 2 271 marginal robust setae. Uropod 2 (Fig. 5R) with peduncle almost as long as inner ramus; 272 273 inner ramus 1.4× outer ramus length, distal part with 6 serrate, 4 simple robust setae, 274 penicillate seta (Fig. 5S). Uropod 3 (Fig. 5H, I) with outer ramus terminal article 0.2× 275 proximal article length. Telson length 1.2× width, cleft for 6.6% of length. 276 Variation: Antenna 1 length 0.55 (female 6.5 mm, KUZ Z1953) to 0.73× (male 6.3 mm, 277 KUZ Z1984, male 7.1 mm, KUZ Z1986) body length; primary flagellar articles of male 7.1 mm (KUZ Z1986), each with 1 or 2 aesthetascs. Antenna 2 length up to 0.66× 278 279 antenna 1 length (female 6.5 mm, KUZ Z1953). Maxilla 1 medial margin of inner plate with 4 (female 6.5 mm, KUZ Z1953), 5 (male 7.1 mm, KUZ Z1986, female 8.5 mm, 280

KUZ Z1987) setae. Maxilla 2 inner plate with oblique inner row of 4 (female 6.5 mm,

282	KUZ Z1953), 5 (males 7.7, 7.1 mm, KUZ Z1981, Z1986) setae. Peduncles of pleopods
283	2, 3 of specimen from Kumamoto (KUZ Z1953) with marginal setae. Telson length $1.3 \times$
284	width (male 7.1 mm, KUZ Z1986, female 6.8 mm, KUZ Z1985), cleft for 7.3 (female
285	6.8 mm, KUZ Z1985) to 12.3% (male 7.1 mm, KUZ Z1986).
286	Etymology: The species name is a noun in the genitive case debased on the name of the
287	late Dr. Kozo Akatsuka, who the first studied the taxonomy of <i>Pseudocrangonyx</i> .
288	New Japanese name: Akatsuka-mekurayokoebi.
289	Distribution and habitat: The species is indigenous to the montane caves of Chugoku
290	Mountains in western Honshu, Japan. It also inhabits the limestone cave in Kamishima
291	Island in the Amakusa Islands off western Kyushu, Japan. Individuals were collected
292	from small streams in the caves.
293	Remarks: Pseudocrangonyx akatsukai n. sp. is most similar to P. shikokunis described
294	from Shikoku Island, Japan. Both species have eyes that are absent; mandible and palp
295	of article 3 is longer than article 2; inner plate of maxilla 1 with more than four setae;
296	inner plate of maxilla 2 with an oblique inner row of more than four setae; carpi of
297	gnathopods 1 and 2 with serrate setae on the posterodistal corners; peduncles of
298	pleopods with marginal setae and the inner margin of the inner rami with bifid setae;
299	and telson, distally concave. The new species can nevertheless be differentiated from $P$ .
300	shikokunis by the armature of the urosomite 1, presence of ventral robust seta, and a
301	shorter telson, 1.1–1.3 (versus 1.5) times its width.
302	Pseudocrangonyx akatsukai <b>n. sp.</b> is similar to P. kyotonis and P. elegantulus in all
303	lacking eyes, article 3 off the mandibular palp is longer than article 2, and presence of
304	serrate setae on the posterodistal corners of the carpi of female gnathopods 1 and 2
305	(Akatsuka & Komai, 1922; Zhao & Hou, 2017). The new species differs from P.

