What is sustainable fashion?

Abstract

Purpose – The purpose of this paper is to examine what the term sustainable fashion means from the perspective of micro-organisations, experts, and consumers.

Design/methodology/approach – This research is qualitative in nature, utilising a multi-methods case study approach (semi-structured interviews, semiotics, questionnaires). Grounded analysis was applied to analyse the data.

Findings – Findings indicate that interpretation of sustainable fashion is context and person dependent. A matrix of key criteria provides the opportunity to find common elements.

Research limitations/implications – Due to the nature of this research the sample size is limited and may not be generalised. Data were collected in the UK and are limited to a geographical region.

Practical implications – An important implication is that defining sustainable fashion is vital in order to avoid challenges, such as greenwashing, which were faced in other industries that have a longer history in sustainable practices. Micro-organisations should take advantage of identifying key sustainable fashion criteria, which will enable them to promote their fashion collections more effectively.

Social implications – The criteria identified provide assurance for consumers that sustainable fashion is produced with social aspects in mind (fair wages, good working conditions).

Originality/value – The paper proposes a matrix that allows micro-organisations to clearly identify their collections as sustainable.

Keywords – sustainable fashion, micro-organisation, sustainability, fashion, sustainable fashion criteria, UK, case study research

Paper type – Research paper

1. Introduction

The second anniversary of the Rana Plaza factory incident marks an increased interest in sustainable fashion and ethical practices in the industry (Westervelt 2015). With sustainability emerging as a ‘megatrend’ (Mittelstaedt *et al* 2014) the fashion landscape changes dramatically, whereby sustainable fashion becomes increasingly mainstream (Watson & Yan 2013; Mora *et al* 2014). Extant research predominantly focused on sustainable fashion consumption (e.g. Joy *et al* 2012; Cao *et al* 2014) rather than on **establishing an academic understanding towards sustainable fashion, which is part of the slow fashion movement (Jung & Jin 2014)**. This article utilises a social constructionist approach to address this gap.

Sustainable fashion is part of the slow fashion movement, developed over the past decades, and used interchangeably with eco-, green-, and ethical-fashion (Carey & Cervellon 2014). Sustainable fashion first emerged in the 1960s, when consumers became aware of the impact clothing manufacturing had on the environment and

1
2
3 demanded the industry change its practices (Jung & Jin 2014). Although eco-fashion
4 was negatively perceived at first this changed with anti-fur campaigns emerging in the
5 1980s/90s, followed by an interest in ethical clothing in the late 1990s. Ethical fashion
6 is associated with fair working conditions, a sustainable business model (Joergens
7 2006), organic and environmentally friendly materials (Johnston 2012), certifications,
8 and traceability (Henninger 2015).

9
10 Sustainable fashion as part of the slow fashion movement is often
11 misleadingly described as the opposite of fast fashion. Slow fashion is based on a
12 philosophical ideal that centres on sustainability values, such as good working
13 conditions and reducing environmental destruction (e.g. Bourland 2011;
14 Pookulangara & Shephard 2013). It challenges the fast fashion paradigm by breaking
15 down existing boundaries between the organisation and its stakeholders, slowing the
16 production process to a more manageable timeframe, moving away from the self-
17 concept, and focusing on empowering workers by offering a choice that enables
18 change (Clark 2008). According to 'The True Cost' movie (2015) sustainable fashion
19 is more than a simple fad, but rather considers the social, natural, and economic
20 'price' paid in fashion production. Yet uncertainty remains around what the term
21 'sustainable fashion' entails and what might be the guidelines for producing
22 sustainable garments (Watson & Yan 2013; The True Cost 2015).

23
24 The slow fashion movement and sustainable fashion are increasing in
25 importance (Battaglia *et al* 2014), yet consumer awareness remains low (Gonzalez
26 2015). Past research on sustainable fashion focused on consumers' perceptions and
27 attitudes (Goworek *et al* 2013; Shen *et al* 2013; McNeill & Moore 2015), and its
28 impact on consumer purchasing behaviour (Shen *et al* 2013). Although research has
29 investigated aspects of sustainable fashion, current studies lack an academic
30 understanding of what sustainable fashion is from a holistic perspective. This article
31 contributes to literature by investigating two research questions from a social
32 constructionist point of view:

- 33 1) What are the underlying principles of sustainable fashion from the point of view
34 of micro-organisations, experts, and consumers?
- 35 2) How is the concept of sustainable fashion related to aspects of social
36 constructionism?