306 kyotonis in having a longer antenna 1, which is 0.55–0.73 (versus 0.39) times as long as 307 body length, and more setose inner plate of the maxilla 1, having 4–6 (versus 3) medial 308 setae. The new species differs from P. elegantulus in having serrate setae on the 309 posterodistal corner of the carpus of male gnathopod 2 (none in *P. elegantulus*), marginal setae on the pleopod 1 peduncle (none in *P. elegantulus*), and the telson cleft is 310 311 up to 12.3% (versus 27%) of its length. 312 Nomenclatural statement: A life science identifier (LSID) number was obtained for the 313 new species: urn:lsid:zoobank.org:pub: 314 Pseudocrangonyx komaii n. sp. 315 316 (Figs. 1B, 6–10) 317 318 Pseudocrangonyx kyotonis – Nunomura, 1975: 11. 319 Pseudocrangonyx sp. 6 – Tomikawa et al., 2016: fig. 10. — Lee et al., 2018: fig. 10. 320 321 *Type material*: Holotype male (5.8 mm), KUZ Z1988, Miyama-shonyudo Cave (35.74889°N, 137.02472°E), Miyama, Gujohachiman, Gifu Prefecture, Japan, 18 322 October 2015, collected by K. Tomikawa and S. Tashiro. Paratypes: 5 females (5.5 mm, 323 4.2 mm, 5.1 mm, 4.6 mm, 4.0 mm), KUZ Z1976, Z1977, Z1989, Z1990, Z1991, data 324 325 same as for holotype. Diagnosis: Antennal sinus with rounded angle; eyes absent; pereonites 1–7 with short 326 327 dorsal setae; urosomite 1 without ventral robust seta; dorsal margin of urosomite 3 lacking setae; sternal gill absent; antenna 1 0.45–0.51× body length; female antenna 2 328 with calceoli; mandible palp article 3 almost as long as article 2; maxilla 1 inner plate 329

with 4 setae; maxilla 2 inner plate with oblique inner row of 5 setae; gnathopods 1, 2 carpi without serrate setae on posterodistal corners; palmar margins of propodi of gnathopods 1,2 with 13–21,14–18 robust setae, respectively; pleopods, peduncles lacking marginal setae, inner margin of inner rami without bifid setae; uropod 1 inner ramus 1.4× outer ramus length; inner, outer margins of uropod 1 inner ramus with 2 or 3, 0 or 1 robust setae, respectively, basal part with 1 or 2 slender setae, outer ramus with marginal robust seta; uropod 2 inner ramus 1.4–1.6× outer ramus length, inner, outer margins with 3, 2 robust setae, respectively; outer ramus with 1 or 2 marginal robust setae; uropod 3 terminal article 0.1× proximal article length; telson length 1.3× width, cleft for 6.8-10.2%. Description: Male (KUZ Z1988, 5.8 mm). Head (Fig. 1B) with short dorsal setae; rostrum reduced; lateral cephalic lobe rounded; antennal sinus with rounded angle; eyes absent. Pereonites 1–7 with short dorsal setae (Fig. 1B); posterolateral margin of pereonites 5–7 with 1, 1, 3 setae, respectively (Fig. 1B). Dorsal margin of pleonites 1–3 with 10, 12, 11 setae, respectively (Fig. 6A-C). Posterior margin of epimeral plate 1 with 4 setae, posteroventral corner not produced, with seta (Fig. 6D); ventral, posterior margins of plate 2 with 2 robust setae, 4 setae, respectively, posteroventral corner not produced, with seta (Fig. 6E); ventral, posterior margins of plate 3 with 2 robust setae, 5 setae, respectively, posteroventral corner rounded, with seta (Fig. 6F). Ventral margin of urosomites 1 without setae (Fig. 1B); dorsal margin of urosomites 1, 2 with 4 slender, 6 robust setae, respectively (Fig. 7G, H), dorsal margin of urosomite 3 lacking setae (Fig. 6I). Antenna 1 (Fig. 6J) 0.45× body length, length ratio of peduncular articles 1–3

1.0:0.7:0.4; accessory flagellum (Fig. 6K) 2-articulate, terminal article with 3 setae, 1