37
38 Understanding underlying principles of sustainable fashion is vital, in order to avoid
39 negative connotations such as greenwashing (e.g. Rahman *et al* 2014). Theoretical

9 10 11 **2. Literature review**

12 *2.1 Slow fashion movement and sustainable fashion*

13
14 The slow fashion movement emerged as a response to fast fashion cycles and
15 'unsustainable' business growth. It promotes ethical conduct, reduced fashion
16 production and purchasing quality over quantity clothing (Fletcher 2010; Ertekin &
17 Atik 2014). Slow fashion and more specifically sustainable fashion seek to empower
18 workers throughout the supply chain, utilise upcycling, recycling, and traditional
19 production techniques, and incorporating renewable and organic raw materials
20 (Johnston 2012). Thus, slow fashion moves away from current industry practices of
21 growth-based fashion, which requires a change in system thinking, infrastructure, and
22 through-put of goods (Fletcher 2010). Key to the slow fashion movement and
23 sustainable fashion is a balanced approach to fashion production, which fosters long-
24 term relationships, builds local production, and focuses on transparency (Ertekin &
25 Atik 2014). The latter aspect has received increased attention since the Rana Plaza
26 incident, which called for enhanced supply chain check-ups and transparency
27 throughout the manufacturing process (e.g. Pookulangara & Shephard 2013; Jung &
28 Jin 2014)
29

30
31 The original meaning of slow fashion highlights sustainability values and
32 ethical conduct, yet media only seem to promote sustainable fashion as garments that
33 are somehow 'less fast', which is enhanced by the fact that slow fashion companies
34 usually produce collections only twice a year for Spring/Summer and Autumn/Winter
35 (Pookulangara & Shephard 2013). Although changes in the environment have already
36 occurred, for example introducing organic materials or promoting sustainable
37 collections (e.g. H&M conscious line), which should make it easier for organisations
38 to promote sustainable fashion, the "mobilization of a sustainable fashion system is
39 both complex and difficult" (Ertekin & Atik 2014: 8). Various barriers to mobilizing
40 sustainable fashion emerge: first, transparency in a globalised supply chain may not
41 always be feasible. In order to stay competitive manufacturers are pressured into
42 lowering their prices and at times cut corners. Second, increased production and
43 availability of garments enhances a 'fashion appetite' that strengthens the attitude-

behaviour-gap of consumers who want ideally to purchase sustainable fashion, yet may not always follow through in their behaviour (e.g. Goworek *et al* 2013; McNeill & Moore 2015). This could be due to a lack of knowledge and awareness, which may hinder further development of sustainable fashion (Goworek *et al* 2013). Third, in a competitive environment such as the fashion industry, it is vital to distinguish oneself from others, which can be achieved through 'greenization' (Ahluwalia & Miller 2014; Du 2015). With sustainability emerging as a 'megatrend' (Mittelstaedt *et al* 2014) organisations start to use buzzwords, such as eco, organic, environmentally friendly, or green in their marketing communications (Chen & Chang 2013). Although communicating aspects of sustainability in the garment manufacturing process is beneficial, more and more companies engage in greenwashing, which is defined as misleading advertising of green credentials (Delmas & Burbano 2011). This implies that an organisation knowingly has a poor environmental performance, yet communicates positively about it (Du 2015). Consumers mistrust sustainability and green claims, as they cannot verify the credibility of the organisation's claims (Chen & Chang 2013). A consequence of greenwashing is that any company promoting social or environmental credentials is first and foremost treated with suspicion. Trusted relationships may emerge later, but take a long time to establish, foster, and maintain (Rahmen *et al* 2015). Finally, past research omits to investigate the concept and scope of slow fashion, as well as a common definition for sustainable and slow fashion (Prothero & Fitchett 2000; Watson & Yan 2013). This is addressed in this research.

2.2 Social constructionism

Sustainable fashion is investigated through social constructionism, which distinguishes two types of 'reality' (Shotter 2002): First, 'reality' refers to the world that exists independently without any interactions, and second, '*reality*' is constructed through social interactions (ibid). The latter suggests that there may be a gap between meanings of different situations/circumstances and the 'reality' (Bañon *et al* 2011). Thus, some people may have a set of associations or beliefs about sustainable fashion that differs from those of others. Whilst a common ground can be reached, parties in different 'realities' may reject these ideas and interpret sustainable fashion in a different manner (ibid). Thus, the assumption is that multiple '*realities*' exist on what sustainable fashion entails. It is through these '*realities*' that the concept of

1
2
3 sustainable fashion is interpreted and understood.
4

5 Sustainability is intuitively understood, yet has no coherent definition
6 (Partridge 2011). Sustainability is context dependent and situational and has different
7 meanings for different people. A question that arises is: can a vague concept such as
8 sustainability be dismissed “as an empty vessel that can be filled with whatever one
9 likes”? (Dryzek 2005: 147). Although sustainability has been criticised and contested,
10 it cannot be dismissed (Dryzek 2005; Naderi & Strutton 2015). A challenge that
11 emerges within sustainability debates is that people may be talking about -
12 metaphorically – different fruits in a basket, which emphasises the fact that
13 “sustainability does [not] apply to the physical environment in itself, but rather our
14 human relationship with the world” (Bañon *et al* 2011: 180). Yet, the lack of a
15 coherent definition can lead to new opportunities in a changing environment (Dryzek
16 2005). Within this article sustainability is understood as “meeting the needs of the
17 present without compromising the ability of future generations to meet their needs”
18 (WCED 1987). Although this definition is general and presumptuous, it is still the
19 most cited definition used to date (Baumgartner 2009).

25
26
27
28
29
30
31

32 Sustainable fashion has often been described as an oxymoron (Clark 2008), as
33 fashion assumes something goes *in* and *out* of style, which contrasts with the long-
34 term perspective of sustainability (Walker 2006). We see fashion as an art form that
35 complements the long-term perspective of sustainability in that it focuses on
36 craftsmanship and artisanry and is not bound to seasonality (Norrell *et al* 1967). A
37 piece of clothing can be transformed from simply being a wearable item to a unique
38 creation that suggests creativity and character, as well as expressing a particular
39 identity (Poon & Fatt 2001).
40
41
42
43
44
45

46 In focusing on the scope of sustainable fashion and investigating the
47 underlying principles from a social constructionist point of view this article
48 contributes to knowledge and addresses a gap in the literature.
49
50
51
52

53 3. Methodology

54 This article is exploratory in nature and uses social constructionist theory to
55 investigate sustainable fashion. Qualitative research methodologies (e.g.
56 Pookulangara & Shephard 2013), such as semi-structured interviews (Is), semiotics
57 (SE), Twitterfeed (TF), and questionnaires (Qs) form the basis to investigate
58 principles of sustainable fashion. Thus, findings not only rely on subjective
59
60

interpretations of the term, but also investigate how 'sustainability' is communicated with the boundaries of the cases selected (e.g. Eisenhardt 1989).

A database compiled through keyword searches on social media and fashion events provided the basis for recruiting micro-organisations. Judgement and convenience sampling led to four micro-organisations fulfilling three criteria: 1) UK based, 2) local production, 3) self-proclaimed sustainable fashion manufacturers. Consumers were accessed through these micro-organisations. Sustainable fashion experts were carefully selected following the same sampling approach. Interviewees recruited had different experiences and knowledge of 'sustainable fashion': micro-organisation members (owner-managers, employees) shared their experience from the perspective of sustainable fashion creators. Industry experts including a Marketing Director of a leading trend-setting agency, provide a broader overview of the term in association with fashion movements and industry trends. Consumers were seen to contribute to the definition from an everyday perspective. Semiotics and Twitterfeed analysis illustrate how sustainability is communicated by the selected four micro-organisations. Data in the micro-organisations was collected over a three month period in 2013-2014, which allowed us to gain an in-depth understanding of these organisations and access to their consumer base. Table 1 provides a data summary.

Table 1: Data summary

	Case 1 Non-customer facing	Case 2 Non-customer facing	Case 3 Customer facing	Case 4 Customer facing	Experts	Consumers (follow up interviews from questionnaire)
No. of interviews (Is)	5	6	7	5	7	6
Interview Duration	13:33– 57:22min	10-60min	7:51– 45:35min	10:52– 34:10min	25- 52min	23-25min
Twitterfeed (TF)	✓	✓	✓	✓		N/A
Semiotics (SE)	Website; Social media; Blog; Newsletter; Email; Photographs; Garment tags					N/A
Questionnaires (Qs)	(no access to consumers granted)		✓ 300 questionnaires			N/A

The data sets were carefully analysed utilising Easterby-Smith *et al.*'s (2008) seven-step process of: familiarisation, reflection, conceptualisation, cataloguing concepts, re-coding, linking, re-evaluation. Multiple researchers dealt with the data,

which were coded and re-coded as many as five times. In order to guarantee continuity, coherence, and clarity the researchers first analysed the data independently, focusing on phrases and words most commonly mentioned by interviewees and across the semiotic data sets and the Twitterfeeds, and explored within their natural boundaries. The themes, patterns, and categories that emerged naturally from the data were reviewed and discussed collectively. We developed 20 broader themes, each of which had various sub-categories. Throughout the coding processes these merged into two dominant patterns with several associated clusters. The research results were presented to the research participants for validation.

Limitations of this research include, but are not limited to: first, the sample size, which focuses on a specific niche market within the segment that may be more familiar with the term *sustainable fashion* than the general public. This however provides the opportunity to understand what the individual target groups understand as *sustainable fashion* and thus, allows for key criteria to emerge. Second, the sample size is not a 'true' representation of the population, but rather was selected strategically. Although these limitations cannot be neglected, we feel that the findings bring forward an engaging discussion, which can be followed up with further research.

4. Findings & Discussion

4.1. Background information

4.1.1 A non-mainstream phenomenon

In the qualitative questionnaire, consumers were asked the question 'how do you define sustainable fashion?' and predominantly used the term *sustainable* as part of their definition: "*sustainably sourced clothing, fair trade*"; "*sourced from sustainable resources and manufactured in a similar fashion*"; or "*produced from sustainable materials/materials which are made from sustainable resources*". This indicates that participants define sustainable fashion in terms of sourcing and production processes, whilst seemingly ignoring social aspects, such as fair wages and working conditions. Consumers state that due to using more environmentally friendly materials sustainable fashion comes at a considerably higher price than mainstream fast fashion (Is; Qs). The price premium of these garments is seen as a hindrance to engaging in sustainable consumption as consumers, even if willing to purchase sustainable garments, may not be able to follow through (e.g. McNeill & Moore 2015). Although this finding is not new, an interesting observation is that the

1
2
3 participants who mentioned price had not previously purchased ‘sustainable fashion’
4 nor actively searched for it. Thus, the perceived price premium is an assumption
5 based on their *reality*, rather than an actual experience.
6
7