354 aesthetasc; primary flagellum 13-articulate, 1 aesthetasc on some articles. Antenna 2 (Fig. 6L) 0.67× antenna 1 length; peduncular article 5 with 1 calceolus (Fig. 6M); 355 356 flagellum 0.58× length of peduncular articles 4, 5 combined, consisting of 7 articles, first 4 with calceolus. 357 Upper lip (Fig. 6N) with rounded anterior margin bearing fine setae. Mandibles 358 359 (Fig. 6O–Q) with left, right incisors 5-dentate; left lacinia mobilis 5-dentate, right 360 lacinia bifid, with many teeth; molar process triturative, molar of right mandible with 361 accessory seta; accessory setal rows of left, right mandibles with 4, 3 weakly pectinate 362 setae, respectively; palp 3-articulate, article 3 almost as long as article 2, with 3 A-setae, 363 about 10 D-setae, about 5 E-setae. Lower lip (Fig. 6R) with broad outer lobes, 364 mandibular process of outer lobe apically rounded; inner lobes indistinct. Maxilla 1 365 (Fig. 7A, B) with inner, outer plates, palp; inner plate subquadrate, medial margin with 366 4 plumose setae; outer plate subrectangular with 7 serrate teeth apically (Fig. 7B); palp 367 2-articulate, longer than outer plate, article 1 lacking marginal setae, article 2 with 3 robust setae, slender seta apically, robust seta plus slender seta subapically. Maxilla 2 368 369 (Fig. 7C) with oblique inner row of 5 plumose setae on inner plate. Maxilliped (Fig. 7D, 370 E) with inner, outer plates, palp; inner plate (Fig. 7E) with 3 apical, 2 subapical robust 371 setae; outer plate with 4 apical plumose setae, 3 robust, some slender setae on medial 372 margin; palp 4-articulate, medial margin of article 2 lined with setae, article 4 with nail. 373 Gnathopod 1 (Fig. 7F, G) with subquadrate coxa bearing setae on anterodistal 374 corner of coxa, width 1.8× depth; anterior margin of basis bare, posterior margin of 375 basis with 6 setae; posterodistal corner of carpus without serrate setae; propodus stout, ovate, palmar margin with 10 lateral, 11 medial robust setae, some distally notched (Fig. 376 7G); posterior margin of dactylus dentate (Fig. 7G). Gnathopod 2 (Fig. 7H, I) with 377

subquadrate coxa bearing setae on anterodistal, posteroventral corners, width 1.5× depth; basis with setae on anterodistal submargin, posterior margin; posterodistal corner of carpus without serrate setae; propodus more slender than propodus of gnathopod 1, with 7 lateral, 11 medial robust setae along palmar margin, some distally notched (Fig. 7I); posterior margin of dactylus dentate (Fig. 7I). Pereopod 3 (Fig. 7J, K) with subquadrate coxa bearing setae on anterodistal, posteroventral corners, width 1.6× depth; anterior, posterior margins of basis with setae; length ratio of merus, carpus, propodus 1.0:0.8:0.8; posterior margin of dactylus with 2 setae (Fig. 7K). Pereopod 4 (Fig. 8A, B) with coxa bearing setae on anterodistal, posteroventral corners, ventral margin, width 1.8× depth; anterior, posterior margins of basis with setae; length ratio of merus, carpus, propodus 1.0:0.9:0.8; posterior margin of dactylus with 2 setae (Fig. 8B). Pereopod 5 (Fig. 8C, D) with weakly bilobed coxa, bearing setae on anterior, posterior lobes; anterior, posterior margins of basis with setae; ratio of merus, carpus, propodus 1.0:0.7:0.9; anterior margin of dactylus with 2 setae (Fig. 8D). Pereopod 6 (Fig. 8E, F) with coxa bearing concave lower margin, posteroproximal corner with seta; anterior, posterior margins of basis with setae; ratio of merus, carpus, propodus 1.0:0.8:0.9; anterior margin of dactylus with 2 setae (Fig. 8F). Pereopod 7 (Fig. 8G, H) with coxa bearing shallowly concave lower margin, posteroproximal corner of coxa with seta; anterior, posterior margins of basis with setae; ratio of merus, carpus, propodus 1.0:0.9:1.0; posterior margin of dactylus with seta (Fig. 8H). Coxal gills (Figs. 7H, J, 8A, C, E) on gnathopod 2, pereopods 3–6; sternal gills absent. Peduncles of pleopods 1–3 (Fig. 9A, C, D) lacking marginal setae, each with paired

retinacula (Fig. 9B); inner basal margin of inner ramus without bifid setae.