8
9 Sustainable fashion was described as “*a bit out there*” (Is), different from
10 mainstream collections, and produced by designers, who model their ‘*it pieces*’ on the
11 catwalk (Is). Sustainable fashion is perceived as a high-end phenomenon linked to
12 aspects of exclusivity and luxury, which may not be affordable for the everyday
13 consumer. Similarly, these garments are not necessarily seen to be to everyone’s taste
14 (Is), which might be why they are described as non-mainstream (Is) and “*different*
15 *from the high street*” (Qs). Thus, within the consumers’ socially constructed reality
16 *sustainable fashion* is not perceived as a high street alternative, but rather a non-
17 mainstream phenomenon that can be observed in the fashion world.
18
19

20
21 Contrarily, the micro-organisations’ owner-managers insist: “*sustainable*
22 *fashion can be affordable, fashion forward, versatile and... interesting*” (Is). In their
23 *reality*, sustainable fashion is a high street alternative. However, the ‘affordability’ of
24 sustainable garments is questionable, with prices ranging from £10 for one pair of
25 socks to £250 for an upcycled dress and up to £500 for a vintage garment. Whilst
26 some items may be comparable in price, the majority of garments sold by these
27 micro-organisations come at a price premium justified by aspects, such as the use of
28 environmentally friendly and/or organic materials, and their one-off, hand-made
29 design (Is; SE; TF).
30
31

32
33 Consumers and micro-organisations both acknowledge that environmentally
34 friendly materials are determining factors for charging higher prices for sustainable
35 fashion. A challenge is to persuasively communicate the benefit of sustainable fashion
36 to consumers to increase buy-in within the mainstream fashion landscape. Although
37 the two realities described show similarities, consumers are not aware that sustainable
38 fashion can be more affordable than they think. Experts agree, insisting that although
39 companies such as Burberry, Stella McCartney, and H&M raise the sustainable
40 fashion profile, this does not necessarily bridge the gap towards a mainstream feel –
41 an aspect we return to later. Experts state that the understanding of sustainable fashion
42 has no impact on their actual business, which could suggest a lack in communicating
43 sustainability values effectively to consumers. Although shoppers are now more
44 familiar with the term *sustainable fashion*, they still see it as a high-end phenomenon
45 that has no applicability in high street retailers (Is). Experts further stated that
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 sustainable fashion promoted through high street retailers could be misleading as
4 these brands still produce new lines with an average turnover of 60 days, thereby
5 going against the 'sustainable fashion principles' (Is). This explains consumers
6 referring to *sustainable fashion* as "an oxymoron" (Qs) or a "contradictory term"
7 (Qs), as the fashion industry is based on fast stock turnovers and fashion
8 consumption, which contradicts aspects of slow fashion (e.g. Joy *et al.* 2012).

9
10
11
12
13
14 Experts explained that although they ideally want to produce in a sustainable
15 manner, this is not always possible as "some of the organic stuff is just too expensive"
16 (Is). Designers insist that they "promise to make environmentally friendly choices,
17 where possible" (SE), "all the footwear is made in China [...] [as producing in the
18 UK] would have made a completely unsustainable business [financially]" (Is). It
19 could be argued that this contradicts aspects of sustainability, as overseas production
20 fosters a larger carbon footprint than producing locally (Clark 2008). Yet, in its
21 advertising this micro-organisation stresses that it is a UK brand, due to being UK
22 based and designing the products in the country (Is; SE). Although designers
23 understand that overseas production may be a less sustainable choice, trade-offs are
24 accepted to overcome financial challenges. Such trade-offs must not lead to 'cutting
25 corners', and maintaining fair payments and good working conditions is essential.
26 Experts point out that care should be taken if referring to a brand as being 'British'
27 when production processes are overseas, as this could lead to consumers' distrust of
28 'green' or 'sustainable' products, as they imply greenwashing due to being deceptive
29 and misleading (e.g. Du 2015).

55
56
57
58
59
60
Commonalities between the different viewpoints identified are price premium
and the use of environmentally friendly alternatives. Barriers to sustainable fashion
from the perspective of experts and micro-organisations are financial capabilities and
being able to produce 'affordable' garments. Thus far, a key implication is that
sustainable fashion manufacturers need to better communicate their offerings and
clearly highlight what makes their collections 'sustainable' in order to avoid
allegations of greenwashing.

4.1.2 Knowledge and awareness

Our analysis found that large organisations, especially high street retailers, play a key
role in disseminating the core message of sustainability. An owner-manager states: "If
I'm 100% ethical and I have 5000 customers and [large retailer] is like .05% ethical

and has 5million customers they're actually reaching more, doing more good and making better change, even though what they do in entirety isn't great. Big companies need to drive change" (Is). Consumers concur, explaining that media outlets such as TV and magazines play a role in raising awareness of issues surrounding sustainable fashion (Is). Newspapers report on sustainable fashion collections and events (Siegle 2014), for example the 'Green Carpet Challenge', which led "sustainable style into the spotlight [...] highlighting the issues of sustainability within the fashion industry" (Eco Age 2013). However, the experts' opinions remain twofold: those in favour say: "I think the Green Carpet Challenge is a really good idea" (Is), whilst sceptics insist: "I think it's trickling through very gradually. 'The carpet' isn't immediately identifiable for everyday people who may read 'heat magazine', they can't go and buy these clothes, it's not immediately accessible. With media and celebrity it can really influence people, however it has to be done in the right way and it has to be accessible, because seeing celebs[sic] makes it aspirational... But it makes it difficult to go down to the shop and find something like that" (Is). Although exploring the full magnitude of media influence on sustainable fashion and consumer behaviour exceeds the scope of this article, it suggests a fruitful direction for further research. However, it is apparent from our research that communication emerges as a key issue. The realities among experts differ in that they acknowledge communication is key, yet its execution strategy needs to be carefully considered to meet consumer expectations. If sustainable fashion is seen as an alternative to fast fashion, it needs to be communicated as such, rather than creating a celebrity hype in magazines, which implies these garments are unaffordable.

60

Consumers' awareness and knowledge of sustainable fashion has increased. A concern mentioned however, was that "at some point when you know enough and even still it doesn't always mean that you can act on it. But when you know enough about sourcing patterns or labour cost or how employees are treated... pro union, anti-union... then you can make the choice, and it's difficult sometimes. It's not always something you can do, which is an uncomfortable position to be in" (Is). Consumers state that in addition to finances, other factors may hinder the purchase of sustainable fashion, such as style, trend, and availability (e.g. McNeill & Moore 2015). Although social sustainability became centre stage after Rana Plaza, concern for how people across the supply chain are treated does not necessarily result in changed action.

1
2
3
4 Slow fashion seems to be interpreted on a surface level in that participants
5 were familiar with the term, but their actions limited to what they feel fits with their
6 everyday consumption patterns. The *reality* is predominantly constructed through
7 media interaction that highlights social and environmental issues as key concerns.
8 However, the philosophical underpinning of the slow fashion movement that seeks to
9 break the boundaries of the fast fashion paradigm does not seem to be of concern. In
10 order to address this aspect, the underpinnings of sustainable fashion are investigated.
11
12
13
14
15
16

17 **4.2 Attributes of sustainable fashion**

18 **4.2.1 Sourcing and production process**

19
20 Sustainable fashion is predominantly associated with environmental sustainability,
21 such as the use of renewable and eco-friendly raw materials, the reduction of the
22 carbon footprint, durability, and longevity (Is; Qs), which are also featured in extant
23 research (e.g. Joergens 2006; Shen *et al* 2013). Social aspects were also mentioned,
24 with issues concerning fair wages, safety measures, and labour rights forming the top
25 three concerns, which aligns with past research (Pookulangara & Shepard 2013;
26 McNeill & Moore 2015). An explanation for social sustainability taking a backseat
27 could be this research's setting: the UK and EU have strict labour laws to which every
28 organisation needs to adhere. However, this aspect may change in the future with
29 research 'exposing' UK garment factories as unethical, due to having sweatshop-like
30 conditions and failure to pay national minimum wage (Hoskins 2015). Environmental
31 issues also play a more prominent role within consumers' everyday lives – a reality
32 they not only experience, but also have to deal with. A consumer summarises
33 sustainable fashion as "*a combination of things. You have to have a consciousness
34 about the planet, about what's happening environmentally, in the factories around the
35 world where clothes are produced, about the working conditions of the people who
36 make them... It's a lot about awareness and consciousness... There's another very
37 real aspect of finances... it always feels like it costs a lot more money*" (Is). Only one
38 participant positively elaborated on the price aspect, explaining: "*you know you are
39 getting quality*" (Is), when purchasing sustainable fashion. Thus, slow fashion is
40 associated with quality rather than quantity, again implying a price premium (Fletcher
41 2010). Yet, the 'locally made' aspect raised concerns that garments produced in the
42 UK were perceived to neither achieve the same quality as high street fashion nor be as
43

1
2
3 fashionable (Is). Although the UK has historically been a fashion hub and led the
4 industrial revolution, consumers distrust local production.
5
6

7 Yet, the case companies predominantly focus on the *local* aspect within their
8 promotional material emphasising that they source materials within the EU and
9 manufacture in the UK, which endeavours to reduce the carbon footprint for
10 production to a minimum – this is in comparison to other organisations, which source
11 their materials from outside the EU. The owner-managers interpret sustainable
12 fashion as '*fashion with a conscience*' (Is), which links to good working conditions
13 and a positive organisational atmosphere. They further insist that any organisation
14 producing sustainable fashion needs to have a personal relationship with their
15 stakeholders. One participant explains that she gains feedback daily from her
16 employees, which helps her to improve the production processes along the supply
17 chain and keeps her workers happy (Is). Other stakeholders, such as consumers and
18 suppliers also have the opportunity to engage with these micro-organisations through
19 creating the feel of '*shared ownership*' (Is) whereby actions are collaboratively
20 discussed and – if financially viable – implemented by the owner-manager. This
21 active engagement fosters stakeholder empowerment and creates trusted relationships
22 that enhance the slow fashion cause, by promoting sustainable values and ethical
23 conduct (e.g. Fletcher 2010; Ertekin & Atik). Choosing to involve stakeholders in the
24 business is an active choice made by the owner-managers, thus, their description of
25 sustainable fashion heavily features the product and production processes, and the
26 supply chain, rather than the design (e.g. versatility) and sustainable production
27 techniques (e.g. upcycling, recycling). A contradiction that emerged however was that
28 although stakeholders are an integral part of the owner-managers' definition, our data
29 show that the involvement of employees, suppliers, and other stakeholders is selective
30 and not explicitly mentioned within any of their communications (SE).