Uropod 1 (Fig. 9E) with basofacial robust seta on peduncle; peduncle 1.3× inner ramus length; inner ramus 1.4x outer ramus length, inner, outer margins of inner ramus with 3 setae, robust seta, respectively, basal part with slender seta; outer ramus with marginal robust seta. Uropod 2 (Fig. 9F) with peduncle 0.8× inner ramus length; inner ramus 1.4× outer ramus length, inner, outer margins with 3, 2 weakly serrate robust setae, respectively, distal part with 4 serrate, 2 simple robust setae; outer ramus with 2 marginal robust setae, distal part with serrate seta plus 4 simple robust setae. Uropod 3 (Fig. 9G, H) with peduncle 0.3× outer ramus length; inner ramus absent; outer ramus 2articulate, proximal article with robust setae, terminal article 0.1× proximal article length, with 3 distal setae (Fig. 9H). Telson (Fig. 9I) 1.3× longer than wide, cleft for 6.8% of length, each telson lobe with 2 lateral long penicillate setae, 2 apical robust setae, apical slender seta. Female (KUZ Z1989, 5.1 mm). Antenna 1 (Fig. 10A, B) 0.51× body length, primary flagellum 14-articulate. Antenna 2 (Fig. 10C) 0.73× antenna 1 length, peduncular article 5 with 2 calceoli; flagellum 0.54× length of peduncular articles 4, 5 combined, 7-articulate, articles 1–4 each with calceolus. Mandibular article 3 1.1× article 2 length. Gnathopod 1 with 6 lateral, 7 medial robust setae on palmar margin (Fig. 10D). Gnathopod 2 with 6 lateral, 8 medial robust setae on palmar margin (Fig. 10E). Brood plates slender, on gnathopod 2, pereopods 3–5. Uropod 1 (Fig. 10F) with basofacial slender seta on peduncle; inner ramus with 2 marginal robust setae, basal part with 2 slender setae; outer ramus with marginal robust seta. Uropod 2 (Fig. 10G) with peduncle 0.9x inner ramus length; inner ramus 1.6x outer ramus length, inner, outer margins with 3, 2 robust setae, respectively, distal part

with 6 simple robust setae, short seta; outer ramus with marginal robust seta, distal part with 5 simple robust setae. Uropod 3 (Fig. 10H, I) with fewer robust setae on proximal article of outer ramus than in male. Etymology: The specific name is a noun in the genitive case formed from the name of the late Professor Taku Komai, who established the genus *Pseudocrangonyx*. New Japanese name: Komai-mekurayokoebi. Distribution and habitat: Known only from its type locality in Gujohachiman, Gifu Prefecture. Specimens were collected from a small stream in the cave. Remarks: Pseudocrangonyx komaii **n. sp.** resembles P. kyotonis in having a head without eyes, short antenna 1 that is less than half of body length, and bifid setae on the inner rami of pleopods. The new species can be clearly distinguished from P. kyotonis by the presence (absent in P. kyotonis) of calceoli on female antenna 2, the mandibular palp of article 3 is equal in length to article 2 (versus longer than article 2 in P. kyotonis), and posterodistal corners of female gnathopods carpi lacking serrate setae (present in P. kyotonis). Pseudocrangonyx komaii **n. sp.** is similar to P. coreanus and P. febras Sidorov, 2009 from Russia in lacking eyes, presence of ventral setae on urosomite 1, serrate setae on the posterodistal corner of gnathopod 1 carpus in females, bifid setae on the inner rami of pleopods, and in having a distally concaved telson (Uéno, 1966; Sidorov, 2009). The new is distinguished from *P. coreanus* by the number of robust setae on the palmar margin of the gnathopod propodus, more than 20 (versus less than 10) in male gnathopod 1, more than 10 (versus less than 10) in female gnathopod 1, more than 10 (versus less than 10) in gnathopod 2, and absence (present in P. coreanus) of marginal setae on pleopod 1 peduncle. The new species differs from *P. febras* by distinct (versus