47
48

49 The owner-managers seem to have a personal affiliation with sustainable
50 fashion. One owner-manager recalls that she had her first experience with sustainable
51 fashion when she was 16, working for a London-based organisation. The owner-
52 manager claims that this London-based company pioneered slow fashion, as "*nearly
53 all their products [were produced] in London or Spain*" (Is). For her sustainable
54 fashion goes beyond the local aspect to further incorporate "*looking at things in a
55 different way... thinking about things differently and [re]using things*" (Is), which is
56 reflected in her micro-company's fashion collections: the raw materials are sourced
57
58
59
60

1
2
3 locally, reclaimed, and upcycled (Is; SE; TF). She highlights that she imposes
4 limitations on her company, by sourcing materials within a 20-mile radius of the
5 production site (SE). This aspect is vital for this micro-organisation emphasising that
6 they are “*big on heritage – many of our products are 100% made in [company’s*
7 *region], right down to the trimmings*” (SE). The owner-manager believes that the 20-
8 mile radius is inclusive enough to have various suppliers, reduces carbon emission,
9 and fosters the local aspect. This however, contradicts observations made during the
10 research: first, the website highlights that the company is “*forward thinking*” (SE)
11 and utilises new techniques to create unique collections (ES). The company produces
12 these items on machines that have been reclaimed. Whilst this fits within the
13 overarching idea of sustainability - making use of ‘waste’ resources - these machines
14 do not incorporate the newest technology and have high-energy usage (SE; TF). It is
15 questionable whether using out-dated machinery that is not energy and eco-efficient
16 can necessarily be classified as “*forward thinking*” (SE). Second, although the
17 material is reclaimed, recycled, upcycled, and sourced within a 20-mile radius, the
18 owner drives a “*big old banger car, which probably isn’t economic[al]*” (Is), uses a
19 lot of petrol and emits more pollutants than a new car. Two different realities are
20 emerging, first the ‘reality’ that sees its origins in a philosophical viewpoint where
21 garments are locally produced with forward thinking, and second, the ‘reality’ in
22 which the owner-manager is constrained by their own limitations and financial
23 capabilities.

Consumers and micro-organisations alike identify *sustainable fashion* as being
locally produced, which links to aspects of good working conditions, fair wages, and
a reduced carbon footprint. Although these micro-organisations heavily feature the
local aspect within their promotion, as it is seen as a vital selling point for sustainable
garments, those consumers who doubt the quality standards of local production, do
not necessarily perceive this as beneficial.

4.2.2 Transparency and traceability

Transparency emerged as a further theme throughout the data analysis. Transparency
looks at the origins of raw materials, dyes and chemicals used in the manufacturing
process, and the employees and their working conditions (Is; SE; TF). Participants say
that they “*strive to achieve a green balance between economics and environmental*
consciousness, [they] manufacture all [their] products in a 100% sweatshop free

59
60

environment, in the UK” (SE). The owner-managers believe that being transparent is vital. One owner-manager insists that her consumers should come visit her manufacturing site to see their process for themselves (Is). She comments “*they should come, see it. I don’t have anything to hide. It’s who we are and what we are. We only had one chap coming in before unannounced... it’s been great, showed him around and got talking. Got a really nice review after, too*” (Is). The owner-manager prides herself in sourcing environmentally friendly fabrics within the EU for her products, which are either made out of polyester (outside) and cotton (inside) or leather (outside) and cotton (inside). All raw materials have been tested for harmful substances and are classified as child safe (Is). Although the owner-manager can trace her raw materials back to the original source, it is noteworthy that the product description on the website does not explicitly state what raw materials were used in the production process. The owner-manager repeatedly states that the products are made from real leather (Is), yet this is omitted from the company’s communications (SE). Questions could be raised whether these materials are in line with the ‘green balance’ advocated on the website, as leather is an animal fibre and polyester a strong pollutant material (Coen 2011). This article does not seek to judge materials used in the manufacturing process, but rather highlights that although materials may be sourced consciously, they may not always be sustainable. Cotton, for example, is a monoculture that drains water resources from ground and surface water and even when produced organically, the pesticides may damage the environment (Parker 1999; Leech 2013).

Various participants reuse and upcycle pre-loved garments for their fashion collections, which keeps textile fabric out of landfill. These micro-organisations claim they are able to trace their raw materials to their original source, which may be misleading. Tracing the origin of an upcycled jumper can be impossible, as tags are removed. Thus, there is no guarantee that these were originally made in good working conditions and not in a factory such as Rana Plaza. Greater care needs to be taken in order to avoid aspects of greenwashing in this kind of production. A participant emphasises that producing sustainably implies a long-term perspective – how ‘sustainable’ is defined however, depends on the way the micro-organisation produces their clothes and thus refer to either certified textiles or reusing pre-loved garments. An aspect that the majority of participants agree on is that “*the product needs to be*

1
2
3 *sustainable from its core*” (Is) which is seen as a philosophical underpinning of the
4 production process rather than an ‘add on’ strategy.
5

6
7 Experts suggest that consumers make “*a lot more considered choices... one*
8 *example is the luxury industry, which saw a rise over the recession, [which] showed*
9 *that people... were making more investment purchases and actually also stems into*
10 *what you might call sustainable fashion or sustainable practices*” (Is). Moreover,
11 interviewees suggest that *sustainable fashion* is about profitability, transparency,
12 environmental principles, and viability. “*A brand has to be completely open... with*
13 *Twitter and everything... so you cannot hide all this information, it’s out there... You*
14 *literally have to look at the process from A to B and be sustainable from there off... this*
15 *relates not just to the fabrics that are used, but how the product goes from*
16 *manufacturing to the store and how that affects the [carbon] footprint*” (Is). This
17 further emphasises the need to communicate sustainable aspects of slow fashion
18 garments and clearly indicate how and why they are classified as sustainable. The
19 various realities presented thus far in the article see similarities in their notions of the
20 use of raw materials and transparency, yet the gap between what manufacturers and
21 consumers believe sustainable fashion to be differs, making it challenging for
22 companies to create engagement. Different production techniques, such as upcycling
23 further extend the meaning of sustainable fashion as being “*based on sustainable*
24 *design principles. So designing for end-of-life management... using waste as a source*
25 *material and diverting it from landfill... If it wasn’t upcycled it would be thrown into*
26 *landfill*” (Is).
27

28
29 Particularly among experts and the owner-managers, transparency and
30 traceability were seen as key aspects to distinguish sustainable fashion production.
31 Within this understanding it is more important to focus on long-term relationships and
32 being able to show transparency along the supply chain rather than establishing the
33 origins of raw materials, such as pre-loved garments.
34

35 ***Sustainable fashion – what have we learned?***

36
37 The article set out to answer two research questions: First, to investigate the
38 underlying principles of sustainable fashion, and second how the concept of
39 sustainable fashion relates to aspects of social constructionism. Data suggest that
40 although similarities exist between the various realities of sustainable fashion,
41
42
43
44
45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 different aspects are not only emphasised, but also understood differently (e.g. Shotter
4
5 2002).

6
7 Underlying principles that emerged include local sourcing and production,
8
9 transparency across the supply chain, traceability of work processes and (ideally) raw
10
11 materials, environmentally friendly raw materials, and social aspects, such as safe
12
13 working conditions and fair wages. An observation that was made is that the
14
15 individual principles gain different levels of priority depending on the group
16
17 discussing these aspects. Whilst local production and sourcing is a distinguishing
18
19 factor for micro-organisations and experts, it is of less prominence for consumers,
20
21 who see the use of environmental friendly raw materials as a priority.

22
23 Due to sustainable fashion being interpreted from different 'realities' experts
24
25 and micro-organisations may face challenges and trade-offs when classifying
26
27 themselves as 'sustainable fashion' producers: First, the choice of raw material can
28
29 lead to an ethical dilemma. Utilising leather is negatively perceived by animal rights
30
31 pressure groups, which could be a reason why one of the micro-organisations omitted
32
33 this information. Whether excluding information about raw materials (intentionally or
34
35 unintentionally) is ethical goes beyond the scope of this article, but could provide the
36
37 basis for future research. Although the majority of case companies use reclaimed
38
39 material, which extends their initial life-cycle, the origin of the recycled garment may
40
41 be unknown, thus claiming that the fabric was locally sourced is misleading, as the
42
43 original product may have been manufactured abroad.

44
45 Second, these self-imposed limitations may have an impact on the product
46
47 price: limiting resources will delay availability of the finished products, which can
48
49 result in a market deficit, due to an unaligned supply and demand curve. In order to
50
51 balance this deficit, the price-point of these goods is set at a higher level, thereby
52
53 restricting purchase to customers who can/are willing to pay the premium. The
54
55 question that emerges is whether the increased price is justified. This may be linked to
56
57 consumers describing sustainable fashion as an "oxymoron" (Qs). Looking at the
58
59 overall fashion industry, organisations are producing fashion lines to satisfy consumer
60
61 needs to buy new products (e.g. Jung & Jin 2014). Slow fashion is based on principles
62
63 of sustainability and ethical conduct that seeks to challenge the fast fashion cycle.
64
65 Yet, sustainable fashion collections are still produced to satisfy consumer needs and
66
67 are based on the assumption that garments will be consumed. A vicious circle begins:
68
69 Kate Fletcher, author of the book 'Sustainable Fashion & Textiles', writes that "we
70