indistinct) antennal sinus, a shorter antenna 1 that is 0.6 times shorter than body length (versus 0.7 times longer), absence of serrate setae on the posterodistal corner of the gnathopod 2 carpus of females, and the outer margin of uropod 1 inner ramus with 0 or 1 (versus three) robust setae. Molecular phylogenies The obtained BI tree (mean ln-Likelihood [L] = -15264.629; Fig. 11A) showed an almost identical topology to that of the ML tree ( $\ln L = -15778.578$ ; not shown). The results of the present analyses are generally concordant to those in Tomikawa et al. (2016), Zhao & Hou, (2017), and Lee et al. (2018). The trees failed to determine the precise phylogenetic position of *P. komaii* **n. sp.** within the genus *Pseudocrangonyx*. The monophyly of *P. tiunovi* (Russia) + *P. korkishkoorum* (Russia) + *P. elegantulus* (China) + P. yezonis (Japan) + P. akatsukai **n. sp.** was well supported in both analyses (BS = 97%, PP = 0.99). This clade was split into three sub-clades, while their relationships remain uncertain. The monophyly of *P. elegantulus* and *P. yezonis* was recovered (BS = 95%, PP = 0.99). The Russian P. tiunovi and P. korkishkoorum formed a monophyletic group with high-support values (BS = 100, PP = 0.99). The specimens identified as *P. akatsukai* **n. sp.** formed a well-supported monophyletic lineage (BS = 99%, PP = 1.0). The Russian clade and P. akatsukai n. sp. formed a clade in ML analyses, but this relationship was not fully supported (BS = 65%). The obtained phylogenies failed to reconstruct the robust relationships among P. akatsukai n. sp. specimens. Both of the newly added OTUs collected from Hyogo (KUZ Z1979; locality 19 in Fig. 11B) and Kumamoto (KUZ Z1952; locality 26) belonged to the clade comprising specimens tentatively identified as *Pseudocrangonyx* sp. 5 (BS = 97%. PP = 1.0). The

474 Kumamoto specimen was sister to the lineage consisting of the other individuals, which was supported only in BI tree (PP = 0.99). 475 476 Nomenclatural statement: A life science identifier (LSID) number was obtained for the new species: urn:lsid:zoobank.org:pub: 477 478 479 **DISCUSSION** 480 The present molecular phylogenies highlight the phylogenetic relationships and 481 distribution of the western Japan species of *Pseudocrangonyx*. Previous studies showed that two genetically highly diverged phylogroups (Pseudocrangonyx sp. 2 = P. 482 483 akatsukai **n. sp.** and Pseudocrangonyx sp. 5) are distributed in the western tip of 484 Honshu Island (Chugoku District), and their putative ranges may overlap in this region (Tomikawa et al., 2016; Zhao & Hou, 2017). We found that P. akatsukai n. sp. and 485 Pseudocrangonyx sp. 5 are also found in Kyushu Island (Supplementary material Fig. 486 487 S2). Previous (Tomikawa et al., 2016; Zhao & Hou, 2017; Lee et al., 2018) and present 488 489 studies have reconstructed the phylogenetic position of *P. akatsukai* **n. sp.**, which is phylogenetically close to P. yezonis and found in northern Japan, and three continental 490 species, P. elegantulus, P. korkishkoorum, and P. tiunovi. Although the obtained 491 492 phylogenies could not resolve the precise relationships among the P. akatsukai n. sp. 493 populations, our results clearly show that this new species is indigenous to underground water habitats in the montane region in Chugoku District and a small islet, Amakusa-494 495 Kamishima, Amakusa Islands, adjacent to Kyushu (Supplementary material Fig. S2). The type locality of *P. akatsukai* **n. sp.** (locality 22 in Fig. 11B and Supplementary 496 material Fig. S2) and a second locality, Uyamado Cave (locality 29), in Chugoku 497

District are located in the Akiyoshi accretionary complex, a geological unit that consists of a Carboniferous-Permian oceanic assemblage. The northernmost part of Kyushu is also composed of this accretionary unit (Isozaki et al., 2010; Nakazawa et al., 2011; Kojima et al., 2016). The deep phylogenetic divergence between the populations of P. akatsukai n. sp. indigenous to Taishodo and Akiyoshido caves (locality 22) and Uyamado Cave (locality 29) could be associated with the geological disjunction between the two limestone regions of the Akiyoshi accretionary complex. The remaining locality, Gongen-shonyudo Cave in Amakusa-Kamishima Island (locality 27), belongs to a different geological unit characterized as the Cretaceous Higo metamorphic complex (Tashiro et al., 1986; Miyazaki et al., 2016). The presence of P. akatsukai **n. sp.** on this island thus indicates a past stygobitic connection during the formation of the limestone areas in Chugoku District and Amakusa-Kamishima Island. The BI tree showed that the OTUs identified as *Pseudocrangonyx* sp. 5 can be split into two sub-clades: a lineage that consists of the individual from the cave in the central Kyushu Mountains, and a clade that contains individuals in Honshu and Shikoku (Supplementary material Fig. S2). The precise phylogenetic relationships within this unidentified species, however, remains unclear; only the monophyly of the amphipods collected from a small islet (locality 23 in Fig. 11B and Supplementary material Fig. S2) and Rakanana Cave in Shikoku (locality 25) was supported in both analyses. The Pseudocrangonyx sp. 5 individuals were only collected from subterranean habitats peripheral to the Chugoku Mountains, whereas individuals from Shikoku and Kyushu are found in caves located deep in the mountainous regions of these islands. The results help elucidate the stygofaunal relationships in western Japan. The occurrence of *P. akatsukai* **n. sp.** indicates a close relationship between the underground

water habitats from the central to the western Chugoku Mountains and those in the Amakusa Islands; both habitats could have been connected through northern Kyushu during a past geological event. *Pseudocrangonyx* sp. 5 are widely distributed in western Japan, so the stygofauna of the Chugoku Mountains in western Honshu, Shikoku, and central Kyushu might be closely related to each other. Additional specimens of this genus should be examined to elucidate the biogeographical history of *Pseudocrangonyx* in western Japan. KEY TO SPECIES OF PSEUDOCRANGONYX Pseudocrangonyx camtschaticus Birstein, 1955 is not included in this key because the original description does not provide appropriate morphological features to discriminate this species from the remaining 24 congeners, including *P. akatsukai* **n. sp.** and *P.* komaii **n. sp.** 1. SUPPLEMENTARY MATERIAL

594 Supplementary material is available at *Journal of Crustacean Biology* online. S1 Table. Samples used for the molecular phylogenetic analyses, with voucher or isolate 595 596 numbers, collection locality, and INSDC accession numbers. S2 Figure. Distributions of two *Pseudocrangonyx* phylogroups in western Japan. 597 598 599 ACKNOWLEDGEMENTS 600 The authors are grateful to two anonymous reviewers and the editors for their 601 constructive comments on this manuscript. We also thank Dr. Naoyuki Nakahama (The University of Tokyo) for providing the specimen of *Pseudocrangonyx* from Hyogo, and 602 603 Dr. Koshiro Eto (Kitakyushu Museum of Natural History & Human History) for 604 allowing us to prepare our map based on his graphic. KT thanks Satoko Tashiro 605 (Hiroshima University) for help in field work. This work was partly supported by Japan 606 Society for the Promotion of Science KAKENHI grants JP15J00720, JP17K15174, and 607 JP17H00820. 608 **REFERENCES** 609 610 Akatsuka, K. & Komai, T. 1922. *Pseudocrangonyx*, a new genus of subterranean amphipods from Japan.