1
2
3 buy many more clothes than we need and the clothes we buy, ‘exploit workers, fuel
4 resource use, increase environmental impact and generate waste’” (O’Connell 2013).
5
6 This could lead to the conclusion that sustainable fashion cannot exist, because as
7 soon as fashion garments are produced, consumers are encouraged to buy these
8 products. Developing this thought further, this could imply that the demand for these
9 particular garments may increase over time, which leads to producing larger batch
10 sizes, which over time may result in moving from a slow fashion to a fast fashion
11 approach. Thus, opponents may argue that sustainable fashion cannot exist, as the
12 economy is based on consumerism.
13
14
15
16
17
18

19
20 Third, can an industry that is based on consumerism ever produce a
21 ‘sustainable product’? Utilising environmentally friendly materials, decreasing the use
22 of pesticides, and promoting recycling and upcycling collections may be a start to
23 encourage more mindful behaviour. However, the fact that clothes are still being sold
24 and produced seems to contradict what sustainability stands for: preserving the
25 environment. Similarly, it is important to ask whether sustainable fashion can be the
26 future. If sustainable fashion was a lucrative business, why would major players in the
27 fashion industry hesitate to change their business practices? The experts highlighted
28 that sustainable fashion needs to be supported throughout the industry (Is). Small
29 organisations can easily adapt to changes in the market, however it is multinationals
30 that have a larger share in the industry, and due to their structure cannot adapt to
31 changes quickly. Although the argument that not all multinationals can spontaneously
32 change their business practices holds true, collaborations could overcome this
33 challenge.
34
35
36
37
38
39
40
41
42
43

44 In summary, sustainable fashion can be interpreted from various different
45 realities and incorporate several aspects. Data indicate that there is no one way of
46 defining what sustainable fashion entails. Rather than providing a clear-cut answer
47 more questions are raised that need answering. The only commonality to emerge is
48 that changing current practices in the fashion industry is important and attempts
49 should be made to reduce the current fashion cycle by being more mindful and
50 conscious of raw materials.
51
52
53
54
55
56
57

58 *Moving forward*

59 Our analysis proposes that understanding the term sustainable fashion is vital, as it:
60

- Provides a common understanding upon which various groups (organisations, stakeholders) can act;
- Prevents greenwashing;
- Allows organisations to align their strategies and objectives with key criteria associated with the term.

Although sustainable fashion can be seen as an oxymoron (Qs), this research suggests that a majority of participants strongly believe that this type of fashion not only exists, but also is currently produced. At the same time the participant groups stress different aspects of what makes sustainable fashion, which implies that the term itself is difficult to define, and even harder to act upon. Taking these challenges into account it becomes apparent that the term is subjective, in that it can mean different things to different people (Shotter 2002).

In order to overcome the challenge of defining sustainable fashion, this article proposes a matrix that provides companies with the flexibility to highlight how they interpret sustainable fashion, what their priorities are, and how they move forward in the future. Table 1 provides an example of such a matrix. **The individual components of this matrix are based on principles underpinning sustainable fashion and link to the different realities highlighted in this article.**

Table 1: Sustainable fashion matrix

	Basic	Low priority	Medium priority	High priority	Organisational evidence	3 rd party evidence
Forward thinking						
Innovation						
Ethical/sustainable design	✓					
Ethically sourced						
Meaningful, interesting						
Local production						
Production techniques (recycling, upcycling, traditional techniques)						
Versatile						
Promoting fair trade, fair wages	✓					
Transparency/Traceability						
Checks for harmful substances	✓					
Long-term focus						
Environmental standards	✓					
Human rights/ working conditions	✓					
Community support/ integration						
Financially viable						
Environmentally friendly materials						
Renewable sources						
Limited transportation						
Fashion with conscience						
Heritage						

1
2
3
4
5 The categories on the left hand side emerged from our analysis, with the ticks
6 indicating which aspects were important to the participants or emerged from the
7 literature. The matrix is designed to cater for various realities in that it allows each
8 micro-organisation to set their own targets, by indicating which elements of
9 sustainable fashion are 'low', 'medium', or 'high' priority. The last column, 3rd party
10 evidence, can include, but is not limited to eco-labels, partnerships with third parties,
11 and industry specific awards or prizes the organisation has won or was nominated for.
12 Stated alternatively, an outsider certifies that the organisation's claims made about
13 specific aspects have been independently evaluated and found to hold true.
14
15
16
17
18
19
20
21

22 ***Conclusion and implications***

23 This article contributes to knowledge by exploring principles underpinning
24 sustainable fashion from a social constructionist viewpoint. The findings indicate that
25 sustainable fashion is subjective in nature and we suggest a matrix that allows
26 companies to indicate their sustainable fashion priorities. This has various
27 implications for practitioners, as in order to sell fashion items that are classified as
28 'sustainable' they need to communicate this clearly to their stakeholders. Highlighting
29 their unique ways of creating fashion could lead to a competitive advantage that
30 strengthens their image. Understanding the various viewpoints is vital for marketers,
31 who can utilise the matrix and clearly communicate what sustainable fashion means
32 to individual companies, which helps to prevent greenwashing.
33
34
35
36
37
38
39
40
41

42 A limitation of this research is the sample size in a specific niche market: the
43 slow fashion industry. Thus, it is suggested that future research investigates whether
44 the individual categories highlighted within the matrix hold true for the wider fashion
45 industry.
